-0.056 to 0.040	90	7 JODIDIO 86	ELEC	μ decay

- 1 ACKERSTAFF 99d limit is from τ decay parameters.
- 2 CZAKON 99 perform a simultaneous fit to charged and neutral sectors.
- 3 The quoted limit is from μ decay parameters. BARENBOIM 97 also evaluate limit from $K_L - K_S$ mass difference.
- 4 MISHRA 92 limit is from the absence of extra large- x , large- y $\bar{\nu}_\mu N \rightarrow \bar{\nu}_\mu X$ events at Tevatron, assuming left-handed ν and right-handed $\bar{\nu}$ in the neutrino beam. The result gives $\zeta^2(1-2m_{W_1}^2/m_{W_2}^2) < 0.0015$. The limit is independent of ν_R mass.
- 5 AQUINO 91 limits obtained from neutron lifetime and asymmetries together with unitarity of the CKM matrix. Manifest left-right asymmetry is assumed.
- 6 BARBIERI 89b limit holds for $m_{\nu_R} \leq 10$ MeV.
- 7 First JODIDIO 86 result assumes $m_{W_R} = \infty$, second is for unconstrained m_{W_R} .

[Z'-Boson Searches](#)

MASS LIMITS for Z' (Heavy Neutral Vector Boson Other Than Z)

Limits for Z'_{SM}

Z'_{SM} is assumed to have couplings with quarks and leptons which are identical to those of Z, and decays only to known fermions. The most recent preliminary results can be found in the "Z'-boson searches" review above.

- 16 AAD 14V search for resonances decaying to $e^+ e^-, \mu^+ \mu^-$ in pp collisions at $\sqrt{s} = 8$ TeV.
- 17 BOBOVNIKOV 18 use the ATLAS limits on $\sigma(pp \rightarrow Z') \cdot \mathcal{B}(Z' \rightarrow W^+ W^-)$ to constrain the $Z-Z'$ mixing parameter ξ . See their Fig. 11 for limits in $M_{Z'} - \xi$ plane.
- 18 AABOUD 16AA search for resonances decaying to $\tau^+ \tau^-$ in pp collisions at $\sqrt{s} = 13$ TeV.
- 19 AAD 15AM search for resonances decaying to $\tau^+ \tau^-$ in pp collisions at $\sqrt{s} = 8$ TeV.
- 20 AAD 13S search for resonances decaying to $\tau^+ \tau^-$ in pp collisions at $\sqrt{s} = 7$ TeV.
- 21 CHATRCHYAN 13A use pp collisions at $\sqrt{s} = 7$ TeV.
- 22 CHATRCHYAN 13AF search for resonances decaying to $e^+ e^-, \mu^+ \mu^-$ in pp collisions at $\sqrt{s} = 7$ TeV and 8 TeV.
- 23 AAD 12CC search for resonances decaying to $e^+ e^-, \mu^+ \mu^-$ in pp collisions at $\sqrt{s} = 7$ TeV.
- 24 CHATRCHYAN 12O search for resonances decaying to $\tau^+ \tau^-$ in pp collisions at $\sqrt{s} = 7$ TeV.
- 25 AALTONEN 11I search for resonances decaying to $\mu^+ \mu^-$ in $p \bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV.
- 26 ABAZOV 11A, AALTONEN 09T, AALTONEN 07H, and ABULENCIA 06L search for resonances decaying to $e^+ e^-$ in $p \bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV.
- 27 The quoted limit assumes $g_{WWZ'} / g_{WWZ} = (M_W / M_{Z'})^2$. See their Fig. 4 for limits in mass-coupling plane.
- 28 AALTONEN 09AC search for new particle decaying to dijets.
- 29 ERLER 09 give 95% CL limit on the $Z-Z'$ mixing $-0.0026 < \theta < 0.0006$.
- 30 ABDALLAH 06C use data $\sqrt{s} = 130-207$ GeV.

See key on page 1127

Gauge & Higgs Boson Particle Listings
New Heavy Bosons

- ³¹ ACOSTA 05R search for resonances decaying to tau lepton pairs in $\bar{p}p$ collisions at $\sqrt{s} = 1.96$ TeV.
- ³² ABBIENDI 04G give 95% CL limit on $Z-Z'$ mixing $-0.00422 < \theta < 0.00091$. $\sqrt{s} = 91$ to 207 GeV.
- ³³ ABAZOV 01B search for resonances in $p\bar{p} \rightarrow e^+e^-$ at $\sqrt{s}=1.8$ TeV. They find $\sigma \cdot B(Z' \rightarrow e e) < 0.06$ pb for $M_{Z'} > 500$ GeV.
- ³⁴ CHEUNG 01B limit is derived from bounds on contact interactions in a global electroweak analysis.
- ³⁵ ABREU 00s uses LEP data at $\sqrt{s}=90$ to 189 GeV.
- ³⁶ BARATE 00i search for deviations in cross section and asymmetries in $e^+e^- \rightarrow$ fermions at $\sqrt{s}=90$ to 183 GeV. Assume $\theta=0$. Bounds in the mass-mixing plane are shown in their Figure 18.
- ³⁷ ERLER 99 give 90%CL limit on the $Z-Z'$ mixing $-0.0041 < \theta < 0.0003$. $\rho_0=1$ is assumed.
- ³⁸ ABE 97s find $\sigma(Z') \times B(e^+e^-, \mu^+\mu^-) < 40$ fb for $m_{Z'} > 600$ GeV at $\sqrt{s} = 1.8$ TeV.
- ³⁹ VILAIN 94B assume $m_t = 150$ GeV.
- ⁴⁰ ALITTI 93 search for resonances in the two-jet invariant mass. The limit assumes $B(Z' \rightarrow q\bar{q})=0.7$. See their Fig. 5 for limits in the $m_{Z'}-B(q\bar{q})$ plane.
- ⁴¹ RIZZO 93 analyses CDF limit on possible two-jet resonances.
- ⁴² ABE 90f use data for $R, R_{\ell\ell}$, and $A_{\ell\ell}$. They fix $m_W = 80.49 \pm 0.43 \pm 0.24$ GeV and $m_Z = 91.13 \pm 0.03$ GeV.

Limits for Z_{LR}

Z_{LR} is the extra neutral boson in left-right symmetric models. $g_L = g_R$ is assumed unless noted. Values in parentheses assume stronger constraint on the Higgs sector, usually motivated by specific left-right symmetric models (see the Note on the W'). Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino. Direct search bounds assume decays to Standard Model fermions only, unless noted.

- ¹ DEL-AGUILA 10 give 95% CL limit on the $Z-Z'$ mixing $-0.0012 < \theta < 0.0004$.
- ² ABE 97s find $\sigma(Z') \times B(e^+e^-, \mu^+\mu^-) < 40$ fb for $m_{Z'} > 600$ GeV at $\sqrt{s} = 1.8$ TeV.
- ³ BOBOVNIKOV 18 use the ATLAS limits on $\sigma(pp \rightarrow Z') \cdot B(Z' \rightarrow W^+W^-)$ to constrain the $Z-Z'$ mixing parameter ξ . See their Fig. 10 for limits in $M_{Z'} - \xi$ plane.
- ⁴ ERLER 09 give 95% CL limit on the $Z-Z'$ mixing $-0.0013 < \theta < 0.0006$.
- ⁵ ABDALLAH 06c give 95% CL limit $|\theta| < 0.0028$. See their Fig. 14 for limit contours in the mass-mixing plane.
- ⁶ ABBIENDI 04G give 95% CL limit on $Z-Z'$ mixing $-0.00098 < \theta < 0.00190$. See their Fig. 20 for the limit contour in the mass-mixing plane. $\sqrt{s} = 91$ to 207 GeV.
- ⁷ CHEUNG 01B limit is derived from bounds on contact interactions in a global electroweak analysis.
- ⁸ ABREU 00s give 95% CL limit on $Z-Z'$ mixing $|\theta| < 0.0018$. See their Fig. 6 for the limit contour in the mass-mixing plane. $\sqrt{s}=90$ to 189 GeV.
- ⁹ BARATE 00i search for deviations in cross section and asymmetries in $e^+e^- \rightarrow$ fermions at $\sqrt{s}=90$ to 183 GeV. Assume $\theta=0$. Bounds in the mass-mixing plane are shown in their Figure 18.
- ¹⁰ CHAY 00 also find $-0.0003 < \theta < 0.0019$. For g_R free, $m_{Z'} > 430$ GeV.
- ¹¹ ERLER 00 discuss the possibility that a discrepancy between the observed and predicted values of $Q_{Wf}(Cs)$ is due to the exchange of Z' . The data are better described in a certain class of the Z' models including Z_{LR} and Z_χ .
- ¹² CASALBUONI 99 discuss the discrepancy between the observed and predicted values of $Q_{Wf}(Cs)$. It is shown that the data are better described in a class of models including the Z_{LR} model.
- ¹³ CZAKON 99 perform a simultaneous fit to charged and neutral sectors. Assumes manifest left-right symmetric model. Finds $|\theta| < 0.0042$.
- ¹⁴ ERLER 99 give 90% CL limit on the $Z-Z'$ mixing $-0.0009 < \theta < 0.0017$.
- ¹⁵ ERLER 99 assumes 2 Higgs doublets, transforming as 10 of $SO(10)$, embedded in E_6 .
- ¹⁶ BARENBOIM 98 also gives 68% CL limits on the $Z-Z'$ mixing $-0.0005 < \theta < 0.0033$. Assumes Higgs sector of minimal left-right model.
- ¹⁷ CONRAD 98 limit is from measurements at CCFR, assuming no $Z-Z'$ mixing.
- ¹⁸ VILAIN 94B assume $m_t = 150$ GeV and $\theta=0$. See Fig. 2 for limit contours in the mass-mixing plane.

- ¹⁹ RIZZO 93 analyses CDF limit on possible two-jet resonances.
- ²⁰ GRIFOLS 90 limit holds for $m_{\nu_R} \lesssim 1$ MeV. A specific Higgs sector is assumed. See also GRIFOLS 90b, RIZZO 91.
- ²¹ BARBIERI 89B limit holds for $m_{\nu_R} \leq 10$ MeV. Bounds depend on assumed supernova core temperature.

Limits for Z_χ

Z_χ is the extra neutral boson in $SO(10) \rightarrow SU(5) \times U(1)_\chi$. $g_\chi = e/\cos\theta_W$ is assumed unless otherwise stated. We list limits with the assumption $\rho = 1$ but with no further constraints on the Higgs sector. Values in parentheses assume stronger constraint on the Higgs sector motivated by superstring models. Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino.

- ⁵ AAD 14v search for resonances decaying to $e^+e^-, \mu^+\mu^-$ in pp collisions at $\sqrt{s} = 8$ TeV.
- ⁶ AAD 12cc search for resonances decaying to $e^+e^-, \mu^+\mu^-$ in pp collisions at $\sqrt{s} = 7$ TeV.
- ⁷ AALTONEN 11i search for resonances decaying to $\mu^+\mu^-$ in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV.
- ⁸ ABAZOV 11A, AALTONEN 09T, AALTONEN 07H, and ABULENCIA 06L search for resonances decaying to e^+e^- in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV.
- ⁹ DEL-AGUILA 10 give 95% CL limit on the $Z-Z'$ mixing $-0.0011 < \theta < 0.0007$.
- ¹⁰ AALTONEN 09v search for resonances decaying to $\mu^+\mu^-$ in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV.
- ¹¹ ERLER 09 give 95% CL limit on the $Z-Z'$ mixing $-0.0016 < \theta < 0.0006$.
- ¹² ABDALLAH 06c give 95% CL limit $|\theta| < 0.0031$. See their Fig. 14 for limit contours in the mass-mixing plane.
- ¹³ ABULENCIA 05A search for resonances decaying to electron or muon pairs in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV.
- ¹⁴ ABBIENDI 04G give 95% CL limit on $Z-Z'$ mixing $-0.00099 < \theta < 0.00194$. See their Fig. 20 for the limit contour in the mass-mixing plane. $\sqrt{s} = 91$ to 207 GeV.
- ¹⁵ BARGER 03b limit is from the nucleosynthesis bound on the effective number of light neutrino $\delta N_\nu < 1$. The quark-hadron transition temperature $T_C=150$ MeV is assumed. The limit with $T_C=400$ MeV is >4300 GeV.
- ¹⁶ CHEUNG 01B limit is derived from bounds on contact interactions in a global electroweak analysis.
- ¹⁷ ABREU 00s give 95% CL limit on $Z-Z'$ mixing $|\theta| < 0.0017$. See their Fig. 6 for the limit contour in the mass-mixing plane. $\sqrt{s}=90$ to 189 GeV.
- ¹⁸ BARATE 00i search for deviations in cross section and asymmetries in $e^+e^- \rightarrow$ fermions at $\sqrt{s}=90$ to 183 GeV. Assume $\theta=0$. Bounds in the mass-mixing plane are shown in their Figure 18.

Gauge & Higgs Boson Particle Listings

New Heavy Bosons

- 19 CHO 00 use various electroweak data to constrain Z' models assuming $m_H=100$ GeV. See Fig. 3 for limits in the mass-mixing plane.
- 20 ERLER 00 discuss the possibility that a discrepancy between the observed and predicted values of $Q_{\mathcal{W}}(Cs)$ is due to the exchange of Z' . The data are better described in a certain class of the Z' models including Z_{LR} and Z_{χ} .
- 21 ROSNER 00 discusses the possibility that a discrepancy between the observed and predicted values of $Q_{\mathcal{W}}(Cs)$ is due to the exchange of Z' . The data are better described in a certain class of the Z' models including Z_{χ} .
- 22 ERLER 99 give 90% CL limit on the Z - Z' mixing $-0.0020 < \theta < 0.0015$.
- 23 ERLER 99 assumes 2 Higgs doublets, transforming as 10 of $SO(10)$, embedded in E_6 .
- 24 CONRAD 98 limit is from measurements at CCFR, assuming no Z - Z' mixing.
- 25 ABE 97s find $\sigma(Z') \times B(e^+e^-, \mu^+\mu^-) < 40$ fb for $m_{Z'} > 600$ GeV at $\sqrt{s}=1.8$ TeV.
- 26 Z - Z' mixing is assumed to be zero. $\sqrt{s}=57.77$ GeV.
- 27 VILAIN 94b assume $m_t = 150$ GeV and $\theta=0$. See Fig. 2 for limit contours in the mass-mixing plane.
- 28 FARAGGI 91 limit assumes the nucleosynthesis bound on the effective number of neutrinos $\Delta N_{\nu} < 0.5$ and is valid for $m_{\nu_R} < 1$ MeV.
- 29 ABE 90f use data for R , $R_{\ell\ell}$, and $A_{\ell\ell}$. ABE 90f fix $m_{\mathcal{W}} = 80.49 \pm 0.43 \pm 0.24$ GeV and $m_Z = 91.13 \pm 0.03$ GeV.
- 30 Assumes the nucleosynthesis bound on the effective number of light neutrinos ($\delta N_{\nu} < 1$) and that ν_R is light ($\lesssim 1$ MeV).
- 31 GRIFOLS 90 limit holds for $m_{\nu_R} \lesssim 1$ MeV. See also GRIFOLS 90d, RIZZO 91.

Limits for Z_{ψ}

Z_{ψ} is the extra neutral boson in $E_6 \rightarrow SO(10) \times U(1)_{\psi}$. $g_{\psi} = e/\cos\theta_{\mathcal{W}}$ is assumed unless otherwise stated. We list limits with the assumption $\rho=1$ but with no further constraints on the Higgs sector. Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino.

- 13 CHATRCHYAN 12M search for resonances decaying to e^+e^- or $\mu^+\mu^-$ in pp collisions at $\sqrt{s} = 7$ TeV.
- 14 AALTONEN 11i search for resonances decaying to $\mu^+\mu^-$ in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV.
- 15 ABAZOV 11A, AALTONEN 09T, AALTONEN 07H, and ABULENCIA 06L search for resonances decaying to e^+e^- in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV.
- 16 DEL-AGUILA 10 give 95% CL limit on the Z - Z' mixing $-0.0019 < \theta < 0.0007$.
- 17 AALTONEN 09v search for resonances decaying to $\mu^+\mu^-$ in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV.
- 18 ERLER 09 give 95% CL limit on the Z - Z' mixing $-0.0018 < \theta < 0.0009$.
- 19 ABDALLAH 06C give 95% CL limit $|\theta| < 0.0027$. See their Fig. 14 for limit contours in the mass-mixing plane.
- 20 ABULENCIA 05A search for resonances decaying to electron or muon pairs in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV.
- 21 ABBIENDI 04G give 95% CL limit on Z - Z' mixing $-0.00129 < \theta < 0.00258$. See their Fig. 20 for the limit contour in the mass-mixing plane. $\sqrt{s} = 91$ to 207 GeV.
- 22 BARGER 03B limit is from the nucleosynthesis bound on the effective number of light neutrino $\delta N_{\nu} < 1$. The quark-hadron transition temperature $T_C=150$ MeV is assumed. The limit with $T_C=400$ MeV is >1100 GeV.
- 23 ABREU 00s give 95% CL limit on Z - Z' mixing $|\theta| < 0.0018$. See their Fig. 6 for the limit contour in the mass-mixing plane. $\sqrt{s} = 90$ to 189 GeV.
- 24 BARATE 00i search for deviations in cross section and asymmetries in $e^+e^- \rightarrow$ fermions at $\sqrt{s}=90$ to 183 GeV. Assume $\theta=0$. Bounds in the mass-mixing plane are shown in their Figure 18.
- 25 CHO 00 use various electroweak data to constrain Z' models assuming $m_H=100$ GeV. See Fig. 3 for limits in the mass-mixing plane.
- 26 ERLER 99 give 90% CL limit on the Z - Z' mixing $-0.0013 < \theta < 0.0024$.
- 27 CONRAD 98 limit is from measurements at CCFR, assuming no Z - Z' mixing.
- 28 ABE 97s find $\sigma(Z') \times B(e^+e^-, \mu^+\mu^-) < 40$ fb for $m_{Z'} > 600$ GeV at $\sqrt{s}=1.8$ TeV.
- 29 VILAIN 94b assume $m_t = 150$ GeV and $\theta=0$. See Fig. 2 for limit contours in the mass-mixing plane.
- 30 ABE 90f use data for R , $R_{\ell\ell}$, and $A_{\ell\ell}$. ABE 90f fix $m_{\mathcal{W}} = 80.49 \pm 0.43 \pm 0.24$ GeV and $m_Z = 91.13 \pm 0.03$ GeV.
- 31 Assumes the nucleosynthesis bound on the effective number of light neutrinos ($\delta N_{\nu} < 1$) and that ν_R is light ($\lesssim 1$ MeV).
- 32 GRIFOLS 90d limit holds for $m_{\nu_R} \lesssim 1$ MeV. See also RIZZO 91.

Limits for Z_{η}

Z_{η} is the extra neutral boson in E_6 models, corresponding to $Q_{\eta} = \sqrt{3/8} Q_{\chi} - \sqrt{5/8} Q_{\psi}$. $g_{\eta} = e/\cos\theta_{\mathcal{W}}$ is assumed unless otherwise stated. We list limits with the assumption $\rho=1$ but with no further constraints on the Higgs sector. Values in parentheses assume stronger constraint on the Higgs sector motivated by superstring models. Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino.

- ¹ SIRUNYAN 21X search for resonances decaying to HZ in pp collisions at $\sqrt{s} = 13$ TeV. The limit quoted above is for heavy-vector-triplet Z' with $g_V = 3$. The limit becomes $M_{Z'} > 3500$ GeV for $g_V = 1$.
- ² AAD 20AJ search for resonances decaying to HZ in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for heavy-vector-triplet Z' with $g_V = 3$. The limit becomes $M_{Z'} > 2200$ GeV for $g_V = 1$. See their Fig. 6 for limits on σ - B .
- ³ AAD 20AM search for a resonance decaying to $t\bar{t}$ in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for a leptophobic top-color Z' with $\Gamma_{Z'}/M_{Z'} = 0.01$. The limit becomes $M_{Z'} > 4700$ GeV for $\Gamma_{Z'}/M_{Z'} = 0.03$.
- ⁴ AAD 20AT search for resonances decaying to WW in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for heavy-vector-triplet Z' with $g_V = 3$. The limit becomes $M_{Z'} > 3500$ GeV for $g_V = 1$. See their Fig. 14 for limits on σ - B .
- ⁵ SIRUNYAN 20Q search for resonances decaying to WW in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for heavy-vector-triplet Z' with $g_V = 3$.
- ⁶ AABOUD 19AS search for a resonance decaying to $t\bar{t}$ in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for a top-color Z' with $\Gamma_{Z'}/M_{Z'} = 0.01$. Limits are also set on Z' masses in simplified Dark Matter models.

Gauge & Higgs Boson Particle Listings

New Heavy Bosons

- 7 AAD 19d search for resonances decaying to WW in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for heavy-vector-triplet Z' with $g_V = 3$. The limit becomes $M_{Z'} > 2900$ GeV for $g_V = 1$. If we assume $M_{Z'} = M_{W'}$, the limit increases $M_{Z'} > 3800$ GeV and $M_{Z'} > 3500$ GeV for $g_V = 3$ and $g_V = 1$, respectively. See their Fig. 9 for limits on $\sigma \cdot B$.
- 8 SIRUNYAN 19AA search for a resonance decaying to $t\bar{t}$ in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for a leptophobic top-color Z' with $\Gamma_{Z'}/M_{Z'} = 0.01$.
- 9 SIRUNYAN 19CP present a statistical combinations of searches for Z' decaying to pairs of bosons or leptons in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for heavy-vector-triplet Z' with $g_V = 3$. If we assume $M_{Z'} = M_{W'}$, the limit becomes $M_{Z'} > 4500$ GeV for $g_V = 3$ and $M_{Z'} > 5000$ GeV for $g_V = 1$. See their Figs. 2 and 3 for limits on $\sigma \cdot B$.
- 10 SIRUNYAN 19I search for resonances decaying to ZW in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for heavy-vector-triplet Z' with $g_V = 3$. The limit becomes $M_{Z'} > 2800$ GeV if we assume $M_{Z'} = M_{W'}$.
- 11 AABOUD 18AB search for resonances decaying to $b\bar{b}$ in pp collisions at $\sqrt{s} = 13$ TeV. The limit quoted above is for a leptophobic Z' with SM-like couplings to quarks. See their Fig. 6 for limits on $\sigma \cdot B$. Additional limits on a Z' axial-vector mediator in a simplified dark-matter model are shown in Fig. 7.
- 12 AABOUD 18AI search for resonances decaying to HZ in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for heavy-vector-triplet Z' with $g_V = 3$. The limit becomes $M_{Z'} > 2650$ GeV for $g_V = 1$. If we assume $M_{W'} = M_{Z'}$, the limit increases $M_{Z'} > 2930$ GeV and $M_{Z'} > 2800$ GeV for $g_V = 3$ and $g_V = 1$, respectively. See their Fig. 5 for limits on $\sigma \cdot B$.
- 13 AABOUD 18AK search for resonances decaying to WW in pp collisions at $\sqrt{s} = 13$ TeV. The limit quoted above is for heavy-vector-triplet Z' with $g_V = 3$. The limit becomes $M_{Z'} > 2750$ GeV for $g_V = 1$.
- 14 AABOUD 18B search for resonances decaying to WW in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for heavy-vector-triplet Z' with $g_V = 1$. See their Fig.11 for limits on $\sigma \cdot B$.
- 15 AABOUD 18BI search for a resonance decaying to $t\bar{t}$ in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for a top-color assisted TC Z' with $\Gamma_{Z'}/M_{Z'} = 0.01$. The limits for wider resonances are available. See their Fig. 14 for limits on $\sigma \cdot B$.
- 16 AABOUD 18F search for resonances decaying to WW in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for heavy-vector-triplet Z' with $g_V = 3$. The limit becomes $M_{Z'} > 2200$ GeV for $g_V = 1$. If we assume $M_{Z'} = M_{W'}$, the limit increases $M_{Z'} > 3500$ GeV and $M_{Z'} > 3100$ GeV for $g_V = 3$ and $g_V = 1$, respectively. See their Fig.5 for limits on $\sigma \cdot B$.
- 17 SIRUNYAN 18ED search for resonances decaying to HZ in pp collisions at $\sqrt{s} = 13$ TeV. The limit above is for heavy-vector-triplet Z' with $g_V = 3$. If we assume $M_{Z'} = M_{W'}$, the limit increases $M_{Z'} > 2900$ GeV and $M_{Z'} > 2800$ GeV for $g_V = 3$ and $g_V = 1$, respectively.
- 18 SIRUNYAN 18P give this limit for a heavy-vector-triplet Z' with $g_V = 3$. If we assume $M_{Z'} = M_{W'}$, the limit increases to $M_{Z'} > 3800$ GeV.
- 19 AABOUD 17AK search for a new resonance decaying to dijets in pp collisions at $\sqrt{s} = 13$ TeV. The limit quoted above is for a leptophobic Z' boson having axial-vector coupling strength with quarks $g_q = 0.2$. The limit is 2100 GeV if $g_q = 0.1$.
- 20 AABOUD 17AO search for resonances decaying to HZ in pp collisions at $\sqrt{s} = 13$ TeV. The limit quoted above is for a Z' in the heavy-vector-triplet model with $g_V = 3$. See their Fig.4 for limits on $\sigma \cdot B$.
- 21 SIRUNYAN 17AK search for resonances decaying to WW or HZ in pp collisions at $\sqrt{s} = 8$ and 13 TeV. The quoted limit is for heavy-vector-triplet Z' with $g_V = 3$. The limit becomes $M_{Z'} > 2200$ GeV for $g_V = 1$. If we assume $M_{Z'} = M_{W'}$, the limit increases $M_{Z'} > 2400$ GeV for both $g_V = 3$ and $g_V = 1$. See their Fig.1 and 2 for limits on $\sigma \cdot B$.
- 22 SIRUNYAN 17Q search for a resonance decaying to $t\bar{t}$ in pp collisions at $\sqrt{s} = 13$ TeV. The limit quoted above is for a resonance with relative width $\Gamma_{Z'}/M_{Z'} = 0.01$. Limits for wider resonances are available. See their Fig.6 for limits on $\sigma \cdot B$.
- 23 SIRUNYAN 17R search for resonances decaying to HZ in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for heavy-vector-triplet Z' with $g_V = 3$. Mass regions $M_{Z'} < 1150$ GeV and 1250 GeV $< M_{Z'} < 1670$ GeV are excluded for $g_V = 1$. If we assume $M_{Z'} = M_{W'}$, the excluded mass regions are $1000 < M_{Z'} < 2500$ GeV and $2760 < M_{Z'} < 3300$ GeV for $g_V = 3$; $1000 < M_{Z'} < 2430$ GeV and $2810 < M_{Z'} < 3130$ GeV for $g_V = 1$. See their Fig.5 for limits on $\sigma \cdot B$.
- 24 AAD 22 search for $b\bar{b}Z'$ productions in pp collisions at $\sqrt{s} = 13$ TeV. Z' is assumed to decay into $b\bar{b}$. See their Fig.4 for limits on $\sigma \cdot B$.
- 25 AAD 21AQ limits are for a $B - L$ gauge boson model derived from their measurements on four-lepton differential cross sections. See their Fig. 13 for exclusion limits on the $B - L$ breaking Higgs boson mass.
- 26 AAD 21AZ search for DM mediator Z' produced in association with a SM Higgs boson in pp collisions at $\sqrt{s} = 13$ TeV. Z' is assumed to decay invisibly $Z' \rightarrow \chi\chi$. See their Fig.7 for limits in $M_{Z'} - M_\chi$ plane.
- 27 AAD 21BB search for Z' productions in pp collisions at $\sqrt{s} = 13$ TeV. Z' is assumed to decay into a SM Higgs boson H and an invisible particle A . See their Fig.7 for limits in $M_{Z'} - M_A$ plane.
- 28 AAD 21d set limits on a dark Higgs model with a spin-1 mediator Z' and a scalar dark Higgs boson s . Dark Higgs s is assumed to decay into WW or ZZ . See their Fig.4 for limits in $M_{Z'} - M_s$ plane.
- 29 AAD 21k search for $\gamma + E_T$ events in pp collision at $\sqrt{s} = 13$ TeV. See their Fig. 5 for limits on Z' particle invisibly decaying to $\chi\chi$.
- 30 BURAS 21 performed global fit to leptophilic Z' models using a large number of observables.
- 31 CADEDDU 21 obtain limits on Z' coupling $g_{Z'}$ from coherent ν -nucleus scattering data collected by COHERENT experiment. For limits in the $M_{Z'} - g_{Z'}$ plane, see their Figures 3 and 4 for the universal Z' model and Figures 5 and 6 for the $B - L$ model.
- 32 COLARESI 21 obtain limits on Z' coupling from coherent ν -nucleus scattering data collected by a Ge detector at the Dresden-II power reactor. See their Fig.7 for limits in mass-coupling plane.
- 33 KRIBS 21 set decay-agnostic limits on kinetic mixing parameter between $U(1)_Y$ field and new heavy abelian vector boson (dark photon) field using the HERA ep collision data. See their Fig. 3 for limits in mass-mixing plane.
- 34 TUMASYAN 21D search for energetic jets + E_T events in pp collisions at $\sqrt{s} = 13$ TeV. Z' is assumed to decay into a pair of invisible particles $\chi\chi$. See their Fig. 7 for limits on signal strength in $M_{Z'} - M_\chi$ plane, and Fig. 8 for limits on signal strength in quark and dark matter coupling vs mediator mass.
- 35 AAD 20AF search for resonances decaying to $H\gamma$ in pp collisions at $\sqrt{s} = 13$ TeV. See their Fig. 1c for limits on $\sigma \cdot B$ for the mass range $0.7 < m_{Z'} < 4$ TeV.
- 36 AAD 20T search for Dark Matter mediator Z' decaying invisibly or decaying to $q\bar{q}$ in pp collisions at $\sqrt{s} = 13$ TeV. See their Fig. 5 for limits in $M_{Z'} - g_q$ plane from the inclusive category. See their Fig. 7(a) for limits on the product of the cross section, acceptance, b -tagging efficiency, and branching fraction from the 2 b -tag category.
- 37 AAD 20W search for a Dark Matter (DM) simplified model Z' produced in association with W in pp collisions at $\sqrt{s} = 13$ TeV. See their Fig. 5 for limits on Z' production cross section.
- 38 AAIJ 20AL search for spin-0 and spin-1 resonances decaying to $\mu^+\mu^-$ in pp collisions at $\sqrt{s} = 13$ TeV in the mass regions $M_{Z'} < 60$ GeV, with non-negligible widths considered above 20 GeV. See their Figs. 7, 8, and 9 for limits on $\sigma \cdot B$.
- 39 ADACHI 20 search for production of Z' in e^+e^- collisions. The Z' is assumed to decay invisibly. See their Fig. 3 and Fig. 5 for limits on Z' coupling and $\sigma(e^+e^- \rightarrow e^+\mu^-\bar{\nu}Z')$.
- 40 SIRUNYAN 20AI search for broad resonances decaying into dijets in pp collisions at $\sqrt{s} = 13$ TeV. See their Fig. 11 for exclusion limits in mass-coupling plane.
- 41 SIRUNYAN 20AQ search for a narrow resonance lighter than 200 GeV decaying to $\mu^+\mu^-$ in pp collisions at $\sqrt{s} = 13$ TeV. See their Fig. 3 for limits on Z' kinetic mixing coefficient.
- 42 SIRUNYAN 20M search for a narrow resonance with a mass between 350 and 700 GeV in pp collisions at $\sqrt{s} = 13$ TeV. See their Fig.3 for exclusion limits in mass-coupling plane.
- 43 AABOUD 19AJ search in pp collisions at $\sqrt{s} = 13$ TeV for a new resonance decaying to $q\bar{q}$ and produced in association with a high p_T photon. For a leptophobic axial-vector Z' in the mass region 250 GeV $< M_{Z'} < 950$ GeV, the Z' coupling with quarks g_q is constrained below 0.18. See their Fig.2 for limits in $M_{Z'} - g_q$ plane.
- 44 AABOUD 19D search in pp collisions at $\sqrt{s} = 13$ TeV for a new resonance decaying to $q\bar{q}$ and produced in association with a high- p_T photon or jet. For a leptophobic axial-vector Z' in the mass region 100 GeV $< M_{Z'} < 220$ GeV, the Z' coupling with quarks g_q is constrained below 0.23. See their Fig. 6 for limits in $M_{Z'} - g_q$ plane.
- 45 AABOUD 19V search for Dark Matter simplified Z' decaying invisibly or decaying to fermion pair in pp collisions at $\sqrt{s} = 13$ TeV.
- 46 AAD 19L search for resonances decaying to t^+t^- in pp collisions at $\sqrt{s} = 13$ TeV. See their Fig. 4 for limits in the heavy vector triplet model couplings.
- 47 LONG 19 uses the weak charge data of Cesium and proton to constrain mass of Z' in the 3-3.1 models.
- 48 PANDEV 19 obtain limits on Z' induced neutrino non-standard interaction (NSI) parameter ϵ from LHC and IceCube data. See their Fig.2 for limits in $M_{Z'} - \epsilon$ plane, where $\epsilon = g_q g_\nu v^2 / (2 M_{Z'}^2)$.
- 49 SIRUNYAN 19AL search for a new resonance decaying to a top quark and a heavy vector-like top partner in pp collisions at $\sqrt{s} = 13$ TeV. See their Fig. 8 for limits on Z' production cross section.
- 50 SIRUNYAN 19AN search for a Dark Matter (DM) simplified model Z' decaying to H DM DM in pp collisions at $\sqrt{s} = 13$ TeV. See their Fig. 7 for limits on the signal strength modifiers.
- 51 SIRUNYAN 19CB search in pp collisions at $\sqrt{s} = 13$ TeV for a new resonance decaying to $q\bar{q}$. For a leptophobic Z' in the mass region 50–300 GeV, the Z' coupling with quarks g'_q is constrained below 0.2. See their Figs. 4 and 5 for limits on g'_q in the mass range $50 < M_{Z'} < 450$ GeV.
- 52 SIRUNYAN 19CD search in pp collisions at $\sqrt{s}=13$ TeV for a leptophobic Z' produced in association of high p_T ISR photon and decaying to $q\bar{q}$. See their Fig. 2 for limits on the Z' coupling strength g'_q to $q\bar{q}$ in the mass range between 10 and 125 GeV.
- 53 SIRUNYAN 19D search for a narrow neutral vector resonance decaying to $H\gamma$. See their Fig. 3 for exclusion limit in $M_{Z'} - \sigma \cdot B$ plane. Upper limits on the production of $H\gamma$ resonances are set as a function of the resonance mass in the range of 720–3250 GeV.
- 54 AABOUD 18AA search for a narrow neutral vector boson decaying to $H\gamma$. See their Fig. 10 for the exclusion limit in $M_{Z'} - \sigma \cdot B$ plane.
- 55 AABOUD 18CJ search for heavy-vector-triplet Z' in pp collisions at $\sqrt{s} = 13$ TeV. The limit quoted above is for model with $g_V = 3$ assuming $M_{Z'} = M_{W'}$. The limit becomes $M_{Z'} > 5500$ GeV for model with $g_V = 1$.
- 56 AABOUD 18N search for a narrow resonance decaying to $q\bar{q}$ in pp collisions at $\sqrt{s} = 13$ TeV using trigger level analysis to improve the low mass region sensitivity. See their Fig. 5 for limits in the mass-coupling plane in the Z' mass range 450–1800 GeV.
- 57 AAIJ 18AQ search for spin-0 and spin-1 resonances decaying to $\mu^+\mu^-$ in pp collisions at $\sqrt{s} = 7$ and 8 TeV in the mass region near 10 GeV. See their Figs. 4 and 5 for limits on $\sigma \cdot B$.
- 58 SIRUNYAN 18DR searches for $\mu^+\mu^-$ resonances produced in association with b -jets in the pp collision data with $\sqrt{s} = 8$ TeV and 13 TeV. An excess of events near $m_{\mu\mu} = 28$ GeV is observed in the 8 TeV data. See their Fig. 3 for the measured fiducial signal cross sections at $\sqrt{s} = 8$ TeV and the 95% CL upper limits at $\sqrt{s} = 13$ TeV.
- 59 SIRUNYAN 18G search for a new resonance decaying to dijets in pp collisions at $\sqrt{s} = 13$ TeV in the mass range 50–300 GeV. See their Fig.7 for limits in the mass-coupling plane.
- 60 SIRUNYAN 18I search for a narrow resonance decaying to $b\bar{b}$ in pp collisions at $\sqrt{s} = 8$ TeV using dedicated b -tagged dijet triggers to improve the sensitivity in the low mass region. See their Fig. 3 for limits on $\sigma \cdot B$ in the Z' mass range 325–1200 GeV.
- 61 AABOUD 17B search for resonances decaying to HZ ($H \rightarrow b\bar{b}, c\bar{c}, Z \rightarrow t^+t^-, \nu\bar{\nu}$) in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for heavy-vector-triplet Z' with

- $g_V = 3$. The limit becomes $M_{Z'} > 1490$ GeV for $g_V = 1$. If we assume $M_{Z'} = M_{W'}$, the limit increases $M_{Z'} > 2310$ GeV and $M_{Z'} > 1730$ GeV for $g_V = 3$ and $g_V = 1$, respectively. See their Fig.3 for limits on $\sigma \cdot B$.
- 62 KHACHATRYAN 17AX search for lepto-phobic resonances decaying to four leptons in pp collisions at $\sqrt{s} = 8$ TeV.
- 63 KHACHATRYAN 17U search for resonances decaying to HZ ($H \rightarrow b\bar{b}$; $Z \rightarrow \ell^+ \ell^-$, $\nu\bar{\nu}$) in pp collisions at $\sqrt{s} = 13$ TeV. The limit on the heavy-vector-triplet model is $M_{Z'} = M_{W'} > 2$ TeV for $g_V = 3$, in which constraints from the $W' \rightarrow HW$ ($H \rightarrow b\bar{b}$; $W \rightarrow \ell\nu$) are combined. See their Fig.3 and Fig.4 for limits on $\sigma \cdot B$.
- 64 SIRUNYAN 17A search for resonances decaying to WW with $WW \rightarrow \ell\nu q\bar{q}$, $q\bar{q}q\bar{q}$ in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for heavy-vector-triplet Z' with $g_V = 3$. The limit becomes $M_{Z'} > 1600$ GeV for $g_V = 1$. If we assume $M_{Z'} = M_{W'}$, the limit increases $M_{Z'} > 2400$ GeV and $M_{Z'} > 2300$ GeV for $g_V = 3$ and $g_V = 1$, respectively. See their Fig.6 for limits on $\sigma \cdot B$.
- 65 SIRUNYAN 17AP search for resonances decaying into a SM-like Higgs scalar H and a light pseudo scalar A . A is assumed to decay invisibly. See their Fig.9 for limits on $\sigma \cdot B$.
- 66 SIRUNYAN 17T search for a new resonance decaying to dijets in pp collisions at $\sqrt{s} = 13$ TeV in the mass range 100–300 GeV. See their Fig.3 for limits in the mass-coupling plane.
- 67 SIRUNYAN 17V search for a new resonance decaying to a top quark and a heavy vector-like top partner T in pp collisions at $\sqrt{s} = 13$ TeV. See their table 5 for limits on the Z' production cross section for various values of $M_{Z'}$ and M_T in the range of $M_{Z'} = 1500$ –2500 GeV and $M_T = 700$ –1500 GeV.
- 68 AABOUD 16 search for a narrow resonance decaying into $b\bar{b}$ in pp collisions at $\sqrt{s} = 13$ TeV. The limit quoted above is for a leptophobic Z' with SM-like couplings to quarks. See their Fig.6 for limits on $\sigma \cdot B$.
- 69 AAD 16L search for $Z' \rightarrow a\gamma$, $a \rightarrow \gamma\gamma$ in pp collisions at $\sqrt{s} = 8$ TeV. See their Table 6 for limits on $\sigma \cdot B$.
- 70 AAD 16S search for a new resonance decaying to dijets in pp collisions at $\sqrt{s} = 13$ TeV. The limit quoted above is for a leptophobic Z' having coupling strength with quark $g_Q = 0.3$ and is taken from their Figure 3.
- 71 KHACHATRYAN 16AP search for a resonance decaying to HZ in pp collisions at $\sqrt{s} = 8$ TeV. Both H and Z' are assumed to decay to fat jets. The quoted limit is for heavy-vector-triplet Z' with $g_V = 3$.
- 72 KHACHATRYAN 16E search for a leptophobic top-color Z' decaying to $t\bar{t}$ using pp collisions at $\sqrt{s} = 8$ TeV. The quoted limit assumes that $\Gamma_{Z'}/m_{Z'} = 0.012$. Also $m_{Z'} < 2.9$ TeV is excluded for wider topcolor Z' with $\Gamma_{Z'}/m_{Z'} = 0.1$.
- 73 AAD 15A0 search for narrow resonance decaying to $t\bar{t}$ using pp collisions at $\sqrt{s} = 8$ TeV. See Fig. 11 for limit on σB .
- 74 AAD 15AT search for monoton production plus large missing E_T events in pp collisions at $\sqrt{s} = 8$ TeV and give constraints on a Z' model having $Z' u\bar{t}$ coupling. Z' is assumed to decay invisibly. See their Fig. 6 for limits on $\sigma \cdot B$.
- 75 AAD 15CD search for decays of Higgs bosons to 4ℓ states via Z' bosons, $H \rightarrow Z' Z' \rightarrow 4\ell$ or $H \rightarrow Z' Z' \rightarrow 4\ell$. See Fig. 5 for the limit on the signal strength of the $H \rightarrow Z' Z' \rightarrow 4\ell$ process and Fig. 16 for the limit on $H \rightarrow Z' Z' \rightarrow 4\ell$.
- 76 KHACHATRYAN 15F search for monoton production plus large missing E_T events in pp collisions at $\sqrt{s} = 8$ TeV and give constraints on a Z' model having $Z' u\bar{t}$ coupling. Z' is assumed to decay invisibly. See Fig. 3 for limits on σB .
- 77 KHACHATRYAN 15O search for narrow Z' resonance decaying to ZH in pp collisions at $\sqrt{s} = 8$ TeV. See their Fig. 6 for limit on σB .
- 78 AAD 14AT search for a narrow neutral vector boson decaying to $Z\gamma$. See their Fig. 3b for the exclusion limit in $m_{Z'} - \sigma B$ plane.
- 79 KHACHATRYAN 14A search for new resonance in the WW ($\ell\nu q\bar{q}$) and the ZZ ($\ell\ell q\bar{q}$) channels using pp collisions at $\sqrt{s}=8$ TeV. See their Fig.13 for the exclusion limit on the number of events in the mass-width plane.
- 80 MARTINEZ 14 use various electroweak data to constrain the Z' boson in the 3-3-1 models.
- 81 AAD 13AQ search for a leptophobic top-color Z' decaying to $t\bar{t}$. The quoted limit assumes that $\Gamma_{Z'}/m_{Z'} = 0.012$.
- 82 CHATRCHYAN 13BM search for top-color Z' decaying to $t\bar{t}$ using pp collisions at $\sqrt{s}=8$ TeV. The quoted limit is for $\Gamma_{Z'}/m_{Z'} = 0.012$.
- 83 CHATRCHYAN 13AP search for top-color leptophobic Z' decaying to $t\bar{t}$ using pp collisions at $\sqrt{s}=7$ TeV. The quoted limit is for $\Gamma_{Z'}/m_{Z'} = 0.012$.
- 84 AAD 12bv search for narrow resonance decaying to $t\bar{t}$ using pp collisions at $\sqrt{s}=7$ TeV. See their Fig. 7 for limit on $\sigma \cdot B$.
- 85 AAD 12k search for narrow resonance decaying to $t\bar{t}$ using pp collisions at $\sqrt{s}=7$ TeV. See their Fig. 5 for limit on $\sigma \cdot B$.
- 86 AALTONEN 12AR search for chromophilic Z' in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. See their Fig. 5 for limit on $\sigma \cdot B$.
- 87 AALTONEN 12N search for $p\bar{p} \rightarrow tZ'$, $Z' \rightarrow t\bar{u}$ events in $p\bar{p}$ collisions. See their Fig. 3 for the limit on $\sigma \cdot B$.
- 88 ABAZOV 12R search for top-color Z' boson decaying exclusively to $t\bar{t}$. The quoted limit is for $\Gamma_{Z'}/m_{Z'} = 0.012$.
- 89 CHATRCHYAN 12AI search for $pp \rightarrow tt$ events and give constraints on a Z' model having $Z'\bar{t}t$ coupling. See their Fig. 4 for the limit in mass-coupling plane.
- 90 Search for resonance decaying to $t\bar{t}$. See their Fig. 6 for limit on $\sigma \cdot B$.
- 91 Search for narrow resonance decaying to $t\bar{t}$. See their Fig. 4 for limit on $\sigma \cdot B$.
- 92 Search for narrow resonance decaying to $t\bar{t}$. See their Fig. 3 for limit on $\sigma \cdot B$.
- 93 CHATRCHYAN 11o search for same-sign top production in pp collisions induced by a hypothetical FCNC Z' at $\sqrt{s} = 7$ TeV. See their Fig. 3 for limit in mass-coupling plane.
- 94 Search for narrow resonance decaying to $t\bar{t}$. See their Fig. 3 for limit on $\sigma \cdot B$.
- 95 Search for narrow resonance decaying to $t\bar{t}$. See their Fig. 2 for limit on $\sigma \cdot B$.
- 96 BARGER 03b use the nucleosynthesis bound on the effective number of light neutrino δN_ν . See their Figs. 4–5 for limits in general E_6 motivated models.
- 97 CHO 00 use various electroweak data to constrain Z' models assuming $m_H=100$ GeV. See Fig. 2 for limits in general E_6 -motivated models.
- 98 CHO 98 study constraints on four-Fermi contact interactions obtained from low-energy electroweak experiments, assuming no Z - Z' mixing.
- 99 Search for Z' decaying to dijets at $\sqrt{s}=1.8$ TeV. For Z' with electromagnetic strength coupling, no bound is obtained.

Searches for Z' with Lepton-Flavor-Violating decays

The following limits are obtained from $p\bar{p}$ or $pp \rightarrow Z' X$ with Z' decaying to the mode indicated in the comments.

1	AABOUD 18CM		search for a new particle with lepton-flavor violating decay in pp collisions at $\sqrt{s} = 13$ TeV. See their Figs. 4, 5, and 6 for limits on $\sigma \cdot B$.
2	SIRUNYAN 18AT		search for a narrow resonance Z' decaying into $e\mu$ in pp collisions at $\sqrt{s} = 13$ TeV. See their Fig.5 for limit on $\sigma \cdot B$ in the range of $600 \text{ GeV} < M_{Z'} < 5000 \text{ GeV}$.
3	AABOUD 16P		search for new particle with lepton flavor violating decay in pp collisions at $\sqrt{s} = 13$ TeV. See their Figs. 2, 3, and 4 for limits on $\sigma \cdot B$.
4	KHACHATRYAN 16BE		search for new particle Z' with lepton flavor violating decay in pp collisions at $\sqrt{s} = 8$ TeV in the range of $200 \text{ GeV} < M_{Z'} < 2000 \text{ GeV}$. See their Fig.4 for limits on $\sigma \cdot B$ and their Table 5 for bounds on various masses.
5	AAD 15O		search for new particle Z' with lepton flavor violating decay in pp collisions at $\sqrt{s} = 8$ TeV in the range of $500 \text{ GeV} < M_{Z'} < 3000 \text{ GeV}$. See their Fig. 2 for limits on σB .
6	AAD 11H		search for new particle Z' with lepton flavor violating decay in pp collisions at $\sqrt{s} = 7$ TeV in the range of $700 \text{ GeV} < M_{Z'} < 1000 \text{ GeV}$. See their Fig. 3 for limits on $\sigma \cdot B$.
7	AAD 11Z		search for new particle Z' with lepton flavor violating decay in pp collisions at $\sqrt{s} = 7$ TeV in the range $700 \text{ GeV} < M_{Z'} < 2000 \text{ GeV}$. See their Fig. 3 for limits on $\sigma \cdot B$.
8	ABULENCIA 06M		search for new particle Z' with lepton flavor violating decay in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV in the range of $100 \text{ GeV} < M_{Z'} < 800 \text{ GeV}$. See their Fig. 4 for limits in the mass-coupling plane.

Indirect Constraints on Kaluza-Klein Gauge Bosons

Bounds on a Kaluza-Klein excitation of the Z boson or photon in $d=1$ extra dimension. These bounds can also be interpreted as a lower bound on $1/R$, the size of the extra dimension. Unless otherwise stated, bounds assume all fermions live on a single brane and all gauge fields occupy the $4+d$ -dimensional bulk. See also the section on “Extra Dimensions” in the “Searches” Listings in this Review.

VALUE (TeV)	CL%	DOCUMENT ID	TECN	COMMENT
• • •	We do not use the following data for averages, fits, limits, etc. • • •			
> 4.7		1 MUECK 02	RVUE	Electroweak
> 3.3	95	2 CORNET 00	RVUE	$e\nu q q'$
>5000		3 DELGADO 00	RVUE	$e\kappa$
> 2.6	95	4 DELGADO 00	RVUE	Electroweak
> 3.3	95	5 RIZZO 00	RVUE	Electroweak
> 2.9	95	6 MARCIANO 99	RVUE	Electroweak
> 2.5	95	7 MASIP 99	RVUE	Electroweak
> 1.6	90	8 NATH 99	RVUE	Electroweak
> 3.4	95	9 STRUMIA 99	RVUE	Electroweak
1		MUECK 02		limit is 2σ and is from global electroweak fit ignoring correlations among observables. Higgs is assumed to be confined on the brane and its mass is fixed. For scenarios of bulk Higgs, of brane-SU(2) $_L$ -bulk-U(1) $_{\gamma}$, and of bulk-SU(2) $_L$ -brane-U(1) $_{\gamma}$, the corresponding limits are > 4.6 TeV, > 4.3 TeV and > 3.0 TeV, respectively.
2				Bound is derived from limits on $e\nu q q'$ contact interaction, using data from HERA and the Tevatron.
3				Bound holds only if first two generations of quarks lives on separate branes. If quark mixing is not complex, then bound lowers to 400 TeV from Δm_{κ} .
4				See Figs. 1 and 2 of DELGADO 00 for several model variations. Special boundary conditions can be found which permit KK states down to 950 GeV and that agree with the measurement of $Q_{WW}(Cs)$. Quoted bound assumes all Higgs bosons confined to brane; placing one Higgs doublet in the bulk lowers bound to 2.3 TeV.
5				Bound is derived from global electroweak analysis assuming the Higgs field is trapped on the matter brane. If the Higgs propagates in the bulk, the bound increases to 3.8 TeV.
6				Bound is derived from global electroweak analysis but considering only presence of the KK W bosons.
7				Global electroweak analysis used to obtain bound independent of position of Higgs on brane or in bulk.
8				Bounds from effect of KK states on G_F , α , $M_{W'}$, and $M_{Z'}$. Hard cutoff at string scale determined using gauge coupling unification. Limits for $d=2,3,4$ rise to 3.5, 5.7, and 7.8 TeV.
9				Bound obtained for Higgs confined to the matter brane with $m_H=500$ GeV. For Higgs in the bulk, the bound increases to 3.5 TeV.

32 SIRUNYAN 18u set limits for scalar and vector leptoquarks decaying to $t\nu, b\nu,$ and $q\nu$. The limit quoted above assumes scalar leptoquark with $B(q\nu) = 1$. Vector leptoquarks with $\kappa = 1$ are excluded below masses of 1790 GeV.

33 SIRUNYAN 18u set limits for scalar and vector leptoquarks decaying to $t\nu, b\nu,$ and $q\nu$. The limit quoted above assumes scalar leptoquark with $B(\nu t) = 1$. Vector leptoquarks with $\kappa = 1$ are excluded below masses of 1780 GeV.

34 SIRUNYAN 18u set limits for scalar and vector leptoquarks decaying to $t\nu, b\nu,$ and $q\nu$. $\kappa = 1$ and $LQ \rightarrow b\nu$ are assumed.

35 SIRUNYAN 18u set limits for scalar and vector leptoquarks decaying to $t\nu, b\nu,$ and $q\nu$. $\kappa = 1$ and $LQ \rightarrow q\nu$ with $q = u, d, s, c$ are assumed.

36 SIRUNYAN 18u set limits for scalar and vector leptoquarks decaying to $t\nu, b\nu,$ and $q\nu$. $\kappa = 1$ and $LQ \rightarrow t\nu$ are assumed.

37 KHACHATRYAN 17j search for scalar leptoquarks decaying to τb using pp collisions at $\sqrt{s} = 13$ TeV. The limit above assumes $B(\tau b) = 1$.

38 SIRUNYAN 17h search for scalar leptoquarks using $\tau\tau bb$ events in pp collisions at $\sqrt{s} = 8$ TeV. The limit above assumes $B(\tau b) = 1$.

39 AAD 16g search for scalar leptoquarks using $eejj$ events in collisions at $\sqrt{s} = 8$ TeV. The limit above assumes $B(eq) = 1$.

40 AAD 16g search for scalar leptoquarks using $\mu\mu jj$ events in collisions at $\sqrt{s} = 8$ TeV. The limit above assumes $B(\mu q) = 1$.

41 AAD 16g search for scalar leptoquarks decaying to $b\nu$. The limit above assumes $B(b\nu) = 1$.

42 AAD 16g search for scalar leptoquarks decaying to $t\nu$. The limit above assumes $B(t\nu) = 1$.

43 KHACHATRYAN 16af search for scalar leptoquarks using $eejj$ and $e\nu jj$ events in pp collisions at $\sqrt{s} = 8$ TeV. The limit above assumes $B(eq) = 1$. For $B(eq) = 0.5$, the limit becomes 850 GeV.

44 KHACHATRYAN 16af search for scalar leptoquarks using $\mu\mu jj$ and $\mu\nu jj$ events in pp collisions at $\sqrt{s} = 8$ TeV. The limit above assumes $B(\mu q) = 1$. For $B(\mu q) = 0.5$, the limit becomes 760 GeV.

45 KHACHATRYAN 15aj search for scalar leptoquarks using $\tau\tau t$ events in pp collisions at $\sqrt{s} = 8$ TeV. The limit above assumes $B(\tau t) = 1$.

46 KHACHATRYAN 14t search for scalar leptoquarks decaying to τb using pp collisions at $\sqrt{s} = 8$ TeV. The limit above assumes $B(\tau b) = 1$. See their Fig. 5 for the exclusion limit as function of $B(\tau b)$.

47 SIRUNYAN 19bc search for scalar leptoquark (LQ) pair production in pp collisions at $\sqrt{s} = 13$ TeV. One LQ is assumed to decay to μq , while the other decays to dark matter pair and SM particles. See their Fig. 4 for limits in $M_{LQ} - M_{DM}$ plane.

48 AAD 13ae search for scalar leptoquarks using $\tau\tau bb$ events in pp collisions at $E_{cm} = 7$ TeV. The limit above assumes $B(\tau b) = 1$.

49 CHATRCHYAN 13m search for scalar and vector leptoquarks decaying to τb in pp collisions at $E_{cm} = 7$ TeV. The limit above is for scalar leptoquarks with $B(\tau b) = 1$.

50 AAD 12h search for scalar leptoquarks using $eejj$ and $e\nu jj$ events in pp collisions at $E_{cm} = 7$ TeV. The limit above assumes $B(eq) = 1$. For $B(eq) = 0.5$, the limit becomes 607 GeV.

51 AAD 12o search for scalar leptoquarks using $\mu\mu jj$ and $\mu\nu jj$ events in pp collisions at $E_{cm} = 7$ TeV. The limit above assumes $B(\mu q) = 1$. For $B(\mu q) = 0.5$, the limit becomes 594 GeV.

52 CHATRCHYAN 12ag search for scalar leptoquarks using $eejj$ and $e\nu jj$ events in pp collisions at $E_{cm} = 7$ TeV. The limit above assumes $B(eq) = 1$. For $B(eq) = 0.5$, the limit becomes 640 GeV.

53 CHATRCHYAN 12ag search for scalar leptoquarks using $\mu\mu jj$ and $\mu\nu jj$ events in pp collisions at $E_{cm} = 7$ TeV. The limit above assumes $B(\mu q) = 1$. For $B(\mu q) = 0.5$, the limit becomes 650 GeV.

54 CHATRCHYAN 12bo search for scalar leptoquarks decaying to νb in pp collisions at $\sqrt{s} = 7$ TeV. The limit above assumes $B(\nu b) = 1$.

55 AAD 11d search for scalar leptoquarks using $eejj$ and $e\nu jj$ events in pp collisions at $E_{cm} = 7$ TeV. The limit above assumes $B(eq) = 1$. For $B(eq) = 0.5$, the limit becomes 319 GeV.

56 AAD 11d search for scalar leptoquarks using $\mu\mu jj$ and $\mu\nu jj$ events in pp collisions at $E_{cm} = 7$ TeV. The limit above assumes $B(\mu q) = 1$. For $B(\mu q) = 0.5$, the limit becomes 362 GeV.

57 ABZOV 11v search for scalar leptoquarks using $e\nu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV. The limit above assumes $B(eq) = 0.5$.

58 CHATRCHYAN 11n search for scalar leptoquarks using $e\nu jj$ events in pp collisions at $E_{cm} = 7$ TeV. The limit above assumes $B(eq) = 0.5$.

59 KHACHATRYAN 11d search for scalar leptoquarks using $eejj$ events in pp collisions at $E_{cm} = 7$ TeV. The limit above assumes $B(eq) = 1$.

60 KHACHATRYAN 11e search for scalar leptoquarks using $\mu\mu jj$ events in pp collisions at $E_{cm} = 7$ TeV. The limit above assumes $B(\mu q) = 1$.

61 ABZOV 10l search for pair productions of scalar leptoquark state decaying to νb in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV. The limit above assumes $B(\nu b) = 1$.

62 ABZOV 09 search for scalar leptoquarks using $\mu\mu jj$ and $\mu\nu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV. The limit above assumes $B(\mu q) = 1$. For $B(\mu q) = 0.5$, the limit becomes 270 GeV.

63 ABZOV 09af search for scalar leptoquarks using $eejj$ and $e\nu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV. The limit above assumes $B(eq) = 1$. For $B(eq) = 0.5$ the bound becomes 284 GeV.

64 AALTONEN 08p search for vector leptoquarks using $\tau^+ \tau^- b\bar{b}$ events in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV. Assuming Yang-Mills (minimal) couplings, the mass limit is >317 GeV (251 GeV) at 95% CL for $B(\tau b) = 1$.

65 Search for pair production of scalar leptoquark state decaying to τb in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV. The limit above assumes $B(\tau b) = 1$.

66 Search for scalar leptoquarks using $\nu\nu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV. The limit above assumes $B(\nu q) = 1$.

67 ABZOV 07j search for pair productions of scalar leptoquark state decaying to νb in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV. The limit above assumes $B(\nu b) = 1$.

68 ABZOV 06a search for scalar leptoquarks using $\mu\mu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV and 1.96 TeV. The limit above assumes $B(\mu q) = 1$. For $B(\mu q) = 0.5$, the limit becomes 204 GeV.

69 ABZOV 06l search for scalar leptoquarks using $\nu\nu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV and at 1.96 TeV. The limit above assumes $B(\nu q) = 1$.

70 ABULENCIA 06t search for scalar leptoquarks using $\mu\mu jj, \mu\nu jj,$ and $\nu\nu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV. The quoted limit assumes $B(\mu q) = 1$. For $B(\mu q) = 0.5$ or 0.1 , the bound becomes 208 GeV or 143 GeV, respectively. See their Fig. 4 for the exclusion limit as a function of $B(\mu q)$.

71 ABZOV 05h search for scalar leptoquarks using $eejj$ and $e\nu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV and 1.96 TeV. The limit above assumes $B(eq) = 1$. For $B(eq) = 0.5$ the bound becomes 234 GeV.

72 ACOSTA 05p search for scalar leptoquarks using $eejj, e\nu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV. The limit above assumes $B(eq) = 1$. For $B(eq) = 0.5$ and 0.1 , the bound becomes 205 GeV and 145 GeV, respectively.

73 ABBIENDI 03r search for scalar/vector leptoquarks in $e^+ e^-$ collisions at $\sqrt{s} = 189-209$ GeV. The quoted limits are for charge $-4/3$ isospin 0 scalar-leptoquark with $B(\ell q) = 1$. See their table 12 for other cases.

74 ABZOV 02 search for scalar leptoquarks using $\nu\nu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The bound holds for all leptoquark generations. Vector leptoquarks are likewise constrained to lie above 200 GeV.

75 ABZOV 01d search for scalar leptoquarks using $e\nu jj, eejj,$ and $\nu\nu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The limit above assumes $B(eq) = 1$. For $B(eq) = 0.5$ and 0 , the bound becomes 204 and 79 GeV, respectively. Bounds for vector leptoquarks are also given. Supersedes ABBOTT 98E.

76 ABBIENDI 00m search for scalar/vector leptoquarks in $e^+ e^-$ collisions at $\sqrt{s} = 183$ GeV. The quoted limits are for charge $-4/3$ isospin 0 scalar-leptoquarks with $B(\ell q) = 1$. See their Table 8 and Figs. 6-9 for other cases.

77 ABBOTT 00c search for scalar leptoquarks using $\mu\mu jj, \mu\nu jj,$ and $\nu\nu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The limit above assumes $B(\mu q) = 1$. For $B(\mu q) = 0.5$ and 0 , the bound becomes 180 and 79 GeV respectively. Bounds for vector leptoquarks are also given.

78 AFFOLDER 00k search for scalar leptoquark using $\nu\nu cc$ events in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The quoted limit assumes $B(\nu c) = 1$. Bounds for vector leptoquarks are also given.

79 AFFOLDER 00k search for scalar leptoquark using $\nu\nu bb$ events in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The quoted limit assumes $B(\nu b) = 1$. Bounds for vector leptoquarks are also given.

80 ABBOTT 99j search for leptoquarks using $\mu\nu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The quoted limit is for a scalar leptoquark with $B(\mu q) = B(\nu q) = 0.5$. Limits on vector leptoquarks range from 240 to 290 GeV.

81 ABBOTT 98e search for scalar leptoquarks using $e\nu jj, eejj,$ and $\nu\nu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The limit above assumes $B(eq) = 1$. For $B(eq) = 0.5$ and 0 , the bound becomes 204 and 79 GeV, respectively.

82 ABBOTT 98j search for charge $-1/3$ third generation scalar and vector leptoquarks in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The quoted limit is for scalar leptoquark with $B(\nu b) = 1$.

83 ABE 98s search for scalar leptoquarks using $\mu\mu jj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The limit is for $B(\mu q) = 1$. For $B(\mu q) = B(\nu q) = 0.5$, the limit is > 160 GeV.

84 GROSS-PILCHER 98 is the combined limit of the CDF and DØ Collaborations as determined by a joint CDF/DØ working group and reported in this FNAL Technical Memo. Original data published in ABE 97x and ABBOTT 98e.

85 ABE 97f search for third generation scalar and vector leptoquarks in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The quoted limit is for scalar leptoquark with $B(\tau b) = 1$.

86 ABE 97x search for scalar leptoquarks using $eejj$ events in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The limit is for $B(eq) = 1$.

87 Limit is for charge $-1/3$ isospin-0 leptoquark with $B(\ell q) = 2/3$.

88 First and second generation leptoquarks are assumed to be degenerate. The limit is slightly lower for each generation.

89 Limits are for charge $-1/3$, isospin-0 scalar leptoquarks decaying to $\ell^- q$ or νq with any branching ratio. See paper for limits for other charge-isospin assignments of leptoquarks.

90 KIM 90 assume pair production of charge $2/3$ scalar-leptoquark via photon exchange. The decay of the first (second) generation leptoquark is assumed to be any mixture of $d e^+$ and $u\bar{\nu}$ ($s\mu^+$ and $c\bar{\nu}$). See paper for limits for specific branching ratios.

91 BARTEL 87b limit is valid when a pair of charge $2/3$ spinless leptoquarks X is produced with point coupling, and when they decay under the constraint $B(X \rightarrow c\bar{\nu}_\mu) + B(X \rightarrow s\mu^+) = 1$.

92 BEHREND 86b assumed that a charge $2/3$ spinless leptoquark, χ , decays either into $s\mu^+$ or $c\bar{\nu}$: $B(X \rightarrow s\mu^+) + B(X \rightarrow c\bar{\nu}) = 1$.

MASS LIMITS for Leptoquarks from Single Production

These limits depend on the q - ℓ -leptoquark coupling g_{LQ} . It is often assumed that $g_{LQ}^2/4\pi = 1/137$. Limits shown are for a scalar, weak isoscalar, charge $-1/3$ leptoquark.

VALUE (TeV)	CL%	DOCUMENT ID	TECN	COMMENT
> 168	95	22 DERRICK 97 ZEUS	Lepton-flavor violation	
		23 DERRICK 93 ZEUS	First generation	
		1 SIRUNYAN 21j	search for single production of charge $-1/3$ scalar leptoquarks decaying to $\tau\tau^-$ and $b\nu$, and charge $2/3$ vector leptoquarks decaying to $t\nu$ and $b\tau^+$ in pp collisions at $\sqrt{s} = 13$ TeV. The limit quoted above assumes a scalar leptoquark with $B(\tau\tau) = B(b\nu) = 0.5$ and the leptoquark coupling strength $\lambda = 1.5$. The limit becomes $M_{LQ} > 75.0$ GeV for $\lambda = 2.5$.	
		2 SIRUNYAN 18bJ	search for single production of charge $2/3$ scalar leptoquarks decaying to τb in pp collisions at $\sqrt{s} = 13$ TeV. The limit above assumes $B(\tau b) = 1$ and the leptoquark coupling strength $\lambda = 1$.	
		3 KHACHATRYAN 16AG	search for single production of charge $\pm 1/3$ scalar leptoquarks using $e e j$ events in pp collisions at $\sqrt{s} = 8$ TeV. The limit above assumes $B(eq) = 1$ and the leptoquark coupling strength $\lambda = 1$.	
		4 KHACHATRYAN 16AG	search for single production of charge $\pm 1/3$ scalar leptoquarks using $\mu\mu j$ events in pp collisions at $\sqrt{s} = 8$ TeV. The limit above assumes $B(\mu q) = 1$ and the leptoquark coupling strength $\lambda = 1$.	
		5 ABRAMOWICZ 12A	limit is for a scalar, weak isoscalar, charge $-1/3$ leptoquark coupled with e_R . See their Figs. 12–17 and Table 4 for states with different quantum numbers.	
		6	Limit from single production in Z decay. The limit is for a leptoquark coupling of electromagnetic strength and assumes $B(lq) = 2/3$. The limit is 77 GeV if first and second leptoquarks are degenerate.	
		7 TUMASYAN 21D	search for energetic jets + \cancel{E}_T events in pp collisions at $\sqrt{s} = 13$ TeV. The branching fraction for the decay of the leptoquark into an electron neutrino and up quark is assumed to be 100% ($\beta = 0$). See their Fig. 12 for exclusion limits in mass-coupling plane.	
		8 DEY 16	use the 2010–2012 IceCube PeV energy data set to constrain the leptoquark production cross section through the $\nu q \rightarrow LQ \rightarrow \nu q$ process. See their Figure 4 for the exclusion limit in the mass-coupling plane.	
		9 AARON 11A	search for various leptoquarks with lepton-flavor violating couplings. See their Figs. 2–3 and Tables 1–4 for detailed limits.	
		10	The quoted limit is for a scalar, weak isoscalar, charge $-1/3$ leptoquark coupled with e_R . See their Figs. 3–5 for limits on states with different quantum numbers.	
		11 ABAZOV 07E	search for leptoquark single production through qg fusion process in $p\bar{p}$ collisions. See their Fig. 4 for exclusion plot in mass-coupling plane.	
		12 AKTAS 05B	limit is for a scalar, weak isoscalar, charge $-1/3$ leptoquark coupled with e_R . See their Fig. 3 for limits on states with different quantum numbers.	
		13 CHEKANOV 05	search for various leptoquarks with lepton-flavor violating couplings. See their Figs. 6–10 and Tables 1–8 for detailed limits.	
		14 CHEKANOV 03B	limit is for a scalar, weak isoscalar, charge $-1/3$ leptoquark coupled with e_R . See their Figs. 11–12 and Table 5 for limits on states with different quantum numbers.	
		15	For limits on states with different quantum numbers and the limits in the mass-coupling plane, see their Fig. 4 and Fig. 5.	
		16 CHEKANOV 02	search for various leptoquarks with lepton-flavor violating couplings. See their Figs. 6–7 and Tables 5–6 for detailed limits.	
		17	For limits on states with different quantum numbers and the limits in the mass-coupling plane, see their Fig. 3.	
		18	See their Fig. 14 for limits in the mass-coupling plane.	
		19 BREITWEG 00E	search for $F=0$ leptoquarks in e^+p collisions. For limits in mass-coupling plane, see their Fig. 11.	
		20 ABREU 99c	limit obtained from process $e\gamma \rightarrow LQ+q$. For limits on vector and scalar states with different quantum numbers and the limits in the coupling-mass plane, see their Fig. 4 and Table 2.	
		21	For limits on states with different quantum numbers and the limits in the mass-coupling plane, see their Fig. 13 and Fig. 14. ADLOFF 99 also search for leptoquarks with lepton-flavor violating couplings. ADLOFF 99 supersedes AID 96b.	
		22 DERRICK 97	search for various leptoquarks with lepton-flavor violating couplings. See their Figs. 8–8 and Table 1 for detailed limits.	
		23 DERRICK 93	search for single leptoquark production in ep collisions with the decay $e q$ and νq . The limit is for leptoquark coupling of electromagnetic strength and assumes $B(eq) = B(\nu q) = 1/2$. The limit for $B(eq) = 1$ is 176 GeV. For limits on states with different quantum numbers, see their Table 3.

		1 CRIVELLIN 21A	set limits on coupling strengths of scalar and vector leptoquarks using $K \rightarrow \pi\nu\nu, K \rightarrow \pi e^+e^-, K^0 - \bar{K}^0$ and $D^0 - \bar{D}^0$ mixings, and weak neutral current measurements. See their Fig. 2 and Fig. 3 for the limits in mass-coupling plane.	
		2 AEBISCHER 20	explain the B decay anomalies using four-fermion operator Wilson coefficients. See their Table 1. These Wilson coefficients may be generated by a U_1 vector leptoquark with U_1 transforming as $(3,1)_{2/3}$ under the SM gauge group. See their Figures 6, 7, 8 for the regions of the LQ parameter space which explains the B anomalies and avoids the indirect low energy constraints.	
		3 DEPPISCH 20	limits on the lepton-number-violating higher-dimensional-operators are derived from $K \rightarrow \pi\nu\nu$ in the standard model effective field theory. These higher-dimensional-operators may be induced from leptoquark-exchange diagrams.	
		4 ABRAMOWICZ 19	obtain a limit on $\lambda/M_{LQ} > 1.16$ TeV $^{-1}$ for weak isotriplet spin-0 leptoquark S_1^+ . We obtain the limit quoted above by converting the limit on λ/M_{LQ} for S_1^+ assuming $\lambda = \sqrt{4\pi}$. See their Table 5 for the limits of leptoquarks with different quantum numbers. These limits are derived from bounds of $e q$ contact interactions.	
		5 MANDAL 19	give bounds on leptoquarks from τ -decays, leptonic dipole moments, lepton-flavor-violating processes, and K decays.	
		6 ZHANG 18A	give bounds on leptoquark induced four-fermion interactions from $D \rightarrow K\ell\nu$. The authors inform us that the shape parameter of the vector form factor in both the abstract and the conclusions of ZHANG 18A should be $r_{+1} = 2.16 \pm 0.07$ rather than ± 0.07 . The numbers listed in their Table 7 are correct.	
		7 BARRANCO 16	give bounds on leptoquark induced four-fermion interactions from $D \rightarrow K\ell\nu$ and $D_S \rightarrow \ell\nu$.	
		8 KUMAR 16	gives bound on SU(2) singlet scalar leptoquark with charge $-1/3$ from $K^0 - \bar{K}^0$ mixing, $K \rightarrow \pi\nu\bar{\nu}, K_L^0 \rightarrow \mu^+\mu^-,$ and $K_L^0 \rightarrow \mu^+e^+\bar{\nu}$ decays.	
		9 BESSAA 15	obtain limit on leptoquark induced four-fermion interactions from the ATLAS and CMS limit on the $\bar{q}q\bar{e}e$ contact interactions.	
		10 SAHOO 15A	obtain limit on leptoquark induced four-fermion interactions from $B_{s,d} \rightarrow \mu^+\mu^-$ for $\lambda \simeq O(1)$.	
		11 SAKAKI 13	explain the $B \rightarrow D^{(*)}\tau\bar{\nu}$ anomaly using Wilson coefficients of leptoquark-induced four-fermion operators.	
		12 KOSNIK 12	obtains limits on leptoquark induced four-fermion interactions from $b \rightarrow s\ell^+\ell^-$ decays.	
		13 AARON 11C	limit is for weak isotriplet spin-0 leptoquark at strong coupling $\lambda = \sqrt{4\pi}$. For the limits of leptoquarks with different quantum numbers, see their Table 3. Limits are derived from bounds of $e q$ contact interactions.	
		14 DORSNER 11	give bounds on scalar, weak singlet, charge $4/3$ leptoquark from K, B, τ decays, meson mixings, LFV, $g-2$ and $Z \rightarrow b\bar{b}$.	
		15 AKTAS 07A	search for lepton-flavor violation in ep collision. See their Tables 4–7 for limits on lepton-flavor violating four-fermion interactions induced by various leptoquarks.	
		16 SCHAEEL 07A	limit is for the weak-isoscalar spin-0 left-handed leptoquark with the coupling of electromagnetic strength. For the limits of leptoquarks with different quantum numbers, see their Table 35.	
		17 SMIRNOV 07	obtains mass limits for the vector and scalar chiral leptoquark states from $K \rightarrow e\mu, B \rightarrow e\tau$ decays.	
		18 CHEKANOV 05	search for various leptoquarks with lepton-flavor violating couplings. See their Figs. 6–10 and Tables 1–8 for detailed limits.	
		19 ADLOFF 03	limit is for the weak isotriplet spin-0 leptoquark at strong coupling $\lambda = \sqrt{4\pi}$. For the limits of leptoquarks with different quantum numbers, see their Table 3. Limits are derived from bounds on $e^\pm q$ contact interactions.	
		20	The bound is derived from $B(B^0 \rightarrow e^\pm\mu^\mp) < 1.7 \times 10^{-7}$.	
		21 CHEKANOV 02	search for lepton-flavor violation in ep collisions. See their Tables 1–4 for limits on lepton-flavor violating and four-fermion interactions induced by various leptoquarks.	
		22 CHEUNG 01B	quoted limit is for a scalar, weak isoscalar, charge $-1/3$ leptoquark with a coupling of electromagnetic strength. The limit is derived from bounds on contact interactions in a global electroweak analysis. For the limits of leptoquarks with different quantum numbers, see Table 5.	
		23 ACCIARRI 00P	limit is for the weak isoscalar spin-0 leptoquark with the coupling of electromagnetic strength. For the limits of leptoquarks with different quantum numbers, see their Table 4.	
		24 ADLOFF 00	limit is for the weak isotriplet spin-0 leptoquark at strong coupling, $\lambda = \sqrt{4\pi}$. For the limits of leptoquarks with different quantum numbers, see their Table 2.	
		ADLOFF 00	limits are from the Q^2 spectrum measurement of $e^+p \rightarrow e^+X$.	
		25 BARATE 00i	search for deviations in cross section and jet-charge asymmetry in $e^+e^- \rightarrow \bar{q}q$ due to t-channel exchange of a leptoquark at $\sqrt{s}=130$ to 183 GeV. Limits for other scalar and vector leptoquarks are also given in their Table 22.	

See key on page 1127

Gauge & Higgs Boson Particle Listings

New Heavy Bosons

- ²⁶ BARGER 00 explain the deviation of atomic parity violation in cesium atoms from pre-diction is explained by scalar leptoquark exchange.
- ²⁷ GABRIELLI 00 calculate various process with lepton flavor violation in leptoquark models.
- ²⁸ ZARNECKI 00 limit is derived from data of HERA, LEP, and Tevatron and from various low-energy data including atomic parity violation. Leptoquark coupling with electromagnetic strength is assumed.
- ²⁹ ABBIENDI 99 limits are from $e^+e^- \rightarrow q\bar{q}$ cross section at 130–136, 161–172, 183 GeV. See their Fig. 8 and Fig. 9 for limits in mass-coupling plane.
- ³⁰ ABE 98v quoted limit is from $B(B_s \rightarrow e^\pm \mu^\mp) < 8.2 \times 10^{-6}$. ABE 98v also obtain a similar limit on $M_{LQ} > 20.4$ TeV from $B(B_d \rightarrow e^\pm \mu^\mp) < 4.5 \times 10^{-6}$. Both bounds assume the non-canonical association of the b quark with electrons or muons under SU(4).
- ³¹ ACCIARRI 98j limit is from $e^+e^- \rightarrow q\bar{q}$ cross section at $\sqrt{s}=130$ –172 GeV which can be affected by the t - and u -channel exchanges of leptoquarks. See their Fig. 4 and Fig. 5 for limits in the mass-coupling plane.
- ³² ACKERSTAFF 98v limits are from $e^+e^- \rightarrow q\bar{q}$ and $e^+e^- \rightarrow b\bar{b}$ cross sections at $\sqrt{s}=130$ –172 GeV, which can be affected by the t - and u -channel exchanges of leptoquarks. See their Fig. 21 and Fig. 22 for limits of leptoquarks in mass-coupling plane.
- ³³ DEANDREA 97 limit is for \tilde{R}_2 leptoquark obtained from atomic parity violation (APV). The coupling of leptoquark is assumed to be electromagnetic strength. See Table 2 for limits of the four-fermion interactions induced by various scalar leptoquark exchange. DEANDREA 97 combines APV limit and limits from Tevatron and HERA. See Fig. 1–4 for combined limits of leptoquark in mass-coupling plane.
- ³⁴ DERRICK 97 search for lepton-flavor violation in ep collision. See their Tables 2–5 for limits on lepton-flavor violating four-fermion interactions induced by various leptoquarks.
- ³⁵ GROSSMAN 97 estimate the upper bounds on the branching fraction $B \rightarrow \tau^+\tau^- (X)$ from the absence of the B decay with large missing energy. These bounds can be used to constrain leptoquark induced four-fermion interactions.
- ³⁶ JADACH 97 limit is from $e^+e^- \rightarrow q\bar{q}$ cross section at $\sqrt{s}=172.3$ GeV which can be affected by the t - and u -channel exchanges of leptoquarks. See their Fig. 1 for limits on vector leptoquarks in mass-coupling plane.
- ³⁷ KUZNETSOV 95B use π, K, B, τ decays and μe conversion and give a list of bounds on the leptoquark mass and the fermion mixing matrix in the Pati-Salam model. The quoted limit is from $K_L \rightarrow \mu e$ decay assuming zero mixing.
- ³⁸ MIZUKOSHI 95 calculate the one-loop radiative correction to the Z-physics parameters in various scalar leptoquark models. See their Fig. 4 for the exclusion plot of third generation leptoquark models in mass-coupling plane.
- ³⁹ BHATTACHARYYA 94 limit is from one-loop radiative correction to the leptonic decay width of the Z. $m_H=250$ GeV, $\alpha_s(m_Z)=0.12$, $m_t=180$ GeV, and the electroweak strength of leptoquark coupling are assumed. For leptoquark coupled to $\bar{\nu}_L t_R, \bar{\nu}_L \tau$, and $\bar{\nu}_L t$, see Fig. 2 in BHATTACHARYYA 94b erratum and Fig. 3.
- ⁴⁰ DAVIDSON 94 gives an extensive list of the bounds on leptoquark-induced four-fermion interactions from π, K, D, B, μ, τ decays and meson mixings, etc. See Table 15 of DAVIDSON 94 for detail.
- ⁴¹ KUZNETSOV 94 gives mixing independent bound of the Pati-Salam leptoquark from the cosmological limit on $\pi^0 \rightarrow \nu\bar{\nu}$.
- ⁴² LEURER 94, LEURER 94b limits are obtained from atomic parity violation and apply to any chiral leptoquark which couples to the first generation with electromagnetic strength. For a nonchiral leptoquark, universality in $\pi_{\ell 2}$ decay provides a much more stringent bound.
- ⁴³ MAHANTA 94 gives bounds of P - and T -violating scalar-leptoquark couplings from atomic and molecular experiments.
- ⁴⁴ From $(\pi \rightarrow e\nu)/(\pi \rightarrow \mu\nu)$ ratio. SHANKER 82 assumes the leptoquark induced four-fermion coupling $4g^2/M^2 (\bar{\nu}_L e_R) (\bar{d}_L e_R)$ with $g=0.004$ for spin-0 leptoquark and $g^2/M^2 (\bar{\nu}_L e_R) (\bar{d}_R \gamma^\mu e_R)$ with $g \approx 0.6$ for spin-1 leptoquark.

- ⁹ KHACHATRYAN 10 search for new resonance decaying to dijets in pp collisions at $\sqrt{s}=7$ TeV.
- ¹⁰ AALTONEN 09AC search for new narrow resonance decaying to dijets.
- ¹¹ ABE 97G search for new particle decaying to dijets.
- ¹² ABREU 94a limit is from $e^+e^- \rightarrow c\bar{c}s$. Range extends up to 43 GeV if diquarks are degenerate in mass.

MASS LIMITS for g_A (axigluon) and Other Color-Octet Gauge Bosons

Axigluons are massive color-octet gauge bosons in chiral color models and have axial-vector coupling to quarks with the same coupling strength as gluons.

- ¹ SIRUNYAN 18Bo search for resonances decaying to dijets in pp collisions at $\sqrt{s}=13$ TeV.
- ² KHACHATRYAN 17W search for resonances decaying to dijets in pp collisions at $\sqrt{s}=13$ TeV.
- ³ KHACHATRYAN 16K search for resonances decaying to dijets in pp collisions at $\sqrt{s}=13$ TeV.
- ⁴ KHACHATRYAN 16L search for resonances decaying to dijets in pp collisions at $\sqrt{s}=8$ TeV with the data scouting technique, increasing the sensitivity to the low mass resonances.
- ⁵ KHACHATRYAN 15V search for resonances decaying to dijets in pp collisions at $\sqrt{s}=8$ TeV.
- ⁶ CHATRCHYAN 13A search for new resonance decaying to dijets in pp collisions at $\sqrt{s}=7$ TeV.
- ⁷ CHATRCHYAN 13AS search for new resonance decaying to dijets in pp collisions at $\sqrt{s}=8$ TeV.
- ⁸ CHATRCHYAN 11Y search for new resonance decaying to dijets in pp collisions at $\sqrt{s}=7$ TeV.

- ¹ SIRUNYAN 20AI search for resonances decaying into dijets in pp collisions at $\sqrt{s}=13$ TeV.
- ² SIRUNYAN 18Bo search for resonances decaying to dijets in pp collisions at $\sqrt{s}=13$ TeV.
- ³ KHACHATRYAN 17W search for resonances decaying to dijets in pp collisions at $\sqrt{s}=13$ TeV.
- ⁴ KHACHATRYAN 16K search for resonances decaying to dijets in pp collisions at $\sqrt{s}=13$ TeV.
- ⁵ KHACHATRYAN 16L search for resonances decaying to dijets in pp collisions at $\sqrt{s}=8$ TeV with the data scouting technique, increasing the sensitivity to the low mass resonances.
- ⁶ KHACHATRYAN 15V search for resonances decaying to dijets in pp collisions at $\sqrt{s}=8$ TeV.
- ⁷ KHACHATRYAN 17Y search for pair production of color-octet gauge boson g_A each decaying to $4j$ in pp collisions at $\sqrt{s}=8$ TeV.
- ⁸ AAD 16W search for a new resonance decaying to a pair of b and B_H in pp collisions at $\sqrt{s}=8$ TeV. The vector-like quark B_H is assumed to decay to bH . See their Fig. 3 and Fig. 4 for limits on σ - B .
- ⁹ KHACHATRYAN 16E search for KK gluon decaying to $t\bar{t}$ in pp collisions at $\sqrt{s}=8$ TeV.
- ¹⁰ KHACHATRYAN 15AV search for pair productions of neutral color-octet weak-triplet scalar particles (Θ^0), decaying to $b\bar{b}, Zg$ or γg , in pp collisions at $\sqrt{s}=8$ TeV. The Θ^0 particle is often predicted in coloron (G' , color-octet gauge boson) models and appear in the pp collisions through $G' \rightarrow \Theta^0 \Theta^0$ decays. Assuming $B(\Theta^0 \rightarrow b\bar{b})=0.5$, they give limits $m_{\Theta^0} > 623$ GeV (426 GeV) for $m_{G'}=2.3 m_{\Theta^0}$ ($m_{G'}=5 m_{\Theta^0}$).
- ¹¹ AALTONEN 13R search for new resonance decaying to $\sigma\sigma$, with hypothetical strongly interacting σ particle subsequently decaying to 2 jets, in $p\bar{p}$ collisions at $\sqrt{s}=1.96$ TeV, using data corresponding to an integrated luminosity of 6.6 fb^{-1} . For $50 \text{ GeV} < m_\sigma < m_{g_A}/2$, axigluons in mass range 150–400 GeV are excluded.
- ¹² CHATRCHYAN 13A search for new resonance decaying to dijets in pp collisions at $\sqrt{s}=7$ TeV.
- ¹³ CHATRCHYAN 13AS search for new resonance decaying to dijets in pp collisions at $\sqrt{s}=8$ TeV.
- ¹⁴ CHATRCHYAN 13AU search for the pair produced color-octet vector bosons decaying to $q\bar{q}$ pairs in pp collisions. The quoted limit is for $B(g_A \rightarrow q\bar{q})=1$.
- ¹⁵ ABAZOV 12R search for massive color octet vector particle decaying to $t\bar{t}$. The quoted limit assumes g_A couplings with light quarks are suppressed by 0.2.
- ¹⁶ CHATRCHYAN 11Y search for new resonance decaying to dijets in pp collisions at $\sqrt{s}=7$ TeV.

Gauge & Higgs Boson Particle Listings

New Heavy Bosons

- 17 AALTONEN 10L search for massive color octet non-chiral vector particle decaying into $t\bar{t}$ pair with mass in the range $400 \text{ GeV} < M < 800 \text{ GeV}$. See their Fig. 6 for limit in the mass-coupling plane.
- 18 KHACHATRYAN 10 search for new resonance decaying to dijets in pp collisions at $\sqrt{s} = 7 \text{ TeV}$.
- 19 AALTONEN 09AC search for new narrow resonance decaying to dijets.
- 20 CHOUDHURY 07 limit is from the $t\bar{t}$ production cross section measured at CDF.
- 21 DONCHESKI 98 compare α_s derived from low-energy data and that from $\Gamma(Z \rightarrow \text{hadrons})/\Gamma(Z \rightarrow \text{leptons})$.
- 22 ABE 97G search for new particle decaying to dijets.
- 23 ABE 95N assume axigluons decaying to quarks in the Standard Model only.
- 24 ABE 93G assume $\Gamma(g_A) = N\alpha_s m_{g_A}/6$ with $N = 10$.
- 25 CUYPERS 91 compare α_s measured in T decay and that from R at PEP/PETRA energies.
- 26 ABE 90H assumes $\Gamma(g_A) = N\alpha_s m_{g_A}/6$ with $N = 5$ ($\Gamma(g_A) = 0.09 m_{g_A}$). For $N = 10$, the excluded region is reduced to 120–150 GeV.
- 27 ROBINETT 89 result demands partial-wave unitarity of $J = 0$ $t\bar{t} \rightarrow t\bar{t}$ scattering amplitude and derives a limit $m_{g_A} > 0.5 m_t$. Assumes $m_t > 56 \text{ GeV}$.
- 28 ALBAJAR 88B result is from the nonobservation of a peak in two-jet invariant mass distribution. $\Gamma(g_A) < 0.4 m_{g_A}$ assumed. See also BAGGER 88.
- 29 CUYPERS 88 requires $\Gamma(T \rightarrow g g_A) < \Gamma(T \rightarrow g g g)$. A similar result is obtained by DONCHESKI 88.
- 30 DONCHESKI 88B requires $\Gamma(T \rightarrow g q \bar{q})/\Gamma(T \rightarrow g g g) < 0.25$, where the former decay proceeds via axigluon exchange. A more conservative estimate of < 0.5 leads to $m_{g_A} > 21 \text{ GeV}$.

MASS LIMITS for Color-Octet Scalar Bosons

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
none 1800–3700	95	1 SIRUNYAN 20AI CMS		$pp \rightarrow S_8 X, S_8 \rightarrow gg$
none 600–3400	95	2 SIRUNYAN 18BO CMS		$pp \rightarrow S_8 X, S_8 \rightarrow gg$
		3 KHACHATRYAN 15AV CMS		$pp \rightarrow \Theta^0 \Theta^0 \rightarrow b\bar{b} Z g$
none 150–287	95	4 AAD 13K ATLS		$pp \rightarrow S_8 S_8 X, S_8 \rightarrow 2 \text{ jets}$

1 SIRUNYAN 20AI search for resonances decaying into dijets in pp collisions at $\sqrt{s} = 13 \text{ TeV}$. The limit above assumes S_{8gg} coupling $k_s^2 = 1/2$.

2 SIRUNYAN 18BO search for color octet scalar boson produced through gluon fusion process in pp collisions at $\sqrt{s} = 13 \text{ TeV}$. The limit above assumes S_{8gg} coupling $k_s^2 = 1/2$.

3 KHACHATRYAN 15AV search for pair productions of neutral color-octet weak-triplet scalar particles (Θ^0), decaying to $b\bar{b}$, Zg or γg , in pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The Θ^0 particle is often predicted in coloron (G' , color-octet gauge boson) models and appear in the pp collisions through $G' \rightarrow \Theta^0 \Theta^0$ decays. Assuming $B(\Theta^0 \rightarrow b\bar{b}) = 0.5$, they give limits $m_{\Theta^0} > 623 \text{ GeV}$ (426 GeV) for $m_{G'} = 2.3 m_{\Theta^0}$ ($m_{G'} = 5 m_{\Theta^0}$).

4 AAD 13K search for pair production of color-octet scalar particles in pp collisions at $\sqrt{s} = 7 \text{ TeV}$. Cross section limits are interpreted as mass limits on scalar partners of a Dirac gluino.

X^0 (Heavy Boson) Searches in Z Decays

Searches for radiative transition of Z to a lighter spin-0 state X^0 decaying to hadrons, a lepton pair, a photon pair, or invisible particles as shown in the comments. The limits are for the product of branching ratios.

		12 AKRAWY 90J OPAL		$X^0 \rightarrow \text{hadrons}$

- 1 RAINBOLT 19 limits are from $B(Z \rightarrow \ell^+ \ell^- \ell^+ \ell^-)$. See their Figs. 5 and 6 for limits in mass-coupling plane.
- 2 SIRUNYAN 19AZ search for $pp \rightarrow Z \rightarrow X^0 \mu^+ \mu^- \rightarrow \mu^+ \mu^- \mu^+ \mu^-$ events in pp collisions at $\sqrt{s} = 13 \text{ TeV}$. See their Fig. 5 for limits on $\sigma(pp \rightarrow X^0 \mu^+ \mu^-) \cdot B(X^0 \rightarrow \mu^+ \mu^-)$.
- 3 BARATE 98U obtain limits on $B(Z \rightarrow \gamma X^0) \cdot B(X^0 \rightarrow \ell\bar{\ell}, q\bar{q}, gg, \gamma\gamma, \nu\bar{\nu})$. See their Fig. 17.
- 4 See Fig. 4 of ACCIARRI 97Q for the upper limit on $B(Z \rightarrow \gamma X^0; E_\gamma > E_{\text{min}})$ as a function of E_{min} .
- 5 ACTON 93E give $\sigma(e^+ e^- \rightarrow X^0 \gamma) \cdot B(X^0 \rightarrow \gamma\gamma) < 0.4 \text{ pb}$ (95%CL) for $m_{X^0} = 60 \pm 2.5 \text{ GeV}$. If the process occurs via s -channel γ exchange, the limit translates to $\Gamma(X^0) \cdot B(X^0 \rightarrow \gamma\gamma)^2 < 20 \text{ MeV}$ for $m_{X^0} = 60 \pm 1 \text{ GeV}$.
- 6 ABREU 92D give $\sigma_Z \cdot B(Z \rightarrow \gamma X^0) \cdot B(X^0 \rightarrow \text{hadrons}) < (3-10) \text{ pb}$ for $m_{X^0} = 10-78 \text{ GeV}$. A very similar limit is obtained for spin-1 X^0 .

- 7 ADRIANI 92F search for isolated γ in hadronic Z decays. The limit $\sigma_Z \cdot B(Z \rightarrow \gamma X^0) \cdot B(X^0 \rightarrow \text{hadrons}) < (2-10) \text{ pb}$ (95%CL) is given for $m_{X^0} = 25-85 \text{ GeV}$.
- 8 ACTON 91 searches for $Z \rightarrow Z^* X^0, Z^* \rightarrow e^+ e^-, \mu^+ \mu^-, \text{ or } \nu\bar{\nu}$. Excludes any new scalar X^0 with $m_{X^0} < 9.5 \text{ GeV}/c$ if it has the same coupling to ZZ^* as the MSM Higgs boson.
- 9 ACTON 91B limits are for $m_{X^0} = 60-85 \text{ GeV}$.
- 10 ADEVA 91D limits are for $m_{X^0} = 30-89 \text{ GeV}$.
- 11 ADEVA 91D limits are for $m_{X^0} = 30-86 \text{ GeV}$.
- 12 AKRAWY 90J give $\Gamma(Z \rightarrow \gamma X^0) \cdot B(X^0 \rightarrow \text{hadrons}) < 1.9 \text{ MeV}$ (95%CL) for $m_{X^0} = 32-80 \text{ GeV}$. We divide by $\Gamma(Z) = 2.5 \text{ GeV}$ to get product of branching ratios. For nonresonant transitions, the limit is $B(Z \rightarrow \gamma q\bar{q}) < 8.2 \text{ MeV}$ assuming three-body phase space distribution.

MASS LIMITS for a Heavy Neutral Boson Coupling to $e^+ e^-$

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
none 55–61		1 ODAKA 89 VNS		$\Gamma(X^0 \rightarrow e^+ e^-) \cdot B(X^0 \rightarrow \text{had.}) \gtrsim 0.2 \text{ MeV}$

> 48	95	3 ADEVA 85 MRKJ		$\Gamma(X^0 \rightarrow e^+ e^-) = 4 \text{ MeV}$
		4 BERGER 85B PLUT		
none 39.8–45.5		5 ADEVA 84 MRKJ		$\Gamma(X^0 \rightarrow e^+ e^-) = 10 \text{ keV}$
> 47.8	95	5 ADEVA 84 MRKJ		$\Gamma(X^0 \rightarrow e^+ e^-) = 4 \text{ MeV}$
none 39.8–45.2		5 BEHREND 84c CELL		
> 47	95	5 BEHREND 84c CELL		$\Gamma(X^0 \rightarrow e^+ e^-) = 4 \text{ MeV}$

1 ODAKA 89 looked for a narrow or wide scalar resonance in $e^+ e^- \rightarrow \text{hadrons}$ at $E_{\text{cm}} = 55.0-60.8 \text{ GeV}$.

2 DERRICK 86 found no deviation from the Standard Model Bhabha scattering at $E_{\text{cm}} = 29 \text{ GeV}$ and set limits on the possible scalar boson $e^+ e^-$ coupling. See their figure 4 for excluded region in the $\Gamma(X^0 \rightarrow e^+ e^-) - m_{X^0}$ plane. Electronic chiral invariance requires a parity doublet of X^0 , in which case the limit applies for $\Gamma(X^0 \rightarrow e^+ e^-) = 3 \text{ MeV}$.

3 ADEVA 85 first limit is from $2\gamma, \mu^+ \mu^-, \text{ hadrons}$ assuming X^0 is a scalar. Second limit is from $e^+ e^-$ channel. $E_{\text{cm}} = 40-47 \text{ GeV}$. Supersedes ADEVA 84.

4 BERGER 85B looked for effect of spin-0 boson exchange in $e^+ e^- \rightarrow e^+ e^-$ and $\mu^+ \mu^-$ at $E_{\text{cm}} = 34.7 \text{ GeV}$. See Fig. 5 for excluded region in the $m_{X^0} - \Gamma(X^0)$ plane.

5 ADEVA 84 and BEHREND 84c have $E_{\text{cm}} = 39.8-45.5 \text{ GeV}$. MARKJ searched X^0 in $e^+ e^- \rightarrow \text{hadrons}, 2\gamma, \mu^+ \mu^-, e^+ e^-$ and CELLO in the same channels plus τ pair. No narrow or broad X^0 is found in the energy range. They also searched for the effect of X^0 with $m_X > E_{\text{cm}}$. The second limits are from Bhabha data and for spin-0 singlet. The same limits apply for $\Gamma(X^0 \rightarrow e^+ e^-) = 2 \text{ MeV}$ if X^0 is a spin-0 doublet. The second limit of BEHREND 84c was read off from their figure 2. The original papers also list limits in other channels.

Search for X^0 Resonance in $e^+ e^-$ Collisions

The limit is for $\Gamma(X^0 \rightarrow e^+ e^-) \cdot B(X^0 \rightarrow f)$, where f is the specified final state. Spin 0 is assumed for X^0 .

• • • We do not use the following data for averages, fits, limits, etc. • • •				
$<3 \times 10^{-5}\text{--}6 \times 10^{-3}$	90	1 BALEST 95 CLE2 $\Upsilon(1S) \rightarrow X^0\bar{X}^0\gamma$, $m_{X^0} < 3.9$ GeV		

- ¹ BALEST 95 three-body limit is for phase-space photon energy distribution and angular distribution same as for $\Upsilon \rightarrow g\bar{g}\gamma$.

Search for X^0 Resonance in $H(125)$ Decays

Spin 1 is assumed for X^0 . See neutral Higgs search listing for pseudoscalar X^0 .

VALUE	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •			
	1 AABOUD 18AP ATLS $H(125) \rightarrow ZX^0$		
	2 AABOUD 18AP ATLS $H(125) \rightarrow X^0X^0$		

- ¹ AABOUD 18AP use pp collision data at $\sqrt{s} = 13$ TeV. $X^0 \rightarrow \ell^+\ell^-$ decay is assumed. See their Fig. 9 for limits on $\sigma_{H(125)} \cdot B(ZX^0)$.
- ² AABOUD 18AP use pp collision data at $\sqrt{s} = 13$ TeV. $X^0 \rightarrow \ell^+\ell^-$ decay is assumed. See their Fig. 10 for limits on $\sigma_{H(125)} \cdot B(X^0X^0)$.

Gauge & Higgs Boson Particle Listings
New Heavy Bosons, Axions (A^0) and Other Very Light Bosons

Axions (A^0) and Other Very Light Bosons, Searches for

See the related review(s):

Axions and Other Similar Particles

A^0 (Axion) MASS LIMITS from Astrophysics and Cosmology

These bounds depend on model-dependent assumptions (i.e. — on a combination of axion parameters).

Table with columns: VALUE (MeV), DOCUMENT ID, TECN, COMMENT. Lists mass limits for Axion from various experiments like BARROSO, RAFFELT, DICUS, MIKAELEIAN, SATO, VYSOTSKII.

1 Lower bound from 5.5 MeV gamma-ray line from the sun.
2 Lower bound from requiring the red giants' stellar evolution not be disrupted by axion emission.

A^0 (Axion) and Other Light Boson (X^0) Searches in Hadron Decays

Limits are for branching ratios.

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Lists branching ratio limits for Axion and other light bosons in hadron decays from experiments like ABRATENKO, CORTINA-GIL, AHN, BATLEY, WON, AAIJ, ADLARSON, BABUSCI, ARCHILLI, GNINENKO, GNINENKO, ADLER, ANISIMOVSK., ADLER, AMMAR, AMMAR, ALTEGOER, KITCHING, ADLER, AMSLER, AMSLER, AMSLER, MEIJERDREES, MEIJERDREES, ATIYA, NG, ALLIEGRO, ATIYA, BARABASH, BARABASH, BARABASH, MEIJERDREES, ATIYA, KORENCHENKO, EICHLER, YAMAZAKI.

Main table listing particle searches with columns: Author, Year, Publication, Particle, Value, Reference. Lists various searches for Axions and other particles from 1982 to 2024.

Gauge & Higgs Boson Particle Listings

Axions (A^0) and Other Very Light Bosons

- $<(1.5-4) \times 10^{-6}$ 90 38 YAMAZAKI 84 SPEC K decay, $m_{X^0} \ll 100$ MeV
 39 ASANO 82 CNTR Stopped $K^+ \rightarrow \pi^+ X^0$
 40 ASANO 81B CNTR Stopped $K^+ \rightarrow \pi^+ X^0$
 41 ZHITNITSKII 79 Heavy axion
- 1 ABRATENKO 21 quoted limit is for $m_{X^0} = 150$ MeV and the lifetime $c\tau_{X^0} = 80$ m. See their Fig. 4 for the limits in the range of $m_{X^0} = 10-210$ MeV.
 2 CORTINA-GIL 21 quoted limit is for $m_{X^0} = 370$ MeV. Limits from $O(10^{-5})$ and $O(10^{-6})$ are obtained for $m_{X^0} = 10-370$ MeV (see their Fig. 7).
 3 CORTINA-GIL 21A quoted limit is for $m_{X^0} = 160-250$ MeV. Limits between 5×10^{-11} and 2×10^{-10} are obtained in the range of $m_{X^0} = 0-110$ and $154-260$ MeV, assuming stable or invisibly decaying X^0 . See their Fig. 4 for mass- and lifetime-dependent limits.
 4 CORTINA-GIL 21C quoted limit is for $m_{X^0} = 130-140$ MeV, and limits of $9 \times 10^{-10}-6 \times 10^{-7}$ are obtained in the mass range of $m_{X^0} = 110-155$ MeV, assuming X^0 escapes detection. See their Fig. 6 for mass- and lifetime-dependent limits.
 5 PARK 21 look for dark photons produced by decays of B^0 through off-shell Higgs-dark Higgs mixing. See their Fig. 5 for limits in the range of $m_{X^0} = 0.01-2.62$ GeV.
 6 AHN 19 is an update of AHN 17 from a new data set. See their Fig. 4 for the limits in the range of $m_{X^0} = 0-250$ MeV.
 7 AAIJ 17Aq limit is for $\tau_{X^0} = 10$ ps. See their Fig. 4 for limits in the range of $m_{X^0} = 250-4700$ MeV and $\tau_{X^0} = 0.1-1000$ ps.
 8 AHN 17 limit as a function of m_{X^0} from 0 to 250 MeV is provided in their Fig. 5.
 9 BATLEY 17 limit is for $m_{X^0} = 216$ MeV and $\tau_{X^0} \leq 10$ ps. See their Fig. 4(c) for limits in the range of $m_{X^0} = 211-354$ MeV and longer lifetimes.
 10 WON 16 look for a vector boson coupled to baryon number. Derived limits on $\alpha' < 10^{-3}-10^{-2}$ for $m_{X^0} = 290-520$ MeV at 95% CL. See their Fig. 4 for mass-dependent limits.
 11 AAIJ 15AZ limit is for $\tau_{X^0} = 10$ ps and $m_{X^0} = 214-4350$ MeV. See their Fig. 4 for mass- and lifetime-dependent limits.
 12 ADLARSON 13 limits between 2.0×10^{-5} and 1.5×10^{-6} are obtained for $m_{X^0} = 20-100$ MeV (see their Fig. 8). Angular momentum conservation requires that X^0 has spin ≥ 1 .
 13 BABUSCI 13B limit is for $B(\phi \rightarrow \eta X^0) \cdot B(X^0 \rightarrow e^+ e^-)$ and applies to $m_{X^0} = 410$ MeV. It is derived by analyzing $\eta \rightarrow \pi^0 \pi^0 \pi^0$ and $\pi^- \pi^+ \pi^0$. Limits between 1×10^{-6} and 2×10^{-8} are obtained for $m_{X^0} \leq 450$ MeV (see their Fig. 6).
 14 ARCHILLI 12 analyzed $\eta \rightarrow \pi^+ \pi^- \pi^0$ decays. Derived limits on $\alpha'/\alpha < 2 \times 10^{-5}$ for $m_{X^0} = 50-420$ MeV at 90% CL. See their Fig. 8 for mass-dependent limits.
 15 GNINENKO 12A limit is for $B(\pi^0 \rightarrow \gamma X^0) \cdot B(X^0 \rightarrow e^+ e^-)$ and applies for $m_{X^0} = 90$ MeV and $\tau_{X^0} \approx 1 \times 10^{-8}$ sec. Limits between 10^{-8} and 2×10^{-15} are obtained for $m_{X^0} = 3-120$ MeV and $\tau_{X^0} = 1 \times 10^{-11}-1$ sec. See their Fig. 3 for limits at different masses and lifetimes.
 16 GNINENKO 12B limit is for $B(\eta \rightarrow \gamma X^0) \cdot B(X^0 \rightarrow e^+ e^-)$ and applies for $m_{X^0} = 100$ MeV and $\tau_{X^0} \approx 6 \times 10^{-9}$ sec. Limits between 10^{-5} and 3×10^{-14} are obtained for $m_{X^0} \lesssim 550$ MeV and $\tau_{X^0} = 10^{-10}-10$ sec. See their Fig. 5 for limits at different mass and lifetime and for η' decays.
 17 ADLER 04 limit applies for a mass near 180 MeV. For other masses in the range $m_{X^0} = 150-250$ MeV the limit is less restrictive, but still improves ADLER 02c and ATIYA 93B.
 18 ANISIMOVSKY 04 bound is for $m_{X^0} = 0$.
 19 ADLER 02c bound is for $m_{X^0} < 60$ MeV. See Fig. 2 for limits at higher masses.
 20 The quoted limit is for $m_{X^0} = 0-80$ MeV. See their Fig. 5 for the limit at higher mass. The branching fraction limit assumes pure phase space decay distributions.
 21 ALTEGOER 98 looked for X^0 from π^0 decay which penetrate the shielding and convert to π^0 in the external Coulomb field of a nucleus.
 22 KITCHING 97 limit is for $B(K^+ \rightarrow \pi^+ X^0) \cdot B(X^0 \rightarrow \gamma\gamma)$ and applies for $m_{X^0} \approx 50$ MeV, $\tau_{X^0} < 10^{-10}$ s. Limits are provided for $0 < m_{X^0} < 100$ MeV, $\tau_{X^0} < 10^{-8}$ s.
 23 ADLER 96 looked for a peak in missing-mass distribution. This work is an update of ATIYA 93. The limit is for massless stable X^0 particles and extends to $m_{X^0} = 80$ MeV at the same level. See paper for dependence on finite lifetime.
 24 AMSLER 94b and AMSLER 96b looked for a peak in missing-mass distribution.
 25 MEIJERDREES 94 limit is based on inclusive photon spectrum and is independent of X^0 decay modes. It applies to $\tau(X^0) > 10^{-23}$ sec.
 26 ATIYA 93B looked for a peak in missing mass distribution. The bound applies for stable X^0 of $m_{X^0} = 150-250$ MeV, and the limit becomes stronger (10^{-8}) for $m_{X^0} = 180-240$ MeV.
 27 NG 93 studied the production of X^0 via $\gamma\gamma \rightarrow \pi^0 \rightarrow \gamma X^0$ in the early universe at $T \approx 1$ MeV. The bound on extra neutrinos from nucleosynthesis $\Delta N_\nu < 0.3$ (WALKER 91) is employed. It applies to $m_{X^0} \ll 1$ MeV in order to be relativistic down to nucleosynthesis temperature. See paper for heavier X^0 .
 28 ALLIEGRO 92 limit applies for $m_{X^0} = 150-340$ MeV and is the branching ratio times the decay probability. Limit is $< 1.5 \times 10^{-8}$ at 99% CL.
 29 ATIYA 92 looked for a peak in missing mass distribution. The limit applies to $m_{X^0} = 0-130$ MeV in the narrow resonance limit. See paper for the dependence on lifetime. Covariance requires X^0 to be a vector particle.
 30 BARABASH 92 is a beam dump experiment that searched for a light Higgs. Limits between 1×10^{-12} and 1×10^{-7} are obtained for $3 < m_{X^0} < 40$ MeV.
 31 Limits between 1×10^{-12} and 1 are obtained for $4 < m_{X^0} < 69$ MeV.
 32 Limits between 1×10^{-11} and 5×10^{-3} are obtained for $4 < m_{X^0} < 63$ MeV.
 33 Limits between 1×10^{-14} and 1 are obtained for $3 < m_{X^0} < 82$ MeV.

- 34 MEIJERDREES 92 limit applies for $\tau_{X^0} = 10^{-23}-10^{-11}$ sec. Limits between 2×10^{-4} and 4×10^{-6} are obtained for $m_{X^0} = 25-120$ MeV. Angular momentum conservation requires that X^0 has spin ≥ 1 .
 35 ATIYA 90b limit is for $B(K^+ \rightarrow \pi^+ X^0) \cdot B(X^0 \rightarrow \gamma\gamma)$ and applies for $m_{X^0} = 50$ MeV, $\tau_{X^0} < 10^{-10}$ s. Limits are also provided for $0 < m_{X^0} < 100$ MeV, $\tau_{X^0} < 10^{-8}$ s.
 36 KORENCHENKO 87 limit assumes $m_{A^0} = 1.7$ MeV, $\tau_{A^0} \lesssim 10^{-12}$ s, and $B(A^0 \rightarrow e^+ e^-) = 1$.
 37 EICHLER 86 looked for $\pi^+ \rightarrow e^+ \nu A^0$ followed by $A^0 \rightarrow e^+ e^-$. Limits on the branching fraction depend on the mass and and lifetime of A^0 . The quoted limits are valid when $\tau(A^0) \gtrsim 3 \cdot 10^{-10}$ s if the decays are kinematically allowed.
 38 YAMAZAKI 84 looked for a discrete line in $K^+ \rightarrow \pi^+ X$. Sensitive to wide mass range (5-300 MeV), independent of whether X decays promptly or not.
 39 ASANO 82 at KEK set limits for $B(K^+ \rightarrow \pi^+ X^0)$ for $m_{X^0} < 100$ MeV as $BR < 4 \cdot 10^{-8}$ for $\tau(X^0 \rightarrow \eta\gamma's) > 1 \cdot 10^{-9}$ s, $BR < 1.4 \cdot 10^{-6}$ for $\tau < 1 \cdot 10^{-9}$ s.
 40 ASANO 81B is KEK experiment. Set $B(K^+ \rightarrow \pi^+ X^0) < 3.8 \cdot 10^{-8}$ at CL = 90%.
 41 ZHITNITSKII 79 argue that a heavy axion predicted by YANG 78 ($3 < m < 40$ MeV) contradicts experimental muon anomalous magnetic moments.

A^0 (Axion) Searches in Quarkonium Decays

Decay or transition of quarkonium. Limits are for branching ratio.

		7 AMALDI 85	CNTR Ortho-positronium	
		8 CARBONI 83	CNTR Ortho-positronium	
1 BADERTSCHER 02 looked for a three-body decay of ortho-positronium into a photon and two penetrating (neutral or milli-charged) particles.				
2 The ASAI 94 limit is based on inclusive photon spectrum and is independent of A^0 decay modes.				
3 The AKOPYAN 91 limit applies for a short-lived A^0 with $\tau_{A^0} < 10^{-13} m_{A^0} [\text{keV}] \text{ s}$.				
4 ASAI 91 limit translates to $g_{A^0 e^+ e^-}^2 / 4\pi < 1.1 \times 10^{-11}$ (90% CL) for $m_{A^0} < 800 \text{ keV}$.				
5 The TSUCHIYAKI 90 limit is based on inclusive photon spectrum and is independent of A^0 decay modes.				
6 ORITO 89 limit translates to $g_{A^0 e^+ e^-}^2 / 4\pi < 6.2 \times 10^{-10}$. Somewhat more sensitive limits are obtained for larger m_{A^0} : $B < 7.6 \times 10^{-6}$ at 100 keV.				
7 AMALDI 85 set limits $B(A^0 \gamma) / B(\gamma\gamma\gamma) < (1-5) \times 10^{-6}$ for $m_{A^0} = 900-100 \text{ keV}$ which are about 1/10 of the CARBONI 83 limits.				
8 CARBONI 83 looked for ortho-positronium $\rightarrow A^0 \gamma$. Set limit for A^0 electron coupling squared, $(g_{A^0 e^+ e^-} / 4\pi)^2 < 6 \cdot 10^{-10} \cdot 7 \cdot 10^{-9}$ for m_{A^0} from 150-900 keV (CL = 99.7%). This is about 1/10 of the bound from $g=2$ experiments.				

A^0 (Axion) Search in Photoproduction

••• We do not use the following data for averages, fits, limits, etc. •••

1 BASSOMPIE... 95 $m_{A^0} = 1.8 \pm 0.2 \text{ MeV}$

See key on page 1127

Gauge & Higgs Boson Particle Listings
Axions (A^0) and Other Very Light Bosons

¹BASSOMPIERRE 95 is an extension of BASSOMPIERRE 93. They looked for a peak in the invariant mass of e^+e^- pairs in the region $m_{e^+e^-} = 1.8 \pm 0.2$ MeV. They obtained bounds on the production rate A^0 for $\tau(A^0) = 10^{-18}$ – 10^{-9} sec. They also found an excess of events in the range $m_{e^+e^-} = 2.1$ – 3.5 MeV.

 A^0 (Axion) Production in Hadron CollisionsLimits are for $\sigma(A^0) / \sigma(\pi^0)$.

¹AAD 21F look for axion production with an energetic jet and large missing p_T , and set a limit on the axion coupling to gluons, $C_G/f_{A^0} < 8 \times 10^{-6}$ GeV $^{-1}$ at 95% CL for $m_{A^0} = 1$ MeV. Using $C_G = \alpha_s/8\pi$, we interpret the limit as $f_{A^0} > 0.4$ TeV for $\alpha_s \approx 0.08$.

²AAD 21K look for axion production with an energetic photon and large missing p_T , and set a limit on the axion coupling to a Z boson and photon, $G_A Z\gamma < 5.1 \times 10^{-4}$ GeV $^{-1}$ at 95% CL for $m_{A^0} = 1$ MeV and assuming $G_A \gamma\gamma = 0$.

³AAD 21N look for axion production using the measurement of light-by-light scattering based on Pb+Pb collision data. They set the limit on the axion-photon coupling, $G_A \gamma\gamma < 5.3 \times 10^{-5}$ – 3.4×10^{-4} GeV $^{-1}$ at 95% CL for $m_{A^0} = 6$ – 100 GeV. Here we use $\lambda_a = G_A \gamma\gamma^{-1}$ to translate their limits. See their Fig. 9 for mass-dependent limits.

⁴CARRA 21 is analogous to GAVELA 20, and they use the differential cross sections for $W W$ and $Z\gamma$ production measured with the ATLAS detector to set limits on the product of the axion couplings to gauge bosons as $G_A W W G_A g g < 6.2 \times 10^{-7}$ GeV $^{-2}$ and $G_A Z\gamma G_A g g < 3.7 \times 10^{-7}$ GeV $^{-2}$ at 95% CL for $m_{A^0} \lesssim 100$ GeV.

⁵AAIJ 20AL look for a light new boson decaying into a pair of muons using the LHCb data with an integrated luminosity of 5.1 fb^{-1} , and set limits on the cross section over a range of $m_{X^0} = 0.22$ – 3 and 20 – 60 GeV. See Figs. 8 and 9 for mass-dependent limits.

⁶GAVELA 20 focus on the axion production as an s-channel off shell mediator, and use the Run 2 CMS public data to set limits on the product of the axion couplings to gluons and photons as well as Z bosons as $G_A \gamma\gamma G_A g g < 2.8 \times 10^{-7}$ GeV $^{-2}$ and $G_A Z Z G_A g g < 9.8 \times 10^{-7}$ GeV $^{-2}$ for $m_{A^0} \lesssim 200$ GeV. See their Fig.3 for the limits.

⁷SIRUNYAN 19BQ look for the pair production of a new light boson decaying into a pair of muons, and set limits on the product of the production cross section times branching fraction to dimuons squared times acceptance over a range of $m_{X^0} = 0.25$ – 8.5 GeV. See the right panel of their Fig. 1 for mass-dependent limits.

⁸JAIN 07 claims evidence for $A^0 \rightarrow e^+e^-$ produced in 207Pb collision on nuclear emulsion (Ag/Br) for $m(A^0) = 7 \pm 1$ or 19 ± 1 MeV and $\tau(A^0) \leq 10^{-13}$ s.

⁹AHMAD 97 reports a result of APEX Collaboration which studied positron production in $^{238}\text{U} + ^{232}\text{Th}$ and $^{238}\text{U} + ^{181}\text{Ta}$ collisions, without requiring a coincident electron. No narrow lines were found for $250 < E_{e^+} < 750$ keV.

¹⁰LEINBERGER 97 (ORANGE Collaboration) at GSI looked for a narrow sum-energy e^+e^- line at ~ 635 keV in $^{238}\text{U} + ^{181}\text{Ta}$ collision. Limits on the production probability for a narrow sum-energy e^+e^- line are set. See their Table 2.

¹¹GANZ 96 (EPOS II Collaboration) has placed upper bounds on the production cross section of e^+e^- pairs from $^{238}\text{U} + ^{181}\text{Ta}$ and $^{238}\text{U} + ^{232}\text{Th}$ collisions at GSI. See Table 2 for limits both for back-to-back and isotropic configurations of e^+e^- pairs. These limits rule out the existence of peaks in the e^+e^- sum-energy distribution, reported by an earlier version of this experiment.

¹²KAMEL 96 looked for e^+e^- pairs from the collision of ^{32}S (200 GeV/nucleon) and emulsion. No evidence of mass peaks is found in the region of sensitivity $m_{ee} > 2$ MeV.

¹³BLUEMLEIN 92 is a proton beam dump experiment at Serpukhov with a secondary target to induce Bethe-Heitler production of e^+e^- or $\mu^+\mu^-$ from the produce A^0 . See Fig. 5 for the excluded region in m_{A^0} - x plane. For the standard axion, $0.3 < x < 25$ is excluded at 95% CL. If combined with BLUEMLEIN 91, $0.008 < x < 32$ is excluded.

¹⁴MEIJERDREES 92 give $\Gamma(\pi^- p \rightarrow nA^0) \cdot B(A^0 \rightarrow e^+e^-) / \Gamma(\pi^- p \rightarrow \text{all}) < 10^{-5}$ (90% CL) for $m_{A^0} = 100$ MeV, $\tau_{A^0} = 10^{-11}$ – 10^{-23} sec. Limits ranging from 2.5×10^{-3} to 10^{-7} are given for $m_{A^0} = 25$ – 136 MeV.

¹⁵BLUEMLEIN 91 is a proton beam dump experiment at Serpukhov. No candidate event for $A^0 \rightarrow e^+e^-, 2\gamma$ are found. Fig. 6 gives the excluded region in m_{A^0} - x plane ($x = \tan\beta = v_2/v_1$). Standard axion is excluded for $0.2 < m_{A^0} < 3.2$ MeV for most $x > 1$, 0.2 – 11 MeV for most $x < 1$.

¹⁶FAISSNER 89 searched for $A^0 \rightarrow e^+e^-$ in a proton beam dump experiment at SIN. No excess of events was observed over the background. A standard axion with mass $2m_e$ – 20 MeV is excluded. Lower limit on f_{A^0} of $\approx 10^4$ GeV is given for $m_{A^0} = 2m_e$ – 20 MeV.

¹⁷DEBOER 88 reanalyze EL-NADI 88 data and claim evidence for three distinct states with mass $\approx 1.1, \approx 2.1$, and ≈ 9 MeV, lifetimes 10^{-16} – 10^{-15} s decaying to e^+e^- and note the similarity of the data with those of a cosmic-ray experiment by Bristol group (B.M. Anand, Proc. of the Royal Society of London, Section A **A22** 183 (1953)). For a criticism see PERKINS 89, who suggests that the events are compatible with π^0 Dalitz decay. DEBOER 89B is a reply which contests the criticism.

¹⁸EL-NADI 88 claim the existence of a neutral particle decaying into e^+e^- with mass 1.60 ± 0.59 MeV, lifetime $(0.15 \pm 0.01) \times 10^{-14}$ s, which is produced in heavy ion interactions with emulsion nuclei at ~ 4 GeV/c/nucleon.

¹⁹FAISSNER 88 is a proton beam dump experiment at SIN. They found no candidate event for $A^0 \rightarrow \gamma\gamma$. A standard axion decaying to 2γ is excluded except for a region $x \approx 1$. Lower limit on f_{A^0} of 10^2 – 10^3 GeV is given for $m_{A^0} = 0.1$ – 1 MeV.

²⁰BADIER 86 did not find long-lived A^0 in 300 GeV π^- Beam Dump Experiment that decays into e^+e^- in the mass range $m_{A^0} = (20$ – $200)$ MeV, which excludes the A^0 decay constant $f(A^0)$ in the interval (60–600) GeV. See their figure 6 for excluded region on $f(A^0)$ - m_{A^0} plane.

²¹BERGSM 85 look for $A^0 \rightarrow 2\gamma, e^+e^-, \mu^+\mu^-$. First limit above is for $m_{A^0} = 1$ MeV; second is for 200 MeV. See their figure 4 for excluded region on f_{A^0} - m_{A^0} plane, where f_{A^0} is A^0 decay constant. For Peccei-Quinn PECCIE 77 $A^0, m_{A^0} < 180$ keV and $\tau > 0.037$ s. (CL = 90%). For the axion of FAISSNER 81B at 250 keV, BERGSM 85 expect 15 events but observe zero.

²²FAISSNER 83 observed 19 $1\text{-}\gamma$ and 12 $2\text{-}\gamma$ events where a background of 4.8 and 2.3 respectively is expected. A small-angle peak is observed even if iron wall is set in front of the decay region.

²³FAISSNER 83B extrapolate SIN γ signal to LAMPF ν experimental condition. Resulting 370 γ 's are not at variance with LAMPF upper limit of 450 γ 's. Derived from LAMPF limit that $[d\sigma(A^0)/d\omega \text{ at } 90^\circ] m_{A^0} / \tau_{A^0} < 14 \times 10^{-35}$ cm 2 sr $^{-1}$ MeV ms $^{-1}$. See comment on FRANK 83B.

²⁴FRANK 83B stress the importance of LAMPF data bins with negative net signal. By statistical analysis say that LAMPF and SIN-A0 are at variance when extrapolation by phase-space model is done. They find LAMPF upper limit is 248 not 450 γ 's. See comment on FAISSNER 83B.

²⁵HOFFMAN 83 set CL = 90% limit $d\sigma/dt B(e^+e^-) < 3.5 \times 10^{-32}$ cm 2 /GeV 2 for $140 < m_{A^0} < 160$ MeV. Limit assumes $\tau(A^0) < 10^{-9}$ s.

²⁶FETSCHER 82 reanalyzes SIN beam-dump data of FAISSNER 81. Claims no evidence for axion since $2\text{-}\gamma$ peak rate remarkably decreases if iron wall is set in front of the decay region.

²⁷FAISSNER 81 see excess μe events. Suggest axion interactions.

²⁸FAISSNER 81B is SIN 590 MeV proton beam dump. Observed 14.5 ± 5.0 events of 2γ decay of long-lived neutral penetrating particle with $m_{2\gamma} \lesssim 1$ MeV. Axion interpretation with η - A^0 mixing gives $m_{A^0} = 250 \pm 25$ keV, $\tau_{(2\gamma)} = (7.3 \pm 3.7) \times 10^{-3}$ s from above rate. See critical remarks below in comments of FETSCHER 82, FAISSNER 83, FAISSNER 83B, FRANK 83B, and BERGSM 85. Also see in the next subsection ALEK-SEEV 82B, CAVAIGNAC 83, and ANANEV 85.

²⁹KIM 81 analyzed 8 candidates for $A^0 \rightarrow 2\gamma$ obtained by Aachen-Padova experiment at CERN with 26 GeV protons on Be. Estimated axion mass is about 300 keV and lifetime is $(0.86 \sim 5.6) \times 10^{-3}$ s depending on models. Faissner (private communication), says axion production underestimated and mass overestimated. Correct value around 200 keV.

Gauge & Higgs Boson Particle Listings

Axions (A^0) and Other Very Light Bosons

- ³⁰ FAISSNER 80 is SIN beam dump experiment with 590 MeV protons looking for $A^0 \rightarrow e^+e^-$ decay. Assuming $A^0/\pi^0 = 5.5 \times 10^{-7}$, obtained decay rate limit $20/(A^0 \text{ mass}) \text{ MeV/s}$ (CL = 90%), which is about 10^{-7} below theory and interpreted as upper limit to $m_{A^0} < 2m_{e^-}$.
- ³¹ JACQUES 80 is a BNL beam dump experiment. First limit above comes from nonobservation of excess neutral-current-type events $[\sigma(\text{production})\sigma(\text{interaction})] < 7. \times 10^{-68} \text{ cm}^4$, CL = 90%. Second limit is from nonobservation of axion decays into 2γ 's or e^+e^- , and for axion mass a few MeV.
- ³² SOUKAS 80 at BNL observed no excess of neutral-current-type events in beam dump.
- ³³ BECHIS 79 looked for the axion production in low energy electron Bremsstrahlung and the subsequent decay into either 2γ or e^+e^- . No signal found. CL = 90% limits for model parameter(s) are given.
- ³⁴ COTEUS 79 is a beam dump experiment at BNL.
- ³⁵ DISHAW 79 is a calorimetric experiment and looks for low energy tail of energy distributions due to energy lost to weakly interacting particles.
- ³⁶ BELLOTTI 78 first value comes from search for $A^0 \rightarrow e^+e^-$. Second value comes from search for $A^0 \rightarrow 2\gamma$, assuming mass $< 2m_{e^-}$. For any mass satisfying this, limit is above value $\times (\text{mass})^{-4}$. Third value uses data of PL 60B 401 and quotes $\sigma(\text{production})\sigma(\text{interaction}) < 10^{-67} \text{ cm}^4$.
- ³⁷ BOSETTI 78B quotes $\sigma(\text{production})\sigma(\text{interaction}) < 2. \times 10^{-67} \text{ cm}^4$.
- ³⁸ DONNELLY 78 examines data from reactor neutrino experiments of REINES 76 and GURR 74 as well as SLAC beam dump experiment. Evidence is negative.
- ³⁹ MICELMACHER 78 finds no evidence of axion existence in reactor experiments of REINES 76 and GURR 74. (See reference on DONNELLY 78 below).
- ⁴⁰ VYSOTSKI 78 derived lower limit for the axion mass 25 keV from luminosity of the sun and 200 keV from red supergiants.

		²² CALAPRICE	79		Carbon

- ¹ DERBIN 02 looked for the axion emission in an M1 transition in ^{125m}Te decay. They looked for a possible presence of a shifted energy spectrum in gamma rays due to the undetected axion.
- ² DEBOER 97C reanalyzed the existent data on Nuclear M1 transitions and find that a 9 MeV boson decaying into e^+e^- would explain the excess of events with large opening angles. See also DEBOER 01 for follow-up experiments.
- ³ TSUNODA 95 looked for axion emission when ²⁵²Cf undergoes a spontaneous fission, with the axion decaying into e^+e^- . The bound is for $m_{A^0} = 40 \text{ MeV}$. It improves to 2.5×10^{-5} for $m_{A^0} = 200 \text{ MeV}$.
- ⁴ MINOWA 93 studied chain process, ¹³⁹Ce \rightarrow ¹³⁹La* by electron capture and M1 transition of ¹³⁹La* to the ground state. It does not assume decay modes of A^0 . The bound applies for $m_{A^0} < 166 \text{ keV}$.
- ⁵ HICKS 92 bound is applicable for $\tau_{X^0} < 4 \times 10^{-11} \text{ sec}$.
- ⁶ The ASANUMA 90 limit is for the branching fraction of X^0 emission per ²⁴¹Am α decay and valid for $\tau_{X^0} < 3 \times 10^{-11} \text{ s}$.
- ⁷ The DEBOER 90 limit is for the branching ratio ⁸Be* (18.15 MeV, 1+) \rightarrow ⁸Be A^0 , $A^0 \rightarrow e^+e^-$ for the mass range $m_{A^0} = 4-15 \text{ MeV}$.
- ⁸ The BINI 89 limit is for the branching fraction of ¹⁶O*(6.05 MeV, 0+) \rightarrow ¹⁶O X^0 , $X^0 \rightarrow e^+e^-$ for $m_X = 1.5-3.1 \text{ MeV}$. $\tau_{X^0} \lesssim 10^{-11} \text{ s}$ is assumed. The spin-parity of X is restricted to 0+ or 1-.
- ⁹ AVIGNONE 88 looked for the 1115 keV transition C* \rightarrow Cu A^0 , either from $A^0 \rightarrow 2\gamma$ in-flight decay or from the secondary A^0 interactions by Compton and by Primakoff processes. Limits for axion parameters are obtained for $m_{A^0} < 1.1 \text{ MeV}$.
- ¹⁰ DATAR 88 rule out light pseudoscalar particle emission through its decay $A^0 \rightarrow e^+e^-$ in the mass range 1.02-2.5 MeV and lifetime range $10^{-13}-10^{-8} \text{ s}$. The above limit is for $\tau = 5 \times 10^{-13} \text{ s}$ and $m = 1.7 \text{ MeV}$; see the paper for the τ -m dependence of the limit.
- ¹¹ The limit is for the branching fraction of ¹⁶O*(6.05 MeV, 0+) \rightarrow ¹⁶O X^0 , $X^0 \rightarrow e^+e^-$ against internal pair conversion for $m_{X^0} = 1.7 \text{ MeV}$ and $\tau_{X^0} < 10^{-11} \text{ s}$. Similar limits are obtained for $m_{X^0} = 1.3-3.2 \text{ MeV}$. The spin parity of X^0 must be either 0+ or 1-. The limit at 1.7 MeV is translated into a limit for the X^0 -nucleon coupling constant: $g_{X^0 NN}^2/4\pi < 2.3 \times 10^{-9}$.
- ¹² The DOEHNER 88 limit is for $m_{A^0} = 1.7 \text{ MeV}$, $\tau(A^0) < 10^{-10} \text{ s}$. Limits less than 10^{-4} are obtained for $m_{A^0} = 1.2-2.2 \text{ MeV}$.
- ¹³ SAVAGE 88 looked for A^0 that decays into e^+e^- in the decay of the 9.17 MeV $J^P = 2^+$ state in ¹⁴N, 17.64 MeV state $J^P = 1^+$ in ⁸Be, and the 18.15 MeV state $J^P = 1^+$ in ⁸Be. This experiment constrains the isovector coupling of A^0 to hadrons, if $m_{A^0} = (1.1 \rightarrow 2.2) \text{ MeV}$ and the isoscalar coupling of A^0 to hadrons, if $m_{A^0} = (1.1 \rightarrow 2.6) \text{ MeV}$. Both limits are valid only if $\tau(A^0) \lesssim 1 \times 10^{-11} \text{ s}$.
- ¹⁴ Limits are for $\Gamma(A^0(1.8 \text{ MeV}))/\Gamma(\pi M1)$; i.e., for 1.8 MeV axion emission normalized to the rate for internal emission of e^+e^- pairs. Valid for $\tau_{A^0} < 2 \times 10^{-11} \text{ s}$. ⁶Li isovector decay data strongly disfavor PECCEI 86 model I, whereas the ¹⁰B and ¹⁴N isoscalar decay data strongly reject PECCEI 86 model II and III.
- ¹⁵ SAVAGE 86B looked for A^0 that decays into e^+e^- in the decay of the 9.17 MeV $J^P = 2^+$ state in ¹⁴N. Limit on the branching fraction is valid if $\tau_{A^0} \lesssim 1. \times 10^{-11} \text{ s}$ for $m_{A^0} = (1.1-1.7) \text{ MeV}$. This experiment constrains the iso-vector coupling of A^0 to hadrons.
- ¹⁶ ANANEV 85 with IBR-2 pulsed reactor exclude standard A^0 at CL = 95% masses below 470 keV (Li* decay) and below $2m_e$ for deuteron* decay.
- ¹⁷ CAVAI GNAC 83 at Bugey reactor exclude axion at any ^{m97}Nb* decay and axion with m_{A^0} between 275 and 288 keV (deuteron* decay).
- ¹⁸ ALEKSEEV 82 with IBR-2 pulsed reactor exclude standard A^0 at CL = 95% mass-ranges $m_{A^0} < 400 \text{ keV}$ (Li* decay) and $330 \text{ keV} < m_{A^0} < 2.2 \text{ MeV}$. (deuteron* decay).
- ¹⁹ LEHMANN 82 obtained $A^0 \rightarrow 2\gamma$ rate $< 6.2 \times 10^{-5}/\text{s}$ (CL = 95%) excluding m_{A^0} between 100 and 1000 keV.
- ²⁰ ZEHNDER 82 used Gosgen 2.8GW light-water reactor to check A^0 production. No 2γ peak in Li*, Nb* decay (both single p transition) nor in n capture (combined with previous Ba* negative result) rules out standard A^0 . Set limit $m_{A^0} < 60 \text{ keV}$ for any A^0 .
- ²¹ ZEHNDER 81 looked for Ba* \rightarrow ¹³⁵Ba transition with $A^0 \rightarrow 2\gamma$. Obtained 2γ coincidence rate $< 2.2 \times 10^{-5}/\text{s}$ (CL = 95%) excluding $m_{A^0} > 160 \text{ keV}$ (or 200 keV depending on Higgs mixing). However, see BARROSO 81.
- ²² CALAPRICE 79 saw no axion emission from excited states of carbon. Sensitive to axion mass between 1 and 15 MeV.

A^0 (Axion) Searches in Reactor Experiments

VALUE	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •			
	¹ CHANG 07		Primakoff or Compton
	² ALTMANN 95	CNTR	Reactor; $A^0 \rightarrow e^+e^-$
	³ KETOV 86	SPEC	Reactor; $A^0 \rightarrow \gamma\gamma$
	⁴ KOCH 86	SPEC	Reactor; $A^0 \rightarrow \gamma\gamma$
	⁵ DATAR 82	CNTR	Light water reactor
	⁶ VUILLEUMIER 81	CNTR	Reactor; $A^0 \rightarrow 2\gamma$

- ¹ CHANG 07 looked for monochromatic photons from Primakoff or Compton conversion of axions from the Kuo-Sheng reactor due to axion coupling to photon or electron, respectively. The search places model-independent limits on the products $G_{A\gamma\gamma} G_{ANN}$ and $G_{Aee} G_{ANN}$ for $m(A^0)$ less than the MeV range.
- ² ALTMANN 95 looked for A^0 decaying into e^+e^- from the Bugey5 nuclear reactor. They obtain an upper limit on the A^0 production rate of $\omega(A^0)/\omega(\gamma) \times B(A^0 \rightarrow e^+e^-) < 10^{-16}$ for $m_{A^0} = 1.5 \text{ MeV}$ at 90% CL. The limit is weaker for heavier A^0 . In the case of a standard axion, this limit excludes a mass in the range $2m_e < m_{A^0} < 4.8 \text{ MeV}$ at 90% CL. See Fig. 5 of their paper for exclusion limits of axion-like resonances Z^0 in the (m_{X^0}, τ_{X^0}) plane.
- ³ KETOV 86 searched for A^0 at the Rovno nuclear power plant. They found an upper limit on the A^0 production probability of $0.8 [100 \text{ keV}/m_{A^0}]^6 \times 10^{-6}$ per fission. In the standard axion model, this corresponds to $m_{A^0} > 150 \text{ keV}$. Not valid for $m_{A^0} \gtrsim 1 \text{ MeV}$.
- ⁴ KOCH 86 searched for $A^0 \rightarrow \gamma\gamma$ at nuclear power reactor Biblis A. They found an upper limit on the A^0 production rate of $\omega(A^0)/\omega(\gamma(M1)) < 1.5 \times 10^{-10}$ (CL=95%). Standard axion with $m_{A^0} = 250 \text{ keV}$ gives 10^{-5} for the ratio. Not valid for $m_{A^0} > 1022 \text{ keV}$.
- ⁵ DATAR 82 looked for $A^0 \rightarrow 2\gamma$ in neutron capture ($np \rightarrow dA^0$) at Tarapur 500 MW reactor. Sensitive to sum of $l = 0$ and $l = 1$ amplitudes. With ZEHNDER 81 ($l = 0$) - ($l = 1$) result, assert nonexistence of standard A^0 .
- ⁶ VUILLEUMIER 81 is at Grenoble reactor. Set limit $m_{A^0} < 280 \text{ keV}$.

- ANDREEV 21 look for invisible decays of axions coupled to electrons, and set limits on $g_{Aee} < 4.6 \times 10^{-6}$ – 3.1×10^{-3} for $m_{A^0} = 10^{-3}$ –1 GeV. This limits the axion contribution to the electron g -2 to an order of magnitude less than the current experimental uncertainty. See their Figs. 3 and 4 for mass-dependent limits.
- ANDREEV 21B set limits on g_{Aee} in the range of 6.3×10^{-6} – 1.6×10^{-3} for $m_{A^0} = 2$ –17 MeV at 90% CL. This excludes $6.6 \times 10^{-5} < g_{Aee} < 1 \times 10^{-4}$ at $m_{A^0} = 16.7$ MeV corresponding to the ATOMKI anomaly. See their Fig. 2 for mass-dependent limits.
- The listed BROSS 91 limit is for $m_{A^0} = 1.14$ MeV. $B(A^0 \rightarrow e^+e^-) = 1$ assumed. Excluded domain in the τ_{A^0} - m_{A^0} plane extends up to $m_{A^0} \approx 7$ MeV (see Fig. 5). Combining with electron g -2 constraint, axions coupling only to e^+e^- ruled out for $m_{A^0} < 4.8$ MeV (90% CL).
- GUO 90 use the same apparatus as BROWN 86 and improve the previous limit in the shorter lifetime region. Combined with g -2 constraint, axions coupling only to e^+e^- are ruled out for $m_{A^0} < 2.7$ MeV (90% CL).
- BJORKEN 88 reports limits on axion parameters (f_A, m_A, τ_A) for $m_{A^0} < 200$ MeV from electron beam-dump experiment with production via Primakoff photoproduction, bremsstrahlung from electrons, and resonant annihilation of positrons on atomic electrons.
- BLINOV 88 assume zero spin, $m = 1.8$ MeV and lifetime $< 5 \times 10^{-12}$ s and find $\Gamma(A^0 \rightarrow \gamma\gamma)B(A^0 \rightarrow e^+e^-) < 2$ eV (CL=90%).
- Assumes $A^0\gamma\gamma$ coupling is small and hence Primakoff production is small. Their figure 2 shows limits on axions for $m_{A^0} < 15$ MeV.
- Uses electrons in hadronic showers from an incident 800 GeV proton beam. Limits for $m_{A^0} < 15$ MeV are shown in their figure 3.
- $m_{A^0} = 1.8$ MeV assumed. The excluded domain in the τ_{A^0} - m_{A^0} plane extends up to $m_{A^0} \approx 14$ MeV, see their figure 4.
- The limits are obtained from their figure 3. Also given is the limit on the $A^0\gamma\gamma$ - $A^0e^+e^-$ coupling plane by assuming Primakoff production.

Search for A^0 (Axion) Resonance in Bhabha Scattering

The limit is for $\Gamma(A^0)|B(A^0 \rightarrow e^+e^-)|^2$.

		10 VONWIMMER.87	CNTR	

- HALLIN 92 quote limits on lifetime, 8×10^{-14} – 5×10^{-13} sec depending on mass, assuming $B(A^0 \rightarrow e^+e^-) = 100\%$. They say that TSERTOS 91 overstated their sensitivity by a factor of 3.
- HENDERSON 92c exclude axion with lifetime $\tau_{A^0} = 1.4 \times 10^{-12}$ – 4.0×10^{-10} s, assuming $B(A^0 \rightarrow e^+e^-) = 100\%$. HENDERSON 92c also exclude a vector boson with $\tau = 1.4 \times 10^{-12}$ – 6.0×10^{-10} s.
- WU 92 quote limits on lifetime $> 3.3 \times 10^{-13}$ s assuming $B(A^0 \rightarrow e^+e^-) = 100\%$. They say that TSERTOS 89 overestimate the limit by a factor of $\pi/2$. WU 92 also quote a bound for vector boson, $\tau > 8.2 \times 10^{-13}$ s.
- WIDMANN 91 bound applies exclusively to the case $B(A^0 \rightarrow e^+e^-) = 1$, since the detection efficiency varies substantially as $\Gamma(A^0)_{\text{total}}$ changes. See their Fig. 6.

- JUDGE 90 excludes an elastic pseudoscalar e^+e^- resonance for 4.5×10^{-13} s $< \tau(A^0) < 7.5 \times 10^{-12}$ s (95% CL) at $m_{A^0} = 1.832$ MeV. Comparable limits can be set for $m_{A^0} = 1.776$ –1.856 MeV.
- See also TSERTOS 88B in references.
- The upper limit listed in TSERTOS 88 is too large by a factor of 4. See TSERTOS 88B, footnote 3.
- VANKLINKEN 88 looked for relatively long-lived resonance ($\tau = 10^{-10}$ – 10^{-12} s). The sensitivity is not sufficient to exclude such a narrow resonance.
- MAIER 87 obtained limits $R\Gamma < 60$ eV (100 eV) at $m_{A^0} \approx 1.64$ MeV (1.83 MeV) for energy resolution $\Delta E_{\text{cm}} \approx 3$ keV, where R is the resonance cross section normalized to that of Bhabha scattering, and $\Gamma = \Gamma_{e^+e^-}^2/\Gamma_{\text{total}}$. For a discussion implying that $\Delta E_{\text{cm}} \approx 10$ keV, see TSERTOS 89.
- VONWIMMERSPERG 87 measured Bhabha scattering for $E_{\text{cm}} = 1.37$ –1.86 MeV and found a possible peak at 1.73 with $\int \sigma dE_{\text{cm}} = 14.5 \pm 6.8$ keV·b. For a comment and a reply, see VANKLINKEN 88B and VONWIMMERSPERG 88. Also see CONNELL 88.

Search for A^0 (Axion) Resonance in $e^+e^- \rightarrow \gamma\gamma$

The limit is for $\Gamma(A^0 \rightarrow e^+e^-)\Gamma(A^0 \rightarrow \gamma\gamma)/\Gamma_{\text{total}}$

		1 MITSUI 96		looked for a monochromatic γ . The bound applies for a vector X^0 with $C = -1$ and $m_{X^0} < 200$ keV. They derive an upper bound on eX^0 coupling and hence on the branching ratio $B(o\text{-Ps} \rightarrow \gamma\gamma X^0) < 6.2 \times 10^{-6}$. The bounds weaken for heavier X^0 .
		2 SKALSEY 95		looked for a monochromatic γ without an accompanying γ in e^+e^- annihilation. The bound applies for scalar and vector X^0 with $C = -1$ and $m_{X^0} = 100$ –1000 keV.
		3 SKALSEY 95		reinterpreted the bound on γA^0 decay of $o\text{-Ps}$ by ASAI 91 where 3% of delayed annihilations are not from 3S_1 states. The bound applies for scalar and vector X^0 with $C = -1$ and $m_{X^0} = 0$ –800 keV.
		4 ADACHI 94		looked for a peak in the $\gamma\gamma$ invariant mass distribution in $\gamma\gamma\gamma\gamma$ production from e^+e^- annihilation. The bound applies for $m_{X^0} = 70$ –800 keV.

Gauge & Higgs Boson Particle Listings

Axions (A^0) and Other Very Light Bosons

⁵ ADACHI 94 looked for a peak in the missing-mass distribution in $\gamma\gamma$ channel, using $\gamma\gamma\gamma\gamma$ production from e^+e^- annihilation. The bound applies for $m_{X^0} < 800$ keV.

⁶ ADACHI 94 looked for a peak in the missing mass distribution in $\gamma\gamma\gamma$ channel, using $\gamma\gamma\gamma$ production from e^+e^- annihilation. The bound applies for $m_{X^0} = 200$ –900 keV.

Searches for Goldstone Bosons (X^0)

(Including Horizontal Bosons and Majorons.) Limits are for branching ratios.

¹ AGUILAR-AREVALO 21A quoted limit applies to $m_{X^0} = 33.9$ MeV. Limits between 4.3×10^{-6} and 7.5×10^{-5} are obtained for $0 < m_{X^0} < 33.9$ MeV. The lifetime of X^0 is assumed to be long enough. See their Fig. 6 for mass-dependent limits.

² AGUILAR-AREVALO 21A quoted limit applies to $m_{X^0} = 85$ MeV. Limits between 5.2×10^{-8} and 1.4×10^{-6} are obtained for $0 < m_{X^0} < 120$ MeV, which improve the limits of PICCIOTTO 88 by an order of magnitude. The lifetime of X^0 is assumed to be long enough. See their Fig. 4 for mass-dependent limits.

³ AGUILAR-AREVALO 20 obtained limits of order 10^{-5} for $m_{X^0} = 47.8$ –95.1 MeV. The quoted limit applies to $m_{X^0} = 75$ MeV. See their Fig. 1 for mass-dependent limits.

⁴ BALDINI 20 obtained limits for $m_{X^0} = 20$ –45 MeV and $\tau_{X^0} < 40$ ps, and supersedes BOLTON 88 for $m_{X^0} = 20$ –40 MeV. See their Fig. 17 for mass-dependent limits.

⁵ BAYES 15 limits are the average over $m_{X^0} = 13$ –80 MeV for the isotropic decay distribution of positrons. See their Fig. 4 and Table II for the mass-dependent limits as well as the dependence on the decay anisotropy. In particular, they find a limit $< 58 \times 10^{-6}$ at 90% CL for massless familons and for the same asymmetry as normal muon decay, a case not covered by JODIDIO 86.

⁶ LATTANZI 13 use WMAP 9 year data as well as X-ray and γ -ray observations to derive limits on decaying majoron dark matter. A limit on the decay width $\Gamma(X^0 \rightarrow \nu\bar{\nu}) < 6.4 \times 10^{-19} \text{ s}^{-1}$ at 95% CL is found if majorons make up all of the dark matter.

⁷ LESSA 07 consider decays of the form Meson $\rightarrow \ell\nu$ Majoron and $\ell \rightarrow \ell'\nu\bar{\nu}$ Majoron and use existing data to derive limits on the neutrino-Majoron Yukawa couplings $g_{\alpha\beta}$ ($\alpha, \beta = e, \mu, \tau$). Their best limits are $|g_{e\alpha}|^2 < 5.5 \times 10^{-6}$, $|g_{\mu\alpha}|^2 < 4.5 \times 10^{-5}$, $|g_{\tau\alpha}|^2 < 5.5 \times 10^{-2}$ at CL = 90%.

⁸ DIAZ 98 studied models of spontaneously broken lepton number with both singlet and triplet Higgses. They obtain limits on the parameter space from invisible decay $Z \rightarrow H^0 A^0 \rightarrow X^0 X^0 X^0 X^0$ and $e^+e^- \rightarrow ZH^0$ with $H^0 \rightarrow X^0 X^0$.

⁹ BOBRAKOV 91 searched for anomalous magnetic interactions between polarized electrons expected from the exchange of a massless pseudoscalar boson (arion). A limit $\chi_e^2 < 2 \times 10^{-4}$ (95%CL) is found for the effective anomalous magneton parametrized as $\chi_e (G_F/8\pi\sqrt{2})^{1/2}$.

¹⁰ ALBRECHT 90E limits are for $B(\tau \rightarrow \ell X^0)/B(\tau \rightarrow \ell\nu\bar{\nu})$. Valid for $m_{X^0} < 100$ MeV. The limits rise to 7.1% (for μ), 5.0% (for e) for $m_{X^0} = 500$ MeV.

¹¹ ATIYA 90 limit is for $m_{X^0} = 0$. The limit $B < 1 \times 10^{-8}$ holds for $m_{X^0} < 95$ MeV. For the reduction of the limit due to finite lifetime of X^0 , see their Fig. 3.

¹² BALKE 88 limits are for $B(\mu^+ \rightarrow e^+ X^0)$. Valid for $m_{X^0} < 80$ MeV and $\tau_{X^0} > 10^{-8}$ sec.

¹³ BOLTON 88 limit corresponds to $F > 3.1 \times 10^9$ GeV, which does not depend on the chirality property of the coupling.

¹⁴ CHANDA 88 find $v_T < 10$ MeV for the weak-triplet Higgs vacuum expectation value in Gelmini-Roncadelli model, and $v_S > 5.8 \times 10^6$ GeV in the singlet Majoron model.

¹⁵ CHOI 88 used the observed neutrino flux from the supernova SN 1987A to exclude the neutrino Majoron Yukawa coupling h in the range $2 \times 10^{-5} < h < 3 \times 10^{-4}$ for the interaction $L_{\text{int}} = \frac{1}{2} i h \bar{\nu}_L \gamma_5 \psi_\nu \phi_X$. For several families of neutrinos, the limit applies for $(\sum h_i^2)^{1/4}$.

¹⁶ PICCIOTTO 88 limit applies when $m_{X^0} < 55$ MeV and $\tau_{X^0} > 2$ ns, and it decreases to 4×10^{-7} at $m_{X^0} = 125$ MeV, beyond which no limit is obtained.

¹⁷ GOLDMAN 87 limit corresponds to $F > 2.9 \times 10^9$ GeV for the family symmetry breaking scale from the Lagrangian $L_{\text{int}} = (1/F) \bar{\psi}_L \gamma^\mu (a + b\gamma_5) \psi_e \partial_\mu \phi_{X^0}$ with $a^2 + b^2 = 1$.

This is not as sensitive as the limit $F > 9.9 \times 10^9$ GeV derived from the search for $\mu^+ \rightarrow e^+ X^0$ by JODIDIO 86, but does not depend on the chirality property of the coupling.

¹⁸ Limits are for $\Gamma(\mu \rightarrow e X^0)/\Gamma(\mu \rightarrow e\nu\bar{\nu})$. Valid when $m_{X^0} = 0$ –93.4, 98.1–103.5 MeV.

¹⁹ EICHLER 86 looked for $\mu^+ \rightarrow e^+ X^0$ followed by $X^0 \rightarrow e^+e^-$. Limits on the branching fraction depend on the mass and lifetime of X^0 . The quoted limits are valid when $\tau_{X^0} \lesssim 3 \times 10^{-10}$ s if the decays are kinematically allowed.

²⁰ JODIDIO 86 corresponds to $F > 9.9 \times 10^9$ GeV for the family symmetry breaking scale with the parity-conserving effective Lagrangian $L_{\text{int}} = (1/F) \bar{\psi}_L \gamma^\mu \psi_e \partial_\mu \phi_{X^0}$.

²¹ BALTRUSAITIS 85 search for light Goldstone boson (X^0) of broken U(1). CL = 95% limits are $B(\tau \rightarrow \mu^+ X^0)/B(\tau \rightarrow \mu^+ \nu\bar{\nu}) < 0.125$ and $B(\tau \rightarrow e^+ X^0)/B(\tau \rightarrow e^+ \nu\bar{\nu}) < 0.04$. Inferred limit for the symmetry breaking scale is $m > 3000$ TeV.

²² The primordial heavy neutrino must decay into ν and familon, f_A , early so that the red-shifted decay products are below critical density, see their table. In addition, $K \rightarrow \pi f_A$ and $\mu \rightarrow e f_A$ are unseen. Combining these excludes $m_{\text{heavy}\nu}$ between 5×10^{-5} and 5×10^{-4} MeV (μ decay) and $m_{\text{heavy}\nu}$ between 5×10^{-5} and 0.1 MeV (K -decay).

Majoron Searches in Neutrinoless Double β Decay

Limits are for the half-life of neutrinoless $\beta\beta$ decay with a Majoron emission.

No experiment currently claims any such evidence. Only the best or comparable limits for each isotope are reported.

¹ BERNATOWICZ 92 studied double- β decays of ¹²⁸Te and ¹³⁰Te, and found the ratio $\tau(^{130}\text{Te})/\tau(^{128}\text{Te}) = (3.52 \pm 0.11) \times 10^{-4}$ in agreement with relatively stable theoretical predictions. The bound is based on the requirement that Majoron-emitting decay cannot be larger than the observed double-beta rate of ¹²⁸Te of $(7.7 \pm 0.4) \times 10^{24}$ year. We calculated 90% CL limit as $(7.7 - 1.28 \times 0.4 = 7.2) \times 10^{24}$.

² AL-KHARUSI 21 utilize the complete dataset of the EXO-200 experiment, corresponding to an exposure of 234 kg yr, to place a limit on the one Majoron mode of the neutrinoless double beta decay of ¹³⁶Xe. Several limits are reported, the one given here corresponds to a spectral index of 1, resulting in a limit of $g_{\nu\chi} < 0.4$ – 0.9×10^{-5} on the Majoron-neutrino coupling constant. The range reflects the spread of the nuclear matrix elements.

³ ARNOLD 19 uses the NEMO-3 tracking calorimeter to determine limits for the Majoron emitting double beta decay, with spectral index $n = 3$. The limit corresponds to the range of the g_{ee} coupling of 0.013–0.035; depending on the nuclear matrix elements used.

⁴ ARNOLD 18 use the NEMO-3 tracking detector. The limit corresponds to $\langle g_{ee} \rangle < 3.2$ – 8.0×10^{-5} ; the range corresponds to different nuclear matrix element calculations.

⁵ AGOSTINI 15A analyze a 20.3 kg yr of data set of the GERDA calorimeter to determine $g_{\nu\chi} < 3.4$ – 8.7×10^{-5} on the Majoron-neutrino coupling constant. The range reflects the spread of the nuclear matrix elements.

⁶ ARNOLD 15 use the NEMO-3 tracking calorimeter with 3.43 kg yr exposure to determine the limit on Majoron emission. The limit corresponds to $g_{\nu\chi} < 1.6$ – 3.0×10^{-4} . The spread reflects different nuclear matrix elements. Supersedes ARNOLD 06.

⁷ ALBERT 14A utilize 100 kg yr of exposure of the EXO-200 tracking calorimeter to place a limit on the $g_{\nu\chi} < 0.8$ – 1.7×10^{-5} on the Majoron-neutrino coupling constant. The range reflects the spread of the nuclear matrix elements.

See key on page 1127

Gauge & Higgs Boson Particle Listings

Axions (A^0) and Other Very Light Bosons

- ⁸ GANDO 12 use the KamLAND-Zen detector to obtain the limit on the $0\nu\chi$ decay with Majoron emission. It implies that the coupling constant $g_{\nu\chi} < 0.8\text{--}1.6 \times 10^{-5}$ depending on the nuclear matrix elements used.
- ⁹ ARNOLD 11 use the NEMO-3 detector to obtain the reported limit on Majoron emission. It implies that the coupling constant $g_{\nu\chi} < 0.6\text{--}1.6 \times 10^{-4}$ depending on the nuclear matrix element used. Supersedes ARNABOLDI 03.
- ¹⁰ ARGYRIADES 10 use the NEMO-3 tracking detector and ^{96}Zr to derive the reported limit. No limit for the Majoron electron coupling is given.
- ¹¹ ARGYRIADES 09 use ^{150}Nd data taken with the NEMO-3 tracking detector. The reported limit corresponds to $\langle g_{\nu\chi} \rangle < 1.7\text{--}3.0 \times 10^{-4}$ using a range of nuclear matrix elements that include the effect of nuclear deformation.
- ¹² ARNOLD 06 use ^{100}Mo data taken with the NEMO-3 tracking detector. The reported limit corresponds to $\langle g_{\nu\chi} \rangle < (0.4\text{--}1.8) \times 10^{-4}$ using a range of matrix element calculations. Superseded by ARNOLD 15.
- ¹³ NEMO-3 tracking calorimeter is used in ARNOLD 06. Reported half-life limit for ^{82}Se corresponds to $\langle g_{\nu\chi} \rangle < (0.66\text{--}1.9) \times 10^{-4}$ using a range of matrix element calculations. Supersedes ARNOLD 04.
- ¹⁴ ARNOLD 04 use the NEMO-3 tracking detector. The limit corresponds to $\langle g_{\nu\chi} \rangle < (0.5\text{--}0.9)10^{-4}$ using the matrix elements of SIMKOVIĆ 99, STOICA 01 and CIVITARESE 03. Superseded by ARNOLD 06.
- ¹⁵ ARNOLD 04 use the NEMO-3 tracking detector. The limit corresponds to $\langle g_{\nu\chi} \rangle < (0.7\text{--}1.6)10^{-4}$ using the matrix elements of SIMKOVIĆ 99, STOICA 01 and CIVITARESE 03.
- ¹⁶ Supersedes ALESSANDRELLO 00. Array of TeO_2 crystals in high resolution cryogenic calorimeter. Some enriched in ^{130}Te . Derive $\langle g_{\nu\chi} \rangle < 17\text{--}33 \times 10^{-5}$ depending on matrix element.
- ¹⁷ Supersedes ALESSANDRELLO 00. Cryogenic calorimeter search.
- ¹⁸ Limit for the $0\nu\chi$ decay with Majoron emission of ^{116}Cd using enriched CdWO_4 scintillators. $\langle g_{\nu\chi} \rangle < 4.6\text{--}8.1 \times 10^{-5}$ depending on the matrix element. Supersedes DANEVICH 00.
- ¹⁹ Limit for the $0\nu 2\chi$ decay of ^{116}Cd . Supersedes DANEVICH 00.
- ²⁰ BERNABEI 02b obtain limit for $0\nu\chi$ decay with Majoron emission of ^{136}Xe using liquid Xe scintillation detector. They derive $\langle g_{\nu\chi} \rangle < 2.0\text{--}3.0 \times 10^{-5}$ with several nuclear matrix elements.
- ²¹ Replaces TANAKA 93. FUSHIMI 02 derive half-life limit for the $0\nu\chi$ decay by means of tracking calorimeter ELEGANT V. Considering various matrix element calculations, a range of limits for the Majoron-neutrino coupling is given: $\langle g_{\nu\chi} \rangle < (6.3\text{--}360) \times 10^{-5}$.
- ²² ASHITKOV 01 result for $0\nu\chi$ of ^{100}Mo is less stringent than ARNOLD 00.
- ²³ DANEVICH 01 obtain limit for the $0\nu\chi$ decay with Majoron emission of ^{160}Gd using $\text{Gd}_2\text{SiO}_5\text{:Ce}$ crystal scintillators.
- ²⁴ DANEVICH 01 obtain limit for the $0\nu 2\chi$ decay with 2 Majoron emission of ^{160}Gd .
- ²⁵ ARNOLD 00 reports limit for the $0\nu\chi$ decay with Majoron emission derived from tracking calorimeter NEMO 2. Using ^{82}Se source: $\langle g_{\nu\chi} \rangle < 1.6 \times 10^{-4}$. Matrix element from GUENTHER 96.
- ²⁶ Using ^{96}Zr source: $\langle g_{\nu\chi} \rangle < 2.6 \times 10^{-4}$. Matrix element from ARNOLD 99.
- ²⁷ ARNOLD 00 reports limit for the $0\nu 2\chi$ decay with two Majoron emission derived from tracking calorimeter NEMO 2.
- ²⁸ ARNOLD 98 determine the limit for $0\nu\chi$ decay with Majoron emission of ^{82}Se using the NEMO-2 tracking detector. They derive $\langle g_{\nu\chi} \rangle < 2.3\text{--}4.3 \times 10^{-4}$ with several nuclear matrix elements.
- ²⁹ LUESCHER 98 report a limit for the 0ν decay with Majoron emission of ^{136}Xe using Xe TPC. This result is more stringent than BARABASH 89. Using the matrix elements of ENGEL 88, they obtain a limit on $\langle g_{\nu\chi} \rangle$ of 2.0×10^{-4} .
- ³⁰ See Table 1 in GUENTHER 96 for limits on the Majoron coupling in different models.

- ¹ BANIK 21 use the subhalo mass function inferred from the analyses of the GD-1 and Pal 5 stellar streams. The limit is strengthened to 2.2×10^{-21} eV when adding dwarf satellite counts.
- ² BAUMHOLZER 21 study the freeze-in production of axion dark matter through couplings to photons, and set the limit using Lyman- α forest data and the observed number of Milky Way subhalos.
- ³ CROON 21 study the supernova cooling effect of the axion-muon coupling, taking account of semi-Compton scattering and muon-proton bremsstrahlung, as well as the loop-induced axion-photon coupling, and exclude the range of $g_{A\mu\mu} \simeq 7 \times 10^{-3}\text{--}2 \times 10^{-10}$ for $m_{A^0} < 0.5$ GeV. See their Fig. 8 for mass-dependent limits.
- ⁴ FUJIKURA 21 use the EROS-2 survey and the Subaru HSC observation to set limits on spherically symmetric axion clumps, taking account of the finite lens and source size effects. $f_{A^0} \gtrsim 10^{12}$ GeV can be constrained depending on the fraction of the axion dark matter collapsed into clumps, and the clump densities. See their Figs. 7-10 for the limits.
- ⁵ MARTINCA MALICH 21 considered axion emission from a supernova core through the A hyperon decay, and set the limit on $B(A \rightarrow nA^0) \lesssim 8 \times 10^{-9}$, or equivalently, $f_{A^0}/C_{sd} \gtrsim 2.6 \times 10^9$ GeV in terms of the flavor-violating axion coupling to the down and strange quarks.
- ⁶ NG 21 use the binary black holes reported by LIGO and Virgo to determine the black hole spin distribution at formation and the scalar boson mass simultaneously, neglecting the boson self-interaction.
- ⁷ ROGERS 21 set the limit by using a framework involving Bayesian emulator optimization to accurately forward-model the Lyman- α flux power spectrum, and comparing this with small-scale data to constrain the predicted suppression of cosmic structure growth.
- ⁸ TSUKADA 21 look for a stochastic GW background produced by extragalactic BH-hidden photon cloud systems through the superradiance instability. They assume a uniform spin distribution at birth of isolated BHs from 0 to 1.
- ⁹ IRSIC 20 used the Lyman- α forest constraint on small-scale isocurvature perturbation to derive limits on the axion mass and decay constant, assuming that the axion makes up all dark matter in the post-inflationary scenario. See their Fig. 1 for other astrophysical limits as well as the limits on the case of the temperature-dependent axion mass.
- ¹⁰ PODDAR 20 used the observed decay in orbital period of four compact binary systems to derive a limit on the emission of axions with $m_{A^0} < 1 \times 10^{-19}$ eV, assuming they couple to nucleons and the strong CP phase vanishes at the potential minimum. They exclude $f_{A^0} \lesssim 10^{11}$ GeV for such axions.
- ¹¹ SCHUTZ 20 set a limit on fuzzy dark matter based on the existing limits for warm dark matter derived from the inferred subhalo mass function.
- ¹² SUN 20 look for quasimonochromatic gravitational waves emitted from boson clouds around the Cygnus X-1 black hole. The quoted limit assume the black hole age of 5×10^6 years. A mass range of $9.6\text{--}15.5 \times 10^{-13}$ eV is disfavored when repeated induction of bosonova for string axions with decay constant $f_{A^0} \simeq 10^{15}$ GeV prevents the superradiance from being saturated.

Invisible A^0 (Axion) MASS LIMITS from Astrophysics and Cosmology

$v_1 = v_2$ is usually assumed ($v_j =$ vacuum expectation values). For a review of these limits, see RAFFELT 91 and TURNER 90. In the comment lines below, D and K refer to DFSZ and KSVZ axion types, discussed in the above minireview.

Gauge & Higgs Boson Particle Listings

Axions (A^0) and Other Very Light Bosons

- ¹³ DAVOUDI ASL 19 used the observed data of M87* by the Event Horizon Telescope to set the limit. A mass range of $0.85\text{--}4.6 \times 10^{-21}$ eV is disfavored for a spin-1 boson.
- ¹⁴ MARSH 19 considered heating of star clusters due to the stochastic oscillations of the core and granular quasiparticles in the outer halo. The limit was derived by requiring the survival of the old star cluster in Eridanus II, where the lower end is set by the validity of diffusion approximation. The effect of tidal stripping is also discussed for lower masses.
- ¹⁵ PALOMBA 19 used the LIGO O2 dataset to derive limits on nearly monochromatic gravitational waves emitted by boson clouds formed around a stellar-mass black hole. They exclude boson masses in a range of 1.1×10^{-13} and 4×10^{-13} eV for high initial black hole spin, and 1.2×10^{-13} and 1.8×10^{-13} eV for moderate spin. See their Figs. 2 and 3 for limits based on various values of black hole initial spin, boson cloud age, and distance.
- ¹⁶ CHANG 18 update axion bremsstrahlung emission rates in nucleon-nucleon collisions, shifting the excluded mass range to higher values. They rule out the hadronic axion with mass up to a few hundred eV, closing the hadronic axion window. See their Fig. 11 for results based on several different choices of the temperature and density profile of the proto-neutron star.
- ¹⁷ ARCHIDIACONO 13A is analogous to HANNESTAD 05A. The limit is based on the CMB temperature power spectrum of the Planck data, the CMB polarization from the WMAP 9-yr data, the matter power spectrum from SDSS-DR7, and the local Hubble parameter measurement by the Carnegie Hubble program.
- ¹⁸ CADAMURO 11 use the deuterium abundance to show that the m_{A^0} range $0.7\text{eV} - 300\text{keV}$ is excluded for axions, complementing HANNESTAD 10.
- ¹⁹ DERBIN 11a look for solar axions produced by Compton and bremsstrahlung processes, in the resonant excitation of ^{169}Tm , constraining the axion-electron \times axion-nucleon couplings.
- ²⁰ ANDRIAMONJE 10 search for solar axions produced from ^7Li (478 keV) and $D(p,\gamma)^3\text{He}$ (5.5 MeV) nuclear transitions. They show limits on the axion-photon coupling for two reference values of the axion-nucleon coupling for $m_A < 100\text{eV}$.
- ²¹ This is an update of HANNESTAD 08 including 7 years of WMAP data.
- ²² ANDRIAMONJE 09 look for solar axions produced from the thermally excited 14.4 keV level of ^{57}Fe . They show limits on the axion-nucleon \times axion-photon coupling assuming $m_A < 0.03\text{eV}$.
- ²³ DERBIN 09a look for Primakoff-produced solar axions in the resonant excitation of ^{169}Tm , constraining the axion-photon \times axion-nucleon couplings.
- ²⁴ KEKEZ 09 look at axio-electric effect of solar axions in HPGe detectors. The one-loop axion-electron coupling for hadronic axions is used.
- ²⁵ This is an update of HANNESTAD 07 including 5 years of WMAP data.
- ²⁶ This is an update of HANNESTAD 05A with new cosmological data, notably WMAP (3 years) and baryon acoustic oscillations (BAO). Lyman- α data are left out, in contrast to HANNESTAD 05A and MELCHIORRI 07A, because it is argued that systematic errors are large. It uses Bayesian statistics and marginalizes over a possible neutrino hot dark matter component.
- ²⁷ MELCHIORRI 07A is analogous to HANNESTAD 05A, with updated cosmological data, notably WMAP (3 years). Uses Bayesian statistics and marginalizes over a possible neutrino hot dark matter component. Leaving out Lyman- α data, a conservative limit is 1.4 eV.
- ²⁸ HANNESTAD 05A puts an upper limit on the mass of hadronic axion because in this mass range it would have been thermalized and contribute to the hot dark matter component of the universe. The limit is based on the CMB anisotropy from WMAP, SDSS large scale structure, Lyman α , and the prior Hubble parameter from HST Key Project. A χ^2 statistic is used. Neutrinos are assumed not to contribute to hot dark matter.
- ²⁹ MOROJ 98 points out that a KSVZ axion of this mass range (see CHANG 93) can be a viable hot dark matter of Universe, as long as the model-dependent $g_{A\gamma}$ is accidentally small enough as originally emphasized by KAPLAN 85; see Fig. 1.
- ³⁰ BORISOV 97 bound is on the axion-electron coupling $g_{ae} < 1 \times 10^{-13}$ from the photo-production of axions off of magnetic fields in the outer layers of neutron stars.
- ³¹ KACHELRIESS 97 bound is on the axion-electron coupling $g_{ae} < 1 \times 10^{-10}$ from the production of axions in strongly magnetized neutron stars. The authors also quote a stronger limit, $g_{ae} < 9 \times 10^{-13}$ which is strongly dependent on the strength of the magnetic field in white dwarfs.
- ³² KEIL 97 uses new measurements of the axial-vector coupling strength of nucleons, as well as a reanalysis of many-body effects and pion-emission processes in the core of the neutron star, to update limits on the invisible-axion mass.
- ³³ RAFFELT 95 reexamined the constraints on axion emission from red giants due to the axion-electron coupling. They improve on DEARBORN 86 by taking into proper account degeneracy effects in the bremsstrahlung rate. The limit comes from requiring the red giant core mass at helium ignition not to exceed its standard value by more than 5% (0.025 solar masses).
- ³⁴ ALTHERR 94 bound is on the axion-electron coupling $g_{ae} < 1.5 \times 10^{-13}$, from energy loss via axion emission.
- ³⁵ CHANG 93 updates ENGEL 90 bound with the Kaplan-Manohar ambiguity in $z=m_H/m_A$ (see the Note on the Quark Masses in the Quark Particle Listings). It leaves the window $f_A = 3 \times 10^5 - 3 \times 10^6$ GeV open. The constraint from Big-Bang Nucleosynthesis is satisfied in this window as well.
- ³⁶ BERSHADY 91 searched for a line at wave length from 3100–8300 Å expected from 2 γ decays of relic thermal axions in intergalactic light of three rich clusters of galaxies.
- ³⁷ KIM 91c argues that the bound from the mass density of the universe will change drastically for the supersymmetric models due to the entropy production of saxion (scalar component in the axionic chiral multiplet) decay. Note that it is an *upperbound* rather than a lowerbound.
- ³⁸ RAFFELT 91B argue that previous SN 1987A bounds must be relaxed due to corrections to nucleon bremsstrahlung processes.
- ³⁹ RESSELL 91 uses absence of any intraculter line emission to set limit.
- ⁴⁰ ENGEL 90 rule out $10^{-10} \lesssim g_{AN} \lesssim 10^{-3}$, which for a hadronic axion with EMC motivated axion-nucleon couplings corresponds to $2.5 \times 10^{-3}\text{eV} \lesssim m_{A^0} \lesssim 2.5 \times 10^4\text{eV}$. The constraint is loose in the middle of the range, i.e. for $g_{AN} \sim 10^{-6}$.
- ⁴¹ RAFFELT 90D is a re-analysis of DEARBORN 86.
- ⁴² The region $m_{A^0} \gtrsim 2\text{eV}$ is also allowed.
- ⁴³ ERICSON 89 considered various nuclear corrections to axion emission in a supernova core, and found a reduction of the previous limit (MAYLE 88) by a large factor.
- ⁴⁴ MAYLE 89 limit based on naive quark model couplings of axion to nucleons. Limit based on couplings motivated by EMC measurements is 2–4 times weaker. The limit from axion-electron coupling is weak; see HATSUDA 88b.

- ⁴⁵ RAFFELT 88b derives a limit for the energy generation rate by exotic processes in helium-burning stars $\epsilon < 100\text{erg g}^{-1}\text{s}^{-1}$, which gives a firmer basis for the axion limits based on red giant cooling.
- ⁴⁶ RAFFELT 87 also gives a limit $g_{A\gamma} < 1 \times 10^{-10}\text{GeV}^{-1}$.
- ⁴⁷ DEARBORN 86 also gives a limit $g_{A\gamma} < 1.4 \times 10^{-11}\text{GeV}^{-1}$.
- ⁴⁸ RAFFELT 86 gives a limit $g_{A\gamma} < 1.1 \times 10^{-10}\text{GeV}^{-1}$ from red giants and $< 2.4 \times 10^{-9}\text{GeV}^{-1}$ from the sun.
- ⁴⁹ KAPLAN 85 says $m_{A^0} < 23\text{eV}$ is allowed for a special choice of model parameters.
- ⁵⁰ FUKUGITA 82 gives a limit $g_{A\gamma} < 2.3 \times 10^{-10}\text{GeV}^{-1}$.

Search for Relic Invisible Axions

Limits are for the dimensionless quantity $[G_{A\gamma\gamma}/m_{A^0}]^2 \rho_A$ where $G_{A\gamma\gamma}$ denotes the axion two-photon coupling, $L_{\text{int}} = -\frac{G_{A\gamma\gamma}}{4} \phi_A F_{\mu\nu} \tilde{F}^{\mu\nu} = G_{A\gamma\gamma} \phi_A \mathbf{E} \cdot \mathbf{B}$, and ρ_A is the axion energy density near the earth, unless otherwise stated. Notice that for QCD axions $G_{A\gamma\gamma}/m_{A^0}$ does not depend on m_{A^0} . For the reference values $m_{A^0} = 1\text{meV}$, $G_{A\gamma\gamma} = 3.9 \times 10^{-16}\text{GeV}^{-1}$ (that would apply to KSVZ axions at that mass), and $\rho_A = 300\text{MeV}/\text{cm}^3$ one finds $[G_{A\gamma\gamma}/m_{A^0}]^2 \rho_A = 3.5 \times 10^{-43}$.

- ¹ ADE 21 looks for a time-variable global rotation of the CMB polarization induced by the harmonic oscillations of local axion-like dark matter and uses data from the 2012 observing season of the Keck Array, part of the BICEP program. The limits get 25% weaker for $m_{A^0} = 4.8 \times 10^{-20}\text{--}5.7 \times 10^{-19}\text{eV}$. See their Eq. (80) and Fig. 6 for mass-dependent limits.
- ² ALESINI 21 is an update of ALESINI 19. See their Figs. 5 and 6 for the mass-dependent limits.
- ³ BARTRAM 21A is analogous to DU 18. See their Fig. 4 for mass-dependent limits.
- ⁴ DEVLIN 21 use the superconducting resonant detection circuit of a cryogenic Penning trap with a single antiproton. See their Fig. 3 for mass-dependent limits.
- ⁵ GRAMOLIN 21 use two detection channels, each consisting of two stacked toroids to look for the axion-induced oscillating magnetic field. The quoted limit applies at $m_{A^0} = 0.02\text{neV}$. See their Fig. 4 for mass-dependent limits.
- ⁶ KWON 21 is analogous to LEE 20A. They also obtain weaker limits in the range of $m_{A^0} = 10.16\text{--}11.37\text{meV}$. See their Fig. 4 for mass-dependent limits.
- ⁷ MELCON 21 use a radio frequency cavity consisting of 5 sub-cavities coupled by inductive irises installed inside the CAST dipole magnet to look for higher axion masses. See their Fig. 9 for mass-dependent limits.

Gauge & Higgs Boson Particle Listings

Axions (A^0) and Other Very Light Bosons

- ⁸SALEMI 21 is an update of OUELLET 19A. See their Fig. 4 for mass-dependent limits.
- ⁹THOMSON 21 use a resonant cavity supporting two spatially overlapping microwave modes, which is sensitive to the axion mass corresponding to the sum or difference of the two resonant frequencies. The original limit was retracted due to a sign error. See their Fig. 2 in the erratum for the corrected limits.
- ¹⁰YUAN 21 use polarimetric observations of Sgr A* taken by the Event Horizon Telescope to search for periodic oscillation of the polarization induced by axion dark matter, assuming a solitonic core near the Galactic center. They obtained limits in the range of $G_{A\gamma\gamma} = 8 \times 10^{-13} - 3 \times 10^{-11} \text{ GeV}^{-1}$.
- ¹¹BRAINE 20 is analogous to DU 18. See Fig. 4 for their mass-dependent limits.
- ¹²CRISOSTO 20 used a resonant LC circuit to look for lighter axion dark matter. They obtained a similar, slightly weaker limit for $m_{A^0} = 174.98-175.19$ and $177.34-177.38$ neV. See their Fig. 4 for mass-dependent limits.
- ¹³DARLING 20A use VLA data to look for radio-frequency radiation converted from axion dark matter in the magnetosphere of the Galactic Center magnetar PSR J1745-2900. They extended the results of DARLING 20, which used only data with the highest angular resolution, by adding sub-optimal data. They use $\rho_A = 6.5 \times 10^4 \text{ GeV/cm}^3$ in the vicinity of the magnetar. See their Fig. 2 for mass-dependent limits.
- ¹⁴FOSTER 20 look for radio-frequency radiation converted from axion dark matter in the magnetic field around neutron stars. They use the observed data of isolated local neutron stars and in the Galactic center. The quoted limit applies to $m_{A^0} \simeq 7 \mu\text{eV}$. See their Fig. 2 for mass-dependent limits.
- ¹⁵JEONG 20 is analogous to LEE 20A, and they use a double-cell cavity to look for axions with mass $> 10 \mu\text{eV}$. See their Fig. 5 for mass-dependent limits.
- ¹⁶KENNEDY 20 is analogous to BRANCA 17, and they compare the frequency ratios of the Si cavity measured by a Sr optical lattice clock and by a H maser. Assuming the local density of moduli dark matter, $\rho_S = 0.3 \text{ GeV/cm}^3$, they obtain a limit $G_{S\gamma\gamma} < 5.8 \times 10^{-24} \text{ GeV}^{-1}$ at $m_{S^0} = 2 \times 10^{-19} \text{ eV}$. See their Fig. 2 for mass-dependent limits as well as limits on the modulus coupling to electrons.
- ¹⁷LEE 20A used a microwave cavity detector at the IBS/CAPP to search for dark matter axions. See Fig. 3 for the mass-dependent limits.
- ¹⁸ALESINI 19 used a superconducting resonant cavity made of NbTi to increase the quality factor. The limit applies to a mass range of 0.2 neV around $m_{A^0} = 37.5 \mu\text{eV}$.
- ¹⁹FUJITA 19 look for photon birefringence under the oscillating axion background using the polarimetric imaging observation of a protoplanetary disk, AB Aur. See their Fig. 2 for a more conservative limit taking account of possible systematic effects.
- ²⁰OUELLET 19A look for the axion-induced oscillating magnetic field generated by a toroidal magnetic field. The quoted limit applies at $m_{A^0} = 8 \text{ neV}$. See their Fig. 3 for the mass-dependent limits.
- ²¹BOUTAN 18 use a small high frequency cavity installed above the main ADMX cavity to look for heavier axion dark matter. See their Fig. 4 for mass-dependent limits.
- ²²DU 18 is analogous to DUFFY 06. They upgraded a dilution refrigerator to reduce the system noise. The quoted limit is around $m_{A^0} = 2.69 \mu\text{eV}$ for the boosted Maxwellian axion line shape. See Fig. 4 for their mass-dependent limits.
- ²³ZHONG 18 is analogous to BRUBAKER 17. The quoted limit applies at $m_{A^0} = 23.76 \mu\text{eV}$. See Fig. 4 for their mass-dependent limits.
- ²⁴BRANCA 17 look for modulations of the fine-structure constant and the electron mass due to moduli dark matter by using the cryogenic resonant-mass AURIGA detector. The limit on the assumed dilatonic coupling implies $G_{S\gamma\gamma} < 1.5 \times 10^{-24} \text{ GeV}^{-1}$ for the scalar to two-photon coupling. See Fig. 5 for the mass-dependent limits.
- ²⁵BRUBAKER 17 used a microwave cavity detector at the Yale Wright Laboratory to search for dark matter axions. See Fig. 3 for the mass-dependent limits.
- ²⁶CHOI 17 used a microwave cavity detector with toroidal geometry. See Fig. 4 for their mass-dependent limits.
- ²⁷HOSKINS 16 is analogous to DUFFY 06. See Fig. 12 for mass-dependent limits in terms of the local dark matter density.
- ²⁸BECK 13 argues that dark-matter axions passing through Earth may generate a small observable signal in resonant S/N/S Josephson junctions. A measurement by HOFFMANN 04 [Physical Review **B70** 180503 (2004)] is interpreted in terms of subdominant dark matter axions with $m_{A^0} = 0.11 \text{ meV}$.
- ²⁹HOSKINS 11 is analogous to DUFFY 06. See Fig. 4 for the mass-dependent limit in terms of the local density.
- ³⁰ASZTALOS 10 used the upgraded detector of ASZTALOS 04 to search for halo axions. See their Fig. 5 for the m_{A^0} dependence of the limit.
- ³¹DUFFY 06 used the upgraded detector of ASZTALOS 04, while assuming a smaller velocity dispersion than the isothermal model as in Eq. (8) of their paper. See Fig. 10 of their paper on the axion mass dependence of the limit.
- ³²ASZTALOS 04 looked for a conversion of halo axions to microwave photons in magnetic field. At 90% CL, the KSVZ axion cannot have a local halo density more than 0.45 GeV/cm^3 in the quoted mass range. See Fig. 7 of their paper on the axion mass dependence of the limit.
- ³³KIM 98 calculated the axion-to-photon couplings for various axion models and compared them to the HAGMANN 90 bounds. This analysis demonstrates a strong model dependence of $G_{A\gamma\gamma}$ and hence the bound from relic axion search.
- ³⁴HAGMANN 90 experiment is based on the proposal of SIKIVIE 83.
- ³⁵WUENSCH 89 looks for condensed axions near the earth that could be converted to photons in the presence of an intense electromagnetic field via the Primakoff effect, following the proposal of SIKIVIE 83. The theoretical prediction with $[G_{A\gamma\gamma}/m_{A^0}]^2 = 2 \times 10^{-14} \text{ MeV}^{-4}$ (the three generation DFSZ model) and $\rho_A = 300 \text{ MeV/cm}^3$ that makes up galactic halos gives $(G_{A\gamma\gamma}/m_{A^0})^2 \rho_A = 4 \times 10^{-44}$. Note that our definition of $G_{A\gamma\gamma}$ is $(1/4\pi)$ smaller than that of WUENSCH 89.

stated otherwise, i.e., many of these bounds apply to low-mass axion-like particles (ALPs), not to QCD axions.

Invisible A^0 (Axion) Limits from Photon Coupling

Limits are for the modulus of the axion-two-photon coupling $G_{A\gamma\gamma}$ defined by $L = -G_{A\gamma\gamma} \phi_A \mathbf{E} \cdot \mathbf{B}$. For scalars S^0 the limit is on the coupling constant in $L = G_{S\gamma\gamma} \phi_S (\mathbf{E}^2 - \mathbf{B}^2)$. The relation between $G_{A\gamma\gamma}$ and m_{A^0} is not used unless

- 1 BASU 21 searched for birefringence induced by axion dark matter using multiple images of the polarized source in the strongly gravitationally lensed system CLASS B1152+199. They assume the axion makes up all dark matter, and used the axion density in the emitting region, $\rho_A = 20 \text{ GeV/cm}^3$. Limits between $9.2 \times 10^{-11}\text{--}7.7 \times 10^{-8} \text{ GeV}^{-1}$ are obtained for $m_{A^0} = 3.6 \times 10^{-21}\text{--}4.6 \times 10^{-18} \text{ eV}$. See their Fig. 2 for mass-dependent limits.
- 2 BI 21 look for the gamma-ray spectral distortions induced by axion-photon oscillations in the presence of the Galactic magnetic field, using the measurements of sub-TeV gamma-rays from the Crab Nebula by the Tibet AS γ and HAWC experiments, together with MAGIC and HEGRA gamma-ray data. See their Fig. 3 for mass-dependent limits.
- 3 DOLAN 21A study the effect of axion production on the evolution of asymptotic giant branch stars, and use the white-dwarf initial-final mass relation to set the limits. See their Fig. 1 for mass-dependent limits.
- 4 GUO 21 is analogous to AJELLO 16, and use the Fermi-LAT and H.E.S.S. II measurements of PG 1553+113 and PKS 2155-304. See their Fig. 6 for mass-dependent limits.
- 5 HOMMA 21 look for the production of axion resonance states and their subsequent stimulated decays by combining linearly polarized creation laser pulses and circularly polarized inducing laser pulses. The quoted limit is at $m_{A^0} \approx 0.178 \text{ eV}$. See their Fig. 14 for mass-dependent limits.
- 6 LI 21B is analogous to AJELLO 16, and use the spectra of the blazar Mrk 421 measured by ARGO-YBJ and Fermi-LAT. They consider ALP-photon mixing in the magnetic fields of both the blazar jet and the Galaxy. The quoted limit applies to $m_{A^0} \approx 1 \times 10^{-9} \text{ eV}$. See their Fig. 5 for mass-dependent limits.
- 7 LLOYD 21 is analogous to FORTIN 18, and set limits on the product of the axion couplings to photons and nucleons as $g_{ANN} G_{A\gamma\gamma} \lesssim 4.6 \times 10^{-19} \text{ GeV}^{-1}$ for $m_{A^0} \lesssim 10^{-5} \text{ eV}$ by using the quiescent soft gamma-ray flux upper limits in five magnetars. We use $g_{ANN} = G_{AN} 2m_N$ to translate their limits. See their Table II and Fig. 3 for the limits.
- 8 REGIS 21 look for monochromatic photons from axion decay, using the MUSE spectroscopic data on the Leo T dwarf spheroidal galaxy. They assume that axions make up all of dark matter and use the integrated dark matter density along the line of sight determined by observations.
- 9 XIAO 21 use X-ray data from Betelgeuse to look for signals from axions produced in the stellar core that were converted to X-rays by the Galactic magnetic field. See their Fig. 1 for the mass-dependent limit.
- 10 ABDUNINEN 20 look for the process $e^+e^- \rightarrow \gamma A^0 (A^0 \rightarrow \gamma\gamma)$ and set upper limits of around 10^{-3} over the mass range. The quoted limit is at $m_{A^0} = 0.3 \text{ GeV}$. See their Fig. 5 for mass dependent limits.
- 11 BANERJEE 20A look for axions produced from high-energy bremsstrahlung photons through the Primakoff effect with the electric field of the target nuclei. They exclude $G_{A\gamma\gamma} = 2 \times 10^{-4}\text{--}5 \times 10^{-2} \text{ GeV}^{-1}$ for $m_{A^0} < 55 \text{ MeV}$. See their Fig. 5 for mass-dependent limits.
- 12 BUEHLER 20 look for the γ -ray transparency due to axion-photon oscillations using high-energy photon events from 79 sources in the Second Fermi-LAT Catalog of High-Energy Sources. The quoted limit is for the intergalactic magnetic field strength and coherence length of $B = 1 \text{ nG}$ and $s = 1 \text{ Mpc}$. See their Figs. 4 and 5 for mass-dependent limits and for different magnetic-field parameters.
- 13 CALORE 20 use the isotropic diffuse γ -ray background measured by the Fermi-LAT to constrain the γ -ray flux convolved in the Galactic magnetic field from axions produced from past core-collapse supernovae. They also derive a limit on a heavier axion with $m_{A^0} \gtrsim \text{keV}$ decaying into two photons of $G_{A\gamma\gamma} \lesssim 5 \times 10^{-11} \text{ GeV}^{-1}$ for $m_{A^0} = 5 \text{ keV}$. See their Figs. 5 and 7 for the limits as well as limits in the presence of axion-nucleon couplings.
- 14 CARENZA 20 extend the globular cluster bound of AYALA 14 to heavier masses ($m_{A^0} \leq$ a few 100 keV) by taking account of the coalescence process $\gamma + \gamma \rightarrow A^0$ as well as the decay of the ALP inside the stellar core. See their Fig.4 for mass-dependent limits.
- 15 DENT 20A is analogous to GAO 20. The quoted limit is from their arXiv:2006.15118v3 (v2 is their published version), using the relativistic Hartree-Fock form factor. The limit is up to two times weaker than the published one. See Fig. 4 in their arXiv version 3 for the correlation between $G_{A\gamma\gamma}$ and g_{Aee} corresponding to the excess reported in APRILE 20.
- 16 DEPTA 20 correct the underestimated D abundance in MILLEA 15, and derive robust cosmological bounds by allowing the reheating temperature, N_{eff} , and neutrino chemical potential to vary. See their Fig. 6 for mass-dependent limits.

- 17 DESSERT 20A use the NuSTAR data of the Quintuplet and Westerlund 1 super star clusters to look for X-rays converted in the Galactic magnetic field from the axions produced in stellar cores. See their Fig. 3 for the mass-dependent limits.
- 18 ESTEBAN 20 show that the two anomalous ANITA events can be explained by the reflected radio pulses that are resonantly produced in the ionosphere via axion-photon conversion for $m_{A^0} \lesssim 1 \times 10^{-7} \text{ eV}$, if an axion clump passes the Earth about once a month. See their Fig.5 for the region consistent with this interpretation for different values of the axion density inside the clumps.
- 19 GAO 20 correct the limit of APRILE 20 by including inverse Primakoff scattering in the XENON1T detector. The quoted limit is from their arXiv:2006.14598v4 (v3 is their published version), taking account of the atomic form factor of Xe as pointed out in ABE 20I. The limit is weaker by a factor of 1.5-2 than the published one. See Fig. 3 in their arXiv version 4 for correlation between $G_{A\gamma\gamma}$ and g_{Aee} corresponding to the excess reported in APRILE 20.
- 20 KOROCHKIN 20 assume the axion makes up all dark matter, and look for a dip in the observed gamma-ray spectrum of the blazar 1ES 1218+304 by Fermi/LAT and VERITAS due to the extragalactic background light produced by the axion decay. Their analysis favors nonzero axion-induced absorption with $G_{A\gamma\gamma} = 3 \times 10^{-11}\text{--}2 \times 10^{-10} \text{ GeV}^{-1}$ over a range of $m_{A^0} = 2\text{--}18 \text{ eV}$. See their Fig. 1 for mass-dependent limits between $0.25 < m_{A^0} < 25 \text{ eV}$.
- 21 LUCENTE 20A study the SN 1987A energy-loss argument on the axion-like particle production. In addition to the Primakoff process, they take account of photon coalescence as well as gravitational trapping that become relevant at $m_{A^0} > 100 \text{ MeV}$. See their Fig. 12 for the mass-dependent limit.
- 22 MEYER 20 look for prompt γ -rays converted in the Galactic magnetic fields from axions produced via the Primakoff process in a sample of 20 extragalactic core-collapse supernovae. The limits assume a progenitor mass of 10 times the solar mass and certain models for the optical emission and the galactic magnetic field. See their Figs. 2 and 6 in the erratum for mass- and model-dependent limits.
- 23 YAMAMOTO 20 look for X-ray photons converted by the Earth's magnetic field from the axions produced by the two-body decay of dark matter, and set the limits by using the Suzaku data. The quoted limit is for the monochromatic X-ray line from the galactic dark matter with lifetime $\tau = 4.32 \times 10^{17} \text{ sec}$. They also derive limits on the continuum spectrum from the extragalactic component. See their Fig. 7 for the limits.
- 24 ALONI 19 used the data collected by the PRIMEX experiment to derive a limit based on a data-driven method. See their Fig. 2 for mass-dependent limits.
- 25 CAPUTO 19 look for an oscillating variation of the polarization angle of the pulsar J0437-4715, where they assume the local axion energy density $\rho_A = 0.3 \text{ GeV/cm}^3$. See their Fig. 2 for mass-dependent limits for $5 \times 10^{-24} \text{ eV} \leq m_{A^0} \leq 2 \times 10^{-19} \text{ eV}$.
- 26 FEDDERKE 19 look for a uniform reduction of the CMB polarization at large scales, which is induced by the oscillating axion background during CMB decoupling. The quoted limit is based on the assumption that axions make up all of the dark matter. See their Fig. 3 for mass-dependent limits for $m_{A^0} = 10^{-22}\text{--}10^{-19} \text{ eV}$.
- 27 IVANOV 19 look for the axion-induced periodic changes in the polarization angle of parsec-scale jets in active galactic nuclei observed by the MOJAVE program, where they use the axion energy density $\rho_A = 20 \text{ GeV/cm}^3$. See their Fig. 6 for mass-dependent limits for $5 \times 10^{-23} \text{ eV} \leq m_{A^0} \leq 1.2 \times 10^{-21} \text{ eV}$.
- 28 LIANG 19 look for spectral irregularities in the spectrum of 10 bright H.E.S.S. sources in the Galactic plane, assuming photon-ALP mixing in the Galactic magnetic fields. See their Fig. 2 for mass-dependent limits with different Galactic magnetic field models.
- 29 FORTIN 18 studied the conversion of axion-like particles produced in the core of a magnetar to hard X-rays in the magnetosphere. See their Fig. 5 for mass-dependent limits with different values of the magnetar core temperature.
- 30 YAMAJI 18 search for axions with an x-ray LSW at Spring-8, using the Laue-case conversion in a silicon crystal. They also obtain $G_{A\gamma\gamma} < 4.2 \times 10^{-3} \text{ GeV}^{-1}$ for $m_{A^0} < 10 \text{ eV}$. See their Fig. 5 for mass-dependent limits.
- 31 ZHANG 18 look for spectral irregularities in the spectrum of PKS 2155-304 measured by Fermi LAT, assuming photon-ALP mixing in the intercluster and Galactic magnetic fields. See their Figs. 2 and 3 for mass-dependent limits with different values of the intercluster magnetic field parameters.
- 32 ADE 17 look for cosmic birefringence from axion-like particles using CMB polarization data taken by the BICEP2 and Keck Array experiments. They set a limit $G_{A\gamma\gamma} H_I < 7.2 \times 10^{-2}$ at 95 % CL for $m_{A^0} < 10^{-28} \text{ eV}$, where H_I is the Hubble parameter during inflation.
- 33 ANASTASSOPOULOS 17 looked for solar axions by the CAST axion helioscope in the vacuum phase, and supersedes ANDRIAMONJON 07.
- 34 DOLAN 17 update existing limits on $G_{A\gamma\gamma}$ for axion-like particles. The limits from the proton beam dump experiments in their Fig. 2 contained an error, and the corrected version is shown in Fig. 1 of DOLAN 21.
- 35 INADA 17 search for axions with an x-ray LSW at Spring-8. See their Fig. 4 for mass-dependent limits.
- 36 KOHRI 17 attributed to axion-photon oscillations the excess of cosmic infrared background observed by the CIBER experiment. See their Fig. 5 for the region preferred by their scenario.
- 37 MARSH 17 is similar to WOUTERS 13, using Chandra observations of M87. See their Fig. 6 for mass-dependent limits.
- 38 TIWARI 17 use observed limits of the cosmic distance-duality relation to constrain the photon-ALP mixing based on 3D simulations of the magnetic field configuration. The quoted value is for the averaged magnetic field of 1 nG with a coherent length of 1 Mpc. See their Fig. 5 for mass-dependent limits.
- 39 AJELLO 16 look for irregularities in the energy spectrum of the NGC1275 measured by Fermi LAT, assuming photon-ALP mixing in the intra-cluster and Galactic magnetic fields. See their Fig. 2 for mass-dependent limits.
- 40 DELLA-VALLE 16 look for the birefringence induced by axion-like particles. See their Fig. 14 for mass-dependent limits.
- 41 DELLA-VALLE 16 look for the dichroism induced by axion-like particles. See their Fig. 14 for mass-dependent limits.
- 42 JAECKEL 16 use the LEP data of $Z \rightarrow 2\gamma$ and $Z \rightarrow 3\gamma$ to constrain the ALP production via $e^+e^- \rightarrow Z \rightarrow A^0\gamma (A^0 \rightarrow \gamma\gamma)$, assuming the ALP coupling with two hypercharge bosons. See their Fig. 4 for mass-dependent limits.
- 43 LEEFER 16 derived limits by using radio-frequency spectroscopy of dysprosium and atomic clock measurements. See their Fig. 1 for mass-dependent limits as well as limits on Yukawa-type couplings of the scalar to the electron and nucleons.

See key on page 1127

Gauge & Higgs Boson Particle Listings

Axions (A^0) and Other Very Light Bosons

44 ANASTASSOPOULOS 15 search for solar chameleons with CAST and derived limits on the chameleon coupling to photons and matter. See their Fig. 12 for the exclusion region.

45 ARIK 15 is analogous to ARIK 09, and search for solar axions for m_{A^0} around 0.2 and 0.4 eV. See their Figs. 1 and 3 for the mass-dependent limits.

46 Based on OSQAR photon regeneration experiment. See their Fig. 6 for mass-dependent limits on scalar and pseudoscalar bosons.

47 BRAX 15 derived limits on conformal and disformal couplings of a scalar to photons by searching for a chaotic absorption pattern in the X-ray and UV bands of the Hydra A galaxy cluster and a BL lac object, respectively. See their Fig. 8.

48 HASEBE 15 look for an axion via a four-wave mixing process at quasi-parallel colliding laser beams. They also derived limits on a scalar coupling to photons $G_{S\gamma\gamma} < 2.62 \times 10^{-4} \text{ GeV}^{-1}$ at $m_{S^0} = 0.15 \text{ eV}$. See their Figs. 11 and 12 for mass-dependent limits.

49 MILLEA 15 is similar to CADAMURO 12, including the Planck data and the latest inferences of primordial deuterium abundance. See their Fig. 3 for mass-dependent limits.

50 VANTILBURG 15 look for harmonic variations in the dysprosium transition frequency data, induced by coherent oscillations of the fine-structure constant due to dilaton-like dark matter, and set the limits, $G_{S\gamma\gamma} < 6 \times 10^{-27} \text{ GeV}^{-1}$ at $m_{S^0} = 6 \times 10^{-23} \text{ eV}$. See their Fig. 4 for mass-dependent limits between $1 \times 10^{-24} < m_{S^0} < 1 \times 10^{-15} \text{ eV}$.

51 VINYOLES 15 performed a global fit analysis based on helioseismology and solar neutrino observations. See their Fig. 9.

52 ARIK 14 is similar to ARIK 11. See their Fig. 2 for mass-dependent limits.

53 AYALA 14 derived the limit from the helium-burning lifetime of horizontal-branch stars based on number counts in globular clusters.

54 DELLA-VALLE 14 use the new PVLAS apparatus to set a limit on vacuum magnetic birefringence induced by axion-like particles. See their Fig. 6 for the mass-dependent limits.

55 EJLLI 14 set limits on a product of primordial magnetic field and the axion mass using CMB distortion induced by resonant axion production from CMB photons. See their Fig. 1 for limits applying specifically to the DFSZ and KSVZ axion models.

56 PUGNAT 14 is analogous to EHRET 10. See their Fig. 5 for mass-dependent limits on scalar and pseudoscalar bosons.

57 REESMAN 14 derive limits by requiring effects of axion-photon interconversion on gamma-ray spectra from distant blazars to be no larger than errors in the best-fit optical depth based on a certain extragalactic background light model. See their Fig. 5 for mass-dependent limits.

58 ABRAMOWSKI 13a look for irregularities in the energy spectrum of the BL Lac object PKS 2155-304 measured by H.E.S.S. The limits depend on assumed magnetic field around the source. See their Fig. 7 for mass-dependent limits.

59 ARMENGAUD 13 is analogous to AVIGNONE 98. See Fig. 6 for the limit.

60 BETZ 13 performed a microwave-based light shining through the wall experiment. See their Fig. 13 for mass-dependent limits.

61 FRIEDLAND 13 derived the limit by considering blue-loop suppression of the evolution of red giants with 7-12 solar masses.

62 MEYER 13 attributed to axion-photon oscillations the observed excess of very high-energy γ -rays with respect to predictions based on extragalactic background light models. See their Fig. 4 for mass-dependent lower limits for various magnetic field configurations.

63 WOUTERS 13 look for irregularities in the X-ray spectrum of the Hydra cluster observed by Chandra. See their Fig. 4 for mass-dependent limits.

64 CADAMURO 12 derived cosmological limits on $G_{A\gamma\gamma}$ for axion-like particles. See their Fig. 1 for mass-dependent limits.

65 PAYEZ 12 derive limits from polarization measurements of quasar light (see their Fig. 3). The limits depend on assumed magnetic field strength in galaxy clusters. The limits depend on assumed magnetic field and electron density in the local galaxy supercluster.

66 ARIK 11 search for solar axions using ^3He buffer gas in CAST, continuing from the ^4He version of ARIK 09. See Fig. 2 for the exact mass-dependent limits.

67 ALPS is a photon regeneration experiment. See their Fig. 4 for mass-dependent limits on scalar and pseudoscalar bosons.

68 AHMED 09a is analogous to AVIGNONE 98.

69 ARIK 09 is the ^4He filling version of the CAST axion helioscope in analogy to INOUE 02 and INOUE 08. See their Fig. 7 for mass-dependent limits.

70 CHOU 09 use the GammeV apparatus in the afterglow mode to search for chameleons, (pseudo)scalar bosons with a mass depending on the environment. For pseudoscalars they exclude at 3σ the range $2.6 \times 10^{-7} \text{ GeV}^{-1} < G_{A\gamma\gamma} < 4.2 \times 10^{-6} \text{ GeV}^{-1}$ for vacuum m_{A^0} roughly below 6 meV for density scaling index exceeding 0.8.

71 GONDOLQ 09 use the all-flavor measured solar neutrino flux to constrain solar interior temperature and thus energy losses.

72 LIPSS photon regeneration experiment, assuming scalar particle s^0 . See Fig. 4 for mass-dependent limits.

73 CHOU 08 perform a variable-baseline photon regeneration experiment. See their Fig. 3 for mass-dependent limits. Excludes the PVLAS result of ZAVATTINI 06.

74 FOCHE 08 is an update of ROBILLIARD 07. See their Fig. 12 for mass-dependent limits.

75 INOUE 08 is an extension of INOUE 02 to larger axion masses, using the Tokyo axion helioscope. See their Fig. 4 for mass-dependent limits.

76 ZAVATTINI 08 is an upgrade of ZAVATTINI 06, see their Fig. 8 for mass-dependent limits. They now exclude the parameter range where ZAVATTINI 06 had seen a positive signature.

77 ANDRIAMONJE 07 looked for Primakoff conversion of solar axions in 9T superconducting magnet into X-rays. Supersedes ZIOUTAS 05.

78 ROBILLIARD 07 perform a photon regeneration experiment with a pulsed laser and pulsed magnetic field. See their Fig. 4 for mass-dependent limits. Excludes the PVLAS result of ZAVATTINI 06 with a CL exceeding 99.9%.

79 ZAVATTINI 06 propagate a laser beam in a magnetic field and observe dichroism and birefringence effects that could be attributed to an axion-like particle. This result is now excluded by ROBILLIARD 07, ZAVATTINI 08, and CHOU 08.

80 INOUE 02 looked for Primakoff conversion of solar axions in 4T superconducting magnet into X ray.

81 MORALES 02b looked for the coherent conversion of solar axions to photons via the Primakoff effect in Germanium detector.

82 BERNABEI 01b looked for Primakoff coherent conversion of solar axions into photons via Bragg scattering in NaI crystal in DAMA dark matter detector.

83 ASTIER 00b looked for production of axions from the interaction of high-energy photons with the horn magnetic field and their subsequent re-conversion to photons via the interaction with the NOMAD dipole magnetic field.

84 MASSO 00 studied limits on axion-proton coupling using the induced axion-photon coupling through the proton loop and CAMERON 93 bound on the axion-photon coupling using optical rotation. They obtained the bound $g_p^2/4\pi < 1.7 \times 10^{-9}$ for the coupling $g_p \vec{p} \cdot \vec{\gamma} \rho \phi_A$.

85 AVIGNONE 98 result is based on the coherent conversion of solar axions to photons via the Primakoff effect in a single crystal germanium detector.

86 Based on the conversion of solar axions to X-rays in a strong laboratory magnetic field.

87 Experiment based on proposal by MAIANI 86.

88 Experiment based on proposal by VANBIBBER 87.

89 LAZARUS 92 experiment is based on proposal found in VANBIBBER 89.

90 RUOSO 92 experiment is based on the proposal by VANBIBBER 87.

91 SEMERTZIDIS 90 experiment is based on the proposal of MAIANI 86. The limit is obtained by taking the noise amplitude as the upper limit. Limits extend to $m_{A^0} = 4 \times 10^{-3}$ where $G_{A\gamma\gamma} < 1 \times 10^{-4} \text{ GeV}^{-1}$.

Limit on Invisible A^0 (Axion) Electron Coupling

The limit is for $g_{Aee} \phi_A \vec{e}(i\gamma_5)e$, or equivalently, the dipole-dipole potential

$$-\frac{g_{Aee}^2}{16\pi m_e^2} ((\sigma_1 \cdot \sigma_2) - 3(\sigma_1 \cdot \mathbf{n})(\sigma_2 \cdot \mathbf{n}))/r^3 \text{ where } \mathbf{n} = \mathbf{r}/r \text{ and the sign of the potential was corrected based on DAIDO 17.}$$

1 CALORE 21 consider the production of axions from Galactic and extragalactic SNe via nucleon-nucleon bremsstrahlung and their subsequent decay into electron-positron pairs, and exclude the range of $g_{Aee} \approx 10^{-19}$ – 10^{-11} at $g_{APP} = 10^{-9}$ for $m_{A^0} = 3$ – 30 MeV. See their Fig. 7 for the limits.

2 LUCENTE 21 study the axion production in a supernova via electron-proton bremsstrahlung and electron-positron fusion, and exclude the range of $g_{Aee} \approx 10^{-10}$ – 10^{-8} for $m_{A^0} = 1$ – 160 MeV. The quoted limit is at $m_{A^0} = 120$ MeV. See their Fig. 12 for the mass-dependent limits.

3 AGOSTINI 20 is analogous to AHMED 09A. The quoted limit applies to $m_{A^0} = 150$ keV. See their Fig. 3 for mass-dependent limits.

4 AMARAL 20 use a second-generation SuperCDMS high-voltage eV-resolution detector to set limits on dark-matter axion absorption. The quoted limit is for $m_{A^0} \approx 17$ eV. The local density $\rho_{\chi} = 0.3$ GeV/cm³ is assumed. See their Fig. 3 for mass-dependent limits.

5 APRILE 20 is an update of APRILE 17B where they look for an absorption signal of axion dark matter. They obtained the limit, $g_{Aee} \lesssim 2 \times 10^{-14}$ – 1×10^{-12} at 90%CL for $m_{A^0} = 1$ – 200 keV. They also found an excess over known backgrounds, which favors the mass $m_{A^0} = 2.3 \pm 0.2$ keV with a 3σ significance. See their Fig. 10 for mass-dependent limits.

6 APRILE 20 look for solar axions from the ABC interactions, the Primakoff conversion, and the 14.4 keV M1 transition of ⁵⁷Fe, and set limits on g_{Aee} , $G_{A\gamma\gamma}$, g_{ANN} , and their products. An excess is observed at low energies between 2 and 3 keV. See their Fig. 8 for correlation between the couplings. The quoted limit applies to the case of vanishing $G_{A\gamma\gamma}$ and g_{ANN} .

7 ARALIS 20 is analogous to AHMED 09A. The quoted limit applies to $m_{A^0} = 0.3$ keV. The limits at masses above 3 keV in their Fig. 9 was later found to be incorrect due to an error in their analysis. See Fig. 2 in ARALIS 21 for the corrected limits.

8 CAPOZZI 20 obtains a limit on the axion-electron coupling from the brightness of the tip of the red-giant branch in ω Centauri. A similar limit of $< 1.6 \times 10^{-13}$ is obtained in NGC 4258.

9 CRESCINI 20 is an update of CRESCINI 18. They assume a local axion dark matter density, $\rho_A = 0.3$ GeV/cm³. See their Fig. 4 for the limits.

10 GHOSH 20A study thermal production of axion via coupling to leptons in the early universe and estimate its contribution to ΔN_{eff} . The quoted limit is for $\Delta N_{\text{eff}} < 0.5$. See their Fig. 7 for their mass-dependent limits.

11 STRANIERO 20 is analogous to CAPOZZI 20, with 22 galactic globular clusters used to derive the limit.

12 WANG 20A is an update of LIU 17A. See their Fig. 9.

13 WANG 20A is an update of LIU 17A. They assume a local axion dark matter density, $\rho_A = 0.3$ GeV/cm³. See their Fig. 10 for limits between $0.185 < m_{A^0} < 10$ keV.

14 ADHIKARI 19B is analogous to LIU 17A.

15 APRILE 19D is analogous to APRILE 17B, but they use only ionization signals. The quoted limit applies to $m_{A^0} = 0.7$ keV. See their Fig. 5(e) for mass-dependent limits.

16 DESSERT 19 used the Suzaku observations of a magnetic white dwarf (RE J0317-853) to look for X-ray signatures converted from axions in the surrounding magnetic fields. They obtained the limit, $g_{Aee} \cdot G_{A\gamma\gamma} < 1.6 \times 10^{-24}$ GeV⁻¹ at 95%CL for $m_{A^0} \lesssim 10^{-5}$ eV. See their Fig. 2 for mass-dependent limits.

17 TERRANO 19 look for the axion-induced oscillating magnetic field acting on the electron spin, using data taken with a rotating torsion pendulum containing polarized electrons. The quoted limit applies to $m_{A^0} = 10^{-23}$ – 10^{-18} eV and assumes a local axion dark matter density, $\rho_A = 0.45$ GeV/cm³. See their Fig. 5 for mass-dependent limits.

18 ABE 18f is an update of ABE 14f. The quoted limit applies to $m_{A^0} = 60$ keV. See their Fig. 5 for mass-dependent limits.

19 ARMENGAUD 18 is analogous to LIU 17A.

20 ARMENGAUD 18 is analogous to AHMED 09A. See the left panel of Fig. 5 for mass-dependent limits.

21 CRESCINI 18 look for collective excitations of the electron spins caused by dark matter axions. The quoted limit assumes the local dark matter density, $\rho_A = 0.45$ GeV/cm³.

22 FICEK 18 use the measurements of the hyperfine structure of antiprotonic helium to constrain a dipole-dipole potential between electron and antiproton. See their Fig. 3 for limits on various spin- and velocity-dependent potentials.

23 ABGRALL 17 is analogous to AHMED 09A using the MAJORANA DEMONSTRATOR. See their Fig. 2 for limits between $6 \text{ keV} < m_{A^0} < 97 \text{ keV}$.

24 AKERIB 17B is analogous to LIU 17A.

25 AKERIB 17B is analogous to AHMED 09A. See their Fig. 7 for mass-dependent limits.

26 APRILE 17B is analogous to AHMED 09A. They found a bug in their code and needed to correct the limits in Fig. 7 of APRILE 14B. See their Fig. 1 for the corrected limits between $1 \text{ keV} < m_{A^0} < 40 \text{ keV}$.

27 FICEK 17 look for spin-dependent interactions between electrons by comparing precision spectroscopic measurements in ⁴He with theoretical calculations. See their Fig. 1 for limits up to $m_{A^0} = 10$ keV.

28 FU 17A is analogous to LIU 17A. See their Fig. 3 for mass-dependent limits.

29 FU 17A is analogous to AHMED 09A. See their Fig. 4 for mass-dependent limits.

30 LIU 17A is analogous to AHMED 09A. See their Fig. 9 for limits between $0.25 \text{ keV} < m_{A^0} < 20 \text{ keV}$.

31 LIU 17A look for solar axions produced from Compton, bremsstrahlung, atomic-recombination and deexcitation channels, and set a limit for $m_{A^0} < 1$ keV.

32 LUO 17 use a recent measurement of the dipole-dipole interaction between two iron atoms at the nanometer scale and set a limit for $m_{A^0} < 1$ keV. See their Fig. 3 for mass-dependent limits.

33 BATTICH 16 is analogous to CORSICO 16 and used the pulsating DB white dwarf PG 1351+489.

34 CORSICO 16 studied the cooling rate of the pulsating DA white dwarf L19-2 based on an asteroseismic model.

35 YOON 16 look for solar axions with the axio-electric effect in CsI(Tl) crystals and set a limit for $m_{A^0} < 1$ keV.

36 TERRANO 15 used a torsion pendulum and rotating attractor with 20-pole electron-spin distributions. See their Fig. 4 for a mass-dependent limit up to $m_{A^0} = 500 \mu\text{eV}$.

37 ABE 14f set limits on the axioelectric effect in the XMASS detector assuming the pseudoscalar constitutes all the local dark matter. See their Fig. 3 for limits between $m_{A^0} = 40$ – 120 keV.

38 APRILE 14B look for solar axions using the XENON100 detector.

39 APRILE 14B is analogous to AHMED 09A. Their Fig. 7 was later found to be incorrect due to a bug in their code. See Fig. 1 in APRILE 17B for the corrected limits.

40 DERBIN 14 is an update of DERBIN 13 with a BGO scintillating bolometer. See their Fig. 3 for mass-dependent limits.

41 MILLER-BERTOLAMI 14 studied the impact of axion emission on white dwarf cooling in a self-consistent way.

42 ABE 13d is analogous to DERBIN 12, using the XMASS detector.

43 ARMENGAUD 13 is similar to AALSETH 11. See their Fig. 10 for limits between $3 \text{ keV} < m_{A^0} < 100 \text{ keV}$.

44 ARMENGAUD 13 is similar to DERBIN 12, and take account of axio-recombination and axio-deexcitation effects. See their Fig. 12 for mass-dependent limits.

45 BARTH 13 search for solar axions produced by axion-electron coupling, and obtained the limit, $g_{Aee} \cdot G_{A\gamma\gamma} < 8.1 \times 10^{-23}$ GeV⁻¹ at 95%CL.

46 DERBIN 13 looked for 5.5 MeV solar axions produced in $pd \rightarrow {}^3\text{He} A^0$ in a BGO detector through the axioelectric effect. See their Fig. 4 for mass-dependent limits.

47 HECKEL 13 studied the influence of 2 or 4 stationary sources each containing 6.0×10^{24} polarized electrons, on a rotating torsion pendulum containing 9.8×10^{24} polarized electrons. See their Fig. 4 for mass-dependent limits.

48 VIAUX 13A constrain axion emission using the observed brightness of the tip of the red-giant branch in the globular cluster M5.

49 CORSICO 12 attributed the excessive cooling rate of the pulsating white dwarf R548 to emission of axions with $g_{Aee} \approx 4.8 \times 10^{-13}$.

50 DERBIN 12 look for solar axions with the axio-electric effect in a Si(Li) detector. The solar production is based on Compton and bremsstrahlung processes.

51 AALSETH 11 is analogous to AHMED 09A. See their Fig. 4 for mass-dependent limits.

52 AHMED 09A assume keV-mass pseudoscalars are the local dark matter and constrain the axio-electric effect in the CDMS detector. See their Fig. 5 for mass-dependent limits.

53 DAVOUDIASL 09 use geophysical constraints on Earth cooling by axion emission.

54 These experiments measured induced magnetization of a bulk material by the spin-dependent potential generated from other bulk material with aligned electron spins, where the magnetic field is shielded with superconductor. The sign of the limit set by CHUI 93 is opposite to that of the axion-mediated dipole-dipole potential.

55 These experiments used a torsion pendulum to measure the potential between two bulk matter objects where the spins are polarized but without a net magnetic field in either of them. The limits reflect the corrected sign of the dipole-dipole potential.

56 WINELAND 91 looked for an effect of bulk matter with aligned electron spins on atomic hyperfine splitting using nuclear magnetic resonance.

Invisible A^0 (Axion) Limits from Nucleon Coupling

Limits are for the axion mass in eV.

		39 BELLINI	08	CNTR	Solar axion
		40 ADELBERGER	07		Test of Newton's law

1 AYBAS 21 limits the axion couplings to the nucleon EDM and the nucleons as $g_{AN\gamma} < 9.5 \times 10^{-4} \text{ GeV}^{-2}$ and $g_{ANN}/2m_N < 0.28 \text{ GeV}^{-1}$ (95% CL) for $m_{A^0} = 162\text{--}166 \text{ neV}$, based on a measurement of ^{207}Pb solid-state NMR in a polarized ferroelectric crystal. Here m_N is the nucleon mass and g_{ANN} is the dimensionless axion-nucleon coupling. They assume that axions make up all the dark matter with $\rho_A \approx 0.46 \text{ GeV}/\text{cm}^3$. See their Fig. 3 for the limits.

2 BHUSAL 21 looked for 5.5 MeV solar axions produced by $p d \rightarrow {}^3\text{He} A^0$ through the axion-induced dissociation of deuterons by using SNO data, and set a limit on the isovector axion-nucleon coupling, $|g_{aNN}^3| < 2 \times 10^{-5} \text{ GeV}^{-1}$, which is equivalent to $|g_{Ann} - g_{App}| < 4 \times 10^{-5}$ in terms of the dimensionless axion-nucleon couplings.

3 JIANG 21 use the spin-amplifier based on hyperpolarized ^{129}Xe gas to set limits on the axion couplings to nucleons as $g_{ANN}/2m_N < 3.2 \times 10^{-9} \text{ GeV}^{-1}$ (95% CL) at $m_{A^0} = 52.94 \text{ feV}$, and comparable limits in the mass range of 8.3–744 feV. Here m_N is the nucleon mass and g_{ANN} is the dimensionless axion-nucleon coupling. They assume that axions make up all the dark matter with $\rho_A \approx 0.4 \text{ GeV}/\text{cm}^3$. See their Fig. 4b for the limits.

4 ROUSSY 21 look for a time-oscillating EDM of molecular ions HfF^+ induced by axion dark matter couplings to gluons. See their Fig. 3 for limits in the range of $m_{A^0} = 10\text{--}22\text{--}10\text{--}15 \text{ eV}$.

5 ZHANG 21B use the gravitational waves from the binary neutron star inspiral GW170817 to look for a type of axion whose mass is suppressed due to cancellation with additional contributions. They exclude $1.6 \times 10^{16} < f_A < 10^{18} \text{ GeV}$ at 3σ for $m_{A^0} \lesssim 10\text{--}13 \text{ eV}$. See their Fig. 1 for mass-dependent limits.

6 ABDELHAMEED 20 look for the resonant excitation of ^{169}Tm (8.41 keV) by solar axions produced via the Primakoff effect. The mass bound assumes the KSVZ axion model, $S = 0.5$, and $m_U/m_d = 0.56$. They set a limit on the product of axion couplings to photons and nucleons as $G_{A\gamma\gamma} \cdot g_{App} < 1.44 \times 10^{-14} \text{ GeV}^{-1}$ (90% CL).

7 ABDELHAMEED 20 look for the resonant excitation of ^{169}Tm (8.41 keV) by solar axions produced via the axion-electron coupling. They set a limit on the product of axion couplings to electrons and nucleons as $g_{Aee} \cdot g_{App} < 2.81 \times 10^{-16}$ (90% CL).

8 APRILE 20 look for solar axions from the ABC interactions, the Primakoff conversion, and the 14.4 keV M1 transition of ^{57}Fe . An excess is observed at low energies between 2 and 3 keV. See their Fig.8 for correlation between the couplings.

9 KLIMCHITSKAYA 20 use the measurement of the Casimir force between a Au-coated microsphere and a SiC plate to constrain the force due to two-axion exchange for $17.8 < m_{A^0} < 100 \text{ eV}$. See their Fig. 2 for mass-dependent limits.

10 WANG 20A is an update of LIU 17A. The limit assumes the DFSZ axion. See their Fig. 7 for the limit on product of axion couplings to electrons and nucleons.

11 LEINSON 19 is analogous to BEZNOGOV 18, but estimating the axion luminosity based on the Tolman's analytic solution to the Einstein equations of spherical fluids in hydrostatic equilibrium. The dimensionless axion-neutron coupling is constrained as $g_{ANN} < 1.0 \times 10\text{--}10$.

12 LLOYD 19 is analogous to BERENJI 16. They highlight that the limit obtained with this technique strongly depends on the assumed NS core temperature.

13 SMORRA 19 look for spin-precession effects from ultra-light axion dark matter in the \bar{p} spin-flip resonance data. Assuming $\rho_A = 0.4 \text{ GeV}/\text{cm}^3$, they constrain the dimensionless axion-antiproton coupling as $g_{A\bar{p}p} < 2\text{--}9$ at 95% CL for $m_{A^0} = 2 \times 10\text{--}23\text{--}4 \times 10\text{--}17 \text{ eV}$. See the right panel of their Fig. 3.

14 WU 19 look for axion-induced time-oscillating features of the NMR spectrum of acetonitrile- $2\text{-}^{13}\text{C}$. Assuming $C_p = C_n$ and $\rho_A = 0.4 \text{ GeV}/\text{cm}^3$, they constrain the dimensionless axion-nucleon coupling as $g_{ANN} < 6 \times 10\text{--}5$ for $m_{A^0} = 10\text{--}21\text{--}1.3 \times 10\text{--}17 \text{ eV}$. Note that the limits for $m_{A^0} < 10\text{--}21 \text{ eV}$ in their Fig. 3(a) should be weaker than those for heavier masses. See ADELBERGER 19 and WU 19c on this issue.

15 AKHMATOV 18 is an update of GAVRILYUK 15.

16 ARMENGAUD 18 is analogous to ALESSANDRIA 13. The quoted limit assumes the DFSZ axion model. See their Fig. 4 for the limit on product of axion couplings to electrons and nucleons.

17 BEZNOGOV 18 constrain the axion-neutron coupling by assuming that thermal evolution of the hot neutron star HESS J1731-347 is dominated by the lowest possible neutrino emission. The quoted limit assumes the KSVZ axion with the effective Peccei-Quinn charge of the neutron $C_n = -0.02$. The dimensionless axion-neutron coupling is constrained as $g_{ANN} < 2.8 \times 10\text{--}10$.

18 GAVRILYUK 18 look for the resonant excitation of ^{83}Kr (9.4 keV) by solar axions produced via the Primakoff effect. The mass bound assumes $m_U/m_d = 0.56$ and $S = 0.5$.

19 HAMAGUCHI 18 studied the axion emission from the neutron star in Cassiopeia A based on the minimal cooling scenario which explains the observed rapid cooling rate. The quoted limit corresponds to $f_A > 5 \times 10^9 \text{ GeV}$ obtained for the KSVZ axion with $C_p = -0.47$ and $C_n = -0.02$.

20 ABEL 17 look for a time-oscillating neutron EDM and an axion-wind spin-precession effect respectively induced by axion dark matter couplings to gluons and nucleons. See their Fig. 4 for limits in the range of $m_{A^0} = 10\text{--}24\text{--}10\text{--}17 \text{ eV}$.

21 ABRALL 17 limit assumes the hadronic axion model used in ALESSANDRIA 13. See their Fig. 4 for the limit on product of axion couplings to electrons and nucleons.

22 FU 17A look for the 14.4 keV ^{57}Fe solar axions. The limit assumes the DFSZ axion model. See their Fig. 3 for mass-dependent limits on the axion-electron coupling. Notice that in this figure the DFSZ and KSVZ lines should be interchanged.

23 KLIMCHITSKAYA 17A use the differential measurement of the Casimir force between a Ni-coated sphere and Au and Ni sectors of the structured disc to constrain the axion coupling to nucleons for $2.61 \text{ meV} < m_{A^0} < 0.9 \text{ eV}$. See their Figs. 1 and 2 for mass dependent limits.

24 LIU 17 is analogous to ALESSANDRIA 13. The limit assumes the hadronic axion model. See their Fig. 6(b) for the limit on product of axion couplings to electrons and nucleons.

25 BERENJI 16 used the Fermi LAT observations of neutron stars to look for photons from axion decay. They assume the effective Peccei-Quinn charge of the neutron $C_n = 0.1$ and a neutron-star core temperature of 20 MeV.

26 GAVRILYUK 15 look for solar axions emitted by the M1 transition of ^{83}Kr (9.4 keV). The mass bound assumes $m_U/m_d = 0.56$ and $S = 0.5$.

27 KLIMCHITSKAYA 15 use the measurement of differential forces between a test mass and rotating source masses of Au and Si to constrain the force due to two-axion exchange for $1.7 \times 10\text{--}3 < m_{A^0} < 0.9 \text{ eV}$. See their Figs. 1 and 2 for mass dependent limits.

28 BEZERRA 14 use the measurement of the thermal Casimir-Polder force between a Bose-Einstein condensate of ^{87}Rb atoms and a SiO_2 plate to constrain the force mediated by exchange of two pseudoscalars for $0.1 \text{ meV} < m_{A^0} < 0.3 \text{ eV}$. See their Fig. 2 for the mass-dependent limit on pseudoscalar coupling to nucleons.

29 BEZERRA 14A is analogous to BEZERRA 14. They use the measurement of the Casimir pressure between two Au-coated plates to constrain pseudoscalar coupling to nucleons for $1 \times 10\text{--}3 \text{ eV} < m_{A^0} < 15 \text{ eV}$. See their Figs. 1 and 2 for the mass-dependent limit.

30 BEZERRA 14B is analogous to BEZERRA 14. BEZERRA 14B use the measurement of the normal and lateral Casimir forces between sinusoidally corrugated surfaces of a sphere and a plate to constrain pseudoscalar coupling to nucleons for $1 \text{ eV} < m_{A^0} < 20 \text{ eV}$. See their Figs. 1–3 for mass-dependent limits.

31 BEZERRA 14C is analogous to BEZERRA 14. They use the measurement of the gradient of the Casimir force between Au- and Ni-coated surfaces of a sphere and a plate to constrain pseudoscalar coupling to nucleons for $3 \times 10\text{--}5 \text{ eV} < m_{A^0} < 1 \text{ eV}$. See their Figs. 1, 3, and 4 for the mass-dependent limits.

32 BLUM 14 studied effects of an oscillating strong CP phase induced by axion dark matter on the primordial ^4He abundance. See their Fig. 1 for mass-dependent limits.

33 LEINSON 14 attributes the excessive cooling rate of the neutron star in Cassiopeia A to axion emission from the superfluid core, and found $C_n^2 m_n^2 \approx 5.7 \times 10\text{--}6 \text{ eV}^2$, where C_n is the effective Peccei-Quinn charge of the neutron.

34 ALESSANDRIA 13 used the CUORE experiment to look for 14.4 keV solar axions produced from the M1 transition of thermally excited ^{57}Fe nuclei in the solar core, using the axio-electric effect. The limit assumes the hadronic axion model. See their Fig. 4 for the limit on product of axion couplings to electrons and nucleons.

35 ARMENGAUD 13 is analogous to ALESSANDRIA 13. The limit assumes the hadronic axion model. See their Fig. 8 for the limit on product of axion couplings to electrons and nucleons.

36 BELLI 12 looked for solar axions emitted by the M1 transition of $^7\text{Li}^*$ (478 keV) after the electron capture of ^7Be , using the resonant excitation ^7Li in the LiF crystal. The mass bound assumes $m_U/m_d = 0.55$, $m_U/m_S = 0.029$, and the flavor-singlet axial vector matrix element $S = 0.4$.

37 BELLINI 12B looked for 5.5 MeV solar axions produced in the $p d \rightarrow {}^3\text{He} A^0$. The limit assumes the hadronic axion model. See their Figs. 6 and 7 for mass-dependent limits on product of axion couplings to photons, electrons, and nucleons.

38 DERBIN 11 looked for solar axions emitted by the M1 transition of thermally excited ^{57}Fe nuclei in the Sun, using their possible resonant capture on ^{57}Fe in the laboratory. The mass bound assumes $m_U/m_d = 0.56$ and the flavor-singlet axial vector matrix element $S = 3F - D \approx 0.5$.

39 BELLINI 08 consider solar axions emitted in the M1 transition of $^7\text{Li}^*$ (478 keV) and look for a peak at 478 keV in the energy spectra of the Counting Test Facility (CTF), a Borexino prototype. For $m_{A^0} < 450 \text{ keV}$ they find mass-dependent limits on products of axion couplings to photons, electrons, and nucleons.

40 ADELBERGER 07 use precision tests of Newton's law to constrain a force contribution from the exchange of two pseudoscalars. See their Fig. 5 for limits on the pseudoscalar coupling to nucleons, relevant for m_{A^0} below about 1 meV.

Axion Limits from T-violating Medium-Range Forces

The limit is for the coupling $g = g_p g_s$ in a T-violating potential between nucleons or nucleon and electron of the form $V = \frac{g\hbar^2}{8\pi m_p} (\boldsymbol{\sigma} \cdot \boldsymbol{r}) \left(\frac{1}{r^2} + \frac{1}{\lambda r} \right) e^{-r/\lambda}$, where g_p and g_s are dimensionless scalar and pseudoscalar coupling constants and $\lambda = \hbar/(m_A c)$ is the range of the force.

Gauge & Higgs Boson Particle Listings
Axions (A^0) and Other Very Light Bosons

$<1.7 \times 10^{-3}$	90	67 ANASTASI	15A KLOE	$m_{\gamma'} = 5\text{--}320$ MeV	14 AAIJ 20c look for hidden photons produced from the pp collision in the decay channel $\gamma' \rightarrow \mu^+ \mu^-$. For hidden photons with lifetimes of order ps, limits at the level of 10^{-5} are obtained for $m_{\gamma'} = 218\text{--}315$ MeV. See their Fig. 4 for mass-dependent limits.
$<4.2 \times 10^{-4}$	90	68 BATLEY	15A NA48	$m_{\gamma'} = 36$ MeV	15 ABLIKIM 20AB search for $J/\psi \rightarrow \eta' \gamma' (\gamma' \rightarrow \gamma \pi^0)$, and set the upper limit on the product branching fraction of order 10^{-7} . See their Fig. 7 for mass-dependent limits.
		69 JAEGLE	15 BELL	$m_{\gamma'} = 0.1\text{--}3.5$ GeV	16 AGOSTINI 20 is analogous to ABE 14F. The quoted limit applies to $m_{\gamma'} = 120$ keV. The local density $\rho_{\gamma'} = 0.3$ GeV/cm ³ is assumed. See their Fig. 3 for mass-dependent limits.
$<3 \times 10^{-13}$		70 KAZANAS	15 ASTR	$m_{\gamma'} = 2m_e - 100$ MeV	17 AMARAL 20 use a second-generation SuperCDMS high-voltage eV-resolution detector to set limits on dark-matter dark photon absorption. The quoted limit is for $m_{\gamma'} \simeq 17$ eV. The local density $\rho_{\gamma'} = 0.3$ GeV/cm ³ is assumed. See their Fig. 3 for mass-dependent limits.
$<6 \times 10^{-12}$		71 SUZUKI	15	$m_{\gamma'} = 1.9\text{--}4.3$ eV	18 AN 20 updates the direct detection limit of AN 13c on solar flux of hidden photons; $\chi < 1.6 \times 10^{-12}$ (eV/ $m_{\gamma'}$) for $m_{\gamma'} < 6$ eV (90% C.L.). For $m_{\gamma'} > 6$ eV, see their Fig. 1 for mass-dependent limits.
$<2.3 \times 10^{-13}$	99.7	72 VINYOLES	15 ASTR	$m_{\gamma'} = 8$ eV	19 ANDRIANAVALOMAHEFA 20 is analogous to SUZUKI 15, but uses a mirror that is about one order of magnitude larger than in similar studies in the past. Limits at the level of 10^{-12} are obtained for $m_{\gamma'} = 2.5\text{--}7$ eV. See their Fig.23 and Table III for mass-dependent limits.
$<2 \times 10^{-13}$		73 ABE	14F XMAS	$m_{\gamma'} = 40\text{--}120$ keV	20 APRILE 20 is analogous to ABE 14F, and set limits $\chi \lesssim 10^{-16}\text{--}10^{-12}$. The quoted limit applies to $m_{\gamma'} = 1$ keV. They also found an excess over known backgrounds, which favors the mass $m_{\gamma'} = 2.3 \pm 0.2$ keV with a 3 σ significance. See their Fig. 10 for mass-dependent limits.
$<1.8 \times 10^{-3}$	90	74 AGAKISHIEV	14 HDES	$m_{\gamma'} = 63$ MeV	21 ARALIS 20 is analogous to ABE 14F. The quoted limit applies to $m_{\gamma'} = 0.1$ keV. The local density $\rho_{\gamma'} = 0.3$ GeV/cm ³ is assumed. The limits at masses above 3 keV in their Fig. 10 was later found to be incorrect due to an error in their analysis. See Fig. 3 in ARALIS 21 for the corrected limits.
$<9.0 \times 10^{-4}$	90	75 BABUSCI	14 KLOE	$m_{\gamma'} = 969$ MeV	22 ARGUELLES 20 examine hidden-photon production in atmospheric cosmic-ray showers and its decay in IceCube and Super-Kamiokande. The quoted limit assumes a lifetime of $\tau = 0.1$ km. See their Fig. 16 for mass- and lifetime-dependent limits.
		76 BATELL	14 BDMP	$m_{\gamma'} = 10^{-3}\text{--}1$ GeV	23 ARNAUD 20 look for the absorption signal of hidden photon dark matter in a Ge detector. The quoted limit applies to $m_{\gamma'} \simeq 9$ eV. The local density $\rho_{\gamma'} = 0.3$ GeV/cm ³ is assumed. See their Fig. 3 for mass-dependent limits.
$<1.3 \times 10^{-7}$	95	77 BLUEMLEIN	14 BDMP	$m_{\gamma'} = 0.6$ GeV	24 BANERJEE 20 is an update of BANERJEE 18. They exclude $8.2 \times 10^{-5} \lesssim \chi \lesssim 1 \times 10^{-2}$ for $m_{\gamma'} = 1.5\text{--}24$ MeV. In particular, they exclude $\chi = 1.2 \times 10^{-4}\text{--}6.8 \times 10^{-4}$ for the 16.7 MeV gauge boson. See their Fig. 5 for mass-dependent limits.
$<3 \times 10^{-18}$		78 FRADETTE	14 COSM	$m_{\gamma'} = 50\text{--}300$ MeV	25 BARAK 20 is analogous to AGUILAR-AREVALO 19A, and look for hidden photon dark matter by using the Skipper CCD. The quoted limit applies to $m_{\gamma'} = 12.8$ eV. See their Fig. 4 for mass-dependent limits.
$<3.5 \times 10^{-4}$	90	79 LEES	14J BABR	$m_{\gamma'} = 0.2$ GeV	26 KRASNIKOV 20 showed that the limit of BANERJEE 20 combined with the measured anomalous magnetic moment of the electron exclude the 16.7 MeV gauge boson suggested by the ATOMKI (KRASZNAHORKAY 16) experiment if it has pure vector or axial-vector interactions.
$<9 \times 10^{-4}$	95	80 MERKEL	14 A1	$m_{\gamma'} = 40\text{--}300$ MeV	27 SHE 20 look for solar hidden photons. The quoted limit applies to $m_{\gamma'} = 180$ eV. See their Fig. 4 for mass-dependent limits.
$<3 \times 10^{-15}$		81 AN	13B ASTR	$m_{\gamma'} = 2$ keV	28 SHE 20 look for hidden photon dark matter and set limits $\chi < 1.3 \times 10^{-15}\text{--}2.8 \times 10^{-14}$ for the quoted mass range. The local density $\rho_{\gamma'} = 0.3$ GeV/cm ³ is assumed. See their Fig. 6 for mass-dependent limits.
$<7 \times 10^{-14}$		82 AN	13C XE10	$m_{\gamma'} = 100$ eV	29 SIRUNYAN 20AQ look for a narrow resonance decaying into a pair of muons. For $m_{\gamma'} < 45$ GeV, they use dedicated high-rate dimuon triggers to reduce the muon transverse momentum thresholds. The quoted limit applies to $m_{\gamma'} = 50$ GeV, and limits of order 10^{-3} are obtained for the quoted mass range. See their Fig. 3 for mass-dependent limits.
$<8 \times 10^{-4}$		83 DIAMOND	13 BDMP	$m_{\gamma'} = 30\text{--}250$ MeV	30 TOMITA 20 look for hidden photon dark matter using a planar metal plate and cryogenic receiver and set limits $\chi < 1.8\text{--}4.3 \times 10^{-10}$ for the quoted mass range. The local density $\rho_{\gamma'} = 0.39$ GeV/cm ³ is assumed. See their Fig. 7 for mass-dependent limits.
$<2 \times 10^{-3}$	90	84 GNINENKO	13 BDMP	$m_{\gamma'} = 25\text{--}120$ MeV	31 WANG 20A is analogous to ABE 14F. The quoted limit applies to $m_{\gamma'} = 185$ eV. The local density $\rho_{\gamma'} = 0.3$ GeV/cm ³ is assumed. See their Fig. 11 for mass-dependent limits.
$<2.2 \times 10^{-13}$		85 HORVAT	13 HPGE	$m_{\gamma'} = 230$ eV	32 AABOUD 19G look for $h \rightarrow \gamma' \gamma' (\gamma' \rightarrow \mu^+ \mu^-)$ and exclude a kinetic mixing around $10^{-9}\text{--}10^{-8}$ for $B(h \rightarrow \gamma' \gamma') = 0.01$ and 0.1 . See their Fig. 9 for mass-dependent limits.
$<8.06 \times 10^{-5}$	95	86 INADA	13 LSW	$m_{\gamma'} = 0.04$ eV $\text{--}26$ keV	33 ABLIKIM 19A look for $J/\psi \rightarrow \gamma' \eta (\gamma' \rightarrow e^+ e^-)$. Limits between 6×10^{-3} and 5×10^{-2} are obtained (see their Fig. 8).
$<2 \times 10^{-10}$	95	87 MIZUMOTO	13	$m_{\gamma'} = 1$ eV	34 ABLIKIM 19H look for $J/\psi \rightarrow \gamma' \eta' (\gamma' \rightarrow e^+ e^-)$. Limits between 3.4×10^{-3} and 2.6×10^{-2} are obtained. See their Fig. 5 for mass-dependent limits.
$<1.7 \times 10^{-7}$		88 PARKER	13 LSW	$m_{\gamma'} = 53$ μ eV	35 AGUILAR-AREVALO 19A look for the absorption signal of hidden photon dark matter by using a CCD. The quoted limit applies to $m_{\gamma'} = 17$ eV. The local density $\rho_{\gamma'} = 0.3$ GeV/cm ³ is assumed. See their Fig. 4 for mass-dependent limits.
$<5.32 \times 10^{-15}$		89 PARKER	13	$m_{\gamma'} = 53$ μ eV	36 APRILE 19D is analogous to ABE 14F. The quoted limit applies to $m_{\gamma'} = 0.7$ keV. See their Fig. 5(f) for mass-dependent limits.
$<1 \times 10^{-15}$		90 REDONDO	13 ASTR	$m_{\gamma'} = 2$ keV	37 BANERJEE 19 is an update of BANERJEE 18A. The quoted limit is at $m_{\gamma'} = 1$ MeV. See their Fig. 3 for mass-dependent limits.
$<8 \times 10^{-8}$	90	91 GNINENKO	12A BDMP	$m_{\gamma'} = 1\text{--}135$ MeV	38 BHOONAH 19 examine heating of Galactic Center gas clouds by hidden photon dark matter. The quoted limit applies to $m_{\gamma'} \simeq 10^{-12}$ eV. See their Fig. 2 for mass-dependent limits.
$<1 \times 10^{-7}$	90	92 GNINENKO	12B CHRM	$m_{\gamma'} = 1\text{--}500$ MeV	39 BRUN 19 is analogous to SUZUKI 15. The limit is derived under an assumption that hidden photons constitute the local dark matter density $\rho_{\gamma'} = 0.3$ GeV/cm ³ .
$<1 \times 10^{-3}$	90	93 ABRAHAMY... 11		$m_{\gamma'} = 175\text{--}250$ MeV	40 CORTINA-GIL 19 look for an invisible hidden photon in the reaction $K^+ \rightarrow \pi^+ \pi^0 (\pi^0 \rightarrow \gamma \gamma')$. The quoted limit applies to $m_{\gamma'} = 62.5\text{--}65$ MeV. See their Figs. 6 and 7 for mass-dependent limits.
$<9 \times 10^{-8}$	95	94 BLUEMLEIN	11 BDMP	$m_{\gamma'} = 70$ MeV	41 DANILOV 19 examined the hidden photon production in nuclear reactors, correctly taking account of the effective photon mass in the reactor and detector. The limit gets weaker
$<1 \times 10^{-7}$		95 BJORKEN	09 BDMP	$m_{\gamma'} = 2\text{--}400$ MeV	
$<5 \times 10^{-9}$		96 BJORKEN	09 ASTR	$m_{\gamma'} = 2\text{--}50$ MeV	

Gauge & Higgs Boson Particle Listings

Axions (A^0) and Other Very Light Bosons

- for $m_{\gamma'}$ less than the effective photon mass in proportion to $1/m_{\gamma'}^2$. See their Fig. 1 for mass-dependent limits.
- 42 HOCHBERG 19 look for the absorption signal of hidden photon dark matter by using superconducting-nanowire single-photon detectors. The quoted limit applies to $m_{\gamma'} \simeq 1$ eV. The local density $\rho_{\gamma'} = 0.3$ GeV/cm³ is assumed. See their Fig. 4 for mass-dependent limits.
- 43 KOPYLOV 19 look for hidden-photon dark matter using a counter with an aluminum cathode and derive limits assuming it constitute all the local dark matter. The quoted limit applies to $m_{\gamma'} = 12$ eV. See their Fig. 7 for mass-dependent limits.
- 44 KOVETZ 19 examine heating of the early Universe plasma by hidden photon dark matter, and derive the limits by requiring that the cosmic mean 21 cm brightness temperature relative to the CMB temperature satisfy $T_{21} > -100$ mK. The quoted limit applies to $m_{\gamma'} \simeq 2 \times 10^{-14}$ eV. See their Fig. 3 for mass-dependent limits.
- 45 NGUYEN 19 look for hidden photon dark matter with a resonant cavity, and set limits $\sim 10^{-12}$ for $m_{\gamma'} = 0.2\text{--}2.07 \mu\text{eV}$. The quoted limit applies to $m_{\gamma'} = 1.3 \mu\text{eV}$. The local density $\rho_{\gamma'} = 0.3$ GeV/cm³ is assumed. See their Fig. 19 for mass-dependent limits.
- 46 ABE 18f is an update of ABE 14f. The quoted limit applies to $m_{\gamma'} \simeq 40$ keV. See their Fig. 5 for mass-dependent limits.
- 47 ADRIAN 18 look for a hidden photon resonance in the reaction $e^- Z \rightarrow e^- Z \gamma'$ ($\gamma' \rightarrow e^+ e^-$). The quoted limit applies to $m_{\gamma'} = 40$ MeV. See their Fig. 4 for mass-dependent limits.
- 48 ANASTASI 18b look for a hidden photon resonance in the reaction $e^+ e^- \rightarrow \gamma' \gamma' \rightarrow \mu^+ \mu^-$. The quoted limit is obtained by combining the result of ANASTASI 16 and it applies to $m_{\gamma'} \simeq 519\text{--}987$ MeV. See their Fig. 9 for mass-dependent limits.
- 49 ARMENGAUD 18 is analogous to ABE 14f. The quoted limits applies to $m_{\gamma'} = 1.6$ keV. See the right panel of Fig. 5 for mass-dependent limits.
- 50 BANERJEE 18 look for hidden photons produced in the reaction $e^- Z \rightarrow e^- Z \gamma'$ ($\gamma' \rightarrow e^+ e^-$), and exclude $9.2 \times 10^{-5} \lesssim \chi \lesssim 1 \times 10^{-2}$ for $m_{\gamma'} = 1\text{--}23$ MeV. They also set a limit on the electron coupling to a 16.7 MeV gauge boson suggested by the ATOMKI (KRASZNAHORKAY 16) experiment. See their Fig. 3 for mass-dependent limits.
- 51 BANERJEE 18a look for invisible decays of hidden photons produced in the reaction $e^- Z \rightarrow e^- Z \gamma'$. The quoted limit is at $m_{\gamma'} = 1$ MeV. See their Fig. 15 for mass-dependent limits.
- 52 KNIRCK 18 is analogous to SUZUKI 15. See their Fig. 5 for mass-dependent limits.
- 53 ABRALL 17 is analogous to ABE 14f using the MAJORANA DEMONSTRATOR. See their Fig. 3 for limits between $6 \text{ keV} < m_{\gamma'} < 97 \text{ keV}$.
- 54 ABLIKIM 17AA look for $e^+ e^- \rightarrow \gamma \gamma' (\gamma' \rightarrow e^+ e^- \text{ or } \mu^+ \mu^-)$. Limits between 10^{-3} and 10^{-4} are obtained (see their Fig. 3).
- 55 ANGLÖHER 17 is analogous to ABE 14f. The quoted limit is at $m_{\gamma'} = 0.7$ keV. See their Fig. 8 for mass-dependent limits.
- 56 BANERJEE 17 look for invisible decays of hidden photons produced in the reaction $e^- Z \rightarrow e^- Z \gamma'$. The quoted limit applies to $m_{\gamma'} = 2$ MeV. See their Fig. 3 for mass-dependent limits.
- 57 CHANG 17 examine the hidden photon emission from SN1987A, including the effects of finite temperature and density on χ and obtain limits $\chi (m_{\gamma'}/\text{MeV}) \lesssim 3 \times 10^{-9}$ for $m_{\gamma'} < 15$ MeV and $\chi \lesssim 10^{-9}$ for $m_{\gamma'} = 15\text{--}120$ MeV.
- 58 DUBININA 17 look for $\mu^+ \rightarrow e^+ \bar{\nu}_\mu \nu_e \gamma' (\gamma' \rightarrow e^+ e^-)$ in a nuclear photoemulsion. The quoted limit applies to $m_{\gamma'} = 1.1$ MeV. Limits between 4.5×10^{-3} and 10^{-2} are obtained (see their Fig. 3).
- 59 LEES 17E look for invisible decays of hidden photons produced in the reaction $e^+ e^- \rightarrow \gamma \gamma'$. See their Fig. 5 for limits in the mass range $m_{\gamma'} \leq 8$ GeV.
- 60 AAD 16AG look for hidden photons promptly decaying into collimated electrons and/or muons, assuming that they are produced in the cascade decays of squarks or the Higgs boson. See their Fig. 10 and Fig.13 for their limits on the cross section times branching fractions.
- 61 ANASTASI 16 look for the decay $\gamma' \rightarrow \pi^+ \pi^-$ in the reaction $e^+ e^- \rightarrow \gamma \gamma'$. Limits between 4.3×10^{-3} and 4.4×10^{-4} are obtained for $527 < m_{\gamma'} < 987$ MeV (see their Fig. 9).
- 62 KHACHATRYAN 16 look for $\gamma' \rightarrow \mu^+ \mu^-$ in a dark SUSY scenario where the SM-like Higgs boson decays into a pair of the visible lightest neutralinos with mass 10 GeV, both of which decay into γ' and a hidden neutralino with mass 1 GeV. See the right panel in their Fig. 2.
- 63 AAD 15CD look for $H \rightarrow Z \gamma' \rightarrow 4\ell$ with the ATLAS detector at LHC and find $\chi < 4\text{--}17 \times 10^{-2}$ for $m_{\gamma'} = 15\text{--}55$ GeV. See their Fig. 6.
- 64 ADARE 15 look for a hidden photon in $\pi^0, \eta^0 \rightarrow \gamma e^+ e^-$ at the PHENIX experiment. See their Fig. 4 for mass-dependent limits.
- 65 AN 15A derived limits from the absence of ionization signals in the XENON10 and XENON100 experiments, assuming hidden photons constitute all the local dark matter. Their best limit is $\chi < 1.3 \times 10^{-15}$ at $m_{\gamma'} = 18$ eV. See their Fig. 1 for mass-dependent limits.
- 66 ANASTASI 15 look for a production of a hidden photon and a hidden Higgs boson with the KLOE detector at DAΦNE, where the hidden photon decays into a pair of muons and the hidden Higgs boson lighter than $m_{\gamma'}$ escape detection. See their Figs. 6 and 7 for mass-dependent limits on a product of the hidden fine structure constant and the kinetic mixing.
- 67 ANASTASI 15A look for the decay $\gamma' \rightarrow e^+ e^-$ in the reaction $e^+ e^- \rightarrow e^+ e^- \gamma'$. Limits between 1.7×10^{-3} and 1×10^{-2} are obtained for $m_{\gamma'} = 5\text{--}320$ MeV (see their Fig. 7).
- 68 BATTLE 15A look for $\pi^0 \rightarrow \gamma \gamma' (\gamma' \rightarrow e^+ e^-)$ at the NA48/2 experiment. Limits between 4.2×10^{-4} and 8.8×10^{-3} are obtained for $m_{\gamma'} = 9\text{--}120$ MeV (see their Fig. 4).
- 69 JAEGLER 15 look for the decay $\gamma' \rightarrow e^+ e^-, \mu^+ \mu^-, \text{ or } \pi^+ \pi^-$ in the dark Higgsstrahlung channel, $e^+ e^- \rightarrow \gamma' H' (H' \rightarrow \gamma' \gamma')$ at the BELLE experiment. They set limits on a product of the branching fraction and the Born cross section as well as a product of the hidden fine structure constant and the kinetic mixing. See their Figs. 3 and 4.
- 70 KAZANAS 15 set limits by studying the decay of hidden photons $\gamma' \rightarrow e^+ e^-$ inside and near the progenitor star of SN1987A. See their Fig. 6 for mass-dependent limits.
- 71 SUZUKI 15 looked for hidden-photon dark matter with a dish antenna and derived limits assuming they constitute all the local dark matter. Their limits are $\chi < 6 \times 10^{-12}$ for $m_{\gamma'} = 1.9\text{--}4.3$ eV. See their Fig. 7 for mass-dependent limits.
- 72 VINYOLES 15 performed a global fit analysis based on helioseismology and solar neutrino observations, and set the limits $\chi m_{\gamma'} < 1.8 \times 10^{-12}$ eV for $m_{\gamma'} = 3 \times 10^{-9}\text{--}8$ eV. See their Fig. 11.
- 73 ABE 14f look for the photoelectric-like interaction in the XMASS detector assuming the hidden photon constitutes all the local dark matter. Limits between 2×10^{-13} and 1×10^{-12} are obtained, where the relation $\chi^2 = \alpha'/\alpha$ is used to translate the original bound on the ratio of the hidden and EM fine-structure constants. See their Fig. 3 for mass-dependent limits.
- 74 AGAKISHIEV 14 look for hidden photons $\gamma' \rightarrow e^+ e^-$ at the HADES experiment, and set limits on χ for $m_{\gamma'} = 0.02\text{--}0.6$ GeV. See their Fig. 5 for mass-dependent limits.
- 75 BABUSCI 14 look for the decay $\gamma' \rightarrow \mu^+ \mu^-$ in the reaction $e^+ e^- \rightarrow \mu^+ \mu^- \gamma'$. Limits between 4×10^{-3} and 9.0×10^{-4} are obtained for $520 \text{ MeV} < m_{\gamma'} < 980 \text{ MeV}$ (see their Fig. 7).
- 76 BATELL 14 derived limits from the electron beam dump experiment at SLAC (E-137) by searching for events with recoil electrons by sub-GeV dark matter produced from the decay of the hidden photon. Limits at the level of $10^{-4}\text{--}10^{-1}$ are obtained for $m_{\gamma'} = 10^{-3}\text{--}1$ GeV, depending on the dark matter mass and the hidden gauge coupling (see their Fig. 2).
- 77 BLUEMLEIN 14 analyzed the beam dump data taken at the U-70 accelerator to look for γ' -bremsstrahlung and the subsequent decay into muon pairs and hadrons. See their Fig. 4 for mass-dependent excluded region.
- 78 FRADETTE 14 studied effects of decay of relic hidden photons on BBN and CMB to set constraints on very small values of the kinetic mixing. See their Figs. 4 and 7 for mass-dependent excluded regions.
- 79 LEES 14J look for hidden photons in the reaction $e^+ e^- \rightarrow \gamma \gamma' (\gamma' \rightarrow e^+ e^-, \mu^+ \mu^-)$. Limits at the level of $10^{-4}\text{--}10^{-3}$ are obtained for $0.02 \text{ GeV} < m_{\gamma'} < 10.2 \text{ GeV}$. See their Fig. 4 for mass-dependent limits.
- 80 MERKEL 14 look for $\gamma' \rightarrow e^+ e^-$ at the A1 experiment at the Mainz Microtron (MAMI). See their Fig. 3 for mass-dependent limits.
- 81 AN 13B examined the stellar production of hidden photons, correcting an important error of the production rate of the longitudinal mode which now dominates. See their Fig. 2 for mass-dependent limits based on solar energy loss.
- 82 AN 13C use the solar flux of hidden photons to set a limit on the atomic ionization rate in the XENON10 experiment. They find $\chi m_{\gamma'} < 3 \times 10^{-12}$ eV for $m_{\gamma'} < 1$ eV. See their Fig. 2 for mass-dependent limits.
- 83 DIAMOND 13 analyzed the beam dump data taken at the SLAC millicharge experiment to constrain a hidden photon invisibly decaying into lighter long-lived particles, which undergo elastic scattering off nuclei in the detector. Limits between $8 \times 10^{-4}\text{--}2 \times 10^{-2}$ are obtained. The quoted limit is applied when the dark gauge coupling is set equal to the electromagnetic coupling. See their Fig. 4 for mass-dependent limits.
- 84 GNINENKO 13 used the data taken at the SINDRUM experiment to constrain the decay, $\pi^0 \rightarrow \gamma \gamma' (\gamma' \rightarrow e^+ e^-)$ to derive limits. See their Fig. 2 for their mass-dependent excluded region.
- 85 HORVAT 13 look for hidden-photo-electric effect in HPGe detectors induced by solar hidden photons. See their Fig. 3 for mass-dependent limits.
- 86 INADA 13 search for hidden photons using an intense X-ray beamline at SPring-8. See their Fig. 4 for mass-dependent limits.
- 87 MIZUMOTO 13 look for solar hidden photons. See their Fig. 5 for mass-dependent limits.
- 88 PARKER 13 look for hidden photons using a cryogenic resonant microwave cavity. See their Fig.5 for mass-dependent limits.
- 89 PARKER 13 derived a limit for the hidden photon CDM with a randomly oriented hidden photon field.
- 90 REDONDO 13 examined the solar emission of hidden photons including the enhancement factor for the longitudinal mode pointed out by AN 13b, and also updated stellar-energy loss arguments. See their Fig.3 for mass-dependent limits, including a review of the currently best limits from other arguments.
- 91 GNINENKO 12A obtained bounds on $B(\pi^0 \rightarrow \gamma \gamma') \cdot B(\gamma' \rightarrow e^+ e^-)$ from the NOMAD and PS191 neutrino experiments, and derived limits between $8 \times 10^{-8}\text{--}2 \times 10^{-4}$. See their Fig.4 for mass-dependent excluded regions.
- 92 GNINENKO 12B used the data taken at the CHARM experiment to constrain the decay, $\eta(\eta') \rightarrow \gamma \gamma' (\gamma' \rightarrow e^+ e^-)$, and derived limits between $1 \times 10^{-7}\text{--}1 \times 10^{-4}$. See their Fig.4 for mass-dependent excluded region.
- 93 ABRAHAMA MYAN 11 look for $\gamma' \rightarrow e^+ e^-$ in the electron-nucleon fixed-target experiment at the Jefferson Laboratory (APEX). See their Fig. 5 for mass-dependent limits.
- 94 BLUEMLEIN 11 analyzed the beam dump data taken at the U-70 accelerator to look for $\pi^0 \rightarrow \gamma \gamma' (\gamma' \rightarrow e^+ e^-)$. See their Fig. 5 for mass-dependent limits.
- 95 BJORKEN 09 analyzed the beam dump data taken at E137, E141, and E774 to constrain a hidden photon produced by bremsstrahlung, subsequently decaying into $e^+ e^-$, and derived limits between 10^{-7} and 10^{-2} . See their Fig. 1 for mass-dependent excluded region.
- 96 BJORKEN 09 required the energy loss in the γ' emission from the core of SN1987A not to exceed 10^{53} erg/s, and derived limits between 5×10^{-9} and 2×10^{-6} . See their Fig. 1 for mass-dependent excluded region.

e MASS (atomic mass units u)

The primary determination of an electron's mass comes from measuring the ratio of the mass to that of a nucleus, so that the result is obtained in u (atomic mass units). The conversion factor to MeV is more uncertain than the mass of the electron in u; indeed, the recent improvements in the mass determination are not evident when the result is given in MeV. In this datablock we give the result in u, and in the following datablock in MeV.

- ¹ BEIER 02 compares Larmor frequency of the electron bound in a ¹²C⁵⁺ ion with the cyclotron frequency of a single trapped ¹²C⁵⁺ ion.
- ² FARNHAM 95 compares cyclotron frequency of trapped electrons with that of a single trapped ¹²C⁶⁺ ion.

e MASS

The mass is known more precisely in u (atomic mass units) than in MeV. The conversion is: 1 u = 931.494 102 42(28) MeV/c² (2018 CODATA value, TIESINGA 21). The conversion error dominates the uncertainty of the masses given below.

- ¹ Converted to MeV using the 1998 CODATA value of the conversion constant, 931.494013 ± 0.000037 MeV/u.
- ² BEIER 02 compares Larmor frequency of the electron bound in a ¹²C⁵⁺ ion with the cyclotron frequency of a single trapped ¹²C⁵⁺ ion.
- ³ FARNHAM 95 compares cyclotron frequency of trapped electrons with that of a single trapped ¹²C⁶⁺ ion.

$$(m_{e^+} - m_{e^-}) / m_{\text{average}}$$

A test of CPT invariance.

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
< 8 × 10⁻⁹	90	¹ FEE 93	CNTR	Positronium spectroscopy
• • • We do not use the following data for averages, fits, limits, etc. • • •				
< 4 × 10 ⁻²³	90	² DOLGOV 14		From photon mass limit
< 4 × 10 ⁻⁸	90	CHU 84	CNTR	Positronium spectroscopy

- ¹ FEE 93 value is obtained under the assumption that the positronium Rydberg constant is exactly half the hydrogen one.
- ² DOLGOV 14 result is obtained under the assumption that any mass difference between electron and positron would lead to a non-zero photon mass. The PDG 12 limit of 1 × 10⁻¹⁸ eV on the photon mass is in turn used to derive the value quoted here.

$$|q_{e^+} + q_{e^-}|/e$$

A test of CPT invariance. See also similar tests involving the proton.

- ⁶ ABDULLAH 90, COMMINS 94, and REGAN 02 use the relativistic enhancement of a valence electron's electric dipole moment in a high-Z atom.

e⁻ MEAN LIFE / BRANCHING FRACTION

A test of charge conservation. See the "Note on Testing Charge Conservation and the Pauli Exclusion Principle" following this section in our 1992 edition (Physical Review **D45** S1 (1992), p. VI.10).

Most of these experiments are one of three kinds: Attempts to observe (a) the 255.5 keV gamma ray produced in e⁻ → ν_eγ, (b) the (K) shell x ray produced when an electron decays without additional energy deposit,

Lepton Particle Listings

e, μ

e.g., $e^- \rightarrow \nu_e \bar{\nu}_e \nu_e$ ("disappearance" experiments), and (c) nuclear de-excitation gamma rays after the electron disappears from an atomic shell and the nucleus is left in an excited state. The last can include both weak boson and photon mediating processes. We use the best $e^- \rightarrow \nu_e \gamma$ limit for the Summary Tables.

Note that we use the mean life rather than the half life, which is often reported.

μ

$$J = \frac{1}{2}$$

μ MASS (atomic mass units u)

The muon's mass is obtained from the muon-electron mass ratio as determined from the measurement of Zeeman transition frequencies in muonium ($\mu^+ e^-$ atom). Since the electron's mass is most accurately known in u, the muon's mass is also most accurately known in u. The conversion factor to MeV has approximately the same relative uncertainty as the mass of the muon in u. In this datablock we give the result in u, and in the following datablock in MeV.

μ MASS

The mass is known more precisely in u (atomic mass units) than in MeV. The conversion is: 1 u = 931.494 102 42(28) MeV/c² (2018 CODATA value, TIESINGA 21). The conversion error contributes significantly to the uncertainty of the masses given below.

Muon Anomalous Magnetic Moment

μ MAGNETIC MOMENT ANOMALY

The parity-violating decay of muons in a storage ring is observed. The difference frequency ω_a between the muon spin precession and the orbital angular frequency ($e/m_\mu c$)(B) is measured, as is the free proton NMR frequency ω_p , thus determining the ratio $R = \omega_a / \omega_p$. Given the magnetic moment ratio $\lambda = \mu_\mu / \mu_p$ (from hyperfine structure in muonium), $(g-2)/2 = R / (\lambda - R)$.

$\mu_\mu / (e\hbar/2m_\mu) - 1 = (g_\mu - 2)/2$

¹ This is the combination of the two BENNETT 09 measurements quoted here separately for μ^+ and μ^- . The result is also presented as a measurement of $(0.0 \pm 0.9) \times 10^{-19}$ e cm.
² Also reported as the limit of $|d(\mu^+)| < 2.1 \times 10^{-19}$ e cm at 95% CL.
³ Also reported as the limit of $|d(\mu^-)| < 1.5 \times 10^{-19}$ e cm at 95% CL.
⁴ This is the combination of the two BAILEY 78 results quoted here separately for μ^+ and μ^- . BAILEY 78 uses the convention $d = 1/2 \cdot (d_{\mu^+} - d_{\mu^-})$ and reports 3.7 ± 3.4 . We convert their result to use the same convention as BENNETT 09.

MUON-ELECTRON CHARGE RATIO ANOMALY $q_{\mu^+}/q_{e^-} - 1$

VALUE	DOCUMENT ID	TECN	CHG	COMMENT
$(1.1 \pm 2.1) \times 10^{-9}$	¹ MEYER	00	CNTR	+ 1s-2s muonium interval

¹ MEYER 00 measure the 1s-2s muonium interval, and then interpret the result in terms of muon-electron charge ratio q_{μ^+}/q_{e^-} .

μ^- DECAY MODES

μ^+ modes are charge conjugates of the modes below.

Mode	Fraction (Γ_i/Γ)	Confidence level
Γ_1 $e^- \bar{\nu}_e \nu_\mu$	$\approx 100\%$	
Γ_2 $e^- \bar{\nu}_e \nu_\mu \gamma$	[a] $(6.0 \pm 0.5) \times 10^{-8}$	
Γ_3 $e^- \bar{\nu}_e \nu_\mu e^+ e^-$	[b] $(3.4 \pm 0.4) \times 10^{-5}$	
Lepton Family number (LF) violating modes		
Γ_4 $e^- \nu_e \bar{\nu}_\mu$	LF [c] < 1.2	% 90
Γ_5 $e^- \gamma$	LF < 4.2	$\times 10^{-13}$ 90
Γ_6 $e^- e^+ e^-$	LF < 1.0	$\times 10^{-12}$ 90
Γ_7 $e^- 2\gamma$	LF < 7.2	$\times 10^{-11}$ 90

[a] This only includes events with energy of $e > 45$ MeV and energy of $\gamma > 40$ MeV. Since the $e^- \bar{\nu}_e \nu_\mu$ and $e^- \bar{\nu}_e \nu_\mu \gamma$ modes cannot be clearly separated, we regard the latter mode as a subset of the former.

[b] See the Particle Listings below for the energy limits used in this measurement.

[c] A test of additive vs. multiplicative lepton family number conservation.

1 FREEDMAN 93 limit on $\bar{\nu}_e$ observation is here interpreted as a limit on lepton family number violation.
 2 BERGSMA 83 gives a limit on the inverse muon decay cross-section ratio $\sigma(\bar{\nu}_\mu e^- \rightarrow \mu^- \bar{\nu}_e) / \sigma(\nu_\mu e^- \rightarrow \mu^- \nu_e)$, which is essentially equivalent to $\Gamma(e^- \nu_e \bar{\nu}_\mu) / \Gamma_{\text{total}}$ for small values like that quoted.

$\Gamma(e^- \gamma) / \Gamma_{\text{total}}$ Γ_5 / Γ
 Forbidden by lepton family number conservation.

1 This limit assumes a giant resonance excitation of the daughter Ca nucleus (mean energy and width both 20 MeV).
 2 KAULARD 98 obtained these same limits using the unified classical analysis of FELDMAN 98.
 3 This limit assumes the daughter Ca nucleus is left in the ground state. However, the probability of this is unknown.
 4 Assuming a giant-resonance-excitation model.

LIMIT ON MUONIUM \rightarrow ANTIMUONIUM CONVERSION

Forbidden by lepton family number conservation.

$R_g = G_C / G_F$

The effective Lagrangian for the $\mu^+ e^- \rightarrow \mu^- e^+$ conversion is assumed to be

$$\mathcal{L} = 2^{-1/2} G_C [\bar{\psi}_\mu \gamma_\lambda (1 - \gamma_5) \psi_e] [\bar{\psi}_e \gamma_\lambda (1 - \gamma_5) \psi_\mu] + \text{h.c.}$$

The experimental result is then an upper limit on G_C / G_F , where G_F is the Fermi coupling constant.

Muon Decay Parameters

μ DECAY PARAMETERS

ρ PARAMETER

(V-A) theory predicts $\rho = 0.75$.

Table with columns: VALUE, EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes 'OUR AVERAGE' and data from BAYES, DERENZO, MACDONALD, MUSSER, AMORUSO, FRYBERGER, SHERWOOD, PEOPLES.

- 1 The quoted systematic error includes a contribution of 0.00013 (added in quadrature) from uncertainties on radiative corrections and on the Michel parameter η .
2 The quoted systematic error includes a contribution of 0.00011 (added in quadrature) from the dependence on the Michel parameter η .
3 The quoted systematic error includes a contribution of 0.00023 (added in quadrature) from the dependence on the Michel parameter η .
4 η constrained = 0. These values incorporated into a two parameter fit to ρ and η by DERENZO 69.

η PARAMETER

(V-A) theory predicts $\eta = 0$.

Table with columns: VALUE, EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes 'OUR AVERAGE' and data from DANNEBERG, BURKARD, DERENZO, DANNEBERG, BURKARD, FRYBERGER, SHERWOOD, PEOPLES, PLANO.

- 1 Previously we used the global fit result from BURKARD 85B in OUR AVERAGE, we now only include their actual measurement.
2 $\alpha = \alpha' = 0$ assumed.
3 Global fit to all measured parameters. The fit correlation coefficients are given in BURKARD 85B.
4 ρ constrained = 0.75.
5 Two parameter fit to ρ and η ; PLANO 60 discounts value for η .

δ PARAMETER

(V-A) theory predicts $\delta = 0.75$.

Table with columns: VALUE, EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes 'OUR AVERAGE' and data from BAYES, BALKE, MACDONALD, GAPONENKO, VOSSLER, FRYBERGER, KRUGER, PLANO.

- 1 The quoted systematic error includes a contribution of 0.00006 (added in quadrature) from uncertainties on radiative corrections and on the Michel parameter η .
2 BALKE 88 uses $\rho = 0.752 \pm 0.003$.
3 VOSSLER 69 has measured the asymmetry below 10 MeV. See comments about radiative corrections in VOSSLER 69.

$(\xi \text{ PARAMETER}) \times (\mu \text{ LONGITUDINAL POLARIZATION})$

(V-A) theory predicts $\xi = 1$, longitudinal polarization = 1.

Table with columns: VALUE, DOCUMENT ID, TECN, CHG, COMMENT. Includes 'OUR AVERAGE' and data from BUENO, BELTRAMI, JAMIESON, IMAZATO, AKHMANOV, GUREVICH, ALI-ZADE, PLANO, BARDON.

- 1 The corresponding 90% confidence limit from IMAZATO 92 is $|\xi P_{\mu}| > 0.990$. This measurement is of K^+ decay, not π^+ decay, so we do not include it in an average, nor do we yet set up a separate data block for K results.
2 Depolarization by medium not known sufficiently well.

$\xi \times (\mu \text{ LONGITUDINAL POLARIZATION}) \times \delta / \rho$

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, CHG, COMMENT. Includes 'OUR AVERAGE' and data from BAYES, JODIDIO, STOKER, CARR.

- 1 BAYES 11 obtains the limit > 0.99909 (90% CL) with the constraint that $\xi \times (\mu \text{ LONGITUDINAL POLARIZATION}) \times \delta / \rho \leq 1.0$.
2 JODIDIO 86 includes data from CARR 83 and STOKER 85. The value here is from the erratum.
3 STOKER 85 find $(\xi P_{\mu} \delta / \rho) > 0.9955$ and > 0.9966 , where the first limit is from new μ spin-rotation data and the second is from combination with CARR 83 data. In V-A theory, $(\delta / \rho) = 1.0$.

$\xi' = \text{LONGITUDINAL POLARIZATION OF } e^+$

(V-A) theory predicts the longitudinal polarization = ± 1 for e^{\pm} , respectively. We have flipped the sign for e^- so our programs can average.

Table with columns: VALUE, EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes 'OUR AVERAGE' and data from BURKARD, SCHWARTZ, BLOOM, DUCLOS, BUHLER.

ξ'' PARAMETER

Table with columns: VALUE, EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes 'OUR AVERAGE' and data from PRIEELS, BURKARD.

- 1 BURKARD 85 measure $(\xi'' - \xi \xi') / \xi$ and ξ' and set $\xi = 1$.

TRANSVERSE e^+ POLARIZATION IN PLANE OF μ SPIN, e^+ MOMENTUM

Table with columns: VALUE (units 10^{-3}), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes 'OUR AVERAGE' and data from DANNEBERG, BURKARD.

TRANSVERSE e^+ POLARIZATION NORMAL TO PLANE OF μ SPIN, e^+ MOMENTUM

Zero if T invariance holds.

Table with columns: VALUE (units 10^{-3}), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes 'OUR AVERAGE' and data from DANNEBERG, BURKARD.

α/A

Table with columns: VALUE (units 10^{-3}), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes 'OUR AVERAGE' and data from BURKARD.

α'/A

Zero if T invariance holds.

Table with columns: VALUE (units 10^{-3}), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes 'OUR AVERAGE' and data from DANNEBERG, BURKARD.

- 1 Previously we used the global fit result from BURKARD 85B in OUR AVERAGE, we now only include their actual measurement. BURKARD 85B measure e^+ polarizations P_{T1} and P_{T2} versus e^+ energy.
2 Global fit to all measured parameters. The fit correlation coefficients are given in BURKARD 85B.

β/A

Table with columns: VALUE (units 10^{-3}), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes 'OUR AVERAGE' and data from BURKARD.

β'/A

Zero if T invariance holds.

Table with columns: VALUE (units 10^{-3}), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes 'OUR AVERAGE' and data from DANNEBERG, BURKARD.

J = 1/2

(τ_{τ+} - τ_{τ-}) / τ_{average}

Test of CPT invariance.

τ discovery paper was PERL 75. e+e- to τ+τ- cross-section threshold behavior and magnitude are consistent with pointlike spin-1/2 Dirac particle. BRANDELIK 78 ruled out pointlike spin-0 or spin-1 particle. FELDMAN 78 ruled out J = 3/2. KIRKBY 79 also ruled out J=integer, J = 3/2.

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Row 1: <7.0 x 10^-3, 90, 1 BELOUS 14 BELL, 711 fb^-1 E_cm^ee = 10.6 GeV. Row 2: 1 BELOUS 14 quote limit on the absolute value of the relative lifetime difference.

τ MASS

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes 'OUR AVERAGE' and various experimental results from ABLIKIM, AUBERT, ANASHIN, BELOUS, ABBIENDI, ANASTASSOV, BAI, ALBRECHT, BACINO, BALEST, BAI.

- 1 ABLIKIM 14D fit σ(e+e- to τ+τ-) at different energies near threshold.
2 AUBERT 09AK and BELOUS 07 fit τ pseudomass spectrum in τ to π+π-π-ντ decays.
3 ABBIENDI 00A fit τ pseudomass spectrum in τ to π± ≤ 2π0ντ and τ to π±π+π- ≤ 1π0ντ decays.
4 BAI 96 fit σ(e+e- to τ+τ-) at different energies near threshold.
5 ALBRECHT 92M fit τ pseudomass spectrum in τ- to 2π-π+ντ decays.
6 BACINO 78B value comes from e±X± threshold.
7 BALEST 97 fit spectra of minimum kinematically allowed τ mass in events of the type e+e- to τ+τ- (π+nπ0ντ)(π-mπ0ντ) n ≤ 2, m ≤ 2, 1 ≤ n+m ≤ 3.
8 BAI 92 fit σ(e+e- to τ+τ-) near threshold using eμ events.

(m_{τ+} - m_{τ-}) / m_{average}

A test of CPT invariance.

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Row 1: <2.8 x 10^-4, 90, BELOUS 07 BELL, 414 fb^-1, E_cm^ee = 10.6 GeV. Row 2: <5.5 x 10^-4, 90, 1 AUBERT 09AK BABB, 423 fb^-1, E_cm^ee = 10.6 GeV. Row 3: <3.0 x 10^-3, 90, ABBIENDI 00A OPAL, 1990-1995 LEP runs. Row 4: 1 AUBERT 09AK quote both the listed upper limit and (m_{τ+} - m_{τ-}) / m_{average} = (-3.4 ± 1.3 ± 0.3) x 10^-4.

τ MEAN LIFE

Table with columns: VALUE (10^-15 s), EVTS, DOCUMENT ID, TECN, COMMENT. Includes 'OUR AVERAGE' and various experimental results from BELOUS, ABDALLAH, ACCIARRI, BARATE, ALEXANDER, BALEST, BARATE, ABREU, ACCIARRI, ABE, BATTLE, KLEINWORT, AMIDEI, BRAUNSCH., ABACHI, ALBRECHT, BAND, BEBEK, FELDMAN.

τ MAGNETIC MOMENT ANOMALY

The q^2 dependence is expected to be small providing no thresholds are nearby.

μτ / (eh/2mτ) - 1 = (gτ - 2) / 2

For a theoretical calculation [(gτ - 2) / 2 = 117 721(5) x 10^-8], see EIDELMAN 07.

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes 'OUR LIMIT' and various experimental results from ABDALLAH, ACHARD, GONZALEZ-S., ACCIARRI, ACKERSTAFF, ESCRIBANO, GRIFOLS, SILVERMAN.

- 1 ABDALLAH 04K limit is derived from e+e- to e+e-τ+τ- total cross-section measurements at sqrt(s) between 183 and 208 GeV.
2 ACHARD 04G limit is derived from e+e- to e+e-τ+τ- total cross-section measurements at sqrt(s) between 189 and 206 GeV.
3 GONZALEZ-SPRINGER 00 use data on tau lepton production at LEP1, SLC, and LEP2.
4 ACCIARRI 98E use Z to τ+τ-γ events.
5 ACKERSTAFF 98N use Z to τ+τ-γ events.
6 ESCRIBANO 97 use preliminary experimental results.
7 ESCRIBANO 93 limit derived from Γ(Z to τ+τ-), and is on the absolute value of the magnetic moment anomaly.
8 SILVERMAN 83 limit is derived from e+e- to τ+τ- total cross-section measurements for q^2 up to (37 GeV)^2.

τ ELECTRIC DIPOLE MOMENT (dτ)

A nonzero value is forbidden by both T invariance and P invariance.

The q^2 dependence is expected to be small providing no thresholds are nearby.

Re(dτ)

Table with columns: VALUE (10^-16 ecm), CL%, DOCUMENT ID, TECN, COMMENT. Includes 'OUR LIMIT' and various experimental results from INAMI, GROZIN, ABDALLAH, ACHARD, ALBRECHT, ACCIARRI, ACKERSTAFF, ESCRIBANO, GRIFOLS, DELAGUILA.

- 1 INAMI 03 use e+e- to τ+τ- events.
2 GROZIN 09A calculate the contribution to the electron electric dipole moment from the τ electric dipole moment appearing in loops.
3 ABDALLAH 04K limit is derived from e+e- to e+e-τ+τ- total cross-section measurements at sqrt(s) between 183 and 208 GeV.
4 ACHARD 04G limit is derived from e+e- to e+e-τ+τ- total cross-section measurements at sqrt(s) between 189 and 206 GeV.
5 ALBRECHT 00 use e+e- to τ+τ- events.
6 ACKERSTAFF 98N use Z to τ+τ-γ events.
7 ESCRIBANO 97 derive the relationship |dτ| = cot θW |dτ^W| using effective Lagrangian methods.
8 ESCRIBANO 97 use preliminary experimental results.
9 ESCRIBANO 93 limit derived from Γ(Z to τ+τ-), and is on the absolute value of the electric dipole moment.

Lepton Family number (LF), Lepton number (L), or Baryon number (B) violating modes

L means lepton number violation (e.g. $\tau^- \rightarrow e^+ \pi^- \pi^-$). Following common usage, LF means lepton family violation and not lepton number violation (e.g. $\tau^- \rightarrow e^- \pi^+ \pi^-$). B means baryon number violation.

Γ ₁₈₆	$e^- \gamma$	LF	< 3.3 × 10 ⁻⁸	CL=90%
Γ ₁₈₇	$e^- \gamma \gamma$		< 2.5 × 10 ⁻⁴	CL=90%
Γ ₁₈₈	$\mu^- \gamma$	LF	< 4.2 × 10 ⁻⁸	CL=90%
Γ ₁₈₉	$\mu^- \gamma \gamma$		< 5.8 × 10 ⁻⁴	CL=90%
Γ ₁₉₀	$e^- \pi^0$	LF	< 8.0 × 10 ⁻⁸	CL=90%
Γ ₁₉₁	$\mu^- \pi^0$	LF	< 1.1 × 10 ⁻⁷	CL=90%
Γ ₁₉₂	$e^- K_S^0$	LF	< 2.6 × 10 ⁻⁸	CL=90%
Γ ₁₉₃	$\mu^- K_S^0$	LF	< 2.3 × 10 ⁻⁸	CL=90%
Γ ₁₉₄	$e^- \eta$	LF	< 9.2 × 10 ⁻⁸	CL=90%

$$\Gamma(a_1(1260) \nu_\tau \rightarrow \pi^- \gamma \nu_\tau)/\Gamma_{total} \quad \Gamma_{31}/\Gamma = (0.0021\Gamma_{20} + 0.0021\Gamma_{70})/\Gamma$$

The uncertainty on $\Gamma(\tau^- \rightarrow a_1(1260) \nu_\tau \rightarrow \pi^- \gamma \nu_\tau)/\Gamma_{total}$ is the sum in quadrature of the uncertainty on the fit result for $\Gamma(\tau^- \rightarrow a_1(1260) \nu_\tau \rightarrow \pi^- \gamma \nu_\tau)/\Gamma_{total}$ and of the uncertainty on $\Gamma(a_1(1260) \rightarrow \pi^- \gamma)/\Gamma_{total} = ((2.1 \pm 0.8) \times 10^{-3})$ as reported in SCHAELE 05c, which is the coefficient of the relationship that defines $\Gamma(\tau^- \rightarrow a_1(1260) \nu_\tau \rightarrow \pi^- \gamma \nu_\tau)/\Gamma_{total}$ in terms of $\Gamma(\tau^- \rightarrow \pi^- 2\pi^0 \nu_\tau (\text{ex. } K^0))/\Gamma_{total}$ and $\Gamma(\tau^- \rightarrow \pi^- \pi^+ \pi^- \nu_\tau (\text{ex. } K^0, \omega))/\Gamma_{total}$.

Heavy Charged Lepton Searches

Charged Heavy Lepton MASS LIMITS

Sequential Charged Heavy Lepton (L^\pm) MASS LIMITS

These experiments assumed that a fourth generation L^\pm decayed to a fourth generation ν_L (or L^0) where ν_L was stable, or that L^\pm decays to a light ν_ℓ via mixing.

See the "Quark and Lepton Compositeness, Searches for" Listings for limits on radiatively decaying excited leptons, i.e. $\ell^* \rightarrow \ell\gamma$. See the "WIMPs and other Particle Searches" section for heavy charged particle search limits in which the charged particle could be a lepton.

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
>100.8	95	ACHARD	01B L3	Decay to νW
>101.9	95	ACHARD	01B L3	$m_L - m_{L^0} > 15$ GeV

1 ACCIARRI 96G assumes LEP result that the associated neutral heavy lepton mass > 40 GeV.

2 THE AHMED 94 limits are from a search for neutral and charged sequential heavy leptons at HERA via the decay channels $L^- \rightarrow e\gamma$, $L^- \rightarrow \nu W^-$, $L^- \rightarrow eZ$; and $L^0 \rightarrow \nu\gamma$, $L^0 \rightarrow e^- W^+$, $L^0 \rightarrow \nu Z$, where the W decays to $\ell\nu_\ell$, or to jets, and Z decays to $\ell^+ \ell^-$ or jets.

3 RILES 90 limits were the result of a special analysis of the data in the case where the mass difference $m_{L^-} - m_{L^0}$ was allowed to be quite small, where L^0 denotes the neutrino into which the sequential charged lepton decays. With a slightly reduced m_{L^\pm} range, the mass difference extends to about 4 GeV.

4 STOKER 89 (Mark II at PEP) gives bounds on charged heavy lepton (L^+) mass for the generalized case in which the corresponding neutral heavy lepton (L^0) in the SU(2) doublet is not of negligible mass.

5 ABE 88 search for L^+ and $L^- \rightarrow$ hadrons looking for acoplanar jets. The bound is valid for $m_\nu < 10$ GeV.

6 ADACHI 88B search for hadronic decays giving acoplanar events with large missing energy. $E_{cm}^{ee} = 52$ GeV.

7 Assumes associated neutrino is approximately massless.

8 ADEVA 85 analyze one-isolated-muon data and sensitive to $\tau < 10$ nanosec. Assume $B(\text{lepton}) = 0.30$, $E_{cm} = 40-47$ GeV.

9 BARTEL 83 limit is from PETRA e^+e^- experiment with average $E_{cm} = 34.2$ GeV.

10 BERGER 81B is DESY DORIS and PETRA experiment. Looking for $e^+e^- \rightarrow L^+L^-$.

11 BRANDELIK 81 is DESY-PETRA experiment. Looking for $e^+e^- \rightarrow L^+L^-$.

12 AZIMOV 80 estimated probabilities for $M + N$ type events in $e^+e^- \rightarrow L^+L^-$ deducing semi-hadronic decay multiplicities of L from e^+e^- annihilation data at $E_{cm} = (2/3)m_L$. Obtained above limit comparing these with e^+e^- data (BRANDELIK 80).

13 BARBER 80B looked for $e^+e^- \rightarrow L^+L^-$, $L \rightarrow \nu^+ X$ with MARK-J at DESY-PETRA.

14 ROTHE 69 examines previous data on μ pair production and π and K decays.

Stable Charged Heavy Lepton (L^\pm) MASS LIMITS

Neutrino Properties

NEUTRINO PROPERTIES

Revised July 2021 by P. Vogel (Caltech) and A. Piepke (University of Alabama).

The Neutrino Properties Listings concern measurements of various properties of neutrinos. Nearly all of the measurements, so far only limits, actually concern superpositions of the mass

eigenstates nu_i, which are in turn related to the weak eigenstates nu_e, via the neutrino mixing matrix

|nu_e> = sum_i U_ei |nu_i>

In the analogous case of quark mixing via the CKM matrix, the smallness of the off-diagonal terms (small mixing angles) permits a "dominant eigenstate" approximation. However, the results of neutrino oscillation searches show that the mixing matrix contains two large mixing angles and a third angle that is not exceedingly small. We cannot therefore associate any particular state |nu_i> with any particular lepton label e, mu or tau. Nevertheless, note that in the standard labeling the |nu_1> has the largest |nu_e> component (~2/3), |nu_2> contains ~1/3 of the |nu_e> component and |nu_3> contains only a small ~2.5% |nu_e> component.

Neutrinos are produced in weak decays with a definite lepton flavor, and are typically detected by the charged current weak interaction again associated with a specific lepton flavor. Hence, the listings for the neutrino mass that follow are separated into the three associated charged lepton categories. Other properties (mean lifetime, magnetic moment, charge and charge radius) are no longer separated this way. If needed, the associated lepton flavor is reported in the footnotes.

Measured quantities (mass-squared, magnetic moments, mean lifetimes, etc.) all depend upon the mixing parameters |U_ei|^2, but to some extent also on experimental conditions (e.g., on energy resolution). Many of these observables, in particular mass-squared, cannot distinguish between Dirac and Majorana neutrinos and are unaffected by CP phases.

Direct neutrino mass measurements are usually based on the analysis of the kinematics of charged particles (leptons, pions) emitted together with neutrinos (flavor states) in various weak decays. The most sensitive neutrino mass measurement to date, involving electron type antineutrinos, is based on fitting the shape of the beta spectrum. The quantity m_nu_e^2(eff) = sum_i |U_ei|^2 m_nu_i^2 is determined or constrained, where the sum is over all mass eigenvalues m_nu_i that are too close together to be resolved experimentally. (The quantity m_nu_e^2(eff) is often denoted <m_beta> in the literature.) If the energy resolution is better than Delta m_ij^2 = m_nu_i^2 - m_nu_j^2, the corresponding heavier m_nu_i and mixing parameter could be determined by fitting the resulting spectral anomaly (step or kink).

The dependence of m_nu_e on the mass of the lightest neutrino is shown in Fig. 14.11 of the Neutrino Masses, Mixing, and Oscillations review. In the case of inverted ordering there is a minimum possible value of m_nu_e^2(eff), approximately sqrt(Delta m_32^2) ~ 50 meV. If m_nu_e^2(eff) is found to be larger than this value, it is impossible, based on this information only, to decide which ordering is realized in nature. On the other hand, if the m_nu_e^2(eff) is less than ~50 meV, only the normal mass ordering is possible.

A limit on m_nu_e^2(eff) implies an upper limit on the minimum value m_min^2 of m_nu_i^2, independent of the mixing parameters U_ei:

Lepton Particle Listings

Neutrino Properties

$m_{min}^2 \leq m_{\nu_e}^{2(eff)}$. However, if and when the value of $m_{\nu_e}^{2(eff)}$ is determined then its combination with the results derived from neutrino oscillations that give us the values of the neutrino mass-squared differences $\Delta m_{ij}^2 \equiv m_i^2 - m_j^2$, including eventually also their signs, and the mixing parameters $|U_{ei}|^2$, the individual neutrino mass squares $m_{\nu_j}^2 = m_{\nu_e}^{2(eff)} - \sum_i |U_{ei}|^2 \Delta m_{ij}^2$ can be determined.

So far solar, reactor, atmospheric and accelerator neutrino oscillation experiments can be consistently described using three active neutrino flavors, i.e. two mass splittings and three mixing angles. However, several experiments with radioactive sources, reactors, and accelerators imply the possible existence of one or more non-interacting, i.e. sterile, neutrino species that might be observable since they couple, albeit weakly, to the flavor neutrinos $|\nu_l\rangle$. In that case, the neutrino mixing matrix would be $n \times n$ unitary matrix with $n > 3$.

Combined three neutrino analyses determine the squared mass differences and all three mixing angles to within reasonable accuracy. For given $|\Delta m_{ij}^2|$ a limit on $m_{\nu_e}^{2(eff)}$ from beta decay defines an upper limit on the maximum value m_{max} of m_{ν_i} : $m_{max}^2 \leq m_{\nu_e}^{2(eff)} + \sum_{i < j} |\Delta m_{ij}^2|$. The analysis of the low energy beta decay of tritium, combined with the oscillation results, thus limits *all* active neutrino masses. Traditionally, experimental neutrino mass limits obtained from pion decay $\pi^+ \rightarrow \mu^+ + \nu_\mu$ or the shape of the spectrum of decay products of the τ lepton did not distinguish between flavor and mass eigenstates. These results are reported as limits of the μ and τ based neutrino mass. After the determination of the $|\Delta m_{ij}^2|$'s and the mixing angles θ_{ij} , the corresponding neutrino mass limits are no longer competitive with those derived from low energy beta decays.

The spread of arrival times of the neutrinos from SN1987A, coupled with the measured neutrino energies, provided a time-of-flight limit on a quantity similar to $\langle m_\beta \rangle \equiv \sqrt{m_{\nu_e}^{2(eff)}}$. This statement, clothed in various degrees of sophistication, has been the basis for a very large number of papers. The resulting limits, however, are no longer comparable with the limits from tritium beta decay.

Constraint, or eventually a value, of the sum of the neutrino masses m_{tot} can be determined from the analysis of the cosmic microwave background anisotropy, combined with the galaxy redshift surveys and other data. These limits are reported in a separate table (Sum of Neutrino Masses, m_{tot}). Obviously, m_{tot} represents an upper limit for all m_i values. Note that many reported m_{tot} limits are considerably more stringent than the listed $m_{\nu_e}^{eff}$ limits. Discussion concerning the model dependence of the m_{tot} limit is continuing.

⚡ MASS (electron based)

Those limits given below are for the square root of $m_{\nu_e}^{2(eff)} \equiv \sum_i |U_{ei}|^2 m_{\nu_i}^2$. Limits that come from the kinematics of ${}^3\text{H} \beta\text{-}\tau$ decay are the

square roots of the limits for $m_{\nu_e}^{2(eff)}$. Obtained from the measurements reported in the Listings for "⚡ Mass Squared," below.

1 AKER 19 report a neutrino mass limit, derived from the first month of data collected by the KATRIN tritium endpoint experiment. The analysis of the electron kinematics shows no evidence for neutrino mass. The quoted result is based on a Bayesian analysis of the data. Using the method of Feldman and Cousins, the derived upper limit is < 0.8 eV at 90% C.L.

2 ASEEV 11 report the analysis of the entire beta endpoint data, taken with the Troitsk integrating electrostatic spectrometer between 1997 and 2002 (some of the earlier runs were rejected), using a windowless gaseous tritium source. The fitted value of m_ν , based on the method of Feldman and Cousins, is obtained from the upper limit of the fit for m_ν^2 . Previous analysis problems were resolved by careful monitoring of the tritium gas column density. Supersedes LOBASHEV 99 and BELESEV 95.

3 PAGLIAROLI 10 is critical of the likelihood method used by LOREDO 02.

4 KRAUS 05 is a continuation of the work reported in WEINHEIMER 99. This result represents the final analysis of data taken from 1997 to 2001. Various sources of systematic uncertainties have been identified and quantified. The background has been reduced compared to the initial running period. A spectral anomaly at the endpoint, reported in LOBASHEV 99, was not observed.

5 ARNABOLDI 03A *et al.* report kinematical neutrino mass limit using β -decay of ${}^{187}\text{Re}$. Bolometric AgReO₄ micro-calorimeters are used. Mass bound is substantially weaker than those derived from tritium β -decays but has different systematic uncertainties.

6 LOREDO 02 updates LOREDO 89.

7 LOBASHEV 99 report a new measurement which continues the work reported in BELESEV 95. This limit depends on phenomenological fit parameters used to derive their best fit to m_ν^2 , making an unambiguous interpretation difficult. See the footnote under "⚡ Mass Squared."

8 WEINHEIMER 99 presents two analyses which exclude the spectral anomaly and result in an acceptable m_ν^2 . We report the most conservative limit, but the other is nearly the same. See the footnote under "⚡ Mass Squared."

9 BELESEV 95 (Moscow) use an integral electrostatic spectrometer with adiabatic magnetic collimation and a gaseous tritium sources. A fit to a normal Kurie plot above 18300-18350 eV (to avoid a low-energy anomaly) plus a monochromatic line 7-15 eV below the endpoint yields $m_\nu^2 = -4.1 \pm 10.9$ eV², leading to this Bayesian limit.

10 CHING 95 quotes results previously given by SUN 93; no experimental details are given. A possible explanation for consistently negative values of m_ν^2 is given.

11 HIDDEMANN 95 (Munich) experiment uses atomic tritium embedded in a metal-dioxide lattice. Bayesian limit calculated from the weighted mean $m_\nu^2 = 221 \pm 4244$ eV² from the two runs listed below.

12 STOEFFL 95 (LLNL) result is the Bayesian limit obtained from the m_ν^2 errors given below but with m_ν^2 set equal to 0. The anomalous endpoint accumulation leads to a value of m_ν^2 which is negative by more than 5 standard deviations.

13 WEINHEIMER 93 (Mainz) is a measurement of the endpoint of the tritium β spectrum using an electrostatic spectrometer with a magnetic guiding field. The source is molecular tritium frozen onto an aluminum substrate.

14 HOLZSCHUH 92B (Zurich) result is obtained from the measurement $m_\nu^2 = -24 \pm 48 \pm 61$ (1 σ errors), in eV², using the PDG prescription for conversion to a limit in m_ν .

15 KAWAKAMI 91 (Tokyo) experiment uses tritium-labeled arachidic acid. This result is the Bayesian limit obtained from the m_ν^2 limit with the errors combined in quadrature. This was also done in ROBERTSON 91, although the authors report a different procedure.

16 ROBERTSON 91 (LANL) experiment uses gaseous molecular tritium. The result is in strong disagreement with the earlier claims by the ITPP group [LUBIMOV 80, BORIS 87 (+ BORIS 88 erratum)] that m_ν lies between 17 and 40 eV. However, the probability of a positive m^2 is only 3% if statistical and systematic error are combined in quadrature.

17 See also comment in BORIS 87B and erratum in BORIS 88.

$\bar{\nu}$ MASS SQUARED (electron based)

Given troubling systematics which result in improbably negative estimators of $m_{\nu_e}^{2(\text{eff})} \equiv \sum_i |U_{ei}|^2 m_{\nu_i}^2$, in many experiments, we use only KRAUS 05, LOBASHEV 99, and AKER 19 for our average.

Table with columns: VALUE (eV^2), DOCUMENT ID, TECN, COMMENT. Includes 'OUR AVERAGE' and various experimental data points.

- 1 AKER 19 use the first month of data collected by the KATRIN experiment to determine m_nu_e^2. The result is consistent with a neutrino mass of zero and is used to place a limit on m_nu_e.
2 ASEEV 11 report the analysis of the entire beta endpoint data, taken with the Troitsk integrating electrostatic spectrometer between 1997 and 2002, using a windowless gaseous tritium source.
3 KRAUS 05 is a continuation of the work reported in WEINHEIMER 99. This result represents the final analysis of data taken from 1997 to 2001.
4 LOBASHEV 99 report a new measurement which continues the work reported in BELESEV 95. The data were corrected for electron trapping effects in the source, eliminating the dependence of the fitted neutrino mass on the fit interval.
5 WEINHEIMER 99 is a continuation of the work reported in WEINHEIMER 93. Using a lower temperature of the frozen tritium source eliminated the dewetting of the T2 film, which introduced a dependence of the fitted neutrino mass on the fit interval in the earlier work.
6 BELESEV 95 (Moscow) use an integral electrostatic spectrometer with adiabatic collimation and a gaseous tritium sources.
7 HIDDEMANN 95 (Munich) experiment uses atomic tritium embedded in a metal-dioxide lattice.
8 STOEFFL 95 (LLNL) uses a gaseous source of molecular tritium.
9 SUN 93 uses a tritiated hydrocarbon source.
10 WEINHEIMER 93 (Mainz) is a measurement of the endpoint of the tritium beta spectrum using an electrostatic spectrometer with a magnetic guiding field.
11 HOLZSCHUH 92B (Zurich) source is a monolayer of tritiated hydrocarbon.
12 KAWAKAMI 91 (Tokyo) experiment uses tritium-labeled arachidic acid.
13 ROBERTSON 91 (LANL) experiment uses gaseous molecular tritium. The result is in strong disagreement with the earlier claims by the ITEP group [LUBIMOV 80, BORIS 87 (+ BORIS 88 erratum)] that m_nu_e lies between 17 and 40 eV. However, the probability of a positive m_nu_e^2 is only 3% if statistical and systematic error are combined in quadrature.

ν MASS (electron based)

These are measurement of m_nu_nu (in contrast to m_T, given above). The masses can be different for a Dirac neutrino in the absence of CPT invariance. The possible distinction between nu and anti-nu properties is usually ignored elsewhere in these Listings.

Table with columns: VALUE (eV), CL%, DOCUMENT ID, TECN, COMMENT. Includes YASUMI 94 and SPRINGER 87.

ν MASS (muon based)

Limits given below are for the square root of the mass squared $m_{\nu_\mu}^{2(\text{eff})} \equiv \sum_i |U_{\mu i}|^2 m_{\nu_i}^2$.

In some of the COSM papers listed below, the authors did not distinguish between weak and mass eigenstates.

OUR EVALUATION is based on OUR AVERAGE for the pi+ mass and the ASSAMAGAN 96 value for the muon momentum for the pi+ decay at rest. The limit is calculated using the unified classical analysis of FELDMAN 98 for a Gaussian distribution near a physical boundary. WARNING: since m_nu_mu^2(eff) is calculated from the differences of large numbers, it and the corresponding limits are extraordinarily sensitive to small changes in the pion mass, the decay muon momentum, and their errors. For example, the limits obtained using JECKELMANN 94, LENZ 98, and the weighted averages are 0.15, 0.29, and 0.19 MeV, respectively.

Table with columns: VALUE (MeV), CL%, DOCUMENT ID, TECN, COMMENT. Includes ASSAMAGAN 96, DOLGOV 95, ENQVIST 93, FULLER 91, LAM 91, ANDERHUB 82, CLARK 74.

- 1 ASSAMAGAN 96 measurement of p_mu from pi+ -> mu+ nu at rest combined with JECKELMANN 94 Solution B pion mass yields m_nu_mu^2 = -0.016 +/- 0.023 with corresponding Bayesian limit listed above. If Solution A is used, m_nu_mu^2 = -0.143 +/- 0.024 MeV^2. Replaces ASSAMAGAN 94.
2 DOLGOV 95 removes earlier assumptions (DOLGOV 93) about thermal equilibrium below T_QCD for wrong-helicity Dirac neutrinos (ENQVIST 93, FULLER 91) to set more stringent limits.
3 ENQVIST 93 bases limit on the fact that thermalized wrong-helicity Dirac neutrinos would speed up expansion of early universe, thus reducing the primordial abundance. FULLER 91 exploits the same mechanism but in the older calculation obtains a larger production rate for these states, and hence a lower limit. Neutrino lifetime assumed to exceed nucleosynthesis time, ~ 1 s.
4 Assumes neutrino lifetime > 1s. For Dirac neutrinos only. See also ENQVIST 93.
5 ANDERHUB 82 kinematics is insensitive to the pion mass.

ν MASS (tau based)

The limits given below are the square roots of limits for m_nu_tau^2(eff) = sum_i |U_tau i|^2 m_nu_i^2.

In some of the ASTR and COSM papers listed below, the authors did not distinguish between weak and mass eigenstates.

Table with columns: VALUE (MeV), CL%, EVTS, DOCUMENT ID, TECN, COMMENT. Includes BARATE 98F, ATHANAS 00, ACKERSTAFF 98T, AMMAR 98, ANASTASSOV 97, FIELDS 97, SWAIN 97, ALEXANDER 96M, BOTTINO 96, HANNESTAD 96C, SOBIE 96, BUSKULIC 95H, DOLGOV 95, SIGL 95, DODELSON 94, KAWASAKI 94, PERES 94, CINABRO 93, DOLGOV 93, ENQVIST 93.

- ¹ BARATE 98F result based on kinematics of $2939 \tau^- \rightarrow 2\pi^- \pi^+ \nu_\tau$ and $52 \tau^- \rightarrow 3\pi^- 2\pi^+ (\pi^0) \nu_\tau$ decays. If possible 2.5% excited a_1 decay is included in 3-prong sample analysis, limit increases to 19.2 MeV.
- ² ATHANAS 00 bound comes from analysis of $\tau^- \rightarrow \pi^- \pi^+ \pi^- \pi^0 \nu_\tau$ decays.
- ³ ACKERSTAFF 98T use $\tau \rightarrow 5\pi^\pm \nu_\tau$ decays to obtain a limit of 43.2 MeV (95%CL). They combine this with ALEXANDER 96M value using $\tau \rightarrow 3h^\pm \nu_\tau$ decays to obtain quoted limit.
- ⁴ AMMAR 98 limit comes from analysis of $\tau^- \rightarrow 3\pi^- 2\pi^+ \nu_\tau$ and $\tau^- \rightarrow 2\pi^- \pi^+ 2\pi^0 \nu_\tau$ decay modes.
- ⁵ ANASTASSOV 97 derive limit by comparing their m_τ measurement (which depends on m_{ν_τ}) to BAL 96 m_τ threshold measurement.
- ⁶ FIELDS 97 limit for a Dirac neutrino. For a Majorana neutrino the mass region < 0.93 or > 31 MeV is excluded. These bounds assume $N_\nu < 4$ from nucleosynthesis; a wider excluded region occurs with a smaller N_ν upper limit.
- ⁷ SWAIN 97 derive their limit from the Standard Model relationships between the tau mass, lifetime, branching fractions for $\tau^- \rightarrow e^- \bar{\nu}_e \nu_\tau$, $\tau^- \rightarrow \mu^- \bar{\nu}_\mu \nu_\tau$, $\tau^- \rightarrow \pi^- \nu_\tau$, and $\tau^- \rightarrow K^- \nu_\tau$, and the muon mass and lifetime by assuming lepton universality and using world average values. Limit is reduced to 48 MeV when the CLEO τ mass measurement (BALEST 93) is included; see CLEO's more recent m_{ν_τ} limit (ANASTASSOV 97). Consideration of mixing with a fourth generation heavy neutrino yields $\sin^2 \theta_L < 0.016$ (95%CL).
- ⁸ ALEXANDER 96M bound comes from analyses of $\tau^- \rightarrow 3\pi^- 2\pi^+ \nu_\tau$ and $\tau^- \rightarrow h^- h^- h^+ \nu_\tau$ decays.
- ⁹ BOTTINO 96 assumes three generations of neutrinos with mixing, finds consistency with massless neutrinos with no mixing based on 1995 data for masses, lifetimes, and leptonic partial widths.
- ¹⁰ HANNESTAD 96c limit is on the mass of a Majorana neutrino. This bound assumes $N_\nu < 4$ from nucleosynthesis. A wider excluded region occurs with a smaller N_ν upper limit. This paper is the corrected version of HANNESTAD 96; see the erratum: HANNESTAD 96b.
- ¹¹ SOBIE 96 derive their limit from the Standard Model relationship between the tau mass, lifetime, and leptonic branching fraction, and the muon mass and lifetime, by assuming lepton universality and using world average values.
- ¹² BUSKULIC 95H bound comes from a two-dimensional fit of the visible energy and invariant mass distribution of $\tau \rightarrow 5\pi(\pi^0) \nu_\tau$ decays. Replaced by BARATE 98F.
- ¹³ DOLGOV 95 removes earlier assumptions (DOLGOV 93) about thermal equilibrium below T_{QCD} for wrong-helicity Dirac neutrinos (ENQVIST 93, FULLER 91) to set more stringent limits. DOLGOV 96 argues that a possible window near 20 MeV is excluded.
- ¹⁴ SIGL 95 exclude massive Dirac or Majorana neutrinos with lifetimes between 10^{-3} and 10^8 seconds if the decay products are predominantly γ or e^+e^- .
- ¹⁵ DODELSON 94 calculate constraints on ν_τ mass and lifetime from nucleosynthesis for 4 generic decay modes. Limits depend strongly on decay mode. Quoted limit is valid for all decay modes of Majorana neutrinos with lifetime greater than about 300s. For Dirac neutrinos limits change to < 0.3 or > 33 .
- ¹⁶ KAWASAKI 94 excluded region is for Majorana neutrino with lifetime > 1000 s. Other limits are given as a function of ν_τ lifetime for decays of the type $\nu_\tau \rightarrow \nu_\mu \phi$ where ϕ is a Nambu-Goldstone boson.
- ¹⁷ PERES 94 used PDG 92 values for parameters to obtain a value consistent with mixing. Reexamination by BOTTINO 96 which included radiative corrections and 1995 PDG parameters resulted in two allowed regions, $m_3 < 70$ MeV and 140 MeV $m_3 < 149$ MeV.
- ¹⁸ CINABRO 93 bound comes from analysis of $\tau^- \rightarrow 3\pi^- 2\pi^+ \nu_\tau$ and $\tau^- \rightarrow 2\pi^- \pi^+ 2\pi^0 \nu_\tau$ decay modes.
- ¹⁹ DOLGOV 93 assumes neutrino lifetime > 100 s. For Majorana neutrinos, the low mass limit is 0.5 MeV. KAWANO 92 points out that these bounds can be overcome for a Dirac neutrino if it possesses a magnetic moment. See also DOLGOV 96.
- ²⁰ ENQVIST 93 bases limit on the fact that thermalized wrong-helicity Dirac neutrinos would speed up expansion of early universe, thus reducing the primordial abundance. FULLER 91 exploits the same mechanism but in the older calculation obtains a larger production rate for these states, and hence a lower limit. Neutrino lifetime assumed to exceed nucleosynthesis time, ~ 1 s.
- ²¹ ALBRECHT 92M reports measurement of a slightly lower τ mass, which has the effect of reducing the ν_τ mass reported in ALBRECHT 88B. Bound is from analysis of $\tau^- \rightarrow 3\pi^- 2\pi^+ \nu_\tau$ mode.
- ²² Assumes neutrino lifetime > 1 s. For Dirac neutrinos. See also ENQVIST 93.
- ²³ KOLB 91 exclusion region is for Dirac neutrino with lifetime > 1 s; other limits are given.

Revised August 2021 by K.A. Olive (University of Minnesota).

Neutrinos decouple from thermal equilibrium in the early universe at temperatures $\mathcal{O}(1)$ MeV. The limits on low mass ($m_\nu \lesssim 1$ MeV) neutrinos apply to m_{tot} given by

$$m_{\text{tot}} = \sum_{\nu} m_{\nu} .$$

Stable neutrinos in this mass range decouple from the thermal bath while still relativistic and make a contribution to the total energy density of the Universe which is given by

$$\rho_\nu = m_{\text{tot}} n_\nu \simeq m_{\text{tot}} (3/11) (3.045/3)^{3/4} n_\gamma ,$$

where the factor 3/11 is the ratio of (light) neutrinos to photons and the factor $(3.045/3)^{3/4}$ corrects for the fact that the effective number of neutrinos in the standard model is 3.045 when taking into account e^+e^- annihilation during neutrino decoupling. Writing $\Omega_\nu = \rho_\nu/\rho_c$, where ρ_c is the critical energy density of the Universe, and using $n_\gamma = 410.7 \text{ cm}^{-3}$, we have

$$\Omega_\nu h^2 \simeq m_{\text{tot}} / (93 \text{ eV}) .$$

While an upper limit to the matter density of $\Omega_m h^2 < 0.12$ would constrain $m_{\text{tot}} < 11$ eV, much stronger constraints are obtained from the observations of the CMB, combined with lensing and baryon acoustic oscillations data. These combine to give an upper limit of around 0.12 eV, and may, in the near future, be able to provide a lower bound on the sum of the neutrino masses. The current lower bound of $m_{\text{tot}} > 0.06$ eV implies a lower limit of $\Omega_\nu h^2 > 6 \times 10^{-4}$. See our review on "Neutrinos in Cosmology" for more details.

SUM OF THE NEUTRINO MASSES, m_{tot}

This is a sum of the neutrino masses, m_{tot} , as defined in the above note, of effectively stable neutrinos, i.e. those with mean lifetimes on cosmological scales. When necessary, we have generalized the results reported so they apply to m_{tot} . For other limits, see SZALAY 76, VYSOTSKY 77, BERNSTEIN 81, FREESE 84, SCHRAMM 84, and COWSIK 85. For more information see a note on "Neutrinos in Cosmology" in this Review.

- 1 ABBOTT 21A combines Dark Energy Survey (DES) year 3 results with Planck CMB lensing measurements.
- 2 ALAM 21 limit on the sum of neutrino masses by the eBOSS collaboration is based on galaxy, quasar, and Lyman- α 3D clustering data combined with Planck temperature and polarization CMB and supernovae data.
- 3 DI-VALENTINO 21 combines CMB temperature and polarization, SNIa luminosity distances and baryon acoustic oscillations data.
- 4 GARNY 21 employs a model for the Lyman- α flux power spectrum to set a limit using BOSS data. When combined with Planck CMB temperature and polarization data, a 95% CL range 0.10–0.13 eV is found.
- 5 STOCKER 21 use terrestrial and cosmological experiments to set a 95% CL range on the sum of neutrino masses of 0.058–0.139 eV for normal ordering and 0.098–0.174 eV for inverse ordering. They also set an upper limit of 0.037 eV (NO) and 0.042 eV (IO) for the lightest neutrino mass.
- 6 AGHANIM 20 limit on the sum of neutrino masses from Planck data combined with lensing and baryon acoustic oscillations (BAO). Without BAO, the limit relaxes to <0.24 eV. Several other limits are quoted based on different combinations of data.
- 7 CHOUDHURY 20 combines 2018 Planck CMB temperature and polarization data plus lensing, together with baryon acoustic oscillation data from BOSS, MGS, and 6dFGS. Assumes Λ CDM model. The upper limit is 0.17 eV for the inverted hierarchy, and 0.12 eV for degenerate neutrinos. Limits are also derived for extended cosmological models.
- 8 IVANOV 20 combines 2018 Planck CMB data with baryon acoustic oscillation data from BOSS. This study is based on a full-shape likelihood for the redshift-space galaxy power spectrum of the BOSS data.
- 9 PALANQUE-DELABROUILLE 20 combine Lyman alpha and Planck temperature and polarization data. Limit improves to 0.09 eV when CMB lensing and baryon acoustic oscillation data are included.
- 10 LOUREIRO 19 combines data from large scale structure, cosmic microwave background, type Ia supernovae and big bang nucleosynthesis using physically motivated neutrino mass models.
- 11 UPADHYE 19 uses the shape of the BOSS redshift-space galaxy power spectrum in combination with the CMB, and supernovae data. Limit weakens to < 0.54 eV if the dark energy equation of state is allowed to vary.
- 12 CHOUDHURY 18 combines 2015 Planck CMB temperature data, information from the optical depth to reionization from Planck 2016 intermediate results together with baryon acoustic oscillation data from BOSS, MGS, and 6dFGS as well as supernovae Type Ia data from the Pantheon Sample. The limit is strengthened to 0.118 eV when high- l CMB polarization data is also included.
- 13 SIMPSON 17 uses a combination of laboratory and cosmological measurements to determine the light neutrino masses and argue that there is strong evidence for the normal mass ordering.
- 14 Combines temperature anisotropies of the CMB from Planck with data on baryon acoustic oscillations and the optical depth to reionization. Limit is strengthened to 0.118 when high multipole polarization data is included. Updates GIUSARMA 16.
- 15 Constrains the total mass of neutrinos using the Lyman-alpha forest power spectrum with BOSS (mid-resolution), XQ-100 (high-resolution) and CMB. Without the CMB data, the limit relaxes to 0.8 eV. Supersedes PALANQUE-DELABROUILLE 15A.
- 16 Constrains the total mass of neutrinos from Planck CMB data combined with baryon acoustic oscillation and Planck cluster data.
- 17 Constrains the total mass of neutrinos from BAO data from SDSS-III/BOSS combined with CMB data from Planck. Limit quoted for normal mass hierarchy. The limit for the inverted mass hierarchy is 0.20 eV and for the degenerate mass hierarchy it is 0.15 eV.
- 18 ROSSI 15 sets limits on the sum of neutrino masses using BOSS Lyman alpha forest data combined with Planck CMB data and baryon acoustic oscillations.
- 19 Constrains the total mass of neutrinos from Planck CMB data along with WMAP polarization, high l , and BAO data.
- 20 Finite neutrino mass fit to resolve discrepancy between CMB and lensing measurements.
- 21 Fit to the total mass of neutrinos from BOSS data along with WMAP CMB data and data from other BAO constraints and weak lensing.
- 22 Fit to the total mass of neutrinos from Planck CMB data along with BAO.
- 23 Constrains the total mass of neutrinos from Planck CMB data combined with baryon acoustic oscillation data from BOSS and HST data on the Hubble parameter.
- 24 Fit based on the SPT-SZ survey combined with CMB, BAO, and H_0 data.
- 25 Constraints the total mass of neutrinos (marginalizing over the effective number of neutrino species) from CMB, CMB lensing, BAO, and galaxy clustering data.

- 26 Constrains the total mass of neutrinos from Planck CMB data combined with baryon acoustic oscillation data from BOSS, 6dFGS, SDSS, WiggleZ data on the galaxy power spectrum, and HST data on the Hubble parameter. The limit is increased to 0.25 eV if a lower bound to the sum of neutrino masses of 0.04 eV is assumed.
- 27 Constrains the total mass of neutrinos from observational Hubble parameter data with seven-year WMAP data and the most recent estimate of H_0 .
- 28 Constrains the total mass of neutrinos from the CFHTLS combined with seven-year WMAP data and a prior on the Hubble parameter. Limit is relaxed to 0.41 eV when small scales affected by non-linearities are removed.
- 29 Constrains the total mass of neutrinos from the Sloan Digital Sky Survey and the five-year WMAP data.
- 30 Constrains the total mass of neutrinos from the 7-year WMAP data including SDSS and HST data. Limit relaxes to 1.19 eV when CMB data is used alone. Supersedes HANNESTAD 06.
- 31 Constrains the total mass of neutrinos from a combination of CMB data, a recent measurement of H_0 (SHOES), and baryon acoustic oscillation data from SDSS.
- 32 Constrains the total mass of neutrinos from SDSS MegaZ LRG DR7 galaxy clustering data combined with CMB, HST, supernovae and baryon acoustic oscillation data. Limit relaxes to 0.47 eV when the equation of state parameter, $w \neq -1$.
- 33 Constrains the total mass of neutrinos from weak lensing measurements when combined with CMB. Limit improves to 0.54 eV when supernovae and baryon acoustic oscillation observations are included. Assumes Λ CDM model.
- 34 Constrains the total mass of neutrinos from five-year WMAP data. Limit improves to 0.67 eV when supernovae and baryon acoustic oscillation observations are included. Limits quoted assume the Λ CDM model. Supersedes SPERGEL 07.
- 35 Constrains the total mass of neutrinos from weak lensing measurements when combined with CMB. Limit improves to $0.03 < \Sigma m_\nu < 0.54$ eV when supernovae and baryon acoustic oscillation observations are included. The slight preference for massive neutrinos at the two-sigma level disappears when systematic errors are taken into account. Assumes Λ CDM model.
- 36 Constrains the total mass of neutrinos from recent Chandra X-ray observations of galaxy clusters when combined with CMB, supernovae, and baryon acoustic oscillation measurements. Assumes flat universe and constant dark-energy equation of state, w .
- 37 Constraints the total mass of neutrinos from recent CMB and SOSS LRG power spectrum data along with bias mass relations from SDSS, DEEP2, and Lyman-Break Galaxies. It assumes Λ CDM model. Limit degrades to 0.59 eV in a more general w CDM model.
- 38 Constrains the total mass of neutrinos from neutrino oscillation experiments and cosmological data. The most conservative limit uses only WMAP three-year data, while the most stringent limit includes CMB, large-scale structure, supernova, and Lyman-alpha data.
- 39 Constrains the total mass of neutrinos from recent CMB, large scale structure, SNIa, and baryon acoustic oscillation data. The limit relaxes to 1.75 when WMAP data alone is used with no prior. Paper shows results with several combinations of data sets. Supersedes KRISTIANSEN 06.
- 40 Constrains the total mass of neutrinos from the CMB and the large scale structure data. The most conservative limit is obtained when generic initial conditions are allowed.
- 41 Constrains the total mass of neutrinos from recent CMB, large scale structure, Lyman-alpha forest, and SNIa data.
- 42 Constrains the total mass of neutrinos from recent CMB and large scale structure data. See also GOOBAR 06. Superseded by HANNESTAD 10.
- 43 Constrains the total mass of neutrinos from the CMB and the final 2dF Galaxy Redshift Survey.
- 44 Constrains the total mass of neutrinos from the CMB experiments alone, assuming Λ CDM Universe. FUKUGITA 06 show that this result is unchanged by the 3-year WMAP data.
- 45 Constrains the total mass of neutrinos from the power spectrum of fluctuations derived from the Sloan Digital Sky Survey and the 2dF galaxy redshift survey, WMAP and 27 other CMB experiments and measurements by the HST Key project.
- 46 Constrains the total mass of neutrinos from the power spectrum of fluctuations derived from the Sloan Digital Sky Survey, the 2dF galaxy redshift survey, WMAP and ACBAR. The limit is strengthened to 0.6 eV when measurements by the HST Key project and supernovae data are included.
- 47 Constrains the fractional contribution of neutrinos to the total matter density in the Universe from WMAP data combined with other CMB measurements, the 2dFGRS data, and Lyman α data. The limit does not noticeably change if the Lyman α data are not used.
- 48 LEWIS 02 constrains the total mass of neutrinos from the power spectrum of fluctuations derived from the CMB, HST Key project, 2dF galaxy redshift survey, supernovae type Ia, and BBN.
- 49 WANG 02 constrains the total mass of neutrinos from the power spectrum of fluctuations derived from the CMB and other cosmological data sets such as galaxy clustering and the Lyman α forest.
- 50 FUKUGITA 00 is a limit on neutrino masses from structure formation. The constraint is based on the clustering scale σ_8 and the COBE normalization and leads to a conservative limit of 0.9 eV assuming 3 nearly degenerate neutrinos. The quoted limit is on the sum of the light neutrino masses.
- 51 CROFT 99 result based on the power spectrum of the Ly α forest. If $\Omega_{\text{matter}} < 0.5$, the limit is improved to $m_\nu < 2.4 (\Omega_{\text{matter}}/0.17-1)$ eV.

Limits on MASSES of Light Stable Right-Handed ν (with necessarily suppressed interaction strengths)

- CAPRINI 05 limit derived from the lack of a charge asymmetry in the universe. Limit assumes that charge asymmetries between particles are not anti-correlated.
- ABE 20E obtains this result by assuming that the low-energy excess events in the XMAS detector are produced by neutrino millicharge which is common for all three neutrino flavors.
- KHAN 20 performed a constrained spectral fit analysis of the excess observed in the electron recoil energy spectrum by the XENON1T experiment. This range of neutrino millicharge values is one of the possible interpretations of these excess events. For the individual flavor constraints at 90% C.L. see the original reference.
- DELLA-VALLE 16 obtain a limit on the charge of neutrinos valid for masses of less than 10 MeV. For heavier neutrinos the limit increases as a power of mass, reaching $10^{-6} e$ for $m = 100 \text{ meV}$.
- CHEN 14A use the Multi-Configuration RPPA method to analyze reactor $\bar{\nu}_e$ scattering on Ge atoms with 300 eV recoil energy threshold to obtain this limit.
- STUDENIKIN 14 uses the limit on μ_ν from BEDA 13 and the 2.8 keV threshold of the electron recoil energy to obtain this limit.
- GNINENKO 07 use limit on $\bar{\nu}_e$ magnetic moment from LI 03b to derive this result. The limit is considerably weaker than the limits on the charge of ν_e and $\bar{\nu}_e$ from various astrophysics considerations.
- This RAFFELT 99 limit applies to all neutrino flavors which are light enough (<5 keV) to be emitted from globular-cluster red giants.
- This RAFFELT 99 limit is derived from the helioseismological limit on a new energy-loss channel of the Sun, and applies to all neutrino flavors which are light enough (<1 keV) to be emitted from the sun.
- BABU 94 use COOPER-SARKAR 92 limit on ν magnetic moment to derive quoted result. It applies to ν_τ .
- DAVIDSON 91 use data from early SLAC electron beam dump experiment to derive charge limit as a function of neutrino mass. It applies to ν_τ .
- Exact BARBIELLINI 87 limit depends on assumptions about the intergalactic or galactic magnetic fields and about the direct distance and time through the field. It applies to ν_e .
- The limit applies to all flavors.

ν (MEAN LIFE) / MASS

Measures $[\sum |U_{ej}|^2 \Gamma_j m_j]^{-1}$, where the sum is over mass eigenstates which cannot be resolved experimentally. Some of the limits constrain the radiative decay and are based on the limit of the corresponding photon flux. Other apply to the decay of a heavier neutrino into the lighter one and a Majoron or other invisible particle. Many of these limits apply to any ν within the indicated mass range.

Limits on the radiative decay are either directly based on the limits of the corresponding photon flux, or are derived from the limits on the neutrino magnetic moments. In the later case the transition rate for $\nu_i \rightarrow \nu_j + \gamma$ is constrained by $\Gamma_{ij} = \frac{1}{\tau_{ij}} = \frac{(m_i^2 - m_j^2)^3}{m_i^3} \mu_{ij}^2$, where μ_{ij} is the neutrino transition moment in the mass eigenstates basis. Typically, the limits on lifetime based on the magnetic moments are many orders of magnitude more restrictive than limits based on the nonobservation of photons.

- KRAKAUER 91 quotes the limit $\tau/m_{\nu_1} > (0.75a^2 + 21.65a + 26.3) \text{ s/eV}$, where a is a parameter describing the asymmetry in the neutrino decay defined as $dN_\nu/d\cos\theta = (1/2)(1 + a\cos\theta)$. The parameter $a = 0$ for a Majorana neutrino, but can vary from -1 to 1 for a Dirac neutrino. The bound given by the authors is the most conservative (which applies for $a = -1$).
- RAFFELT 85 limit on the radiative decay is from solar x- and γ -ray fluxes. Limit depends on ν flux from pp, now established from GALLEX and SAGE to be > 0.5 of expectation.
- REINES 74 looked for ν of nonzero mass decaying radiatively to a neutral of lesser mass + γ . Used liquid scintillator detector near fission reactor. Finds lab lifetime 6×10^7 s or more. Above value of (mean life)/mass assumes average effective neutrino energy of 0.2 MeV. To obtain the limit 6×10^7 s REINES 74 assumed that the full $\bar{\nu}_e$ reactor flux could be responsible for yielding decays with photon energies in the interval 0.1 MeV - 0.5 MeV. This represents some overestimate so their lower limit is an over-estimate of the lab lifetime (VOGEL 84). If so, OBERAUER 87 may be comparable or better.
- AHARMIM 19 quotes the limit τ/m_{ν_2} for invisible nonradiative decay of ν_2 . They obtained this result by analyzing the entire SNO dataset, allowing for the decay of ν_2 which would cause an energy-dependent distortion of the survival probability of electron-type solar neutrinos.
- AHARMIM 19 quotes the limit τ/m_{ν_2} for invisible nonradiative decay of ν_2 . They obtained this result by combining the τ/m_{ν_2} measurements from SNO and other solar neutrino experiments (Super-Kamiokande, KamLAND, and Borexino ⁸B results; Borexino and KamLAND ⁷Be results; the combined gallium interaction rate from GNO, GALLEX, and SAGE; and the chlorine interaction rate from Homestake). The quoted limit at 99% CL is $> 1.04 \times 10^{-3}$.
- ESCUDERO 19 sets limits on invisible neutrino decays using Planck 2018 data of $\tau > 1.3-0.3 \times 10^9$ s at 95% C.L. Values in the range $\tau = 2-16 \times 10^9$ s are preferred at 95% C.L. when Planck polarization data is included. Limits scale as $(m_\nu/0.05 \text{ eV})^3$.
- CECCHINI 11 search for radiative decays of solar neutrinos into visible photons during the 2006 total solar eclipse. The range of (mean life)/mass values corresponds to a range of ν_1 masses between 10^{-4} and 0.1 eV.
- MIRIZZI 07 determine a limit on the neutrino radiative decay from analysis of the maximum allowed distortion of the CMB spectrum as measured by the COBE/FIRAS. For the decay $\nu_2 \rightarrow \nu_1$ the lifetime limit is $\lesssim 4 \times 10^{20}$ s for $m_{min} \lesssim 0.14 \text{ eV}$. For transition

- with the $|\Delta m_{31}|$ mass difference the lifetime limit is $\sim 2 \times 10^{19}$ s for $m_{min} \lesssim 0.14$ eV and $\sim 5 \times 10^{20}$ s for $m_{min} \gtrsim 0.14$ eV.
- ⁹ MIRIZZI 07 determine a limit on the neutrino radiative decay from analysis of the cosmic infrared background (CIB) using the Spitzer Observatory data. For transition with the $|\Delta m_{31}|$ mass difference they obtain the lifetime limit $\sim 10^{20}$ s for $m_{min} \lesssim 0.14$ eV.
- ¹⁰ WONG 07 use their limit on the neutrino magnetic moment together with the assumed experimental value of $\Delta m_{23}^2 \sim 2 \times 10^{-3}$ eV² to obtain $\tau_{13}/m_1^3 > 3.2 \times 10^{27}$ s/eV³ for the radiative decay in the case of the inverted mass hierarchy. Similarly to RAFFELT 89 this limit can be violated if electric and magnetic moments are equal to each other. Analogous, but numerically somewhat different limits are obtained for τ_{23} and τ_{21} .
- ¹¹ XIN 05 search for the γ from radiative decay of ν_e produced by the electron capture on ⁵¹Cr. No events were seen and the limit on τ/m_ν was derived. This is a weaker limit on the decay of ν_e than KRAKAUER 91.
- ¹² XIN 05 use their limit on the neutrino magnetic moment of ν_e together with the assumed experimental value of $\Delta m_{23}^2 \sim 2 \times 10^{-3}$ eV² to obtain $\tau_{13}/m_1^3 > 1 \times 10^{23}$ s/eV³ for the radiative decay in the case of the inverted mass hierarchy. Similarly to RAFFELT 89 this limit can be violated if electric and magnetic moments are equal to each other. Analogous, but numerically somewhat different limits are obtained for τ_{23} and τ_{21} . Again, this limit is specific for ν_e .
- ¹³ AHARMIM 04 obtained these results from the solar $\bar{\nu}_e$ flux limit set by the SNO measurement assuming ν_2 decay through nonradiative process $\nu_2 \rightarrow \bar{\nu}_1 X$, where X is a Majoron or other invisible particle. Limits are given for the cases of quasidegenerate and hierarchical neutrino masses.
- ¹⁴ CECCHINI 04 obtained this bound through the observations performed on the occasion of the 21 June 2001 total solar eclipse, looking for visible photons from radiative decays of solar neutrinos. Limit is a τ/m_{ν_2} in $\nu_2 \rightarrow \nu_1 \gamma$. Limit ranges from ~ 100 to 10^7 s/eV for $0.01 < m_{\nu_1} < 0.1$ eV.
- ¹⁵ EGUCHI 04 obtained these results from the solar $\bar{\nu}_e$ flux limit set by the KamLAND measurement assuming ν_2 decay through nonradiative process $\nu_2 \rightarrow \bar{\nu}_1 X$, where X is a Majoron or other invisible particle. Limits are given for the cases of quasidegenerate and hierarchical neutrino masses.
- ¹⁶ The ratio of the lifetime over the mass derived by BANDYOPADHYAY 03 is for ν_2 . They obtained this result using the following solar-neutrino data: total rates measured in Cl and Ga experiments, the Super-Kamiokande's zenith-angle spectra, and SNO's day and night spectra. They assumed that ν_1 is the lowest mass, stable or nearly stable neutrino state and ν_2 decays through nonradiative Majoron emission process, $\nu_2 \rightarrow \bar{\nu}_1 + J$, or through nonradiative process with all the final state particles being sterile. The best fit is obtained in the region of the LMA solution.
- ¹⁷ DERBIN 02b (also BACK 03b) obtained this bound for the radiative decay from the results of background measurements with Counting Test Facility (the prototype of the Borexino detector). The laboratory gamma spectrum is given as $dN_\gamma/d\cos\theta = (1/2)(1 + \alpha\cos\theta)$ with $\alpha=0$ for a Majorana neutrino, and α varying to -1 to 1 for a Dirac neutrino. The listed bound is for the case of $\alpha=0$. The most conservative bound 1.5×10^3 s eV⁻¹ is obtained for the case of $\alpha=-1$.
- ¹⁸ The ratio of the lifetime over the mass derived by JOSHIPURA 02b is for ν_2 . They obtained this result from the total rates measured in all solar neutrino experiments. They assumed that ν_1 is the lowest mass, stable or nearly stable neutrino state and ν_2 decays through nonradiative process like Majoron emission decay, $\nu_2 \rightarrow \nu'_1 + J$ where ν'_1 state is sterile. The exact limit depends on the specific solution of the solar neutrino problem. The quoted limit is for the LMA solution.
- ¹⁹ DOLGOV 99 places limits in the (Majorana) τ -associated ν mass-lifetime plane based on nucleosynthesis. Results would be considerably modified if neutrino oscillations exist.
- ²⁰ BILLER 98 use the observed TeV γ -ray spectra to set limits on the mean life of any radiatively decaying neutrino between 0.05 and 1 eV. Curve shows $\tau_\nu/B_\gamma > 0.15 \times 10^{21}$ s at 0.05 eV, $> 1.2 \times 10^{21}$ s at 0.17 eV, $> 3 \times 10^{21}$ s at 1 eV, where B_γ is the branching ratio to photons.
- ²¹ BLUDMAN 92 sets additional limits by this method for higher mass ranges. Cosmological limits are also obtained.
- ²² Limit on the radiative decay based on nonobservation of γ 's in coincidence with ν 's from SN1987A.
- ²³ DODELSON 92 range is for wrong-helicity keV mass Dirac ν 's from the core of neutron star in SN1987A decaying to ν 's that would have interacted in KAM2 or IMB detectors.
- ²⁴ GRANEK 91 considers heavy neutrino decays to $\gamma\nu_L$ and $3\nu_L$, where $m_{\nu_L} < 100$ keV. Lifetime is calculated as a function of heavy neutrino mass, branching ratio into $\gamma\nu_L$, and m_{ν_L} .
- ²⁵ KRAKAUER 91 quotes the limit for ν_e , $\tau/m_\nu > (0.3a^2 + 9.8a + 15.9)$ s/eV, where a is a parameter describing the asymmetry in the radiative neutrino decay defined as $dN_\gamma/d\cos\theta = (1/2)(1 + a\cos\theta)$ $a=0$ for a Majorana neutrino, but can vary from -1 to 1 for a Dirac neutrino. The bound given by the authors is the most conservative (which applies for $a = -1$).
- ²⁶ WALKER 90 uses SN1987A γ flux limits after 289 days.
- ²⁷ CHUPP 89 should be multiplied by a branching ratio (about 1) and a detection efficiency (about 1/4), and pertains to radiative decay of any neutrino to a lighter or sterile neutrino.
- ²⁸ RAFFELT 89 uses KYULDJIEV 84 to obtain $\tau m^3 > 3 \times 10^{18}$ s eV³ (based on $\bar{\nu}_e e^-$ cross sections). The bound for the radiative decay is not valid if electric and magnetic transition moments are equal for Dirac neutrinos.
- ²⁹ RAFFELT 89b analyze stellar evolution and exclude the region $3 \times 10^{12} < \tau m^3 < 3 \times 10^{21}$ s eV³.
- ³⁰ Model-dependent theoretical analysis of SN1987A neutrinos. Quoted limit is for $[\sum_j |U_{\ell j}|^2 \Gamma_j m_j]^{-1}$, where $\ell = \mu, \tau$. Limit is 3.3×10^{14} s/eV for $\ell = e$.
- ³¹ OBERAUER 87 looks for photons and $e^+ e^-$ pairs from radiative decays of reactor neutrinos.
- ³² BINETRUY 84 finds $\tau < 10^8$ s for neutrinos in a radiation-dominated universe.

- ³³ These experiments look for $\nu_k \rightarrow \nu_j \gamma$ or $\bar{\nu}_k \rightarrow \bar{\nu}_j \gamma$.
- ³⁴ STECKER 80 limit based on UV background; result given is $\tau > 4 \times 10^{22}$ s at $m_\nu = 20$ eV.
- ³⁵ FALK 78 finds lifetime constraints based on supernova energetics.
- ³⁶ COWSIK 77 considers variety of scenarios. For neutrinos produced in the big bang, present limits on optical photon flux require $\tau > 10^{23}$ s for $m_\nu \sim 1$ eV. See also COWSIK 79 and GOLDMAN 79.

ν MAGNETIC MOMENT

The coupling of neutrinos to an electromagnetic field is characterized by a 3x3 matrix λ of the magnetic (μ) and electric (d) dipole moments ($\lambda = \mu - id$). For Majorana neutrinos the matrix λ is antisymmetric and only transition moments are allowed, while for Dirac neutrinos λ is a general 3x3 matrix. In the standard electroweak theory extended to include neutrino masses (see FUJIKAWA 80) $\mu_\nu = 3eG_F m_\nu / (8\pi^2 \sqrt{2}) = 3.2 \times 10^{-19} (m_\nu / \text{eV}) \mu_B$, i.e. it is unobservably small given the known small neutrino masses. In more general models there is no longer a proportionality between neutrino mass and its magnetic moment, even though only massive neutrinos have nonvanishing magnetic moments without fine tuning.

Laboratory bounds on λ are obtained via elastic ν -e scattering, where the scattered neutrino is not observed. The combinations of matrix elements of λ that are constrained by various experiments depend on the initial neutrino flavor and on its propagation between source and detector (e.g., solar ν_e and reactor $\bar{\nu}_e$ do not constrain the same combinations). The listings below therefore identify the initial neutrino flavor.

Other limits, e.g. from various stellar cooling processes, apply to all neutrino flavors. Analogous flavor independent, but weaker, limits are obtained from the analysis of $e^+ e^- \rightarrow \nu \bar{\nu} \gamma$ collider experiments.

1 APRILE 20 observed an excess of low-energy events in the XENON1T detector, which could be interpreted as a signal produced by a neutrino magnetic moment with this magnitude.

2 AGOSTINI 17A obtained this limit using the shape of the recoil electron energy spectrum from the Borexino Phase-II 1291.5 live days of solar neutrino data and the constraints on the sum of the solar neutrino fluxes from the radiochemical gallium experiments SAGE, Gallex, and GNO. Without radiochemical constraints, the 90% C.L. limit of $4.0 \times 10^{-11} \mu_B$ is obtained.

3 BEDA 13 report $\bar{\nu}_e e^-$ scattering results, using the Kalinin Nuclear Power Plant and a shielded Ge detector. The recoil electron spectrum is analyzed between 2.5 and 55 keV. Supersedes BEDA 07. Supersedes BEDA 10. This is the most stringent limit on the magnetic moment of reactor $\bar{\nu}_e$.

4 AUERBACH 01 limit is based on the LSND ν_e and ν_μ electron scattering measurements. The limit is slightly more stringent than KRAKAUER 90.

5 SCHWIENHORST 01 quote an experimental sensitivity of 4.9×10^{-7} .

6 ABE 20E observed an excess of low-energy events in the XMASS detector, which could be interpreted as a signal produced by a neutrino magnetic moment with this magnitude.

7 CAPOZZI 20 obtains a limit on the neutrino dipole moment from the brightness of the tip of the red-giant branch in ω Centauri. A similar limit of $\mu_\nu < 1.5 \times 10^{-12} \mu_B$ is obtained in NGC 4258.

8 KHAN 20 performed a constrained spectral fit analysis of the excess observed in the electron recoil energy spectrum by the XENON1T experiment. This range of the μ_B values is one of the possible interpretations of these excess events. For the individual flavor constraints at 90% C.L. see the original reference.

9 ARCEO-DIAZ 15 constrains the neutrino magnetic moment from observation of the tip of the red giant branch in the globular cluster ω -Centauri.

10 CORSICO 14 constrains the neutrino magnetic moment from observations of white dwarf pulsations.

11 MILLER-BERTOLAMI 14b constrains the neutrino magnetic moment from observations of the white dwarf luminosity function of the Galactic disk.

12 VIAUX 13a constrains the neutrino magnetic moment from observations of the globular cluster M5.

13 BEDA 10 report $\bar{\nu}_e e^-$ scattering results, using the Kalinin Nuclear Power Plant and a shielded Ge detector. The recoil electron spectrum is analyzed between 2.9 and 45 keV. Supersedes BEDA 07. Supersedes by BEDA 13.

14 DENIZ 10 observe reactor $\bar{\nu}_e e$ scattering with recoil kinetic energies 3–8 MeV using CsI(Tl) detectors. The observed rate and spectral shape are consistent with the Standard Model prediction, leading to the reported constraint on $\bar{\nu}_e$ magnetic moment.

15 KUZNETSOV 09 obtain a limit on the flavor averaged magnetic moment of Dirac neutrinos from the time averaged neutrino signal of SN1987A. Improves and supersedes the analysis of BARBIERI 88 and AYALA 99.

16 ARPESELLA 08a obtained this limit using the shape of the recoil electron energy spectrum from the Borexino 192 live days of solar neutrino data.

17 BEDA 07 performed search for electromagnetic $\bar{\nu}_e e$ scattering at Kalininskaya nuclear reactor. A Ge detector with active and passive shield was used and the electron recoil spectrum between 3.0 and 61.3 keV analyzed. Supersedes by BEDA 10.

18 WONG 07 performed search for non-standard $\bar{\nu}_e e$ scattering at the Kuo-Sheng nuclear reactor. Ge detector equipped with active anti-Compton shield is used. Most stringent laboratory limit on magnetic moment of reactor $\bar{\nu}_e$. Supersedes LI 03b.

19 DARAKTCHIEVA 05 present the final analysis of the search for non-standard $\bar{\nu}_e e$ scattering component at Bugey nuclear reactor. Full kinematical event reconstruction of both the kinetic energy above 700 keV and scattering angle of the recoil electron, by use of TPC. Most stringent laboratory limit on magnetic moment. Supersedes DARAKTCHIEVA 03.

20 XIN 05 evaluated the ν_e flux at the Kuo-Sheng nuclear reactor and searched for non-standard $\nu_e e$ scattering. Ge detector equipped with active anti-Compton shield was used. This laboratory limit on magnetic moment is considerably less stringent than the limits for reactor $\bar{\nu}_e$, but is specific to ν_e .

21 GRIFOLS 04 obtained this bound using the SNO data of the solar ^8B neutrino flux measured with deuteron breakup. This bound applies to $\mu_{\text{eff}} = (\mu_{21}^2 + \mu_{22}^2 + \mu_{23}^2)^{1/2}$.

22 LIU 04 obtained this limit using the shape of the recoil electron energy spectrum from the Super-Kamiokande-I 1496 days of solar neutrino data. Neutrinos are assumed to have only diagonal magnetic moments, $\mu_{\nu 1} = \mu_{\nu 2}$. This limit corresponds to the oscillation parameters in the vacuum oscillation region.

23 LIU 04 obtained this limit using the shape of the recoil electron energy spectrum from the Super-Kamiokande-I 1496 live-day solar neutrino data, by limiting the oscillation parameter region in the LMA region allowed by solar neutrino experiments plus KamLAND. $\mu_{\nu 1} = \mu_{\nu 2}$ is assumed. In the LMA region, the same limit would be obtained even if neutrinos have off-diagonal magnetic moments.

24 BACK 03b obtained this bound from the results of background measurements with Counting Test Facility (the prototype of the Borexino detector). Standard Solar Model flux was assumed. This μ_ν can be different from the reactor μ_ν in certain oscillation scenarios (see BEACOM 99).

25 DARAKTCHIEVA 03 searched for non-standard $\bar{\nu}_e e$ scattering component at Bugey nuclear reactor. Full kinematical event reconstruction by use of TPC. Supersedes by DARAKTCHIEVA 05.

26 LI 03b used Ge detector in active shield near nuclear reactor to test for nonstandard $\bar{\nu}_e e$ scattering.

27 GRIMUS 02 obtain stringent bounds on all Majorana neutrino transition moments from a simultaneous fit of LMA-MSW oscillation parameters and transition moments to global solar neutrino data + reactor data. Using only solar neutrino data, a 90% CL bound of $6.3 \times 10^{-10} \mu_B$ is obtained.

28 TANIMOTO 00 combined $e^+ e^- \rightarrow \nu \bar{\nu} \gamma$ data from VENUS, TOPAZ, and AMY.

29 AYALA 99 improves the limit of BARBIERI 88.

30 BEACOM 99 obtain the limit using the shape, but not the absolute magnitude which is affected by oscillations, of the solar neutrino spectrum obtained by Superkamiokande (825 days). This μ_ν can be different from the reactor μ_ν in certain oscillation scenarios.

31 RAFFELT 99 is an update of RAFFELT 90. This limit applies to all neutrino flavors which are light enough (< 5 keV) to be emitted from globular-cluster red giants. This limit pertains equally to electric dipole moments and magnetic transition moments, and it applies to both Dirac and Majorana neutrinos.

32 RAFFELT 99 is essentially an update of BERNSTEIN 63, but is derived from the helioseismological limit on a new energy-loss channel of the Sun. This limit applies to all neutrino flavors which are light enough (< 1 keV) to be emitted from the Sun. This limit pertains equally to electric dipole and magnetic transition moments, and it applies to both Dirac and Majorana neutrinos.

33 ACCIARRI 97q result applies to both direct and transition magnetic moments and for $q^2=0$.

34 ELMFORS 97 calculate the rate of depolarization in a plasma for neutrinos with a magnetic moment and use the constraints from a big-bang nucleosynthesis on additional degrees of freedom.

35 Applies to absolute value of magnetic moment.

36 DERBIN 93 determine the cross section for 0.6–2.0 MeV electron energy as $(1.28 \pm 0.63) \times \sigma_{\text{weak}}$. However, the (reactor on – reactor off)/(reactor off) is only $\sim 1/100$.

37 COOPER-SARKAR 92 assume $f_{D_s}/f_\pi = 2$ and D_s, \bar{D}_s production cross section = $2.6 \mu\text{b}$ to calculate ν flux.

38 VIDYAKIN 92 limit is from a $e \bar{\nu}_e$ elastic scattering experiment. No experimental details are given except for the cross section from which this limit is derived. Signal/noise was 1/10. The limit uses $\sin^2 \theta_W = 0.23$ as input.

39 DORENBOSCH 91 corrects an incorrect statement in DORENBOSCH 89 that the ν magnetic moment is $< 1 \times 10^{-9}$ at the 95%CL. DORENBOSCH 89 measures both $\nu_\mu e$ and $\bar{\nu}_e e$ elastic scattering and assume $\mu(\nu) = \mu(\bar{\nu})$.

40 KRAKAUER 90 experiment fully reported in ALLEN 93.

41 RAFFELT 90 limit applies for a diagonal magnetic moment of a Dirac neutrino, or for a transition magnetic moment of a Majorana neutrino. In the latter case, the same analysis gives $< 1.4 \times 10^{-12}$. Limit at 95%CL obtained from δm_C .

42 Significant dependence on details of stellar models.

43 FUKUGITA 88 find magnetic dipole moments of any two neutrino species are bounded by $\mu < 10^{-16} [10^{-9} G/B_0]$ where B_0 is the present-day intergalactic field strength.

44 GROTH 88 combined data from MAC, ASP, CELLO, and Mark J.

45 For $m_\nu = 8\text{--}200$ eV. NUSSINOV 87 examines transition magnetic moments for $\nu_\mu \rightarrow \nu_e$ and obtain $< 3 \times 10^{-15}$ for $m_\nu > 16$ eV and $< 6 \times 10^{-14}$ for $m_\nu > 4$ eV.

46 We obtain above limit from SUTHERLAND 76 using their limit $f < 1/3$.

47 KIM 74 is a theoretical analysis of $\bar{\nu}_\mu$ reaction data.

NEUTRINO CHARGE RADIUS SQUARED

We report limits on the so-called neutrino charge radius squared. While the straight-forward definition of a neutrino charge radius has been proven to be gauge-dependent and, hence, unphysical (LEE 77c), there have been recent attempts to define a physically observable neutrino charge radius (BERNABEU 00, BERNABEU 02). The issue is still controversial (FUJIKAWA 03, BERNABEU 03). A more general interpretation of the experimental results is that they are limits on certain nonstandard contributions to neutrino scattering.

VALUE (10^{-32} cm^2)	CL%	DOCUMENT ID	TECN	COMMENT
– 2.1 to 3.3	90	1 DENIZ	10 TEXO	Reactor $\bar{\nu}_e e$
• • • We do not use the following data for averages, fits, limits, etc. • • •				
– 27.5 to 3	90	2 CADEDDU	18	ν_μ coherent scat. on Csl
– 0.53 to 0.68	90	3 HIRSCH	03	$\nu_\mu e$ scat.
– 8.2 to 9.9	90	4 HIRSCH	03	anomalous $e^+ e^- \rightarrow \nu \bar{\nu} \gamma$

< 2.3	95	MOURAO	92 ASTR	HOME/KAM2 ν rates
< 7.3	90	6 VIDYAKIN	92 CNTR	Reactor $\bar{\nu} e \rightarrow \bar{\nu} e$
1.1 \pm 2.3		ALLEN	91 CNTR	Repl. by ALLEN 93
– 1.1 \pm 1.0		7 AHRENS	90 CNTR	$\nu_\mu e$ elastic scat.

- 0.3 ± 1.5 ⁷ DORENBOS... 89 CHR M $\nu_{\mu}e$ elastic scat.
- 8 GRIFOLS 89B ASTR SN 1987A
- 1 DENIZ 10 observe reactor $\bar{\nu}_e e$ scattering with recoil kinetic energies 3–8 MeV using CsI(Tl) detectors. The observed rate and spectral shape are consistent with the Standard Model prediction, leading to the reported constraint on $\bar{\nu}_e$ charge radius.
- 2 CADEDDU 18 use the data of the COHERENT experiment, AKIMOV 18. The limit is $\langle r_{\nu}^2 \rangle$ for ν_{μ} obtained from the time-dependent data. Weaker limits were obtained for charge radii of ν_e and for transition charge radii. The published value was divided by 2 to conform to the convention of this table.
- 3 Based on analysis of CCFR 98 results. Limit is on $\langle r_{\nu}^2 \rangle + \langle r_A^2 \rangle$. The CHARM II and E734 at BNL results are reanalyzed, and weaker bounds on the charge radius squared than previously published are obtained. The NuTeV result is discussed; when tentatively interpreted as ν_{μ} charge radius it implies $\langle r_{\nu}^2 \rangle + \langle r_A^2 \rangle = (4.20 \pm 1.64) \times 10^{-33} \text{ cm}^2$.
- 4 Results of LEP-2 are interpreted as limits on the axial-vector charge radius squared of a Majorana ν_{μ} . Slightly weaker limits for both vector and axial-vector charge radius squared are obtained for the Dirac case, and somewhat weaker limits are obtained from the analysis of lower energy data (LEP-1.5 and TRISTAN).
- 5 AUERBACH 01 measure $\nu_e e$ elastic scattering with LSND detector. The cross section agrees with the Standard Model expectation, including the charge and neutral current interference. The 90% CL applies to the range shown.
- 6 VIDYAKIN 92 limit is from a $e\bar{\nu}$ elastic scattering experiment. No experimental details are given except for the cross section from which this limit is derived. Signal/noise was 1/10. The limit uses $\sin^2 \theta_W = 0.23$ as input.
- 7 Result is obtained from reanalysis given in ALLEN 91, followed by our reduction to obtain 1σ errors.
- 8 GRIFOLS 89B sets a limit of $\langle r^2 \rangle < 0.2 \times 10^{-32} \text{ cm}^2$ for right-handed neutrinos.

Number of Neutrino Types

The neutrinos referred to in this section are those of the Standard $SU(2) \times U(1)$ Electroweak Model possibly extended to allow nonzero neutrino masses. Light neutrinos are those with $m < m_Z/2$. The limits are on the number of neutrino mass eigenstates, including ν_1 , ν_2 , and ν_3 .

THE NUMBER OF LIGHT NEUTRINO TYPES FROM COLLIDER EXPERIMENTS

Revised June 2020 by C.-J. Lin (LBNL). Written by D. Karlen (University of Victoria and TRIUMF).

The most precise measurements of the number of light neutrino types, N_ν , come from studies of Z production in e^+e^- collisions. The invisible partial width, Γ_{inv} , is determined by subtracting the measured visible partial widths, corresponding to Z decays into quarks and charged leptons, from the total Z width. The invisible width is assumed to be due to N_ν light neutrino species each contributing the neutrino partial width Γ_ν as given by the Standard Model. In order to reduce the model dependence, the Standard Model value for the ratio of the neutrino to charged leptonic partial widths, $(\Gamma_\nu/\Gamma_\ell)_{\text{SM}} = 1.991 \pm 0.001$, is used instead of $(\Gamma_\nu)_{\text{SM}}$ to determine the number of light neutrino types:

$$N_\nu = \frac{\Gamma_{\text{inv}}}{\Gamma_\ell} \left(\frac{\Gamma_\ell}{\Gamma_\nu} \right)_{\text{SM}}. \quad (1)$$

The combined result from the four LEP experiments is $N_\nu = 2.984 \pm 0.008$ [1]. Recent analyses applied corrections to the LEP result [1] by including the effect of correlated luminosity systematics and also using an improved Bhabha cross section calculation [2,3] to obtain $N_\nu = 2.9963 \pm 0.0074$.

In the past, when only small samples of Z decays had been recorded by the LEP experiments and by the Mark II at SLC, the uncertainty in N_ν was reduced by using Standard Model fits to the measured hadronic cross sections at several center-of-mass energies near the Z resonance. Since this method is much more dependent on the Standard Model, the approach described above is favored.

Before SLC and LEP, limits on the number of neutrino generations were placed by experiments at lower-energy e^+e^- colliders by measuring the cross section of the process $e^+e^- \rightarrow \nu\bar{\nu}\gamma$. The ASP, CELLO, MAC, MARK J, and VENUS experiments observed a total of 3.9 events above background [4], leading to a 95% CL limit of $N_\nu < 4.8$. This process has a much larger cross section at center-of-mass energies near the Z mass and has been measured at LEP by the ALEPH, DELPHI, L3, and OPAL experiments [5]. These experiments have observed several thousand such events, and the combined result is $N_\nu = 3.00 \pm 0.08$. The same process has also been measured by the LEP experiments at much higher center-of-mass energies, between 130 and 208 GeV, in searches for new physics [6]. Combined with the lower energy data, the result is $N_\nu = 2.92 \pm 0.05$.

Experiments at $p\bar{p}$ colliders also placed limits on N_ν by determining the total Z width from the observed ratio of $W^\pm \rightarrow \ell^\pm \nu$ to $Z \rightarrow \ell^+ \ell^-$ events [7]. This involved a calculation that assumed Standard Model values for the total W width and the ratio of W and Z leptonic partial widths, and used an estimate of the ratio of Z to W production cross sections. Now that the Z width is very precisely known from the LEP experiments, the approach is now one of those used to determine the W width.

- JANOT 20 applies a correction to LEP-SLC 06 using an updated Bhabha cross section calculation. This result also includes a correction to account for correlated luminosity bias as presented in VOUTSINAS 20.
- VOUTSINAS 20 applies a correction to LEP-SLC 06 to account for correlated luminosity bias.
- Combined fit from ALEPH, DELPHI, L3 and OPAL Experiments.
- Simultaneous fits to all measured cross section data from all four LEP experiments.

Number of Light ν Types from Direct Measurement of Invisible Z Width

In the following, the invisible Z width is obtained from studies of single-photon events from the reaction $e^+e^- \rightarrow \nu\bar{\nu}\gamma$. All are obtained from LEP runs in the $E_{\text{CM}}^{\text{e}} = 88\text{--}209$ GeV.

- AGHANIM 20 best fit on number of neutrino types is based on Planck data combined with lensing and baryon acoustic oscillations (BAO). Without BAO, they find $2.89^{+0.18}_{-0.19}$. Several other values are quoted using different combinations of data.
- FIELDS 20 combines Planck 2018 CMB data with BBN and observations of deuterium and Helium-4.
- IVANOV 20 combines 2018 Planck CMB data with baryon acoustic oscillation data from BOSS. This study is based on a full-shape likelihood for the redshift-space galaxy power spectrum of the BOSS data.
- Uses Planck Data combined with an independent standard measure of distance to the sound horizon to set a limit on the total number of neutrinos. Only CMB and early-time information are used.
- CYBURT 16 combines Planck 2015 CMB data with BBN and observations of deuterium and Helium-4.
- ROSSI 15 sets limits on the number of neutrino types using BOSS Lyman alpha forest data combined with Planck CMB data and baryon acoustic oscillations.
- Fit to the number of neutrino degrees of freedom from Planck CMB data along with WMAP polarization, high L, and BAO data.
- Fit to the number of neutrinos degrees of freedom from Planck CMB data along with BAO, shear and cluster data.
- Fit based on the SPT-SZ survey combined with CMB, BAO, and H_0 data.
- Constrains the number of neutrino degrees of freedom (marginalizing over the total mass) from CMB, CMB lensing, BAO, and galaxy clustering data.
- Limit on the number of light neutrino types from observational Hubble parameter data with seven-year WMAP data, SPT, and the most recent estimate of H_0 . Best fit is 3.45 ± 0.65 .
- Limit on the number of light neutrino types from the CFHTLS combined with seven-year WMAP data and a prior on the Hubble parameter. Best fit is $4.17^{+1.62}_{-1.26}$. Limit is relaxed to $3.98^{+2.02}_{-1.20}$ when small scales affected by non-linearities are removed.
- Constrains the number of neutrino types from recent CMB and large scale structure data. No priors on other cosmological parameters are used.
- Constrains the number of neutrino types from recent CMB, large scale structure, Lyman-alpha forest, and SNIa data. The slight preference for $N_{\nu} > 3$ comes mostly from the Lyman-alpha forest data.
- Constrains the number of neutrino types from recent CMB and large scale structure data. See also HAMANN 07.
- Limit on the number of neutrino types based on ^4He and D/H abundance assuming a baryon density fixed to the WMAP data. Limit relaxes to 4.6 if D/H is not used or to 5.8 if only D/H and the CMB are used. See also CYBURT 01 and CYBURT 03.
- Limit on the number of neutrino types based on combination of WMAP data and big-bang nucleosynthesis. The limit from WMAP data alone is 8.3. See also KNELLER 01. $N_{\nu} \geq 3$ is assumed to compute the limit.
- 95% confidence level range on the number of neutrino flavors from WMAP data combined with other CMB measurements, the 2dFGRS data, and HST data.
- SHVARTSMAN 69 limit inferred from his equations.

Double- β Decay

OMITTED FROM SUMMARY TABLE

NEUTRINOLESS DOUBLE- β DECAY

Revised August 2019 by A. Piepke (University of Alabama) and P. Vogel (Caltech) .

Observation of neutrinoless double-beta ($0\nu\beta\beta$) decay would signal violation of total lepton number conservation. The process can be mediated by an exchange of a light Majorana neutrino, or by an exchange of other particles. However, the existence of $0\nu\beta\beta$ -decay requires a nonvanishing Majorana neutrino mass, no matter what the actual mechanism is. As long as only a limit on the lifetime is available, limits on the effective Majorana neutrino mass, on the lepton-number violating right-handed current or other possible mechanisms mediating $0\nu\beta\beta$ decay can be obtained, independently of the actual mechanism, by assuming that one of these “new physics” possibilities dominates. These limits are listed in the Double- β Decay Listings of the experimental measurements.

In the following we assume that the exchange of light Majorana neutrinos ($m_{\nu_i} \leq 10$ MeV) contributes dominantly to the decay rate. Besides a dependence on the phase space ($G^{0\nu}$) and the nuclear matrix element ($M^{0\nu}$), the observable $0\nu\beta\beta$ -decay rate is proportional then to the square of the effective Majorana mass m_{ee} , $(T_{1/2}^{0\nu})^{-1} = G^{0\nu} \cdot |M^{0\nu}|^2 \cdot m_{ee}^2$, with $m_{ee}^2 = |\sum_i U_{ei}^2 m_{\nu_i}|^2$. The sum contains, in general, complex CP-phases in U_{ei}^2 , i.e., cancellations may occur. For three neutrino flavors there are two physical phases for Majorana neutrinos (η_1, η_2) and one for Dirac neutrinos (δ_{CP}). The relevant Majorana phases affect only processes to which lepton-number changing amplitudes contribute. Given the general 3×3 mixing matrix for Majorana neutrinos, one can construct other analogous lepton number violating quantities, $m_{\ell\ell'} = \sum_i U_{ei} U_{\ell i} m_{\nu_i} (\ell \text{ or } \ell' \neq e)$. However, these are currently much less constrained than m_{ee} .

Nuclear structure calculations are needed to deduce m_{ee} from the decay rate. While $G^{0\nu}$ can be calculated accurately,

the computation of $M^{0\nu}$ is subject to uncertainty. Comparing different nuclear model evaluations indicates a factor ~ 2 -3 spread in the calculated nuclear matrix elements. Nuclear structure calculation consistently overestimate Gamow-Teller (axial current) matrix elements. This inability of the nuclear models to reproduce Gamow-Teller decay rates is often parametrized in form of a modified coupling constant g_A . Many nuclear theorists interpret this shortcoming as evidence that important physics is missing in the modeling of weak nuclear transitions. It is not clear how these observed uncertainties impact $0\nu\beta\beta$ -matrix elements. Nevertheless, this constitutes an additional element of uncertainty. Recent work, [1] shows how the discrepancy between experimental and theoretical axial current matrix elements might be resolved. However, application of this approach to the $0\nu\beta\beta$ decay remains to be accomplished. The particle physics quantities to be determined are thus nuclear model-dependent, so the half-life measurements are listed first. Where possible, we reference the nuclear matrix elements used in the subsequent analysis. Since rates for the conventional $2\nu\beta\beta$ decay serve to constrain the nuclear theory models, results for this process are also given.

Oscillation experiments utilizing atmospheric, accelerator, solar, and reactor produced neutrinos and anti-neutrinos show that at least some neutrinos are massive. However, so far the inverted mass ordering (i.e., whether $\Delta m_{31}^2 < 0$) is disfavored only by 2-3 σ compared to the normal mass ordering (when $\Delta m_{31}^2 > 0$), while the absolute neutrino mass values or the properties of neutrinos under CPT-conjugation (Dirac or Majorana) remain undetermined. All confirmed oscillation experiments can be consistently described using three interacting neutrino species with two mass splittings and three mixing angles. (For values of the mixing angles and mass square differences see the corresponding tables.)

Based on the 3-neutrino analysis:
 $m_{ee}^2 = |\cos^2 \theta_{13} \cos^2 \theta_{12} m_1 + e^{2i(\eta_2 - \eta_1)} \cos^2 \theta_{13} \sin^2 \theta_{12} m_2 + e^{-2i(\eta_1 + \delta_{CP})} \sin^2 \theta_{13} m_3|^2$, valid for both mass orderings. Given the present knowledge of the neutrino oscillation parameters one can derive a relation between the effective Majorana mass and the mass of the lightest neutrino, as illustrated in Figure 14.11 in the Neutrino Masses, Mixing and Oscillations review. The three mass orderings allowed by the oscillation data: normal ($m_1 < m_2 \ll m_3$), inverted ($m_3 \ll m_1 < m_2$), and degenerate ($m_1 \approx m_2 \approx m_3$), result in different projections. The width of the colored bands reflects the uncertainty introduced by the unknown Majorana and Dirac phases as well as the experimental errors of the oscillation parameters. The latter causes only minor broadening of the bands. Because of the overlap of the different mass scenarios, a measurement of m_{ee} would not reveal which mass ordering is applicable, provided the value of m_{ee} is in the overlapping range.

Analogous plots depict the relation of m_{ee} with the summed neutrino mass $m_{tot} = m_1 + m_2 + m_3$, constrained by observational cosmology, and m_{ee} as a function of the average mass

See key on page 1127

Lepton Particle Listings

Double-β Decay

$m_{\nu_e}^{eff} = [\sum |U_{ei}|^2 m_{\nu_i}^2]^{1/2}$ determined through the analysis of the electron energy distribution in low energy beta decays. (See Fig. 1 of [2].) The oscillation data thus allow to test whether observed values of m_{ee} and m_{tot} or $m_{\nu_e}^{eff}$ are consistent within the 3 neutrino framework. The rather large intrinsic width of the $\beta\beta$ -decay constraints essentially does not allow to positively identify the mass ordering, and thus the sign of Δm_{31}^2 , even in combination with these other observables. Naturally, if a value of $0 < m_{ee} \leq 0.01$ eV is ever established, then the normal mass ordering becomes the only possible scenario.

It should be noted that systematic uncertainties of the nuclear matrix elements and possible quenching of the axial current matrix elements are sometimes not folded into the mass limits reported by $\beta\beta$ -decay experiments. Taking this additional uncertainty into account would further widen the projections. The plots are based on a 3-neutrino analysis. If it turns out that additional, i.e. sterile light neutrinos exist, the allowed regions would be modified substantially.

If neutrinoless double-beta decay is observed, it will be possible to fix a range of absolute values of the masses m_{ν_i} . Unlike the direct neutrino mass measurements, however, a limit on m_{ee} does not allow one to constrain the individual mass values m_{ν_i} , even when the mass differences Δm_{ij}^2 are known.

Neutrino oscillation data imply the existence of a lower limit ~ 0.014 eV for the Majorana neutrino mass for the inverted mass ordering pattern, while m_{ee} could, by fine tuning, vanish in the case of the normal mass ordering. Several new double-beta searches have been proposed to probe the interesting m_{ee} mass range, with the prospect of full coverage of the inverted mass ordering region within the next decade.

The $0\nu\beta\beta$ decay mechanism discussed so far is not the only way in which the decay can occur. Numerous other possible scenarios have been proposed, however, all of them requiring new physics. It will be a challenging task to decide which mechanism was responsible once $0\nu\beta\beta$ decay is observed. LHC experiments may reveal corresponding signatures for new physics of lepton number violation. If lepton-number violating right-handed weak current interactions exist, its strength can be characterized by the phenomenological coupling constants η and λ (η describes the coupling between the right-handed lepton current and left-handed quark current while λ describes the coupling when both currents are right-handed). The $0\nu\beta\beta$ decay rate then depends on $\langle\eta\rangle = \eta \sum_i U_{ei} V_{ei}$ and $\langle\lambda\rangle = \lambda \sum_i U_{ei} V_{ei}$ that vanish for massless or unmixed neutrinos ($V_{\ell j}$ is a matrix analogous to $U_{\ell j}$ but describing the mixing with the hypothetical right-handed neutrinos). The observation of the single electron spectra could, in principle, allow to distinguish this mechanism of $0\nu\beta\beta$ from the light Majorana neutrino exchange driven mode. The limits on $\langle\eta\rangle$ and $\langle\lambda\rangle$ are listed in a separate table. The reader is cautioned that a number of earlier experiments did not distinguish between η and λ . In addition, see the section on Majoron searches for additional limits set by these experiments.

Half-life 0ν double-β decay

In most cases the transitions $(Z,A) \rightarrow (Z+2,A) + 2e^-$ to the 0^+ ground state of the final nucleus are listed. We also list transitions that decrease the nuclear charge ($2e^+$, e^+ CC and double EC) and transitions to an excited state of the final nucleus (0_1^+ , 2^+ , and 2_1^+). In the following Listings only the best or comparable limits for the half-lives of each transition are reported and only those with about $T_{1/2} > 10^{23}$ years that are relevant for particle physics.

¹ ADAMS 21A et al. used 101.76 kg yr of ¹³⁰Te exposure of the CUORE (LNGS) bolometric detector to place a limit on the decay to the first excited state of ¹³⁰Xe, superseding ALDUINO 19 as the most restrictive bound on this particular decay.
² ARMENGAUD 21 use the CUPID-Mo 4.2 kg array of enriched Li₂¹⁰⁰MoO₄ scintillating bolometers, with 1.17 kg-yr exposure, to set this limit.
³ ARNQUIST 21 use the MAJORANA demonstrator to set this limit for the $0\nu\beta\beta$ decay to the first excited 0^+ state, with a 41.9 kg yr isotopic exposure. The median sensitivity is 39.9×10^{23} yr.
⁴ ARNQUIST 21 use the MAJORANA demonstrator to set this limit for the $0\nu\beta\beta$ decay to the first excited 2^+ state, with a 41.9 kg yr isotopic exposure. The median sensitivity is 21.2×10^{23} yr.
⁵ ARNQUIST 21 use the MAJORANA demonstrator to set this limit for the $0\nu\beta\beta$ decay to the second excited 2^+ state, with a 41.9 kg yr isotopic exposure. The median sensitivity is 18.6×10^{23} yr.

Lepton Particle Listings

Double- β Decay

- 6 ADAMS 20A use the CUORE detector to search for the $0\nu\beta\beta$ decay of ^{130}Te . The exposure was 372.5 kg-yr of TeO_2 corresponding to 103.6 kg-yr of ^{130}Te . The exclusion sensitivity is 1.7×10^{25} yr. Supersedes ALDUINO 18.
- 7 AGOSTINI 20b present the final data set of the GERDA experiment, searching for $0\nu\beta\beta$ decay of ^{76}Ge with isotopically enriched, high resolution Ge detectors. A final exposure of 127.2 kg-yr is reported. The experiment reports the lowest background and longest half life limit ever achieved by any double beta decay experiment. The reported experiment sensitivity equals the limit. Supersedes AGOSTINI 19.
- 8 AGOSTINI 19 use 82.4 kg-yr of data, collected by the GERDA experiment, to search for the $0\nu\beta\beta$ decay of ^{76}Ge . High resolution Ge-calorimeters, made from isotopically enriched Ge, are used. A median sensitivity of 1.1×10^{26} yr is reported. Supersedes AGOSTINI 18.
- 9 ALDUINO 19 use the combined data of the CUORICINO and CUORE-0 experiments to place a lower limit on the half life of the $0\nu\beta\beta$ decay of ^{130}Te to the first excited 0^+ state of ^{130}Xe . Supersedes ANDREOTTI 12.
- 10 ALENKOV 19 report the $0\nu\beta\beta$ decay half-life limit based on the 52.1 kg-d exposure of ^{100}Mo , of a cryogenic dual heat and light detector in the Yangyang underground laboratory. The median sensitivity is 1.1×10^{23} years.
- 11 ALVIS 19 use the MAJORANA Demonstrator with enriched in ^{76}Ge detectors to set this limit on $0\nu\beta\beta$ half-life of ^{76}Ge . The exposure is 26.0 kg yr. The sensitivity is 4.8×10^{25} yr.
- 12 ANTON 19 uses the complete dataset of the EXO-200 detector to search for the $0\nu\beta\beta$ decay. The exposure is 234.1 kg yr. The median sensitivity is 5.0×10^{25} yr. Supersedes ALBERT 18 and ALBERT 14b.
- 13 AZZOLINI 19 use the CPID-0 scintillating cryogenic bolometer to set this limit on $0\nu\beta\beta$ half-life of ^{82}Se . The exposure is 5.29 kg yr. The sensitivity is 5×10^{24} yr.
- 14 NI 19 use the PandaX-II dual phase TPC at CJPL to search for the $0\nu\beta\beta$ decay of ^{136}Xe . The half-life limit 2.4×10^{23} yr is obtained from 22.2 kg yr exposure with a sensitivity of 1.9×10^{23} yr.
- 15 AALSETH 18 uses the MAJORANA Demonstrator to search for the $0\nu\beta\beta$ decay. The exposure is 9.95 kg-year. The median sensitivity is 2.1×10^{25} yr.
- 16 AGOSTINI 18 uses the GERDA detector to search for the $0\nu\beta\beta$ decay. The exposure is 46.7 kg-year. The median sensitivity is 5.8×10^{25} yr. Supersedes AGOSTINI 17.
- 17 ALBERT 18 uses the EXO-200 detector to search for the $0\nu\beta\beta$ decay. The exposure is 177.6 kg-year. The median sensitivity is 3.7×10^{25} years.
- 18 ALDUINO 18 uses the CUORE detector to search for the $0\nu\beta\beta$ decay of ^{130}Te . The exposure is 86.3 kg-year of natural TeO_2 corresponding to 24.0 kg-year for ^{130}Te . The median sensitivity is 0.7×10^{25} yr. The limit is obtained combining the new data from CUORE with those of CUORE0 (9.8 kg-year of ^{130}Te) and Cuoricino (19.8 kg-year of ^{130}Te).
- 19 ARNOLD 18 use the NEMO-3 tracking detector to place a limit on the $0\nu\beta\beta$ decay of ^{82}Se . This is a slightly weaker limit than in BARABASH 11A, using the same detector. Supersedes ARNOLD 05A.
- 20 AZZOLINI 18 uses CUPID-0 detector, a novel scintillating cryogenic calorimeter, operated in the LNGS. This results replaces BARABASH 11A (NEMO-3) as the most stringent limit on the $0\nu\beta\beta$ -decay of ^{82}Se .
- 21 AZZOLINI 18A data collected by CUPID-0 based on scintillating bolometers is used to derive a new most stringent limit on the $0\nu\beta\beta$ -decay of ^{82}Se to the 0_1^+ state of ^{82}Kr .
- 22 BARABASH 18 use 1.162 kg of $^{116}\text{CdWO}_4$ scintillating crystals to obtain this limit. Supersedes DANEVICH 03 with analogous source and is more sensitive than ARNOLD 17.
- 23 AGOSTINI 17 result corresponds to data collected with GERDA phase 1 and first release of phase 2 for a total of 343 mol-yr exposure. Supersedes AGOSTINI 13A. The median sensitivity is 4.0×10^{25} yr.
- 24 ALBERT 17c uses the EXO-200 detector that contains $19.098 \pm 0.014\%$ admixture of ^{134}Xe to search for the 0ν and $2\nu\beta\beta$ decay modes. The exposure is 29.6 kg-year. The median sensitivity is 1.9×10^{21} years.
- 25 ARNOLD 17 use the NEMO-3 tracking calorimeter, containing 410 g of enriched ^{116}Cd exposed for 5.26 yr, to determine the half-life limit. Supersedes BARABASH 11A.
- 26 ALDUINO 16 report result obtained with 9.8 kg y of data collected with the CUORE-0 bolometer, combined with data from the CUORICINO. Supersedes ALFONSO 15.
- 27 ASAKURA 16 use the KamLAND-Zen liquid scintillator calorimeter (^{136}Xe 89.5 kg yr) to place a limit on the $0\nu\beta\beta$ -decay into the first excited state of the daughter nuclide.
- 28 ASAKURA 16 use the KamLAND-Zen liquid scintillator calorimeter (^{136}Xe 89.5 kg yr) to place a limit on the $0\nu\beta\beta$ -decay into the second excited state of the daughter nuclide.
- 29 ASAKURA 16 use the KamLAND-Zen liquid scintillator calorimeter (^{136}Xe 89.5 kg yr) to place a limit on the $0\nu\beta\beta$ -decay into the third excited state of the daughter nuclide.
- 30 GANDO 16 use the the KamLAND detector to search for the 0ν decay of ^{136}Xe . With a significant background reduction, the combination of results of the first (270.7 days) and the second phase (263.8 days) of the experiment leads to about six fold improvement over the previous limit. Supersedes GANDO 13A. The sensitivity is 5.6×10^{25} yr.
- 31 ARNOLD 15 use the NEMO-3 tracking calorimeter with 34.3 kg yr exposure to determine the limit of $0\nu\beta\beta$ -half life of ^{100}Mo . Supersedes ARNOLD 2005A and BARABASH 11A.
- 32 ALBERT 14b use 100 kg yr of exposure of the EXO-200 tracking calorimeter to place a lower limit on the $0\nu\beta\beta$ -half life of ^{136}Xe . Supersedes AUGER 12.
- 33 ANDREOTTI 12 use high resolution TeO_2 bolometric calorimeter to search for the $0\nu\beta\beta$ decay of ^{130}Te leading to the excited 0_1^+ state at 1793.5 keV.
- 34 BARABASH 11A use the NEMO-3 detector to measure $2\nu\beta\beta$ rates and place limits on $0\nu\beta\beta$ half lives for various nuclides. Supersedes ARNOLD 05A, ARNOLD 04, ARNOLD 98, and ELLIOTT 92.

- 35 Supersedes ARNOLDI 04. Bolometric TeO_2 detector array CUORICINO is used for high resolution search for $0\nu\beta\beta$ decay. The half-life limit is derived from 3.09 kg yr ^{130}Te exposure.
- 36 UMEHARA 08 use CaF_2 scintillation calorimeter to search for double beta decay of ^{48}Ca . Limit is significantly more stringent than quoted sensitivity: 18×10^{21} years.
- 37 Limit on 0ν -decay to the first excited 0_1^+ -state of daughter nucleus using NEMO-3 tracking calorimeter. Supersedes DASSIE 95.
- 38 Limit on 0ν -decay to the first excited 2^+ -state of daughter nucleus using NEMO-3 tracking calorimeter.
- 39 NEMO-3 tracking calorimeter is used in ARNOLD 05A to place limit on $0\nu\beta\beta$ half-life of ^{82}Se . Detector contains 0.93 kg of enriched ^{82}Se . Supersedes ARNOLD 04.
- 40 Supersedes ALESSANDRELLO 00. Array of TeO_2 crystals in high resolution cryogenic calorimeter. Some enriched in ^{128}Te . Ground state to ground state decay.
- 41 Limit on $0\nu\beta\beta$ decay of ^{116}Cd using enriched CdWO_4 scintillators. Supersedes DANEVICH 00.
- 42 AALSETH 02b limit is based on 117 mol-yr of data using enriched Ge detectors. Background reduction by means of pulse shape analysis is applied to part of the data set. Reported limit is slightly less restrictive than that in KLAPDOR-KLEINGROTHAUS 01 However, it excludes part of the allowed half-life range reported in KLAPDOR-KLEINGROTHAUS 01b for the same nuclide. The analysis has been criticized in KLAPDOR-KLEINGROTHAUS 04b. The criticism was addressed and disputed in AALSETH 04.
- 43 KLAPDOR-KLEINGROTHAUS 01 is a continuation of the work published in BAUDIS 99. Isotopically enriched Ge detectors are used in calorimetric measurement. The most stringent bound is derived from the data set in which pulse-shape analysis has been used to reduce background. Exposure time is 35.5 kg y. Supersedes BAUDIS 99 as most stringent result.

Half-life measurements of the two-neutrino double- β decay

The measured half-life values for the transitions $(Z,A) \rightarrow (Z+2,A) + 2e^- + 2\bar{\nu}_e$ to the 0^+ ground state of the final nucleus are listed. We also list the transitions to an excited state of the final nucleus (0_i^+ , etc.). We report only the measurements with the smallest (or comparable) uncertainty for each transition.

- 1 ADAMS 21 use 102.7 kg yr of ^{130}Te exposure, collected by the CUORE bolometric detector at LNGS, to perform the most precise measurement of $2\nu\beta\beta$ decay of this nuclide to date. The dataset is more than 10-times that used by the CUORE-0 experiment. Supersedes ALDUINO 17.
- 2 ARMENGAUD 20 use the $\text{Li}_2^{100}\text{MoO}_4$ scintillating bolometers to determine the half-life of the $2\nu\beta\beta$ decay of ^{100}Mo . The total exposure was 42.235 kg-d. The single-state dominance for this decay is favored at $> 3 \sigma$.
- 3 APRILE 19E report first measurement of two-neutrino double electron capture in ^{124}Xe using the XENON1T detector with a 0.73 t-yr exposure. An excess of 126 ± 29 events is observed at 64.3 ± 0.6 keV decay energy, corresponding to $\sqrt{\Delta\chi^2} = 4.4$ with respect to the background-only hypothesis.
- 4 ARNOLD 19 use the NEMO-3 tracking calorimeter with 34.3 kg y exposure to determine the $2\nu\beta\beta$ half-life of ^{100}Mo . Supersedes ARNOLD 15.

See key on page 1127

Lepton Particle Listings

Double-β Decay

- ⁵ AZZOLINI 19B use the CUPID-0 experiment, utilizing ZnSe bolometers and an exposure of 9.95 kg-yr of Zn⁸²Se, to determine the half-life of the 2νββ decay of ⁸²Se. The analysis provides evidence for single state dominance showing that the higher state dominance is disfavored at the level of 5.5 σ.
- ⁶ ARNOLD 18 use the NEMO-3 tracking detector to determine the 2νββ half-life of ⁸²Se. 0.93 kg of ⁸²Se was observed for 5.25 y. The half-life value was obtained based on the single-state-dominance (SSD) hypothesis, preferred in this case by about 2 σ. Supersedes ARNOLD 05A.
- ⁷ BARABASH 18 use 1.162 kg of ¹¹⁶CdWO₄ scintillating crystals to obtain this value. Supersedes DANEVICH 03 with analogous source and agrees with ARNOLD 17 with the NEMO-3 detector.
- ⁸ ALBERT 17C uses the EXO-200 detector that contains 19.098 ± 0.014% admixture of ¹³⁴Xe to search for the 2νββ decay mode. The exposure is 29.6 kg-year. The median sensitivity is 1.2 × 10²¹ years.
- ⁹ ALDUINO 17 use the CUORE-0 detector containing 10.8 kg of ¹³⁰Te in 52 crystals of TeO₂. The exposure was 9.3 kg yr of ¹³⁰Te. This is a more accurate rate determination than in ARNOLD 11 and BARABASH 11A.
- ¹⁰ ARMENGAUD 17 use 185.9 ± 0.1 g crystal of Li₂¹⁰⁰MoO₄ to determine the ¹⁰⁰Mo 2νββ half-life. The exposure was of 1303 ± 26 hours only, using novel technique.
- ¹¹ ARNOLD 17 use the NEMO-3 tracking calorimeter, containing 410 grams of enriched ¹¹⁶Cd exposed for 5.26 years, to determine the half-life value.
- ¹² ARNOLD 16 use the NEMO-3 detector and a source of 6.99 g of ⁴⁸Ca. The half-life is based on 36.7 g year exposure. It is consistent, although somewhat longer, than the previous determinations of the half-life. Supersedes BARABASH 11A.
- ¹³ ARNOLD 16A use the NEMO-3 tracking calorimeter, containing 36.6 g of ¹⁵⁰Nd exposed for 1918.5 days, to determine the half-life. Supersedes ARGYRIADES 09.
- ¹⁴ AGOSTINI 15A use 17.9 kg yr exposure of the GERDA calorimeter to derive an improved measurement of the 2νββ decay half life of ⁷⁶Ge.
- ¹⁵ ARNOLD 15 use the NEMO-3 tracking calorimeter with 34.3 kg yr exposure to determine the 2νββ-half life of ¹⁰⁰Mo. Supersedes ARNOLD 05A and ARNOLD 04.
- ¹⁶ ALBERT 14 use the EXO-200 tracking detector for a re-measurement of the 2νββ-half life of ¹³⁶Xe. A nuclear matrix element of 0.0218 ± 0.0003 MeV⁻¹ is derived from this data. Supersedes ACKERMAN 11.
- ¹⁷ GAVRILYAK 13 use a proportional counter filled with Kr gas to search for the 2ν2K decay of ⁷⁸Kr. Data with the enriched and depleted Kr were used to determine signal and background. A 2.5σ excess of events obtained with the enriched sample is interpreted as an indication for the presence of this decay.
- ¹⁸ GANDO 12A use a modification of the existing KamLAND detector. The ββ decay source/detector is 13 tons of enriched ¹³⁶Xe-loaded scintillator contained in an inner balloon. The 2νββ decay rate is derived from the fit to the spectrum between 0.5 and 4.8 MeV. This result is in agreement with ACKERMAN 11.
- ¹⁹ ARNOLD 11 use enriched ¹³⁰Te in the NEMO-3 detector to measure the 2νββ decay rate. This result is in agreement with, but more accurate than ARNOLDI 03.
- ²⁰ ARGYRIADES 10 use 9.4 ± 0.2 g of ⁹⁶Zr in NEMO-3 detector and identify its 2νββ decay. The result is in agreement and supersedes ARNOLD 99.
- ²¹ BELLI 10 use enriched ¹⁰⁰Mo with 4 HP Ge detectors to record the 590.8 and 539.5 keV γ rays from the decay of the 0₁⁺ state in ¹⁰⁰Ru both in singles and coincidences. This result confirms the measurement of KIDD 09 and ARNOLD 07 and supersedes them.
- ²² First exclusive measurement of 2ν-decay to the first excited 0₁⁺-state of daughter nucleus. ARNOLD 07 use the NEMO-3 tracking calorimeter to detect all particles emitted in decay. Result agrees with the inclusive (0ν + 2ν) measurement of DEBRAECKELEER 01.
- ²³ ARNOLD 05A use the NEMO-3 tracking detector to determine the 2νββ half-life of ⁸²Se with high statistics and low background (389 days of data taking). Supersedes ARNOLD 04.
- ²⁴ DANEVICH 03 is calorimetric measurement of 2νββ ground state decay of ¹¹⁶Cd using enriched CdWO₄ scintillators. Agrees with EJIRI 95 and ARNOLD 96. Supersedes DANEVICH 00.

$\langle m_{ee} \rangle$. The Effective Weighted Sum of Majorana Neutrino Masses Contributing to Neutrinoless Double-β Decay

$\langle m_{ee} \rangle = |\sum U_{ei}^2 m_{\nu_i}|$, $i = 1, 2, 3$. It is assumed that ν_i are Majorana particles and that the transition is dominated by the known (light) neutrinos. Note that U_{ei}^2 and not $|U_{ei}|^2$ occur in the sum, and that consequently cancellations are possible. The experiments obtain the limits on $\langle m_{\nu} \rangle$ from the measured ones on $T_{1/2}$ using a range of nuclear matrix elements (NME), which is reflected in the spread of $\langle m_{\nu} \rangle$. Different experiments may choose different NME. All assume $g_A = 1.27$. In the following Listings, only the best or comparable limits for each isotope are reported. When not mentioned explicitly the transition is between ground states, but transitions between excited states are also reported.

- ¹ ARMENGAUD 21 use the CUPID-Mo demonstrator, with 1.17 kg-yr exposure of ¹⁰⁰Mo, to set this limit. The range reflects the estimated uncertainty of the calculated nuclear matrix elements.
- ² ADAMS 20A use the data of CUORE (372.5 kg-yr exposure of TeO₂) to obtain this limit.
- ³ AGOSTINI 20B use the final data set of the GERDA experiment, representing an exposure of 127.2 kg-yr to derive an upper limit for $\langle m_{\beta\beta} \rangle$. Isotopically enriched Ge detectors were used. The range reflects the variability of the theoretically calculated nuclear matrix elements. Supersedes AGOSTINI 19.
- ⁴ AGOSTINI 19 use 82.4 kg-yr of data collected by the isotopically enriched ⁷⁶Ge detectors of the GERDA experiment to derive an upper limit for $\langle m_{\beta\beta} \rangle$. The range reflects the variability of the theoretically calculated nuclear matrix elements. Supersedes AGOSTINI 18.
- ⁵ ALENKOV 19 report the range of the effective masses $\langle m_{\beta\beta} \rangle$ corresponding to the 0νββ decay half-life limit. It is based on the 52.1 kg-d exposure of ¹⁰⁰Mo, in the Yangyang underground laboratory. The median sensitivity is 1.1 × 10²³ years. The range of $\langle m_{\beta\beta} \rangle$ reflects the uncertainty of nuclear matrix elements.
- ⁶ ALVIS 19 use the MAJORANA Demonstrator with enriched ⁷⁶Ge detectors to set this limit. The exposure is 26.0 kg yr. The sensitivity is 4.8 × 10²⁵ yr.
- ⁷ ANTON 19 uses the complete dataset of the EXO-200 experiment to obtain these limits. The spread reflect the uncertainty in the nuclear matrix elements. Supersedes ALBERT 18 and ALBERT 14B.
- ⁸ AZZOLINI 19 use the CPID-0 scintillating cryogenic bolometer to set this limit. The exposure is 5.29 kg yr. The sensitivity is 5 × 10²⁴ yr.
- ⁹ NI 19 use the PandaX-II dual phase TPC at CJPL to search for the 0νββ decay of ¹³⁶Xe with 22.2 kg yr exposure. The range in the $m_{\beta\beta}$ limit of 1.3–3.5 eV reflects the range of the calculated nuclear matrix elements. The sensitivity is 1.9 × 10²³ yr.
- ¹⁰ AALSETH 18 uses the MAJORANA Demonstrator detector to establish this limit.
- ¹¹ AGOSTINI 18 uses the GERDA detector to establish this limit.
- ¹² ALBERT 18 uses the EXO-200 experiment to obtain this limit.
- ¹³ ALDUINO 18 use the combined data of CUORE, CUORE0, and Cuoricino to obtain this limit.
- ¹⁴ ARNOLD 18 use the NEMO-3 tracking detector to constrain the 0νββ decay of ⁸²Se. The limit on $\langle m_{\beta\beta} \rangle$ is obtained assuming light neutrino exchange; the range reflects different calculations of the nuclear matrix elements. This is a somewhat weaker limit than in BARABASH 11A using the same detector.
- ¹⁵ AZZOLINI 18 uses data collected by the CUPID-0 scintillating cryogenic calorimeter, operated in the LNGS, to derive a range of limits on $\langle m_{\nu} \rangle$. The reported range reflects the spread of the nuclear matrix element calculations considered in this work. Use $g_A = 1.269$.
- ¹⁶ BARABASH 18 use 1.162 kg of ¹¹⁶CdWO₄ scintillating crystals to obtain these limits. The spread reflects the estimated uncertainty in the nuclear matrix element. Supersedes DANEVICH 03.
- ¹⁷ AGOSTINI 17 is based on 343 mol yr of data from GERDA phase 1 and phase 2 first part and the corresponding limit on $T_{1/2}$ using the different nuclear matrix elements mentioned by the authors. Supersedes AGOSTINI 13A.
- ¹⁸ ARNOLD 17 utilize NEMO-3 data, taken with enriched ¹¹⁶Cd to limit the effective Majorana neutrino mass. The reported range results from the use of different nuclear matrix elements. Supersedes BARABASH 11A.
- ¹⁹ ALDUINO 16 place a limit on the effective Majorana neutrino mass using the combined data of the CUORE-0 and CUORICINO experiments. The range reflects the authors' evaluation of the variability of the nuclear matrix elements. Supersedes ALFONSO 15.
- ²⁰ ARNOLD 16A limit is derived from data taken with the NEMO-3 detector and ¹⁵⁰Nd. A range of nuclear matrix elements that include the effect of nuclear deformation have been used. Supersedes ARGYRIADES 09.
- ²¹ GANDO 16 result is based on the 2016 KamLAND-Zen half-life limit. The stated range reflects different nuclear matrix elements, an unquenched $g_A = 1.27$ is used. Supersedes GANDO 13A.
- ²² ARNOLD 15 use the NEMO-3 tracking calorimeter with 34.3 kg yr exposure to determine the neutrino mass limit based on the 0νββ-half life of ¹⁰⁰Mo. The spread range reflects different nuclear matrix elements. Supersedes ARNOLD 14 and BARABASH 11A.
- ²³ ALBERT 14B is based on 100 kg yr of exposure of the EXO-200 tracking calorimeter. The mass range reflects the nuclear matrix element calculations. Supersedes AUGER 12.

Lepton Particle Listings

Double- β Decay, Neutrino Mixing

- ²⁴ BARABASH 11A limit is based on NEMO-3 data for ⁸²Se. The reported range reflects different nuclear matrix elements. Supersedes ARNOLD 05A and ARNOLD 04.
- ²⁵ ARGYRIADES 10 use ⁹⁶Zr and the NEMO-3 tracking detector to obtain the reported mass limit. The range reflects the fluctuation of the nuclear matrix elements considered.
- ²⁶ Limit was obtained using CaF₂ scintillation calorimeter to search for double beta decay of ⁴⁸Ca. Reported range of limits reflects spread of QRPA and SM matrix element calculations used. Supersedes OGAWA 04.
- ²⁷ Supersedes ARNABOLDI 04. Reported range of limits due to use of different nuclear matrix element calculations.
- ²⁸ Supersedes ARNABOLDI 03. Reported range of limits due to use of different nuclear matrix element calculations.
- ²⁹ Limit for $\langle m_{\nu} \rangle$ is based on the nuclear matrix elements of STAUDT 90 and ARNOLD 96. Supersedes DANEVICH 00.
- ³⁰ KLAPDOR-KLEINGROTHAUS 01 uses the calculation by STAUDT 90. Using several other models in the literature could worsen the limit up to 1.2eV. This is the most stringent experimental bound on m_{ν} . It supersedes BAUDIS 99B.

Limits on Lepton-Number Violating (V+A) Current Admixture

For reasons given in the discussion at the beginning of this section, we list only results from 1989 and later. $\langle \lambda \rangle = \lambda \sum U_{ej} V_{ej}$ and $\langle \eta \rangle = \eta \sum U_{ej} V_{ej}$, where the sum is over the number of neutrino generations. This sum vanishes for massless or unmixed neutrinos. In the following Listings, only best or comparable limits or lifetimes for each isotope are reported.

$\langle \lambda \rangle$ (10^{-6})	CL%	$\langle \eta \rangle$ (10^{-8})	CL%	ISOTOPE	METHOD	DOCUMENT ID

- ¹ ARNOLD 18 use the NEMO03 tracking detector, with 0.93 kg of ⁸²Se mass and 5.25 y exposure to obtain the limits for the hypothetical right-handed currents. Supersedes ARNOLD 05A.
- ² BARABASH 18 use 1.162 kg of ¹¹⁶CdWO₄ scintillating crystals to obtain this limits for the hypothetical right-handed currents in the 0 $\nu\beta\beta$ decay of ¹¹⁶Cd.
- ³ ARNOLD 14 is based on 34.7 kg yr of exposure of the NEMO-3 tracking calorimeter. The reported range limit on $\langle \lambda \rangle$ and $\langle \eta \rangle$ reflects the nuclear matrix element uncertainty in ¹⁰⁰Mo.
- ⁴ ARNOLD 07 use NEMO-3 half life limit for 0 ν -decay of ¹⁰⁰Mo to the first excited 2⁺-state of daughter nucleus to limit the right-right handed admixture of weak currents $\langle \lambda \rangle$. This limit is not competitive when compared to the decay to the ground state.
- ⁵ Re-analysis of data originally published in KLAPDOR-KLEINGROTHAUS 04A. Modified pulse shape analysis leads the authors to claim 6 σ statistical evidence for observation of 0 ν -decay. Authors use matrix element of MUTO 89 to determine $\langle \lambda \rangle$ and $\langle \eta \rangle$. Uncertainty of nuclear matrix element is not reflected in stated errors.
- ⁶ ARNOLD 05A derive limit for $\langle \lambda \rangle$ based on ¹⁰⁰Mo data collected with NEMO-3 detector. No limit for $\langle \eta \rangle$ is given. Supersedes ARNOLD 04.
- ⁷ ARNOLD 05A derive limit for $\langle \lambda \rangle$ based on ⁸²Se data collected with NEMO-3 detector. No limit for $\langle \eta \rangle$ is given. Supersedes ARNOLD 04.
- ⁸ ARNOLD 04 use the matrix elements of SUHONEN 94 to obtain a limit for $\langle \lambda \rangle$, no limit for $\langle \eta \rangle$ is given. This limit is more stringent than the limit in EJIRI 01 for the same nucleus.
- ⁹ ARNOLD 04 use the matrix elements of TOMODA 91 and SUHONEN 91 to obtain a limit for $\langle \lambda \rangle$, no limit for $\langle \eta \rangle$ is given.
- ¹⁰ Supersedes ALESSANDRELLO 00. Cryogenic calorimeter search. Reported a range reflecting uncertainty in nuclear matrix element calculations.
- ¹¹ Limits for $\langle \lambda \rangle$ and $\langle \eta \rangle$ are based on nuclear matrix elements of STAUDT 90. Supersedes DANEVICH 00.
- ¹² The range of the reported $\langle \lambda \rangle$ and $\langle \eta \rangle$ values reflects the spread of the nuclear matrix elements. On axis value assuming $\langle m_{\nu} \rangle = 0$ and $\langle \lambda \rangle = \langle \eta \rangle = 0$, respectively.
- ¹³ GUENTHER 97 limits use the matrix elements of STAUDT 90. Supersedes BALYSH 95 and BALYSH 92.
- ¹⁴ VUILLEUMIER 93 uses the matrix elements of MUTO 89. Based on a half-life limit 2.6×10^{23} y at 90%CL.
- ¹⁵ BERNATOWICZ 92 takes the measured geochemical decay width as a limit on the 0 ν width, and uses the SUHONEN 91 coefficients to obtain the least restrictive limit on η . Further details of the experiment are given in BERNATOWICZ 93.

Neutrino Mixing

With the possible exceptions of "short-baseline anomalies," such as LSND, all neutrino data can be described within the framework of a 3x3 mixing matrix between the mass eigenstates ν_1 , ν_2 , and ν_3 , leading to the flavor eigenstates ν_e , ν_μ , and ν_τ , as described in the review "Neutrino masses, mixing and oscillations."

The Listings are divided in the following sections:

(A) Neutrino fluxes and event ratios: shows measurements which correspond to various oscillation tests for Accelerator, Reactor, Atmospheric, and Solar neutrino experiments. Typically, ratios involve a measurement in a realm sensitive to oscillations compared to one for which no oscillation effect is expected.

(B) Neutrino mixing parameters: shows measurements of $\sin^2(\theta_{12})$, $\sin^2(\theta_{23})$, $\sin^2(\theta_{13})$, Δm_{21}^2 , Δm_{32}^2 , and δ_{CP} as extracted from the measured data in the quoted publications in the frame of the three-neutrino mixing scheme. The quoted averages are not the result of a global fit, as in the review "Neutrino masses, mixing, and oscillations," and, as a consequence, might slightly differ from them. In some cases, measurements depend on the mass order (normal when $\Delta m_{32}^2 > 0$ or inverted when $\Delta m_{32}^2 < 0$) or octant of θ_{23} (lower when $\theta_{23} < 45^\circ$ or upper when $\theta_{23} > 45^\circ$).

(C) Other neutrino mixing results:

The LSND anomaly [AGUILAR 01], reported a signal which is consistent with $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ oscillations. In a three neutrino framework, this would be a measurement of θ_{12} and Δm_{21}^2 . This does not appear to be consistent with the interpretation of other neutrino data. It has been interpreted as evidence for a 4th "sterile" neutrino. The following listings include results which might be relevant towards understanding this observation. They include searches for $\nu_\mu \rightarrow \nu_e$, $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$, sterile neutrino oscillations, and others.

(A) Neutrino fluxes and event ratios

Events (observed/expected) from accelerator ν_μ experiments.

Some neutrino oscillation experiments compare the flux in two or more detectors. This is usually quoted as the ratio of the event rate in the far detector to the expected rate based on an extrapolation from the near detector in the absence of oscillations.

VALUE	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •			
1.01 ± 0.10	1 ABE	14B T2K	ν_e rate in T2K near detect.
0.71 ± 0.08	2 AHN	06A K2K	K2K to Super-K
0.64 ± 0.05	3 MICHAEL	06 MINS	All charged current events
0.71 ^{+0.08} _{-0.09}	4 ALIU	05 K2K	KEK to Super-K
0.70 ^{+0.10} _{-0.11}	5 AHN	03 K2K	KEK to Super-K

- ¹ The rate of ν_e from μ decay was measured to be 0.68 ± 0.30 compared to the predicted flux. From K decay 1.10 ± 0.14 compared to the predicted flux.
- ² Based on the observation of 112 events when 158.1 ± 9.2 were expected without oscillations. Including not only the number of events but also the shape of the energy distribution, the evidence for oscillation is at the level of about 4.3σ . Supersedes ALIU 05.
- ³ This ratio is based on the observation of 215 events compared to an expectation of 336 ± 14 without oscillations. See also ADAMSON 08.
- ⁴ This ratio is based on the observation of 107 events at the far detector 250 km away from KEK, and an expectation of 151 ± 10 .
- ⁵ This ratio is based on the observation of 56 events with an expectation of 80.1 ± 6.2 .

Events (observed/expected) from reactor $\bar{\nu}_e$ experiments.

The quoted values are the ratios of the measured reactor $\bar{\nu}_e$ event rate at the quoted distances, and the rate expected without oscillations. The expected rate is based on the experimental data for the most significant reactor fuels (^{235}U , ^{239}Pu , ^{241}Pu) and on calculations for ^{238}U .

A recent re-evaluation of the spectral conversion of electron to $\bar{\nu}_e$ in MUELLER 11 results in an upward shift of the reactor $\bar{\nu}_e$ spectrum by 3% and, thus, might require revisions to the ratios listed in this table.

0.89 ± 0.15	11 BOEHM	80	$\bar{\nu}_e p \rightarrow e^+ n$

- ¹ ALMAZAN 20 use the RHF research reactor at ILL to compare their measured anti-neutrino event rate to the calculation by HUBER 11. Reported $0.948 \pm 0.008 \pm 0.023 \pm 0.023$ measurement with uncertainties from statistics, systematic, and model. Note that this result is obtained for highly enriched ^{235}U reactor fuel while most other reactor experiments utilize a low-enrichment mix of fissile nuclides.
- ² ADEY 19 present a re-analysis of 1230 days of Daya Bay near detector data with reduced systematic uncertainties on the neutron detection efficiency. Note that ADEY 19 report the measured to predicted antineutrino ratio using the reactor model of MUELLER 11 (Huber-Mueller model). The ratio using the older ILL-Vogel model is $1.001 \pm 0.015 \pm 0.027$.
- ³ AN 16 use 217 days of data (338k events) to determine the neutrino flux ratio relative to the prediction of Mueller-Huber and ILL-Vogel models (see AN 16 for details). The reported flux ratios were corrected for θ_{13} oscillation effect. The flux measurement is consistent with results from previous short-baseline reactor experiments. The measured inverse beta decay yield is $(1.55 \pm 0.04) \times 10^{-18} \text{ cm}^2/(\text{GW day})$ or $\sigma_f = (5.92 \pm 0.14) \times 10^{-43} \text{ cm}^2/\text{fission}$. About 4σ excess of events was observed in the 4–6 MeV prompt energy region.
- ⁴ DENIZ 10 observe reactor $\bar{\nu}_e e$ scattering with recoil kinetic energies 3–8 MeV using CsI(Tl) detectors. The observed rate is consistent with the Standard Model prediction, leading to a constraint on $\sin^2\theta_{W} = 0.251 \pm 0.031(\text{stat}) \pm 0.024(\text{sys})$.
- ⁵ Updated result of KamLAND, including the data used in EGUCHI 03. Note that the survival probabilities for different periods are not directly comparable because the effective baseline varies with power output of the reactor sources involved, and there were large variations in the reactor power production in Japan in 2003.
- ⁶ EGUCHI 03 observe reactor neutrino disappearance at ~180 km baseline to various Japanese nuclear power reactors.
- ⁷ BOEHM 01 search for neutrino oscillations at 0.75 and 0.89 km distance from the Palo Verde reactors.
- ⁸ APOLLONIO 99, APOLLONIO 98 search for neutrino oscillations at 1.1 km fixed distance from Chooz reactors. They use $\bar{\nu}_e p \rightarrow e^+ n$ in Gd-loaded scintillator target. APOLLONIO 99 supersedes APOLLONIO 98. See also APOLLONIO 03 for detailed description.
- ⁹ GREENWOOD 96 search for neutrino oscillations at 18 m and 24 m from the reactor at Savannah River.
- ¹⁰ DECLAIS 94 result based on integral measurement of neutrons only. Result is ratio of measured cross section to that expected in standard V-A theory. Replaced by ACHKAR 95.
- ¹¹ KWON 81 represents an analysis of a larger set of data from the same experiment as BOEHM 80.

Atmospheric neutrinos

Neutrinos and antineutrinos produced in the atmosphere induce μ -like and e -like events in underground detectors. The ratio of the numbers of the two kinds of events is defined as μ/e . It has the advantage that systematic effects, such as flux uncertainty, tend to cancel, for both experimental and theoretical values of the ratio. The "ratio of the ratios" of experimental to theoretical μ/e , $R(\mu/e)$, or that of experimental to theoretical μ/total , $R(\mu/\text{total})$ with $\text{total} = \mu + e$, is reported below. If the actual value is not unity, the value obtained in a given experiment may depend on the experimental conditions. In addition, the measured "up-down asymmetry" for μ ($N_{up}(\mu)/N_{down}(\mu)$) or e ($N_{up}(e)/N_{down}(e)$) is reported. The expected "up-down asymmetry" is nearly unity if there is no neutrino oscillation.

$R(\mu/e) = (\text{Measured Ratio } \mu/e) / (\text{Expected Ratio } \mu/e)$

¹ ASHIE 05 results are based on an exposure of 92 kton yr during the complete Super-Kamiokande I running period. The analyzed data sample consists of fully-contained single-ring e -like events with $0.1 \text{ GeV}/c < p_e$ and μ -like events $0.2 \text{ GeV}/c < p_\mu$, both having a visible energy $< 1.33 \text{ GeV}$. These criteria match the definition used by FUKUDA 94.

² ASHIE 05 results are based on an exposure of 92 kton yr during the complete Super-Kamiokande I running period. The analyzed data sample consists of fully-contained single-ring events with visible energy $> 1.33 \text{ GeV}$ and partially-contained events. All partially-contained events are classified as μ -like.

³ SANCHEZ 03 result is based on an exposure of 5.9 kton yr, and updates ALLISON 99 result. The analyzed data sample consists of fully-contained e -flavor and μ -flavor events having lepton momentum $> 0.3 \text{ GeV}/c$.

⁴ FUKUDA 96b studied neutron background in the atmospheric neutrino sample observed in the Kamiokande detector. No evidence for the background contamination was found.

⁵ DAUM 95 results are based on an exposure of 2.0 kton yr which includes the data used by BERGER 90b. This ratio is for the contained and semicontained events. DAUM 95 also report $R(\mu/e) = 0.99 \pm 0.13 \pm 0.08$ for the total neutrino induced data sample which includes upward going stopping muons and horizontal muons in addition to the contained and semicontained events.

⁶ FUKUDA 94 result is based on an exposure of 7.7 kton yr and updates the HIRATA 92 result. The analyzed data sample consists of fully-contained e -like events with $0.1 < p_e < 1.33 \text{ GeV}/c$ and fully-contained μ -like events with $0.2 < p_\mu < 1.5 \text{ GeV}/c$.

⁷ FUKUDA 94 analyzed the data sample consisting of fully contained events with visible energy $> 1.33 \text{ GeV}$ and partially contained μ -like events.

⁸ BECKER-SZENDY 92b reports the fraction of nonshowering events (mostly muons from atmospheric neutrinos) as $0.36 \pm 0.02 \pm 0.02$, as compared with expected fraction $0.51 \pm 0.01 \pm 0.05$. After cutting the energy range to the Kamiokande limits, BEIER 92 finds $R(\mu/e)$ very close to the Kamiokande value.

 $R(\nu_\mu) = (\text{Measured Flux of } \nu_\mu) / (\text{Expected Flux of } \nu_\mu)$

$\bullet \bullet \bullet$ We do not use the following data for averages, fits, limits, etc. $\bullet \bullet \bullet$

¹ ADAMSON 06 uses a measurement of 107 total neutrinos compared to an expected rate of 127 ± 13 without oscillations.

² AMBROSIO 01 result is based on the upward through-going muon tracks with $E_\mu > 1 \text{ GeV}$. The data came from three different detector configurations, but the statistics is largely dominated by the full detector run, from May 1994 to December 2000. The total live time, normalized to the full detector configuration, is 6.17 years. The first error is the statistical error, the second is the systematic error, dominated by the theoretical error in the predicted flux.

³ AMBROSIO 00 result is based on the upgoing partially contained event sample. It came from 4.1 live years of data taking with the full detector, from April 1994 to February 1999. The average energy of atmospheric muon neutrinos corresponding to this sample is 4 GeV. The first error is statistical, the second is the systematic error, dominated by the 25% theoretical error in the rate (20% in the flux and 15% in the cross section, added in quadrature). Within statistics, the observed deficit is uniform over the zenith angle.

⁴ AMBROSIO 00 result is based on the combined samples of downgoing partially contained events and upgoing stopping events. These two subsamples could not be distinguished due to the lack of timing information. The result came from 4.1 live years of data taking with the full detector, from April 1994 to February 1999. The average energy of atmospheric muon neutrinos corresponding to this sample is 4 GeV. The first error is statistical, the second is the systematic error, dominated by the 25% theoretical error in the rate (20% in the flux and 15% in the cross section, added in quadrature). Within statistics, the observed deficit is uniform over the zenith angle.

⁵ AMBROSIO 98 result is for all nadir angles and updates AHLEN 95 result. The lower cutoff on the muon energy is 1 GeV. In addition to the statistical and systematic errors, there is a Monte Carlo flux error (theoretical error) of ± 0.13 . With a neutrino oscillation hypothesis, the fit either to the flux or zenith distribution independently yields $\sin^2 2\theta = 1.0$ and $\Delta(m^2) \sim$ a few times 10^{-3} eV^2 . However, the fit to the observed zenith distribution gives a maximum probability for χ^2 of only 5% for the best oscillation hypothesis.

⁶ CASPER 91 correlates showering/nonshowering signature of single-ring events with parent atmospheric-neutrino flavor. They find nonshowering ($\approx \nu_\mu$ induced) fraction is $0.41 \pm 0.03 \pm 0.02$, as compared with expected 0.51 ± 0.05 (syst).

⁷ AGLIETTA 89 finds no evidence for any anomaly in the neutrino flux. They define $\rho = (\text{measured number of } \nu_e\text{'s})/(\text{measured number of } \nu_\mu\text{'s})$. They report $\rho(\text{measured}) = \rho(\text{expected}) = 0.96 \pm 0.32 \pm 0.28$.

⁸ From this data BOLIEV 81 obtain the limit $\Delta(m^2) \leq 6 \times 10^{-3} \text{ eV}^2$ for maximal mixing, $\nu_\mu \leftrightarrow \nu_\mu$ type oscillation.

 $R(\mu/\text{total}) = (\text{Measured Ratio } \mu/\text{total}) / (\text{Expected Ratio } \mu/\text{total})$

¹ ADAMSON 12b reports the atmospheric neutrino results obtained with MINOS far detector in 2,553 live days (an exposure of 37.9 kton-yr). This result is obtained with a sample of high resolution contained-vertex muons. The quoted error is statistical only.

² ASHIE 05 results are based on an exposure of 92 kton yr during the complete Super-Kamiokande I running period. The analyzed data sample consists of fully-contained single-ring μ -like events with visible energy $> 1.33 \text{ GeV}$ and partially-contained events. All partially-contained events are classified as μ -like. Upward-going events are those with $-1 < \cos(\text{zenith angle}) < -0.2$ and downward-going events are those with $0.2 < \cos(\text{zenith angle}) < 1$. The μ -like up-down ratio for the multi-GeV data deviates from 1 (the expectation for no atmospheric ν_μ oscillations) by more than 12 standard deviations.

 $N_{\text{up}}(e)/N_{\text{down}}(e)$

Neutrino Mixing

- ²This result is obtained with a charge-separated sample of high resolution contained-vertex muons.
- ³This result is obtained with a charge-separated sample of high resolution neutrino-induced rock-muons.
- ⁴The charge-separated samples of high resolution contained-vertex muons and neutrino-induced rock-muons are combined to obtain this result which is consistent with unity.
- ⁵ADAMSON 07 result is obtained with the MINOS far detector in 854.24 live days, based on neutrino-induced upward-going and horizontal muons. This result is consistent with CPT conservation.
- ⁶ADAMSON 06 result is obtained with the MINOS far detector with an exposure of 4.54 kton yr, based on contained events. The expected ratio is calculated by assuming the same oscillation parameters for neutrinos and antineutrinos.

Solar neutrinos

Solar neutrinos are produced by thermonuclear fusion reactions in the Sun. Radiochemical experiments measure particular combinations of fluxes from various neutrino-producing reactions, whereas water-Cherenkov experiments mainly measure a flux of neutrinos from decay of ⁸B. Solar neutrino fluxes are composed of all active neutrino species, ν_e , ν_μ , and ν_τ . In addition, some other mechanisms may cause antineutrino components in solar neutrino fluxes. Each measurement method is sensitive to a particular component or a combination of components of solar neutrino fluxes.

ν_e Capture Rates from Radiochemical Experiments

1 SNU (Solar Neutrino Unit) = 10^{-36} captures per atom per second.

VALUE (SNU)	DOCUMENT ID	TECN	COMMENT
● ● ● We do not use the following data for averages, fits, limits, etc. ● ● ●			
73.4 $\begin{smallmatrix} +6.1 & +3.7 \\ -6.0 & -4.1 \end{smallmatrix}$	1 KAETHER	10	GALX reanalysis
67.6 $\pm 4.0 \pm 3.2$	2 KAETHER	10	GNO+GALX reanalysis combined
65.4 $\begin{smallmatrix} +3.1 & +2.6 \\ -3.0 & -2.8 \end{smallmatrix}$	3 ABDURASHI... 09	SAGE	⁷¹ Ga → ⁷¹ Ge
62.9 $\begin{smallmatrix} +5.5 \\ -5.3 \end{smallmatrix} \pm 2.5$	4 ALTMANN	05	GNO ⁷¹ Ga → ⁷¹ Ge
69.3 $\pm 4.1 \pm 3.6$	5 ALTMANN	05	GNO + GALX combined
77.5 $\pm 6.2 \begin{smallmatrix} +4.3 \\ -4.7 \end{smallmatrix}$	6 HAMPEL	99	GALX ⁷¹ Ga → ⁷¹ Ge
2.56 $\pm 0.16 \pm 0.16$	7 CLEVELAND	98	HOME ³⁷ Cl → ³⁷ Ar

- ¹KAETHER 10 reports the reanalysis results of a complete GALLEX data (GALLEX I+II+III+IV, reported in HAMPEL 99) based on the event selection with a new pulse shape analysis, which provides a better background reduction than the rise time analysis adopted in HAMPEL 99.
- ²Combined result of GALLEX I+II+III+IV reanalysis and GNO I+II+III (ALTMANN 05).
- ³ABDURASHITOV 09 reports a combined analysis of 168 extractions of the SAGE solar neutrino experiment during the period January 1990 through December 2007, and updates the ABDURASHITOV 02 result. The data are consistent with the assumption that the solar neutrino production rate is constant in time. Note that a $\sim 15\%$ systematic uncertainty in the overall normalization may be added to the ABDURASHITOV 09 result, because calibration experiments for gallium solar neutrino measurements using intense ⁵¹Cr (twice by GALLEX and once by SAGE) and ³⁷Ar (by SAGE) result in an average ratio of 0.87 ± 0.05 of the observed to calculated rates.
- ⁴ALTMANN 05 reports the complete result from the GNO solar neutrino experiment (GNO I+II+III), which is the successor project of GALLEX. Experimental technique of GNO is essentially the same as that of GALLEX. The run data cover the period 20 May 1998 through 9 April 2003.
- ⁵Combined result of GALLEX I+II+III+IV (HAMPEL 99) and GNO I+II+III.
- ⁶HAMPEL 99 report the combined result for GALLEX I+II+III+IV (65 runs in total), which update the HAMPEL 96 result. The GALLEX IV result (12 runs) is $118.4 \pm 17.8 \pm 6.6$ SNU. (HAMPEL 99 discuss the consistency of partial results with the mean.) The GALLEX experimental program has been completed with these runs. The total run data cover the period 14 May 1991 through 23 January 1997. A total of 300 ⁷¹Ge events were observed. Note that a $\sim 15\%$ systematic uncertainty in the overall normalization may be added to the HAMPEL 99 result, because calibration experiments for gallium solar neutrino measurements using intense ⁵¹Cr (twice by GALLEX and once by SAGE) and ³⁷Ar (by SAGE) result in an average ratio of 0.87 ± 0.05 of the observed to calculated rates.
- ⁷CLEVELAND 98 is a detailed report of the ³⁷Cl experiment at the Homestake Mine. The average solar neutrino-induced ³⁷Ar production rate from 108 runs between 1970 and 1994 updates the DAVIS 89 result.

$\phi_{ES} (^8B)$

⁸B solar-neutrino flux measured via νe elastic scattering. This process is sensitive to all active neutrino flavors, but with reduced sensitivity to ν_μ, ν_τ due to the cross-section difference, $\sigma(\nu_{\mu,\tau} e) \sim 0.16\sigma(\nu_e e)$. If the ⁸B solar-neutrino flux involves nonelectron flavor active neutrinos, their contribution to the flux is ~ 0.16 times of ν_e .

- ¹AGOSTINI 20A obtained this result from the $\nu_e e$ elastic scattering rate over the period between January 2008 and December 2016. Uses the same data as AGOSTINI 18B, but the analysis technique is significantly improved.
- ²ANDERSON 19 reports this result from the $\nu_e e$ elastic scattering rate using a 69.2 kton-day (or 114.7 days) of exposure from May through December, 2017 during the SNO+ detector's water commissioning phase. The events over the reconstructed electron kinetic energy range of 5–15 MeV were analyzed.
- ³AGOSTINI 18B obtained this result from the $\nu_e e$ elastic scattering rate over the period between January 2008 and December 2016.
- ⁴ABE 16c reports the combined results of the four phases of the Super-Kamiokande average flux measurements. Here the revised Super-Kamiokande-III result is used.
- ⁵ABE 16c reports the Super-Kamiokande-IV results for 1664 live days from September 2008 to February 2014. The analysis threshold is total electron energy of 4.0 MeV.
- ⁶ABE 16c revised the Super-Kamiokande-III average flux value reported in ABE 11. Super-Kamiokande-III results are for 548 live days from August 4, 2006 to August 18, 2008. The analysis threshold is 5.0 MeV, but the event sample in the 5.0–6.5 MeV total electron energy range has a total live time of 298 days.
- ⁷ABE 11 recalculated the Super-Kamiokande-II results using ⁸B spectrum of WINTER 06A.
- ⁸ABE 11 recalculated the Super-Kamiokande-I results using ⁸B spectrum of WINTER 06A.
- ⁹ABE 11B use a 123 kton-day exposure of the KamLAND liquid scintillation detector to measure the ⁸B solar neutrino flux. They utilize $\nu - e$ elastic scattering above a reconstructed-energy threshold of 5.5 MeV, corresponding to 5 MeV electron recoil energy. 299 electron recoil candidate events are reported, of which 157 ± 23.6 are assigned to background.
- ¹⁰BELLINI 10A reports the Borexino result with 3 MeV energy threshold for scattered electrons. The data correspond to 345.3 live days with a target mass of 100 t, between July 15, 2007 and August 23, 2009.
- ¹¹AHARMIM 08 reports the results from SNO Phase III measurement using an array of ³He proportional counters to measure the rate of NC interactions in heavy water, over the period between November 27, 2004 and November 28, 2006, corresponding to 385.17 live days. A simultaneous fit was made for the number of NC events detected by the proportional counters and the numbers of NC, CC, and ES events detected by the PMTs, where the spectral distributions of the ES and CC events were not constrained to the ⁸B shape.
- ¹²CRAVENS 08 reports the Super-Kamiokande-II results for 791 live days from December 2002 to October 2005. The photocathode coverage of the detector is 19% (reduced from 40% of that of Super-Kamiokande-I due to an accident in 2001). The analysis threshold for the average flux is 7 MeV.
- ¹³HOSAKA 06 reports the final results for 1496 live days with Super-Kamiokande-I between May 31, 1996 and July 15, 2001, and replace FUKUDA 02 results. The analysis threshold is 5 MeV except for the first 280 live days (6.5 MeV).
- ¹⁴AHARMIM 05A measurements were made with dissolved NaCl (0.195% by weight) in heavy water over the period between July 26, 2001 and August 28, 2003, corresponding to 391.4 live days, and update AHMED 04A. The CC, ES, and NC events were statistically separated. In one method, the ⁸B energy spectrum was not constrained. In the other method, the constraint of an undistorted ⁸B energy spectrum was added for comparison with AHMAD 02 results.
- ¹⁵AHMAD 02 reports the ⁸B solar-neutrino flux measured via νe elastic scattering above the kinetic energy threshold of 5 MeV. The data correspond to 306.4 live days with SNO between November 2, 1999 and May 28, 2001, and updates AHMAD 01 results.
- ¹⁶AHMAD 01 reports the ⁸B solar-neutrino flux measured via νe elastic scattering above the kinetic energy threshold of 6.75 MeV. The data correspond to 241 live days with SNO between November 2, 1999 and January 15, 2001.
- ¹⁷FUKUDA 96 results are for a total of 2079 live days with Kamiokande II and III from January 1987 through February 1995, covering the entire solar cycle 22, with threshold $E_e > 9.3$ MeV (first 449 days), > 7.5 MeV (middle 794 days), and > 7.0 MeV (last 836 days). These results update the HIRATA 90 result for the average ⁸B solar-neutrino flux and HIRATA 91 result for the day-night variation in the ⁸B solar-neutrino flux. The total

Lepton Particle Listings

Neutrino Mixing

data sample was also analyzed for short-term variations: within experimental errors, no strong correlation of the solar-neutrino flux with the sunspot numbers was found.

ϕ_{CC} (^8B)

^8B solar-neutrino flux measured with charged-current reaction which is sensitive exclusively to ν_e .

¹AHARMIM 05A measurements were made with dissolved NaCl (0.195% by weight) in heavy water over the period between July 26, 2001 and August 28, 2003, corresponding to 391.4 live days, and update AHMED 04A. The CC, ES, and NC events were statistically separated. In one method, the ^8B energy spectrum was not constrained. In the other method, the constraint of an undistorted ^8B energy spectrum was added for comparison with AHMAD 02 results.

²AHMAD 02 deduced the nonelectron-flavor active neutrino component (ν_μ and ν_τ) in the ^8B solar-neutrino flux, by combining the charged-current result, the ν_e elastic-scattering result and the neutral-current result. The complete description of the SNO Phase I data set is given in AHARMIM 07.

³AHMAD 01 deduced the nonelectron-flavor active neutrino component (ν_μ and ν_τ) in the ^8B solar-neutrino flux, by combining the SNO charged-current result (AHMAD 01) and the Super-Kamiokande ν_e elastic-scattering result (FUKUDA 01).

Total Flux of Active pp Solar Neutrinos

- ANDERSON 19 reports this result from the measured $\nu_e e$ elastic scattering rate using a 69.2 kton-day (or 114.7 days) of exposure from May through December, 2017 during the SNO+ detector's water commissioning phase, assuming the neutrino mixing parameters given in PDG 16 and a standard solar model given in BAHCALL 05.
- AGOSTINI 18B obtained this result from the measured $\nu_e e$ elastic scattering rate over the period between January 2008 and December 2016, assuming the MSW-LMA oscillation parameters derived by ESTEBAN 17. Assuming a high-metallicity standard solar model, the electron neutrino survival probability for the 8B solar neutrino is calculated to be 0.37 ± 0.08 .
- AHARMIM 13 obtained this result from a combined analysis of the data from all three phases, SNO-I, II, and III. The measurement of the 8B flux mostly comes from the NC signal, however, CC contribution is included in the fit.
- AHARMIM 10 reports this result from a joint analysis of SNO Phase I+II data with the "effective electron kinetic energy" threshold of 3.5 MeV. This result is obtained with the assumption of unitarity, which relates the NC, CC, and ES rates. The data were fit with the free parameters directly describing the total 8B neutrino flux and the energy-dependent ν_e survival probability.
- AHARMIM 08 reports the results from SNO Phase III measurement using an array of 3He proportional counters to measure the rate of NC interactions in heavy water, over the period between November 27, 2004 and November 28, 2006, corresponding to 385.17 live days. A simultaneous fit was made for the number of NC events detected by the proportional counters and the numbers of NC, CC, and ES events detected by the PMTs, where the spectral distributions of the ES and CC events were not constrained to the 8B shape.
- AHARMIM 05A measurements were made with dissolved NaCl (0.195% by weight) in heavy water over the period between July 26, 2001 and August 28, 2003, corresponding to 391.4 live days, and update AHMED 04A. The CC, ES, and NC events were statistically separated. In one method, the 8B energy spectrum was not constrained. In the other method, the constraint of an undistorted 8B energy spectrum was added for comparison with AHMAD 02 results.
- AHMAD 02 determined the total flux of active 8B solar neutrinos by directly measuring the neutral-current reaction, $\nu_e d \rightarrow np \nu_e$, which is equally sensitive to $\nu_e, \nu_\mu,$ and ν_τ . The complete description of the SNO Phase I data set is given in AHARMIM 07.
- AHMAD 01 deduced the total flux of active 8B solar neutrinos by combining the SNO charged-current result (AHMAD 01) and the Super-Kamiokande νe elastic-scattering result (FUKUDA 01).

<2.2	90	3 AGOSTINI	18B BORX	Use $\nu_e e$ scattering rate
		1 AGOSTINI	20A	AGOSTINI 20A obtained this result from an upper limit of the $\nu_e e$ elastic scattering rate and NC-mediated inelastic scattering on carbon nuclei with 15.1 MeV deexcitation γ -ray for the hep neutrino. The dataset corresponds to an effective exposure of 0.745 kt-yr from November 2009 to October 2017. A FADC DAQ system, optimized for the acquisition of high-energy events was used for data collection. The MSW-LMA oscillation parameters derived by ESTEBAN 17 were assumed.
		2 AHARMIM	20	AHARMIM 20 uses the entire SNO dataset, corresponding to 2.47 kton-yr of exposure after fiducialization. With the D_2O target, SNO was sensitive to charged current, neutral current, and elastic scattering channels.
		3 AGOSTINI	18B	AGOSTINI 18B obtained this result from an upper limit of the $\nu_e e$ elastic scattering rate for the hep neutrino using the dataset corresponding to an exposure of 0.8 kt-yr and assuming the MSW-LMA oscillation parameters derived by ESTEBAN 17.

Day-Night Asymmetry (8B)

$$A = (\phi_{\text{night}} - \phi_{\text{day}}) / \phi_{\text{average}}$$

VALUE	DOCUMENT ID	TECN	COMMENT
0.033 ± 0.010 ± 0.005	1 ABE	16c SKAM	SK combined; Based on ϕ_{ES}
• • •			We do not use the following data for averages, fits, limits, etc. • • •
0.036 ± 0.016 ± 0.006	2 ABE	16c SKAM	SK-IV; Based on ϕ_{ES}
0.032 ± 0.011 ± 0.005	3 RENSHAW	14 SKAM	Based on ϕ_{ES}

- ABE 16c reports the combined day-night flux asymmetry results of the four phases of the Super-Kamiokande measurements. Amplitude fit method is used. See footnote to RENSHAW 14.
- ABE 16c reports the Super-Kamiokande-IV results for 1664 live days from September 2008 to February 2014. The analysis threshold for day-night flux asymmetry is recoil electron energy of 4.49 MeV (total electron energy of 5.0 MeV). Amplitude fit method is used. See footnote to RENSHAW 14.
- RENSHAW 14 obtains this result by using the "amplitude fit" introduced in SMY 04. The data from the Super-Kamiokande(SK)-I, -II, -III, and 1306 live days of the SK-IV measurements are used. The analysis threshold is recoil-electron kinetic energy of 4.5 MeV for SK-III, and SK-IV except for 250 live days in SK-III (6.0 MeV). The analysis threshold for SK-I and SK-II is the same as in the previous reports. (Note that in the previous SK solar-neutrino results, the analysis threshold is quoted as recoil-electron total energy.) This day-night asymmetry result is consistent with neutrino oscillations for $4 \times 10^{-5} \text{ eV}^2 < \Delta m_{21}^2 < 7 \times 10^{-5} \text{ eV}^2$ and large mixing values of θ_{12} at the 68% CL.
- CRAVENS 08 reports the Super-Kamiokande-II results for 791 live days from December 2002 to October 2005. The photocathode coverage of the detector is 19% (reduced from 40% of that of Super-Kamiokande-I due to an accident in 2001). The analysis threshold for the day and night fluxes is 7.5 MeV except for the first 159 live days (8.0 MeV).
- HOSAKA 06 reports the final results for 1496 live days with Super-Kamiokande-I between May 31, 1996 and July 15, 2001, and replace FUKUDA 02 results. The analysis threshold is 5 MeV except for the first 280 live days (6.5 MeV).
- This result with reduced statistical uncertainty is obtained by assuming two-neutrino oscillations within the LMA (large mixing angle) region and by fitting the time variation of the solar neutrino flux measured via ν_e elastic scattering to the variations expected from neutrino oscillations. For details, see SMY 04. There is an additional small systematic error of ± 0.0004 coming from uncertainty of oscillation parameters.
- AHARMIM 05A measurements were made with dissolved NaCl (0.195% by weight) in heavy water over the period between July 26, 2001 and August 28, 2003, with 176.5 days of the live time recorded during the day and 214.9 days during the night. This result is obtained with the spectral distribution of the CC events not constrained to the 8B shape.
- AHMAD 02B results are based on the charged-current interactions recorded between November 2, 1999 and May 28, 2001, with the day and night live times of 128.5 and 177.9 days, respectively. The complete description of the SNO Phase I data set is given in AHARMIM 07.
- AHMAD 02B results are derived from the charged-current interactions, neutral-current interactions, and νe elastic scattering, with the total flux of active neutrinos constrained to have no asymmetry. The data were recorded between November 2, 1999 and May 28, 2001, with the day and night live times of 128.5 and 177.9 days, respectively. The complete description of the SNO Phase I data set is given in AHARMIM 07.

ϕ_{ES} (7Be)

7Be solar-neutrino flux measured via ν_e elastic scattering. This process is sensitive to all active neutrino flavors, but with reduced sensitivity to ν_μ, ν_τ due to the cross-section difference, $\sigma(\nu_{\mu,\tau} e) \sim 0.2 \sigma(\nu_e e)$. If the 7Be solar-neutrino flux involves nonelectron flavor active neutrinos, their contribution to the flux is ~ 0.2 times that of ν_e .

¹ABE 16c obtained this result by a three-neutrino oscillation analysis, with a constraint of $\sin^2(\theta_{13}) = 0.0219 \pm 0.0014$ coming from reactor neutrino experiments, using all solar data and KamLAND data. $CP T$ invariance is assumed.

²SALAS 21 reports results of a global fit to neutrino oscillation data available at the time of the Neutrino 2020 conference.

³ESTEBAN 20A reports results of a global fit to neutrino oscillation data available at the time of the Neutrino2020 conference.

- ⁴ ABE 16c obtained this result by a three-neutrino oscillation analysis, with a constraint of $\sin^2(\theta_{13}) = 0.0219 \pm 0.0014$ coming from reactor neutrino experiments, using Super-Kamiokande (I+II+III+IV) and SNO data.
- ⁵ ABE 16c obtained this result by a three-neutrino oscillation analysis, with a constraint of $\sin^2(\theta_{13}) = 0.0219 \pm 0.0014$ coming from reactor neutrino experiments, by combining the four phases of the Super-Kamiokande solar data.
- ⁶ ABE 16c obtained this result by a three-neutrino oscillation analysis, with a constraint of $\sin^2(\theta_{13}) = 0.0219 \pm 0.0014$ coming from reactor neutrino experiments, using the Super-Kamiokande-IV data.
- ⁷ FORERO 14 performs a global fit to neutrino oscillations using solar, reactor, long-baseline accelerator, and atmospheric neutrino data.
- ⁸ GONZALEZ-GARCIA 14 result comes from a frequentist global fit. The corresponding Bayesian global fit to the same data results are reported in BERGSTROM 15 as $0.304^{+0.013}_{-0.012}$ for normal and $0.305^{+0.012}_{-0.013}$ for inverted mass ordering.
- ⁹ AHARMIM 13 obtained this result by a two-neutrino oscillation analysis using global solar neutrino data.
- ¹⁰ AHARMIM 13 global solar neutrino data include SNO's all-phases-combined analysis results on the total active ⁸B neutrino flux and energy-dependent ν_e survival probability parameters, measurements of Cl (CLEVELAND 98), Ga (ABDURASHITOV 09 which contains combined analysis with GNO (ALTMANN 05 and Ph.D. thesis of F. Kaether)), and ⁷Be (BELLINI 11A) rates, and ⁸B solar-neutrino recoil electron measurements of SK-I (HOSAKA 06) zenith, SK-II (CRAVENS 08) and SK-III (ABE 11) day/night spectra, and Borexino (BELLINI 10A) spectra.
- ¹¹ AHARMIM 13 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{32}^2 fixed to $2.45 \times 10^{-3} \text{ eV}^2$, using global solar neutrino data.
- ¹² AHARMIM 13 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{32}^2 fixed to $2.45 \times 10^{-3} \text{ eV}^2$, using global solar neutrino and KamLAND (GANDO 11) data. *CPT* invariance is assumed.
- ¹³ GANDO 13 obtained this result by a three-neutrino oscillation analysis using KamLAND, global solar neutrino, short-baseline (SBL) reactor, and accelerator data, assuming *CPT* invariance. Supersedes GANDO 11.
- ¹⁴ GANDO 13 obtained this result by a three-neutrino oscillation analysis using KamLAND and global solar neutrino data, assuming *CPT* invariance. Supersedes GANDO 11.
- ¹⁵ GANDO 13 obtained this result by a three-neutrino oscillation analysis using KamLAND data. Supersedes GANDO 11.
- ¹⁶ ABE 11 obtained this result by a two-neutrino oscillation analysis using solar neutrino data including Super-Kamiokande, SNO, Borexino (ARPESELLA 08A), Homestake, GALLEX/GNO, SAGE, and KamLAND data. *CPT* invariance is assumed.
- ¹⁷ ABE 11 obtained this result by a two-neutrino oscillation analysis using solar neutrino data including Super-Kamiokande, SNO, Borexino (ARPESELLA 08A), Homestake, GALLEX/GNO, and SAGE data.
- ¹⁸ ABE 11 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{32}^2 fixed to $2.4 \times 10^{-3} \text{ eV}^2$, using solar neutrino data including Super-Kamiokande, SNO, Borexino (ARPESELLA 08A), Homestake, GALLEX/GNO, SAGE, and KamLAND data. The normal neutrino mass ordering and *CPT* invariance are assumed.
- ¹⁹ ABE 11 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{32}^2 fixed to $2.4 \times 10^{-3} \text{ eV}^2$, using solar neutrino data including Super-Kamiokande, SNO, Borexino (ARPESELLA 08A), Homestake, and GALLEX/GNO data. The normal neutrino mass ordering is assumed.
- ²⁰ BELLINI 11A obtained this result by a two-neutrino oscillation analysis using KamLAND, Homestake, SAGE, Gallex, GNO, Kamiokande, Super-Kamiokande, SNO, and Borexino (BELLINI 11A) data and the SSM flux prediction in SERENELLI 11 (Astrophysical Journal **743** 24 (2011)) with the exception that the ⁸B flux was left free. *CPT* invariance is assumed.
- ²¹ BELLINI 11A obtained this result by a two-neutrino oscillation analysis using Homestake, SAGE, Gallex, GNO, Kamiokande, Super-Kamiokande, SNO, and Borexino (BELLINI 11A) data and the SSM flux prediction in SERENELLI 11 (Astrophysical Journal **743** 24 (2011)) with the exception that the ⁸B flux was left free.
- ²² GANDO 11 obtain this result with three-neutrino fit using the KamLAND + solar data. Superseded by GANDO 13.
- ²³ GANDO 11 obtain this result with three-neutrino fit using the KamLAND data only. Superseded by GANDO 13.
- ²⁴ AHARMIM 10 global solar neutrino data include SNO's low-energy-threshold analysis survival probability day/night curves, SNO Phase III integral rates (AHARMIM 08), Cl (CLEVELAND 98), SAGE (ABDURASHITOV 09), Gallex/GNO (HAMPEL 99, ALTMANN 05), Borexino (ARPESELLA 08A), SK-I zenith (HOSAKA 06), and SK-II day/night spectra (CRAVENS 08).
- ²⁵ AHARMIM 10 obtained this result by a two-neutrino oscillation analysis using global solar neutrino data and KamLAND data (ABE 08A). *CPT* invariance is assumed.
- ²⁶ AHARMIM 10 obtained this result by a two-neutrino oscillation analysis using global solar neutrino data.
- ²⁷ AHARMIM 10 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{31}^2 fixed to $2.3 \times 10^{-3} \text{ eV}^2$, using global solar neutrino data and KamLAND data (ABE 08A). *CPT* invariance is assumed.
- ²⁸ AHARMIM 10 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{31}^2 fixed to $2.3 \times 10^{-3} \text{ eV}^2$, using global solar neutrino data.
- ²⁹ ABE 08A obtained this result by a rate + shape + time combined geoneutrino and reactor two-neutrino fit for Δm_{21}^2 and $\tan^2\theta_{12}$, using KamLAND data only. Superseded by GANDO 11.
- ³⁰ ABE 08A obtained this result by means of a two-neutrino fit using KamLAND, Homestake, SAGE, GALLEX, GNO, SK (zenith angle and E-spectrum), the SNO χ^2 -map, and solar flux data. *CPT* invariance is assumed. Superseded by GANDO 11.
- ³¹ The result given by AHARMIM 08 is $\theta = (34.4^{+1.3}_{-1.2})^\circ$. This result is obtained by a two-neutrino oscillation analysis using solar neutrino data including those of Borexino (ARPESELLA 08A) and Super-Kamiokande-I (HOSAKA 06), and KamLAND data (ABE 08A). *CPT* invariance is assumed.
- ³² HOSAKA 06 obtained this result by a two-neutrino oscillation analysis using SK ν_e data, CC data from other solar neutrino experiments, and KamLAND data (ARAKI 05). *CPT* invariance is assumed.
- ³³ HOSAKA 06 obtained this result by a two-neutrino oscillation analysis using the data from Super-Kamiokande, SNO (AHMAD 02 and AHMAD 02B), and KamLAND (ARAKI 05) experiments. *CPT* invariance is assumed.
- ³⁴ HOSAKA 06 obtained this result by a two-neutrino oscillation analysis using the Super-Kamiokande and SNO (AHMAD 02 and AHMAD 02B) solar neutrino data.
- ³⁵ The result given by AHARMIM 05A is $\theta = (33.9 \pm 1.6)^\circ$. This result is obtained by a two-neutrino oscillation analysis using SNO pure deuterium and salt phase data, SK ν_e data, Cl and Ga CC data, and KamLAND data (ARAKI 05). *CPT* invariance is assumed. AHARMIM 05A also quotes $\theta = (33.9^{+2.4}_{-2.2})^\circ$ as the error enveloping the 68% CL two-dimensional region. This translates into $\sin^2 2\theta = 0.86^{+0.05}_{-0.06}$.
- ³⁶ AHARMIM 05A obtained this result by a two-neutrino oscillation analysis using the data from all solar neutrino experiments. The listed range of the parameter envelops the 95% CL two-dimensional region shown in figure 35a of AHARMIM 05A. AHARMIM 05A also quotes $\tan^2\theta = 0.45^{+0.09}_{-0.08}$ as the error enveloping the 68% CL two-dimensional region. This translates into $\sin^2 2\theta = 0.86^{+0.05}_{-0.07}$.
- ³⁷ ARAKI 05 obtained this result by a two-neutrino oscillation analysis using KamLAND and solar neutrino data. *CPT* invariance is assumed. The 1σ error shown here is translated from the number provided by the KamLAND collaboration, $\tan^2\theta = 0.40^{+0.05}_{-0.05}$. The corresponding number quoted in ARAKI 05 is $\tan^2\theta = 0.40^{+0.10}_{-0.07}$ ($\sin^2 2\theta = 0.82 \pm 0.07$), which envelops the 68% CL two-dimensional region.
- ³⁸ The result given by AHMED 04A is $\theta = (32.5^{+1.7}_{-1.6})^\circ$. This result is obtained by a two-neutrino oscillation analysis using solar neutrino and KamLAND data (EGUCHI 03). *CPT* invariance is assumed. AHMED 04A also quotes $\theta = (32.5^{+2.4}_{-2.3})^\circ$ as the error enveloping the 68% CL two-dimensional region. This translates into $\sin^2 2\theta = 0.82 \pm 0.06$.
- ³⁹ AHMED 04A obtained this result by a two-neutrino oscillation analysis using the data from all solar neutrino experiments. The listed range of the parameter envelops the 95% CL two-dimensional region shown in Fig. 5(a) of AHMED 04A. The best-fit point is $\Delta(m^2) = 6.5 \times 10^{-5} \text{ eV}^2$, $\tan^2\theta = 0.40$ ($\sin^2 2\theta = 0.82$).
- ⁴⁰ The result given by SMY 04 is $\tan^2\theta = 0.44 \pm 0.08$. This result is obtained by a two-neutrino oscillation analysis using solar neutrino and KamLAND data (IANNI 03). *CPT* invariance is assumed.
- ⁴¹ SMY 04 obtained this result by a two-neutrino oscillation analysis using the data from all solar neutrino experiments. The 1σ errors are read from Fig. 6(a) of SMY 04.
- ⁴² SMY 04 obtained this result by a two-neutrino oscillation analysis using the Super-Kamiokande and SNO (AHMAD 02 and AHMAD 02B) solar neutrino data. The 1σ errors are read from Fig. 6(a) of SMY 04.
- ⁴³ AHMAD 02B obtained this result by a two-neutrino oscillation analysis using the data from all solar neutrino experiments. The listed range of the parameter envelops the 95% CL two-dimensional region shown in Fig. 4(b) of AHMAD 02B. The best fit point is $\Delta(m^2) = 5.0 \times 10^{-5} \text{ eV}^2$ and $\tan\theta = 0.34$ ($\sin^2 2\theta = 0.76$).
- ⁴⁴ FUKUDA 02 obtained this result by a two-neutrino oscillation analysis using the data from all solar neutrino experiments. The listed range of the parameter envelops the 95% CL two-dimensional region shown in Fig. 4 of FUKUDA 02. The best fit point is $\Delta(m^2) = 6.9 \times 10^{-5} \text{ eV}^2$ and $\tan^2\theta = 0.38$ ($\sin^2 2\theta = 0.80$).

- ¹ GANDO 13 obtained this result by a three-neutrino oscillation analysis using KamLAND, global solar neutrino, short-baseline (SBL) reactor, and accelerator data, assuming CPT invariance. Supersedes GANDO 11.
- ² SALAS 21 reports results of a global fit to neutrino oscillation data available at the time of the Neutrino 2020 conference.
- ³ ESTEBAN 20A reports results of a global fit to neutrino oscillation data available at the time of the Neutrino2020 conference.
- ⁴ ABE 16c obtained this result by a three-neutrino oscillation analysis, with a constraint of $\sin^2(\theta_{13}) = 0.0219 \pm 0.0014$ coming from reactor neutrino experiments, using all solar data and KamLAND data. CPT invariance is assumed.
- ⁵ ABE 16c obtained this result by a three-neutrino oscillation analysis, with a constraint of $\sin^2(\theta_{13}) = 0.0219 \pm 0.0014$ coming from reactor neutrino experiments, using Super-Kamiokande (I+II+III+IV) and SNO data.
- ⁶ ABE 16c obtained this result by a three-neutrino oscillation analysis, with a constraint of $\sin^2(\theta_{13}) = 0.0219 \pm 0.0014$ coming from reactor neutrino experiments, by combining the four phases of the Super-Kamiokande solar data.
- ⁷ ABE 16c obtained this result by a three-neutrino oscillation analysis, with a constraint of $\sin^2(\theta_{13}) = 0.0219 \pm 0.0014$ coming from reactor neutrino experiments, using the Super-Kamiokande-IV data.
- ⁸ FORERO 14 performs a global fit to Δm_{21}^2 using solar, reactor, long-baseline accelerator, and atmospheric neutrino data.
- ⁹ GONZALEZ-GARCIA 14 result comes from a frequentist global fit. The corresponding Bayesian global fit to the same data results are reported in BERGSTROM 15 as $(7.50_{-0.19}^{+0.17}) \times 10^{-5} \text{ eV}^2$ for normal and $(7.50_{-0.17}^{+0.18}) \times 10^{-5} \text{ eV}^2$ for inverted mass ordering.
- ¹⁰ AHARMIM 13 obtained this result by a two-neutrino oscillation analysis using global solar neutrino data.
- ¹¹ AHARMIM 13 global solar neutrino data include SNO's all-phases-combined analysis results on the total active ^8B neutrino flux and energy-dependent ν_e survival probability parameters, measurements of Cl (CLEVELAND 98), Ga (ABDURASHITOV 09 which contains combined analysis with GNO (ALTMANN 05 and Ph.D. thesis of F. Kaether)), and ^7Be (BELLINI 11A) rates, and ^8B solar-neutrino recoil electron measurements of SK-I (HOSAKA 06) zenith, SK-II (CRAVENS 08), and SK-III (ABE 11) day/night spectra, and Borexino (BELLINI 10A) spectra.
- ¹² AHARMIM 13 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{31}^2 fixed to $2.45 \times 10^{-3} \text{ eV}^2$, using global solar neutrino data.
- ¹³ AHARMIM 13 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{31}^2 fixed to $2.45 \times 10^{-3} \text{ eV}^2$, using global solar neutrino and KamLAND data (GANDO 11). CPT invariance is assumed.
- ¹⁴ GANDO 13 obtained this result by a three-neutrino oscillation analysis using KamLAND and global solar neutrino data, assuming CPT invariance. Supersedes GANDO 11.
- ¹⁵ GANDO 13 obtained this result by a three-neutrino oscillation analysis using KamLAND data. Supersedes GANDO 11.

- ¹⁶ ABE 11 obtained this result by a two-neutrino oscillation analysis using solar neutrino data including Super-Kamiokande, SNO, Borexino (ARPESELLA 08A), Homestake, GALLEX/GNO, SAGE, and KamLAND data. CPT invariance is assumed.
- ¹⁷ ABE 11 obtained this result by a two-neutrino oscillation analysis using solar neutrino data including Super-Kamiokande, SNO, Borexino (ARPESELLA 08A), Homestake, GALLEX/GNO, and SAGE data.
- ¹⁸ ABE 11 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{32}^2 fixed to $2.4 \times 10^{-3} \text{ eV}^2$, using solar neutrino data including Super-Kamiokande, SNO, Borexino (ARPESELLA 08A), Homestake, GALLEX/GNO, SAGE, and KamLAND data. The normal neutrino mass ordering and CPT invariance are assumed.
- ¹⁹ ABE 11 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{32}^2 fixed to $2.4 \times 10^{-3} \text{ eV}^2$, using solar neutrino data including Super-Kamiokande, SNO, Borexino (ARPESELLA 08A), Homestake, and GALLEX/GNO data. The normal neutrino mass ordering is assumed.
- ²⁰ BELLINI 11A obtained this result by a two-neutrino oscillation analysis using KamLAND, Homestake, SAGE, Gallex, GNO, Kamiokande, Super-Kamiokande, SNO, and Borexino (BELLINI 11A) data and the SSM flux prediction in SERENELLI 11 (Astrophysical Journal **743** 24 (2011)) with the exception that the ^8B flux was left free. CPT invariance is assumed.
- ²¹ BELLINI 11A obtained this result by a two-neutrino oscillation analysis using Homestake, SAGE, Gallex, GNO, Kamiokande, Super-Kamiokande, SNO, and Borexino (BELLINI 11A) data and the SSM flux prediction in SERENELLI 11 (Astrophysical Journal **743** 24 (2011)) with the exception that the ^8B flux was left free.
- ²² GANDO 11 obtain this result with three-neutrino fit using the KamLAND + solar data. Superseded by GANDO 13.
- ²³ GANDO 11 obtain this result with three-neutrino fit using the KamLAND data only. Supersedes ABE 08A.
- ²⁴ AHARMIM 10 global solar neutrino data include SNO's low-energy-threshold analysis survival probability day/night curves, SNO Phase III integral rates (AHARMIM 08), Cl (CLEVELAND 98), SAGE (ABDURASHITOV 09), Gallex/GNO (HAMPEL 99, ALTMANN 05), Borexino (ARPESELLA 08A), SK-I zenith (HOSAKA 06), and SK-II day/night spectra (CRAVENS 08).
- ²⁵ AHARMIM 10 obtained this result by a two-neutrino oscillation analysis using global solar neutrino data and KamLAND data (ABE 08A). CPT invariance is assumed.
- ²⁶ AHARMIM 10 obtained this result by a two-neutrino oscillation analysis using global solar neutrino data.
- ²⁷ AHARMIM 10 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{31}^2 fixed to $2.3 \times 10^{-3} \text{ eV}^2$, using global solar neutrino data and KamLAND data (ABE 08A). CPT invariance is assumed.
- ²⁸ AHARMIM 10 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{31}^2 fixed to $2.3 \times 10^{-3} \text{ eV}^2$, using global solar neutrino data.
- ²⁹ ABE 08a obtained this result by a rate + shape + time combined geoneutrino and reactor two-neutrino fit for Δm_{21}^2 and $\tan^2\theta_{12}$, using KamLAND data only. Superseded by GANDO 11.
- ³⁰ ABE 08a obtained this result by means of a two-neutrino fit using KamLAND, Homestake, SAGE, GALLEX, GNO, SK (zenith angle and E-spectrum), the SNO χ^2 -map, and solar flux data. CPT invariance is assumed. Superseded by GANDO 11.
- ³¹ AHARMIM 08 obtained this result by a two-neutrino oscillation analysis using all solar neutrino data including those of Borexino (ARPESELLA 08A) and Super-Kamiokande-I (HOSAKA 06), and KamLAND data (ABE 08A). CPT invariance is assumed.
- ³² HOSAKA 06 obtained this result by a two-neutrino oscillation analysis using solar neutrino and KamLAND data (ARAKI 05). CPT invariance is assumed.
- ³³ HOSAKA 06 obtained this result by a two-neutrino oscillation analysis using the data from Super-Kamiokande, SNO (AHMAD 02 and AHMAD 02B), and KamLAND (ARAKI 05) experiments. CPT invariance is assumed.
- ³⁴ HOSAKA 06 obtained this result by a two-neutrino oscillation analysis using the Super-Kamiokande and SNO (AHMAD 02 and AHMAD 02B) solar neutrino data.
- ³⁵ HOSAKA 06 obtained this result from the consistency between the observed and expected day-night flux asymmetry amplitude. The listed 68% CL range is derived from the 1σ boundary of the amplitude fit to the data. Oscillation parameters are constrained to be in the LMA region. The mixing angle is fixed at $\tan^2\theta = 0.44$ because the fit depends only very weakly on it.
- ³⁶ AHARMIM 05a obtained this result by a two-neutrino oscillation analysis using solar neutrino and KamLAND data (ARAKI 05). CPT invariance is assumed. AHARMIM 05a also quotes $\Delta(m^2) = (8.0_{-0.4}^{+0.6}) \times 10^{-5} \text{ eV}^2$ as the error enveloping the 68% CL two-dimensional region.
- ³⁷ AHARMIM 05a obtained this result by a two-neutrino oscillation analysis using the data from all solar neutrino experiments. The listed range of the parameter envelops the 95% CL two-dimensional region shown in figure 35a of AHARMIM 05a. AHARMIM 05a also quotes $\Delta(m^2) = (6.5_{-2.3}^{+4.4}) \times 10^{-5} \text{ eV}^2$ as the error enveloping the 68% CL two-dimensional region.
- ³⁸ ARAKI 05 obtained this result by a two-neutrino oscillation analysis using KamLAND and solar neutrino data. CPT invariance is assumed. The 1σ error shown here is provided by the KamLAND collaboration. The error quoted in ARAKI 05, $\Delta(m^2) = (7.9_{-0.5}^{+0.6}) \times 10^{-5}$, envelops the 68% CL two-dimensional region.
- ³⁹ AHMED 04a obtained this result by a two-neutrino oscillation analysis using solar neutrino and KamLAND data (EGUCHI 03). CPT invariance is assumed. AHMED 04a also quotes $\Delta(m^2) = (7.1_{-0.6}^{+1.2}) \times 10^{-5} \text{ eV}^2$ as the error enveloping the 68% CL two-dimensional region.
- ⁴⁰ AHMED 04a obtained this result by a two-neutrino oscillation analysis using the data from all solar neutrino experiments. The listed range of the parameter envelops the 95% CL two-dimensional region shown in Fig. 5(a) of AHMED 04a. The best-fit point is $\Delta(m^2) = 6.5 \times 10^{-5} \text{ eV}^2$, $\tan^2\theta = 0.40$ ($\sin^2 2\theta = 0.82$).

Neutrino Mixing

- ⁴¹ SMY 04 obtained this result by a two-neutrino oscillation analysis using solar neutrino and KamLAND data (IANNI 03). *CPT* invariance is assumed.
- ⁴² SMY 04 obtained this result by a two-neutrino oscillation analysis using the data from all solar neutrino experiments. The 1σ errors are read from Fig. 6(a) of SMY 04.
- ⁴³ SMY 04 obtained this result by a two-neutrino oscillation analysis using the Super-Kamiokande and SNO (AHMAD 02 and AHMAD 02B) solar neutrino data. The 1σ errors are read from Fig. 6(a) of SMY 04.
- ⁴⁴ AHMAD 02B obtained this result by a two-neutrino oscillation analysis using the data from all solar neutrino experiments. The listed range of the parameter envelopes the 95% CL two-dimensional region shown in Fig. 4(b) of AHMAD 02B. The best fit point is $\Delta(m^2) = 5.0 \times 10^{-5} \text{ eV}^2$ and $\tan\theta = 0.34$ ($\sin^2 2\theta = 0.76$).
- ⁴⁵ FUKUDA 02 obtained this result by a two-neutrino oscillation analysis using the data from all solar neutrino experiments. The listed range of the parameter envelopes the 95% CL two-dimensional region shown in Fig. 4 of FUKUDA 02. The best fit point is $\Delta(m^2) = 6.9 \times 10^{-5} \text{ eV}^2$ and $\tan^2\theta = 0.38$ ($\sin^2 2\theta = 0.80$).

$\sin^2(\theta_{23})$

The reported limits below correspond to the projection onto the $\sin^2(\theta_{23})$ axis of the 90% CL contours in the $\sin^2(\theta_{23}) - \Delta m_{32}^2$ plane presented by the authors. Unless otherwise specified, the limits are 90% CL and the reported uncertainties are 68% CL.

If an experiment reports $\sin^2(2\theta_{23})$ we convert the value to $\sin^2(\theta_{23})$.

- ¹ ABE 20F results are based on data collected between 2009 and 2018 in (anti)neutrino mode and include a neutrino beam exposure of 1.49×10^{21} (1.64×10^{21}) protons on target. Supersedes ABE 18G.
- ² ADAMSON 20A uses the complete dataset from MINOS and MINOS+ experiments. The data were collected using a total exposure of 23.76×10^{20} protons on target and 60.75 kton-yr exposure to atmospheric neutrinos. Supersedes ADAMSON 14.
- ³ ACERO 19 is based on a sample size of 12.33×10^{20} protons on target. The fit combines both antineutrino and neutrino data to extract the oscillation parameters. The results favor the normal mass ordering by 1.9σ and θ_{23} values in octant II by 1.6σ . Supersedes ACERO 18.
- ⁴ Errors are from normal mass ordering and θ_{13} octant II fits.
- ⁵ AARTSEN 18A uses three years (April 2012 – May 2015) of neutrino data from full sky with reconstructed energies between 5.6 and 56 GeV, measured with the low-energy subdetector DeepCore of the IceCube neutrino telescope. AARTSEN 18A also reports the best fit result for the inverted mass ordering as $\Delta m_{32}^2 = -2.32 \times 10^{-3} \text{ eV}^2$ and $\sin^2(\theta_{23}) = 0.51$. Uncertainties for the inverted mass ordering fits were not provided. Supersedes AARTSEN 15A.
- ⁶ ABE 18b uses 328 kton-years of Super-Kamiokande I-IV atmospheric neutrino data to obtain this result. The fit is performed over the three parameters, Δm_{32}^2 , $\sin^2(\theta_{23})$, and

Lepton Particle Listings

Neutrino Mixing

- δ , while the solar parameters and $\sin^2(\theta_{13})$ are fixed to $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5}$ eV², $\sin^2(\theta_{12}) = 0.304 \pm 0.014$, and $\sin^2(\theta_{13}) = 0.0219 \pm 0.0012$.
- 7 ABE 21A results are based on 1.49×10^{21} POT in neutrino mode and 1.64×10^{21} POT in antineutrino mode.
 - 8 SALAS 21 reports results of a global fit to neutrino oscillation data available at the time of the Neutrino 2020 conference.
 - 9 AARTSEN 20 uses the data taken between May 2012 and April 2014 with the low-energy subdetector DeepCore of the IceCube neutrino telescope. The reconstructed energy range is between 4 (5) and 90 (80) GeV for the main (confirmatory) analysis. Though the observed best-fit is in the lower octant for both mass orderings, a substantial range of $\sin^2(\theta_{23}) > 0.5$ is still compatible with the observed data for both mass orderings.
 - 10 ESTEBAN 20A reports results of a global fit to neutrino oscillation data available at the time of the Neutrino2020 conference.
 - 11 AARTSEN 19c uses three years (April 2012 – May 2015) of neutrino data from full sky with reconstructed energies between 5.6 and 56 GeV, measured with the low-energy subdetector DeepCore of the IceCube neutrino telescope. AARTSEN 19c adopts looser event selection criteria to prioritize the efficiency of selecting neutrino events, different from tighter event selection criteria which closely follow the criteria used by AARTSEN 18A to measure the ν_μ disappearance.
 - 12 ALBERT 19 measured the oscillation parameters of atmospheric neutrinos with the ANTARES deep sea neutrino telescope using the data taken from 2007 to 2016 (2830 days of total live time). Supersedes ADRIAN-MARTINEZ 12.
 - 13 ABE 18b uses 328 kton-years of Super-Kamiokande I-IV atmospheric neutrino data to obtain this result. The fit is performed over the four parameters, Δm_{21}^2 , $\sin^2\theta_{23}$, $\sin^2\theta_{13}$, and δ , while the solar parameters are fixed to $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5}$ eV² and $\sin^2\theta_{12} = 0.304 \pm 0.014$.
 - 14 ABE 18c data prefers normal mass ordering is with a posterior probability of 87%. Supersedes ABE 17F.
 - 15 ACERO 18 performs a joint fit to the data for ν_μ disappearance and ν_e appearance. The overall best fit favors normal mass ordering and θ_{23} in octant II. No 1σ confidence intervals are presented for the inverted mass ordering scenarios. Superseded by ACERO 19.
 - 16 Errors are from the projections of the 68% contour on 2D plot of Δm^2 versus $\sin^2(\theta_{23})$. ABE 17f supersedes ABE 17A. Superseded by ABE 18g.
 - 17 Superseded by ACERO 18.
 - 18 ABE 16d reports oscillation results using $\bar{\nu}_\mu$ disappearance in an off-axis beam.
 - 19 ADAMSON 16a obtains $\sin^2(\theta_{23})$ in the 68% C.L. range [0.38, 0.65] ([0.37, 0.64]), with two statistically degenerate best-fit values of 0.44 and 0.59 (0.44 and 0.59) for normal (inverted) mass ordering. Superseded by ADAMSON 17A.
 - 20 AARTSEN 15A obtains this result by a three-neutrino oscillation analysis using 10–100 GeV muon neutrino sample from a total of 953 days of measurement with the low-energy subdetector DeepCore of the IceCube neutrino telescope. Superseded by AARTSEN 18A.
 - 21 ABE 14 results are based on ν_μ disappearance using three-neutrino oscillation fit. The confidence intervals are derived from one dimensional profiled likelihoods. Superseded by ABE 17A.
 - 22 ADAMSON 14 uses a complete set of accelerator and atmospheric data. The analysis combines the ν_μ disappearance and ν_e appearance data using three-neutrino oscillation fit. The fit results are obtained for normal and inverted mass ordering assumptions. The best fit is for first θ_{23} octant and inverted mass ordering.
 - 23 FORERO 14 performs a global fit to neutrino oscillations using solar, reactor, long-baseline accelerator, and atmospheric neutrino data.
 - 24 GONZALEZ-GARCIA 14 result comes from a frequentist global fit. The corresponding Bayesian global fit to the same data results are reported in BERGSTROM 15 as 68% CL intervals of 0.433–0.496 or 0.530–0.594 for normal and 0.514–0.612 for inverted mass ordering.
 - 25 AARTSEN 13B obtained this result by a two-neutrino oscillation analysis using 20–100 GeV muon neutrino sample from a total of 318.9 days of live-time measurement with the low-energy subdetector DeepCore of the IceCube neutrino telescope.
 - 26 The best fit value is $\sin^2(\theta_{23}) = 0.514 \pm 0.082$. Superseded by ABE 14.
 - 27 ADAMSON 13b obtained this result from ν_μ and $\bar{\nu}_\mu$ disappearance using ν_μ (10.71×10^{20} POT) and $\bar{\nu}_\mu$ (3.36×10^{20} POT) beams, and atmospheric (37.88kton-years) data from MINOS The fit assumed two-flavor neutrino hypothesis and identical ν_μ and $\bar{\nu}_\mu$ oscillation parameters. Superseded by ADAMSON 14.
 - 28 ABE 12A obtained this result by a two-neutrino oscillation analysis. The best-fit point is $\sin^2(2\theta_{23}) = 0.98$.
 - 29 ADAMSON 12 is a two-neutrino oscillation analysis using antineutrinos. The best fit value is $\sin^2(2\theta_{23}) = 0.95^{+0.10}_{-0.11} \pm 0.01$.
 - 30 ADAMSON 12b obtained this result by a two-neutrino oscillation analysis of the L/E distribution using 37.9 kton-yr atmospheric neutrino data with the MINOS far detector.
 - 31 The best fit point is $\Delta m^2 = 0.0019$ eV² and $\sin^2 2\theta = 0.99$. The 90% single-parameter confidence interval at the best fit point is $\sin^2 2\theta > 0.86$.
 - 32 The data are separated into pure samples of ν_s and $\bar{\nu}_s$, and separate oscillation parameters for ν_s and $\bar{\nu}_s$ are fit to the data. The best fit point is $(\Delta m^2, \sin^2 2\theta) = (0.0022$ eV², 0.99) and $(\Delta \bar{m}^2, \sin^2 2\bar{\theta}) = (0.0016$ eV², 1.00). The quoted result is taken from the 90% C.L. contour in the $(\Delta m^2, \sin^2 2\theta)$ plane obtained by minimizing the four parameter log-likelihood function with respect to the other oscillation parameters.
 - 33 ADRIAN-MARTINEZ 12 measured the oscillation parameters of atmospheric neutrinos with the ANTARES deep sea neutrino telescope using the data taken from 2007 to 2010 (863 days of total live time). Superseded by ALBERT 19.
 - 34 ABE 11c obtained this result by a two-neutrino oscillation analysis using the Super-Kamiokande-I+II+III atmospheric neutrino data. ABE 11c also reported results under a two-neutrino disappearance model with separate mixing parameters between ν and $\bar{\nu}$, and obtained $\sin^2 2\theta > 0.93$ for ν and $\sin^2 2\theta > 0.83$ for $\bar{\nu}$ at 90% C.L.
 - 35 ADAMSON 11b obtained this result by a two-neutrino oscillation analysis of antineutrinos in an antineutrino enhanced beam with 1.71×10^{20} protons on target. This result is consistent with the neutrino measurements of ADAMSON 11 at 2% C.L.
 - 36 WENDELL 10 obtained this result ($\sin^2\theta_{23} = 0.407\text{--}0.583$) by a three-neutrino oscillation analysis using the Super-Kamiokande-I+II+III atmospheric neutrino data, assuming $\theta_{13} = 0$ but including the solar oscillation parameters Δm_{21}^2 and $\sin^2\theta_{12}$ in the fit.
 - 37 WENDELL 10 obtained this result ($\sin^2\theta_{23} = 0.43\text{--}0.61$) by a three-neutrino oscillation analysis with one mass scale dominance ($\Delta m_{21}^2 = 0$) using the Super-Kamiokande-I+II+III atmospheric neutrino data, and updates the HOSAKA 06a result.
 - 38 WENDELL 10 obtained this result ($\sin^2\theta_{23} = 0.44\text{--}0.63$) by a three-neutrino oscillation analysis with one mass scale dominance ($\Delta m_{21}^2 = 0$) using the Super-Kamiokande-I+II+III atmospheric neutrino data, and updates the HOSAKA 06a result.
 - 39 ADAMSON 06 obtained this result by a two-neutrino oscillation analysis of the L/E distribution using 4.54 kton yr atmospheric neutrino data with the MINOS far detector.
 - 40 Supersedes ALIU 05.
 - 41 MICHAEL 06 best fit is for maximal mixing. See also ADAMSON 08.
 - 42 The best fit is for maximal mixing.
 - 43 ALLISON 05 result is based upon atmospheric neutrino interactions including upward-stopping muons, with an exposure of 5.9 kton yr. From a two-flavor oscillation analysis the best-fit point is $\Delta m^2 = 0.0017$ eV² and $\sin^2(2\theta) = 0.97$.
 - 44 ASHIE 05 obtained this result by a two-neutrino oscillation analysis using 92 kton yr atmospheric neutrino data from the complete Super-Kamiokande I running period.
 - 45 AMBROSIO 04 obtained this result, without using the absolute normalization of the neutrino flux, by combining the angular distribution of upward through-going muon tracks with $E_\mu > 1$ GeV, N_{low} and N_{high} , and the numbers of InDown + UpStop and InUp events. Here, N_{low} and N_{high} are the number of events with reconstructed neutrino energies < 30 GeV and > 130 GeV, respectively. InDown and InUp represent events with downward and upward-going tracks starting inside the detector due to neutrino interactions, while UpStop represents entering upward-going tracks which stop in the detector. The best fit is for maximal mixing.
 - 46 ASHIE 04 obtained this result from the L(flight length)/E(estimated neutrino energy) distribution of ν_μ disappearance probability, using the Super-Kamiokande-I 1489 live-day atmospheric neutrino data.
 - 47 There are several islands of allowed region from this K2K analysis, extending to high values of Δm^2 . We only include the one that overlaps atmospheric neutrino analyses. The best fit is for maximal mixing.
 - 48 AMBROSIO 03 obtained this result on the basis of the ratio $R = N_{low}/N_{high}$, where N_{low} and N_{high} are the number of upward through-going muon events with reconstructed neutrino energy < 30 GeV and > 130 GeV, respectively. The data came from the full detector run started in 1994. The method of FELDMAN 98 is used to obtain the limits.
 - 49 AMBROSIO 03 obtained this result by using the ratio R and the angular distribution of the upward through-going muons. R is given in the previous note and the angular distribution is reported in AMBROSIO 01. The method of FELDMAN 98 is used to obtain the limits. The best fit is to maximal mixing.
 - 50 SANCHEZ 03 is based on an exposure of 5.9 kton yr. The result is obtained using a likelihood analysis of the neutrino L/E distribution for a selection μ flavor sample while the e-flavor sample provides flux normalization. The method of FELDMAN 98 is used to obtain the allowed region. The best fit is $\sin^2(2\theta) = 0.97$.
 - 51 AMBROSIO 01 result is based on the angular distribution of upward through-going muon tracks with $E_\mu > 1$ GeV. The data came from three different detector configurations, but the statistics is largely dominated by the full detector run, from May 1994 to December 2000. The total live time, normalized to the full detector configuration is 6.17 years. The best fit is obtained outside the physical region. The method of FELDMAN 98 is used to obtain the limits. The best fit is for maximal mixing.
 - 52 AMBROSIO 01 result is based on the angular distribution and normalization of upward through-going muon tracks with $E_\mu > 1$ GeV. See the previous footnote.
 - 53 FUKUDA 99c obtained this result from a total of 537 live days of upward through-going muon data in Super-Kamiokande between April 1996 to January 1998. With a threshold of $E_\mu > 1.6$ GeV, the observed flux is $(1.74 \pm 0.07 \pm 0.02) \times 10^{-13}$ cm⁻²s⁻¹sr⁻¹. The best fit is $\sin^2(2\theta) = 0.95$.
 - 54 FUKUDA 99b obtained this result from a simultaneous fitting to zenith angle distributions of upward-stopping and through-going muons. The flux of upward-stopping muons of minimum energy of 1.6 GeV measured between April 1996 and January 1998 is $(0.39 \pm 0.04 \pm 0.02) \times 10^{-13}$ cm⁻²s⁻¹sr⁻¹. This is compared to the expected flux of $(0.73 \pm 0.16$ (theoretical error)) $\times 10^{-13}$ cm⁻²s⁻¹sr⁻¹. The best fit is to maximal mixing.
 - 55 FUKUDA 99d obtained this result from the zenith dependence of the upward-stopping/through-going flux ratio. The best fit is to maximal mixing.
 - 56 FUKUDA 98c obtained this result by an analysis of 33.0 kton yr atmospheric neutrino data. The best fit is for maximal mixing.
 - 57 HATAKEYAMA 98 obtained this result from a total of 2456 live days of upward-going muon data in Kamiokande between December 1985 and May 1995. With a threshold of $E_\mu > 1.6$ GeV, the observed flux of upward through-going muons is $(1.94 \pm 0.10^{+0.07}_{-0.06}) \times 10^{-13}$ cm⁻²s⁻¹sr⁻¹. This is compared to the expected flux of $(2.46 \pm 0.54$ (theoretical error)) $\times 10^{-13}$ cm⁻²s⁻¹sr⁻¹. The best fit is for maximal mixing.
 - 58 HATAKEYAMA 98 obtained this result from a combined analysis of Kamiokande contained events (FUKUDA 94) and upward going muon events. The best fit is $\sin^2(2\theta) = 0.95$.
 - 59 FUKUDA 94 obtained the result by a combined analysis of sub- and multi-GeV atmospheric neutrino events in Kamiokande. The best fit is for maximal mixing.

Neutrino Mixing

Δm_{32}^2

The sign of Δm_{32}^2 is not known at this time. If given, values are shown separately for the normal and inverted mass ordering. Unless otherwise specified, the ranges below correspond to the projection onto the Δm_{32}^2 axis of the 90% CL contours in the $\sin^2(2\theta_{23}) - \Delta m_{32}^2$ plane presented by the authors. If uncertainties are reported with the value, they correspond to one standard deviation uncertainty.

1 ABE 20F results are based on data collected between 2009 and 2018 in (anti)neutrino mode and include a neutrino beam exposure of 1.49×10^{21} (1.64×10^{21}) protons on target. Supersedes ABE 18c.

2 ABE 20F reports $\Delta m_{13}^2 = (2.43 \pm 0.07) \times 10^{-3} \text{ eV}^2$ for inverted mass ordering. We convert to Δm_{32}^2 using PDG 20 value of $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5} \text{ eV}^2$.

3 ADAMSON 20A uses the complete dataset from MINOS and MINOS+ experiments. The data were collected using a total exposure of 23.76×10^{20} protons on target and 60.75 kton-yr exposure to atmospheric neutrinos. Supersedes ADAMSON 14.

4 ACERO 19 is based on a sample size of 12.33×10^{20} protons on target. The fit combines both antineutrino and neutrino data to extract the oscillation parameters. The results favor the normal mass ordering by 1.9 σ and θ_{23} values in octant II by 1.6 σ . Supersedes ACERO 18.

5 AARTSEN 18A uses three years (April 2012 - May 2015) of neutrino data from full sky with reconstructed energies between 5.6 and 56 GeV, measured with the low-energy subdetector DeepCore of the IceCube neutrino telescope. AARTSEN 18A also reports the best fit values for the inverted mass ordering as $\Delta m_{32}^2 = -2.32 \times 10^{-3} \text{ eV}^2$ and $\sin^2(\theta_{23}) = 0.51$. Uncertainties for the inverted mass ordering fits were not provided. Supersedes AARTSEN 15A.

Lepton Particle Listings

Neutrino Mixing

- ⁶ ABE 18b uses 328 kton-years of Super-Kamiokande I-IV atmospheric neutrino data to obtain this result. The fit is performed over the three parameters, Δm_{32}^2 , $\sin^2(\theta_{23})$, and δ , while the solar parameters and $\sin^2(\theta_{13})$ are fixed to $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5} \text{ eV}^2$, $\sin^2(\theta_{12}) = 0.304 \pm 0.014$, and $\sin^2(\theta_{13}) = 0.0219 \pm 0.0012$.
- ⁷ ADEY 18a reports results from analysis of 1958 days of data taking with the Daya-Bay experiment, with $3.9 \times 10^6 \bar{\nu}_e$ candidates. The fit to the data gives $\Delta m_{ee}^2 = (2.522^{+0.068}_{-0.070}) \times 10^{-3} \text{ eV}^2$. Solar oscillation parameters are fixed in the analysis using the global averages, $\sin^2(\theta_{12}) = 0.307^{+0.013}_{-0.012}$, $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5} \text{ eV}^2$, from PDG 18. Supersedes AN 17a.
- ⁸ BAK 18 reports results of the RENO experiment using about 2200 live-days of data taken with detectors placed at 410.6 and 1445.7 m from reactors of the Hanbit Nuclear Power Plant. We convert the results to Δm_{32}^2 using the PDG 18 values of $\sin^2\theta_{12} = 0.307^{+0.013}_{-0.012}$ and $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5} \text{ eV}^2$. Supersedes SEO 18.
- ⁹ ABE 21a results are based on 1.49×10^{21} POT in neutrino mode and 1.64×10^{21} POT in antineutrino mode.
- ¹⁰ ESTEBAN 20a reports results of a global fit to neutrino oscillation data available at the time of the Neutrino2020 conference.
- ¹¹ AARTSEN 19c uses three years (April 2012 – May 2015) of neutrino data from full sky with reconstructed energies between 5.6 and 56 GeV, measured with the low-energy sub-detector DeepCore of the IceCube neutrino telescope. AARTSEN 19c adopts looser event selection criteria to prioritize the efficiency of selecting neutrino events, different from tighter event selection criteria which closely follow the criteria used by AARTSEN 18a to measure the ν_μ disappearance.
- ¹² ALBERT 19 measured the oscillation parameters of atmospheric neutrinos with the ANTARES deep sea neutrino telescope using the data taken from 2007 to 2016 (2830 days of total live time). Supersedes ADRIAN-MARTINEZ 12.
- ¹³ ABE 18b uses 328 kton-years of Super-Kamiokande I-IV atmospheric neutrino data to obtain this result. The fit is performed over the four parameters, Δm_{32}^2 , $\sin^2\theta_{23}$, $\sin^2\theta_{13}$, and δ , while the solar parameters are fixed to $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5} \text{ eV}^2$ and $\sin^2\theta_{12} = 0.304 \pm 0.014$.
- ¹⁴ ABE 18c data prefers normal ordering with a posterior probability of 87%. Supersedes ABE 17f.
- ¹⁵ ABE 18c reports $\Delta m_{13}^2 = (2.432 \pm 0.070) \times 10^{-3} \text{ eV}^2$ for inverted mass ordering. We convert to Δm_{32}^2 using PDG 18 value of $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5} \text{ eV}^2$.
- ¹⁶ ACERO 18 performs a joint fit to the data for ν_μ disappearance and ν_e appearance. The overall best fit favors normal mass ordering and θ_{23} in octant II. No 1σ confidence intervals are presented for the inverted mass ordering scenarios. Supersedes by ACERO 19.
- ¹⁷ The error for octant I is taken from the result for octant II.
- ¹⁸ AGAFONOVA 18 assumes maximal θ_{23} mixing.
- ¹⁹ SEO 18 reports result of the RENO experiment from a rate and shape analysis of 500 days of data. A simultaneous fit to θ_{13} and Δm_{ee}^2 yields $\Delta m_{ee}^2 = (2.62^{+0.21+0.12}_{-0.23-0.13}) \times 10^{-3} \text{ eV}^2$. We convert the results to Δm_{32}^2 using the PDG 18 values of $\sin^2\theta_{12}$ and Δm_{21}^2 . SEO 18 is a detailed description of the results published in CHOI 16, which it supersedes. Supersedes by BAK 18.
- ²⁰ ABE 17f confidence intervals are obtained using a frequentist analysis including θ_{13} constraint from reactor experiments. Bayesian intervals based on Markov Chain Monte Carlo method are also provided by the authors. Supersedes by ABE 18c.
- ²¹ Supersedes by ACERO 18.
- ²² AN 17a report results from combined rate and spectral shape analysis of 1230 days of data taken with the Daya Bay reactor experiment. The data set contains more than 2.5×10^6 inverse beta-decay events with neutron capture on Gd. The fit to the data gives $\Delta_{ee}^2 = (2.50 \pm 0.06 \pm 0.06) \times 10^{-3} \text{ eV}^2$. Supersedes by ADEY 18a.
- ²³ ABE 16d reports oscillation results using $\bar{\nu}_\mu$ disappearance in an off-axis beam.
- ²⁴ Supersedes by ADAMSON 17a.
- ²⁵ CHOI 16 reports result of the RENO experiment from a rate and shape analysis of 500 days of data. A simultaneous fit to θ_{13} and Δm_{ee}^2 yields $\Delta m_{ee}^2 = (2.62^{+0.21+0.12}_{-0.23-0.13}) \times 10^{-3} \text{ eV}^2$. We convert the results to Δm_{32}^2 using PDG 18 values of $\sin^2(\theta_{12})$ and Δm_{21}^2 .
- ²⁶ AARTSEN 15a obtains this result by a three-neutrino oscillation analysis using 10–100 GeV muon neutrino sample from a total of 953 days of measurements with the low-energy sub-detector DeepCore of the IceCube neutrino telescope. Supersedes by AARTSEN 18a.
- ²⁷ AGAFONOVA 15a result is based on $5 \nu_\mu \rightarrow \nu_\tau$ appearance candidates with an expected background of 0.25 ± 0.05 events. The best fit is for $\Delta m_{32}^2 = 3.3 \times 10^{-3} \text{ eV}^2$.
- ²⁸ AN 15 uses all eight identical detectors, with four placed near the reactor cores and the remaining four at the far hall to determine prompt energy spectra. The results correspond to the exposure of $6.9 \times 10^5 \text{ GW}_{th}\text{-ton-days}$. They derive $\Delta m_{ee}^2 = (2.42 \pm 0.11) \times 10^{-3} \text{ eV}^2$. Assuming the normal (inverted) ordering, the fitted $\Delta m_{32}^2 = (2.37 \pm 0.11) \times 10^{-3} \text{ eV}^2$ ($(2.47 \pm 0.11) \times 10^{-3} \text{ eV}^2$). Supersedes by AN 17a.
- ²⁹ ABE 14 results are based on ν_μ disappearance using three-neutrino oscillation fit. The confidence intervals are derived from one dimensional profiled likelihoods. In ABE 14 the inverted mass ordering result is reported as $\Delta m_{13}^2 = (2.48 \pm 0.10) \times 10^{-3} \text{ eV}^2$ which we converted to Δm_{32}^2 by adding PDG 14 value of $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5} \text{ eV}^2$. Supersedes by ABE 17c.
- ³⁰ ADAMSON 14 uses a complete set of accelerator and atmospheric data. The analysis combines The analysis combines the ν_μ disappearance and ν_e appearance data using three-neutrino oscillation fit. The fit results are obtained for normal and inverted mass ordering assumptions.
- ³¹ AN 14 uses six identical detectors, with three placed near the reactor cores (flux-weighted baselines of 512 and 561 m) and the remaining three at the far hall (at the flux averaged distance of 1579 m from all six reactor cores) to determine prompt energy spectra and derive $\Delta m_{ee}^2 = (2.59^{+0.19}_{-0.20}) \times 10^{-3} \text{ eV}^2$. Assuming the normal (inverted) ordering, the fitted $\Delta m_{32}^2 = (2.54^{+0.19}_{-0.20}) \times 10^{-3} \text{ eV}^2$ ($(2.64^{+0.19}_{-0.20}) \times 10^{-3} \text{ eV}^2$). Supersedes by AN 15.
- ³² FORERO 14 performs a global fit to Δm_{31}^2 using solar, reactor, long-baseline accelerator, and atmospheric neutrino data.
- ³³ GONZALEZ-GARCIA 14 result comes from a frequentist global fit. The corresponding Bayesian global fit to the same data results are reported in BERGSTROM 15 as $(2.460 \pm 0.046) \times 10^{-3} \text{ eV}^2$ for normal and $(2.445^{+0.047}_{-0.045}) \times 10^{-3} \text{ eV}^2$ for inverted mass ordering.
- ³⁴ The value for normal mass ordering is actually a measurement of Δm_{31}^2 which differs from Δm_{32}^2 by a much smaller value of Δm_{21}^2 .
- ³⁵ AARTSEN 13b obtained this result by a two-neutrino oscillation analysis using 20–100 GeV muon neutrino sample from a total of 318.9 days of live-time measurement with the low-energy sub-detector DeepCore of the IceCube neutrino telescope.
- ³⁶ Based on the observation of 58 ν_μ events with $205 \pm 17(\text{syst})$ expected in the absence of neutrino oscillations. Supersedes by ABE 14.
- ³⁷ ADAMSON 13b obtained this result from ν_μ and $\bar{\nu}_\mu$ disappearance using ν_μ (10.71×10^{20} POT) and $\bar{\nu}_\mu$ (3.36×10^{20} POT) beams, and atmospheric (37.88 kton-years) data from MINOS. The fit assumed two-flavor neutrino hypothesis and identical ν_μ and $\bar{\nu}_\mu$ oscillation parameters.
- ³⁸ ABE 12a obtained this result by a two-neutrino oscillation analysis. The best-fit point is $\Delta m_{32}^2 = 2.65 \times 10^{-3} \text{ eV}^2$.
- ³⁹ ADAMSON 12 is a two-neutrino oscillation analysis using antineutrinos.
- ⁴⁰ ADAMSON 12b obtained this result by a two-neutrino oscillation analysis of the L/E distribution using 37.9 kton-yr atmospheric neutrino data with the MINOS far detector.
- ⁴¹ The 90% single-parameter confidence interval at the best fit point is $\Delta m^2 = 0.0019 \pm 0.0004 \text{ eV}^2$.
- ⁴² The data are separated into pure samples of ν_s and $\bar{\nu}_s$, and separate oscillation parameters for ν_s and $\bar{\nu}_s$ are fit to the data. The best fit point is $(\Delta m^2, \sin^2 2\theta) = (0.0022 \text{ eV}^2, 0.99)$ and $(\Delta \bar{m}^2, \sin^2 2\bar{\theta}) = (0.0016 \text{ eV}^2, 1.00)$. The quoted result is taken from the 90% C.L. contour in the $(\Delta m^2, \sin^2 2\theta)$ plane obtained by minimizing the four parameter log-likelihood function with respect to the other oscillation parameters.
- ⁴³ ADRIAN-MARTINEZ 12 measured the oscillation parameters of atmospheric neutrinos with the ANTARES deep sea neutrino telescope using the data taken from 2007 to 2010 (863 days of total live time). Supersedes by ALBERT 19.
- ⁴⁴ ABE 11c obtained this result by a two-neutrino oscillation analysis with separate mixing parameters between neutrinos and antineutrinos, using the Super-Kamiokande-I+II+III atmospheric neutrino data. The corresponding 90% CL neutrino oscillation parameter range obtained from this analysis is $\Delta m^2 = 1.7\text{--}3.0 \times 10^{-3} \text{ eV}^2$.
- ⁴⁵ ADAMSON 11b obtained this result by a two-neutrino oscillation analysis of antineutrinos in an antineutrino enhanced beam with 1.71×10^{20} protons on target. This result is consistent with the neutrino measurements of ADAMSON 11 at 2% C.L.
- ⁴⁶ ADAMSON 11c obtains this result based on a study of antineutrinos in a neutrino beam and assumes maximal mixing in the two-flavor approximation.
- ⁴⁷ WENDELL 10 obtained this result by a three-neutrino oscillation analysis with one mass scale dominance ($\Delta m_{21}^2 = 0$) using the Super-Kamiokande-I+II+III atmospheric neutrino data, and updates the HOSAKA 06a result.
- ⁴⁸ ADAMSON 06 obtained this result by a two-neutrino oscillation analysis of the L/E distribution using 4.54 kton yr atmospheric neutrino data with the MINOS far detector.
- ⁴⁹ The best fit in the physical region is for $\Delta m^2 = 2.8 \times 10^{-3} \text{ eV}^2$.
- ⁵⁰ Supersedes ALIU 05.
- ⁵¹ MICHAEL 06 best fit is $2.74 \times 10^{-3} \text{ eV}^2$. See also ADAMSON 08.
- ⁵² ALLISON 05 result is based on an atmospheric neutrino observation with an exposure of 5.9 kton yr. From a two-flavor oscillation analysis the best-fit point is $\Delta m^2 = 0.0017 \text{ eV}^2$ and $\sin^2 2\theta = 0.97$.
- ⁵³ ASHIE 05 obtained this result by a two-neutrino oscillation analysis using 92 kton yr atmospheric neutrino data from the complete Super-Kamiokande I running period. The best fit is for $\Delta m^2 = 2.1 \times 10^{-3} \text{ eV}^2$.
- ⁵⁴ AMBROSIO 04 obtained this result, without using the absolute normalization of the neutrino flux, by combining the angular distribution of upward through-going muon tracks with $E_\mu > 1 \text{ GeV}$, N_{low} and N_{high} , and the numbers of InDown + UpStop and InUp events. Here, N_{low} and N_{high} are the number of events with reconstructed neutrino energies $< 30 \text{ GeV}$ and $> 130 \text{ GeV}$, respectively. InDown and InUp represent events with downward and upward-going tracks starting inside the detector due to neutrino interactions, while UpStop represents entering upward-going tracks which stop in the detector. The best fit is for $\Delta m^2 = 2.3 \times 10^{-3} \text{ eV}^2$.
- ⁵⁵ ASHIE 04 obtained this result from the $L(\text{flight length})/E(\text{estimated neutrino energy})$ distribution of ν_μ disappearance probability, using the Super-Kamiokande-I 1489 live-day atmospheric neutrino data. The best fit is for $\Delta m^2 = 2.4 \times 10^{-3} \text{ eV}^2$.
- ⁵⁶ There are several islands of allowed region from this K2K analysis, extending to high values of Δm^2 . We only include the one that overlaps atmospheric neutrino analyses. The best fit is for $\Delta m^2 = 2.8 \times 10^{-3} \text{ eV}^2$.
- ⁵⁷ AMBROSIO 03 obtained this result on the basis of the ratio $R = N_{low}/N_{high}$, where N_{low} and N_{high} are the number of upward through-going muon events with reconstructed neutrino energy $< 30 \text{ GeV}$ and $> 130 \text{ GeV}$, respectively. The data came from the full detector run started in 1994. The method of FELDMAN 98 is used to obtain the limits. The best fit is for $\Delta m^2 = 2.5 \times 10^{-3} \text{ eV}^2$.
- ⁵⁸ AMBROSIO 03 obtained this result by using the ratio R and the angular distribution of the upward through-going muons. R is given in the previous note and the angular

See key on page 1127

Lepton Particle Listings

Neutrino Mixing

distribution is reported in AMBROSIO 01. The method of FELDMAN 98 is used to obtain the limits. The best fit is for $\Delta m^2 = 2.5 \times 10^{-3} \text{ eV}^2$.

⁵⁹ SANCHEZ 03 is based on an exposure of 5.9 kton yr. The result is obtained using a likelihood analysis of the neutrino L/E distribution for a selection μ flavor sample while the e -flavor sample provides flux normalization. The method of FELDMAN 98 is used to obtain the allowed region. The best fit is for $\Delta m^2 = 5.2 \times 10^{-3} \text{ eV}^2$.

⁶⁰ AMBROSIO 01 result is based on the angular distribution of upward through-going muon tracks with $E_\mu > 1 \text{ GeV}$. The data came from three different detector configurations, but the statistics is largely dominated by the full detector run, from May 1994 to December 2000. The total live time, normalized to the full detector configuration is 6.17 years. The best fit is obtained outside the physical region. The method of FELDMAN 98 is used to obtain the limits.

⁶¹ AMBROSIO 01 result is based on the angular distribution and normalization of upward through-going muon tracks with $E_\mu > 1 \text{ GeV}$. See the previous footnote.

⁶² FUKUDA 99c obtained this result from a total of 537 live days of upward through-going muon data in Super-Kamiokande between April 1996 to January 1998. With a threshold of $E_\mu > 1.6 \text{ GeV}$, the observed flux is $(1.74 \pm 0.07 \pm 0.02) \times 10^{-13} \text{ cm}^{-2}\text{s}^{-1}\text{sr}^{-1}$. The best fit is for $\Delta m^2 = 5.9 \times 10^{-3} \text{ eV}^2$.

⁶³ FUKUDA 99b obtained this result from a simultaneous fitting to zenith angle distributions of upward-stopping and through-going muons. The flux of upward-stopping muons of minimum energy of 1.6 GeV measured between April 1996 and January 1998 is $(0.39 \pm 0.04 \pm 0.02) \times 10^{-13} \text{ cm}^{-2}\text{s}^{-1}\text{sr}^{-1}$. This is compared to the expected flux of $(0.73 \pm 0.16 \text{ (theoretical error)}) \times 10^{-13} \text{ cm}^{-2}\text{s}^{-1}\text{sr}^{-1}$. The best fit is for $\Delta m^2 = 3.9 \times 10^{-3} \text{ eV}^2$.

⁶⁴ FUKUDA 99d obtained this result from the zenith dependence of the upward-stopping/through-going flux ratio. The best fit is for $\Delta m^2 = 3.1 \times 10^{-3} \text{ eV}^2$.

⁶⁵ FUKUDA 98c obtained this result by an analysis of 33.0 kton yr atmospheric neutrino data. The best fit is for $\Delta m^2 = 2.2 \times 10^{-3} \text{ eV}^2$.

⁶⁶ HATAKEYAMA 98 obtained this result from a total of 2456 live days of upward-going muon data in Kamiokande between December 1985 and May 1995. With a threshold of $E_\mu > 1.6 \text{ GeV}$, the observed flux of upward through-going muons is $(1.94 \pm 0.10^{+0.07}_{-0.06}) \times 10^{-13} \text{ cm}^{-2}\text{s}^{-1}\text{sr}^{-1}$. This is compared to the expected flux of $(2.46 \pm 0.54 \text{ (theoretical error)}) \times 10^{-13} \text{ cm}^{-2}\text{s}^{-1}\text{sr}^{-1}$. The best fit is for $\Delta m^2 = 2.2 \times 10^{-3} \text{ eV}^2$.

⁶⁷ HATAKEYAMA 98 obtained this result from a combined analysis of Kamiokande contained events (FUKUDA 94) and upward going muon events. The best fit is for $\Delta m^2 = 13 \times 10^{-3} \text{ eV}^2$.

⁶⁸ FUKUDA 94 obtained the result by a combined analysis of sub- and multi-GeV atmospheric neutrino events in Kamiokande. The best fit is for $\Delta m^2 = 16 \times 10^{-3} \text{ eV}^2$.

$\sin^2(\theta_{13})$

At present time direct measurements of $\sin^2(\theta_{13})$ are derived from the reactor $\bar{\nu}_e$ disappearance at distances corresponding to the Δm_{21}^2 value, i.e. $L \sim 1 \text{ km}$. Alternatively, limits can also be obtained from the analysis of the solar neutrino data and accelerator-based $\nu_\mu \rightarrow \nu_e$ experiments.

If an experiment reports $\sin^2(2\theta_{13})$ we convert the value to $\sin^2(\theta_{13})$.

¹ DE-KERRET 20 uses 481 days of data from single detector operation and also 384 days of data with both near and far detectors operating. A rate and shape analysis is performed on combined neutron captures on H and Gd. Supersedes ABE 16B.

² SHIN 20 uses the RENO detector and 1500 live days of data. The near (far) detector observed 567,690 (90,747) $\bar{\nu}_e$ candidate events with a delayed neutron capture on hydrogen. The extracted value of $\sin^2\theta_{13}$ is consistent with the previous analysis with neutron capture on Gd in BAK 18.

³ ADEY 18A reports results from analysis of 1958 days of data taking with the Daya-Bay experiment, with 3.9×10^6 $\bar{\nu}_e$ candidates. The fit to the data gives $\Delta m_{ee}^2 = (2.522 \pm 0.068) \times 10^{-3} \text{ eV}^2$. Solar oscillation parameters are fixed in the analysis using the global averages, $\sin^2(\theta_{12}) = 0.307^{+0.013}_{-0.012}$, $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5} \text{ eV}^2$, from PDG 18. Supersedes AN 17A.

⁴ BAK 18 reports results of the RENO experiment using about 2200 live-days of data taken with detectors placed at 410.6 and 1445.7 m from reactors of the Hanbit Nuclear Power Plant. Supersedes SEO 18.

⁵ AN 16A uses data from the eight antineutrino detectors (404 days) and six antineutrino detectors (217 days) runs to determine the mixing parameter $\sin^2(2\theta_{13})$ using the neutron capture on H only. Supersedes AN 14B.

Lepton Particle Listings

Neutrino Mixing

- ⁶ ABRAHAO 21 uses 865 days of data collected in both near and far detectors with at least one reactor in operation. The analysis is based on a background model independent approach, so called Reactor Rate Modulation, to determine the mixing angle θ_{13} . Adding the background model reduces the uncertainty to 0.0041. Supersedes ABE 16B.
- ⁷ SALAS 21 reports results of a global fit to neutrino oscillation data available at the time of the Neutrino 2020 conference.
- ⁸ ESTEBAN 20A reports results of a global fit to neutrino oscillation data available at the time of the Neutrino2020 conference.
- ⁹ ABE 18B uses 328 kton-years of Super-Kamiokande I-IV atmospheric neutrino data to obtain this result. The fit is performed over the four parameters, Δm_{32}^2 , $\sin^2\theta_{23}$, $\sin^2\theta_{13}$, and δ , while the solar parameters are fixed to $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5} \text{ eV}^2$ and $\sin^2\theta_{12} = 0.304 \pm 0.014$.
- ¹⁰ AGAFONOVA 18A reports $\sin^2(2\theta_{13}) < 0.43$ at 90% C.L. The result on the sterile neutrino search in the context of 3+1 model is also reported. A 90% C.L. upper limit on $\sin^2(2\theta_{\mu e}) = 0.021$ for $\Delta m_{41}^2 \geq 0.1 \text{ eV}^2$ is set.
- ¹¹ SEO 18 reports results of the RENO experiment using about 500 days of data, performing a rate and shape analysis. Compared to AHN 12, a significant reduction of the systematic uncertainties is reported. A 3% excess of events near 5 MeV of the prompt energy is observed. SEO 18 is a detailed description of the results published in CHOI 16, which it supersedes. Superseded by BAK 18.
- ¹² T2K data only. For inverted mass ordering, all values of θ_{13} are ruled out at 68% CL.
- ¹³ AN 17A reports results from combined rate and spectral shape analysis of 1230 days of data taken with the Daya Bay reactor experiment. The data set contains more than 2.5×10^6 inverse beta-decay events with neutron capture on Gd. A simultaneous fit to θ_{13} and Δm_{ee}^2 is performed. Superseded by ADEY 18A.
- ¹⁴ ABE 16B uses 455.57 live days of data from a detector 1050 m away from two reactor cores of the Chooz nuclear power station, to determine the mixing parameter $\sin^2(2\theta_{13})$. This analysis uses 7.15 reactor-off days for constraining backgrounds. A rate and shape analysis is performed on combined neutron captures on H and Gd. Supersedes ABE 14H and ABE 13C.
- ¹⁵ CHOI 16 reports results of the RENO experiment using about 500 days of data, performing a rate and shape analysis. Compared to AHN 12, a significant reduction of the systematic uncertainties is reported. A 3% excess of events near 5 MeV of the prompt energy is observed. Supersedes AHN 12.
- ¹⁶ AN 15 uses all eight identical detectors, with four placed near the reactor cores and the remaining four at the far hall to determine the mixing angle θ_{13} using the $\overline{\nu}_e$ observed interaction rates with neutron capture on Gd and energy spectra. The result corresponds to the exposure of $6.9 \times 10^5 \text{ GW}_{th}$ -ton-days. Superseded by AN 17A.
- ¹⁷ ABE 14A uses 467.9 live days of one detector, 1050 m away from two reactor cores of the Chooz nuclear power station, to determine the mixing parameter $\sin^2(2\theta_{13})$. The Bugey4 data (DECLAIS 94) is used to constrain the neutrino flux. The data set includes 7.24 reactor-off days. A "rate-modulation" analysis is performed. Supersedes ABE 12B.
- ¹⁸ ABE 14C result is for ν_e appearance and assumes $\Delta m_{32}^2 = 2.4 \times 10^{-3} \text{ eV}^2$, $\sin^2(\theta_{23}) = 0.5$, and $\delta = 0$.
- ¹⁹ ABE 14H uses 467.9 live days of one detector, 1050 m away from two reactor cores of the Chooz nuclear power station, to determine the mixing parameter $\sin^2(2\theta_{13})$. The Bugey4 data (DECLAIS 94) is used to constrain the neutrino flux. The data set includes 7.24 reactor-off days. A rate and shape analysis is performed. Superseded by ABE 16B.
- ²⁰ AN 14 uses six identical detectors, with three placed near the reactor cores (flux-weighted baselines of 512 and 561 m) and the remaining three at the far hall (at the flux averaged distance of 1579 m from all six reactor cores) to determine the mixing angle θ_{13} using the $\overline{\nu}_e$ observed interaction rates with neutron capture on Gd and energy spectra. Supersedes AN 13 and superseded by AN 15.
- ²¹ AN 14B uses six identical anti-neutrino detectors with flux-weighted baselines of $\sim 500 \text{ m}$ and $\sim 1.6 \text{ km}$ to six power reactors. This rate analysis uses a 217-day data set and neutron capture on protons (not Gd) only. $\Delta m_{31}^2 = 2.32 \times 10^{-3} \text{ eV}^2$ is assumed. Superseded by AN 16A.
- ²² FORERO 14 performs a global fit to neutrino oscillations using solar, reactor, long-baseline accelerator, and atmospheric neutrino data.
- ²³ GONZALEZ-GARCIA 14 result comes from a frequentist global fit. The corresponding Bayesian global fit to the same data results are reported in BERGSTROM 15 as $(2.18^{+0.10}_{-0.11}) \times 10^{-2} \text{ eV}^2$ for normal and $(2.19^{+0.12}_{-0.10}) \times 10^{-2} \text{ eV}^2$ for inverted mass ordering.
- ²⁴ ABE 13C uses delayed neutron capture on hydrogen instead of on Gd used previously. The physical volume is thus three times larger. The fit is based on the rate and shape analysis as in ABE 12B. The Bugey4 data (DECLAIS 94) is used to constrain the neutrino flux. Superseded by ABE 16B.
- ²⁵ ABE 13E assumes maximal θ_{23} mixing and CP phase $\delta = 0$.
- ²⁶ ADAMSON 13A results obtained from ν_e appearance, assuming $\delta = 0$, and $\sin^2(2\theta_{23}) = 0.957$.
- ²⁷ AHARMIM 13 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{32}^2 fixed to $2.45 \times 10^{-3} \text{ eV}^2$, using global solar neutrino data. AHARMIM 13 global solar neutrino data include SNO's all-phases-combined analysis results on the total active ^8B neutrino flux and energy-dependent ν_e survival probability parameters, measurements of Cl (CLEVELAND 98), Ga (ABDURASHITOV 09 which contains combined analysis with GNO (ALTMANN 05 and Ph.D. thesis of F. Kaether)), and ^7Be (BELLINI 11A) rates, and ^8B solar-neutrino recoil electron measurements of SK-I (HOSAKA 06) zenith, SK-II (CRAVENS 08) and SK-III (ABE 11) day/night spectra, and Borexino (BELLINI 10A) spectra. AHARMIM 13 also reported a result combining global solar and KamLAND data, which is $\sin^2(2\theta_{13}) = (9.1^{+2.9}_{-3.1}) \times 10^{-2}$.
- ²⁸ AN 13 uses six identical detectors, with three placed near the reactor cores (flux-weighted baselines of 498 and 555 m) and the remaining three at the far hall (at the flux averaged distance of 1628 m from all six reactor cores) to determine the $\overline{\nu}_e$ interaction rate ratios. Superseded by AN 14.
- ²⁹ ABE 12 determines the $\overline{\nu}_e$ interaction rate in a single detector, located 1050 m from the cores of two reactors. A rate and shape analysis is performed. The rate normalization is fixed by the results of the Bugey4 reactor experiment, thus avoiding any dependence on possible very short baseline oscillations. The value of $\Delta m_{31}^2 = 2.4 \times 10^{-3} \text{ eV}^2$ is used in the analysis. Superseded by ABE 12B.
- ³⁰ ABE 12B determines the neutrino mixing angle θ_{13} using a single detector, located 1050 m from the cores of two reactors. This result is based on a spectral shape and rate analysis. The Bugey4 data (DECLAIS 94) is used to constrain the neutrino flux. Superseded by ABE 14A.
- ³¹ AHN 12 uses two identical detectors, placed at flux weighted distances of 408.56 m and 1433.99 m from six reactor cores, to determine the mixing angle θ_{13} . This rate-only analysis excludes the no-oscillation hypothesis at 4.9 standard deviations. The value of $\Delta m_{31}^2 = (2.32^{+0.12}_{-0.08}) \times 10^{-3} \text{ eV}^2$ was assumed in the analysis. Superseded by CHOI 16.
- ³² AN 12 uses six identical detectors with three placed near the reactor cores (flux-weighted baselines of 470 m and 576 m) and the remaining three at the far hall (at the flux averaged distance of 1648 m from all six reactor cores) to determine the mixing angle θ_{13} using the $\overline{\nu}_e$ observed interaction rate ratios. This rate-only analysis excludes the no-oscillation hypothesis at 5.2 standard deviations. The value of $\Delta m_{31}^2 = (2.32^{+0.12}_{-0.08}) \times 10^{-3} \text{ eV}^2$ was assumed in the analysis. Superseded by AN 13.
- ³³ ABE 11 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{32}^2 fixed to $2.4 \times 10^{-3} \text{ eV}^2$, using solar neutrino data including Super-Kamiokande, SNO, Borexino (ARPESELLA 08A), Homestake, GALLEX/GNO, SAGE, and KamLAND data. This result implies an upper bound of $\sin^2\theta_{13} < 0.059$ (95% CL) or $\sin^2 2\theta_{13} < 0.22$ (95% CL). The normal neutrino mass ordering and CPT invariance are assumed.
- ³⁴ ABE 11 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{32}^2 fixed to $2.4 \times 10^{-3} \text{ eV}^2$, using solar neutrino data including Super-Kamiokande, SNO, Borexino (ARPESELLA 08A), Homestake, and GALLEX/GNO data. The normal neutrino mass ordering is assumed.
- ³⁵ The quoted limit is for $\Delta m_{32}^2 = 2.4 \times 10^{-3} \text{ eV}^2$, $\theta_{23} = \pi/2$, $\delta = 0$, and the normal mass ordering. For other values of δ , the 68% region spans from 0.03 to 0.25, and the 90% region from 0.02 to 0.32.
- ³⁶ The quoted limit is for $\Delta m_{32}^2 = 2.4 \times 10^{-3} \text{ eV}^2$, $\theta_{23} = \pi/2$, $\delta = 0$, and the inverted mass ordering. For other values of δ , the 68% region spans from 0.04 to 0.30, and the 90% region from 0.02 to 0.39.
- ³⁷ The quoted limit is for $\Delta m_{32}^2 = 2.32 \times 10^{-3} \text{ eV}^2$, $\theta_{23} = \pi/2$, $\delta = 0$, and the normal mass ordering. For other values of δ , the 68% region spans from 0.02 to 0.12, and the 90% region from 0 to 0.16.
- ³⁸ The quoted limit is for $\Delta m_{32}^2 = 2.32 \times 10^{-3} \text{ eV}^2$, $\theta_{23} = \pi/2$, $\delta = 0$, and the inverted mass ordering. For other values of δ , the 68% region spans from 0.02 to 0.16, and the 90% region from 0 to 0.21.
- ³⁹ FOGLI 11 obtained this result from an analysis using the atmospheric, accelerator long baseline, CHOOZ, solar, and KamLAND data. Recently, MUELLER 11 suggested an average increase of about 3.5% in normalization of the reactor $\overline{\nu}_e$ fluxes, and using these fluxes, the fitted result becomes 0.10 ± 0.03 .
- ⁴⁰ GANDO 11 report $\sin^2\theta_{13} = 0.020 \pm 0.016$. This result was obtained with three-neutrino fit using the KamLAND + solar data.
- ⁴¹ GANDO 11 report $\sin^2\theta_{13} = 0.032 \pm 0.037$. This result was obtained with three-neutrino fit using the KamLAND data only.
- ⁴² This result corresponds to the limit of < 0.12 at 90% CL for $\Delta m_{32}^2 = 2.43 \times 10^{-3} \text{ eV}^2$, $\theta_{23} = \pi/2$, and $\delta = 0$. For other values of δ , the 90% CL region spans from 0 to 0.16.
- ⁴³ This result corresponds to the limit of < 0.20 at 90% CL for $\Delta m_{32}^2 = 2.43 \times 10^{-3} \text{ eV}^2$, $\theta_{23} = \pi/2$, and $\delta = 0$. For other values of δ , the 90% CL region spans from 0 to 0.21.
- ⁴⁴ AHARMIM 10 global solar neutrino data include SNO's low-energy-threshold analysis survival probability day/night curves, SNO Phase III integral rates (AHARMIM 08), Cl (CLEVELAND 98), SAGE (ABDURASHITOV 09), Gallex/GNO (HAMPEL 99, ALTMANN 05), Borexino (ARPESELLA 08A), SK-I zenith (HOSAKA 06), and SK-II day/night spectra (CRAVENS 08).
- ⁴⁵ AHARMIM 10 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{31}^2 fixed to $2.3 \times 10^{-3} \text{ eV}^2$, using global solar neutrino data and KamLAND data (ABE 08A). CPT invariance is assumed. This result implies an upper bound of $\sin^2\theta_{13} < 0.057$ (95% CL) or $\sin^2 2\theta_{13} < 0.22$ (95% CL).
- ⁴⁶ AHARMIM 10 obtained this result by a three-neutrino oscillation analysis with the value of Δm_{31}^2 fixed to $2.3 \times 10^{-3} \text{ eV}^2$, using global solar neutrino data.
- ⁴⁷ WENDELL 10 obtained this result by a three-neutrino oscillation analysis with one mass scale dominance ($\Delta m_{21}^2 = 0$) using the Super-Kamiokande-I+II+III atmospheric neutrino data, and updates the HOSAKA 06A result.
- ⁴⁸ The quoted limit is for $\Delta m_{32}^2 = 2.43 \times 10^{-3} \text{ eV}^2$, $\theta_{23} = \pi/2$, and $\delta = 0$. For other values of δ , the 68% CL region spans from 0.02 to 0.26.
- ⁴⁹ The quoted limit is for $\Delta m_{32}^2 = 2.43 \times 10^{-3} \text{ eV}^2$, $\theta_{23} = \pi/2$, and $\delta = 0$. For other values of δ , the 68% CL region spans from 0.04 to 0.34.
- ⁵⁰ FOGLI 08 obtained this result from a global analysis of all neutrino oscillation data, that is, solar + KamLAND + atmospheric + accelerator long baseline + CHOOZ.
- ⁵¹ FOGLI 08 obtained this result from an analysis using the solar and KamLAND neutrino oscillation data.
- ⁵² FOGLI 08 obtained this result from an analysis using the atmospheric, accelerator long baseline, and CHOOZ neutrino oscillation data.
- ⁵³ YAMAMOTO 06 searched for $\nu_\mu \rightarrow \nu_e$ appearance. Assumes $2 \sin^2(2\theta_{\mu e}) = \sin^2(2\theta_{13})$. The quoted limit is for $\Delta m_{32}^2 = 1.9 \times 10^{-3} \text{ eV}^2$. That value of Δm_{32}^2 is the one- σ low value for AHN 06A. For the AHN 06A best fit value of $2.8 \times 10^{-3} \text{ eV}^2$, the $\sin^2(2\theta_{13})$ limit is < 0.26 . Supersedes AHN 04.

See key on page 1127

Lepton Particle Listings

Neutrino Mixing

- 54 AHN 04 searched for $\nu_\mu \rightarrow \nu_e$ appearance. Assuming $2 \sin^2(2\theta_{\mu e}) = \sin^2(2\theta_{13})$, a limit on $\sin^2(2\theta_{\mu e})$ is converted to a limit on $\sin^2(2\theta_{13})$. The quoted limit is for $\Delta m_{32}^2 = 1.9 \times 10^{-3} \text{ eV}^2$. That value of Δm_{32}^2 is the one- σ low value for ALIU 05. For the ALIU 05 best fit value of $2.8 \times 10^{-3} \text{ eV}^2$, the $\sin^2(2\theta_{13})$ limit is < 0.30 .
- 55 The quoted limit is for $\Delta m_{32}^2 = 1.9 \times 10^{-3} \text{ eV}^2$. That value of Δm_{32}^2 is the 1- σ low value for ALIU 05. For the ALIU 05 best fit value of $2.8 \times 10^{-3} \text{ eV}^2$, the $\sin^2 2\theta_{13}$ limit is < 0.19 . In this range, the θ_{13} limit is larger for lower values of Δm_{32}^2 , and smaller for higher values of Δm_{32}^2 .
- 56 The quoted limit is for $\Delta m_{32}^2 = 1.9 \times 10^{-3} \text{ eV}^2$. That value of Δm_{32}^2 is the 1- σ low value for ALIU 05. For the ALIU 05 best fit value of $2.8 \times 10^{-3} \text{ eV}^2$, the $\sin^2 2\theta_{13}$ limit is < 0.23 .
- 57 The quoted limit is for $\Delta m_{32}^2 = 2.43 \times 10^{-3} \text{ eV}^2$. That value of Δm_{32}^2 is the central value for ADAMSON 08. For the ADAMSON 08 1- σ low value of $2.30 \times 10^{-3} \text{ eV}^2$, the $\sin^2 2\theta_{13}$ limit is < 0.16 . See also APOLLONIO 03 for a detailed description of the experiment.

CP violating phase

δ , CP violating phase

Measurements of δ come from atmospheric and accelerator experiments looking at ν_e appearance. We encode values between 0 and 2π , though it is equivalent to use $-\pi$ to π .

- 1 ABE 20F results are based on data collected between 2009 and 2018 in (anti)neutrino mode and include a neutrino beam exposure of 1.49×10^{21} (1.64×10^{21}) protons on target. For inverted mass ordering, the quoted result is $1.56^{+0.15}_{-0.17} \pi$ rad. Supersedes ABE 18g.
- 2 ACERO 19 is based on a sample size of 1.33×10^{20} protons on target with combined antineutrino and neutrino data. Supersedes ACERO 18.
- 3 ABE 18b uses 328 kton-years of Super-Kamiokande I-IV atmospheric neutrino data to obtain this result. The fit is performed over the three parameters, Δm_{32}^2 , $\sin^2 \theta_{23}$, and δ , while the solar parameters and $\sin^2 \theta_{13}$ are fixed to $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5} \text{ eV}^2$, $\sin^2 \theta_{12} = 0.304 \pm 0.014$, and $\sin^2 \theta_{13} = 0.0219 \pm 0.0012$.
- 4 SALAS 21 reports results of a global fit to neutrino oscillation data available at the time of the Neutrino 2020 conference.
- 5 ESTEBAN 20A reports results of a global fit to neutrino oscillation data available at the time of the Neutrino 2020 conference.
- 6 ABE 18b uses 328 kton-years of Super-Kamiokande I-IV atmospheric neutrino data to obtain this result. The fit is performed over the four parameters, Δm_{32}^2 , $\sin^2 \theta_{23}$, $\sin^2 \theta_{13}$, and δ , while the solar parameters are fixed to $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5} \text{ eV}^2$ and $\sin^2 \theta_{12} = 0.304 \pm 0.014$.
- 7 ABE 18g confidence intervals are marginalized over both mass orderings. Normal order preferred with a posterior probability of 87%. The 1-sigma result for normal mass ordering is presented in the average was provided by the experiment via private communications. Supersedes ABE 17f.
- 8 ACERO 18 performs a joint fit to the data for ν_μ disappearance and ν_e appearance. The overall best fit favors normal mass ordering and θ_{23} in octant II. No 1σ confidence intervals are presented for the inverted mass ordering scenarios. Superseded by ACERO 19.
- 9 ABE 17f confidence intervals are obtained using a frequentist analysis including θ_{13} constraint from reactor experiments. Bayesian intervals based on Markov Chain Monte Carlo method are also provided by the authors. Superseded by ABE 18g.
- 10 Errors are projections of 68% C.L. curve of δ_{CP} vs. $\sin^2 \theta_{23}$.
- 11 ADAMSON 16 result is based on a data sample with 2.74×10^{20} protons on target. The likelihood-based analysis observed 6 ν_e events with an expected background of 0.99 ± 0.11 events.
- 12 ADAMSON 14 result is based on three-flavor formalism and $\theta_{23} > \pi/4$. Likelihood as a function of δ is also shown for the other three combinations of hierarchy and θ_{23} octants; all values of δ are allowed at 90% C.L.
- 13 GONZALEZ-GARCIA 14 result comes from a frequentist global fit. The corresponding Bayesian global fit to the same data results are reported in BERGSTROM 15 as 68% CL intervals of 1.24–1.94 for normal and 1.15–1.77 for inverted mass ordering.
- 14 ADAMSON 13A result is based on ν_e appearance in MINOS and the calculated $\sin^2(2\theta_{23}) = 0.957$, $\theta_{23} > \pi/4$, and normal mass hierarchy. Likelihood as a function of δ is also shown for the other three combinations of hierarchy and θ_{23} octants; all values of δ are allowed at 90% C.L.

(C) Other neutrino mixing results

The LSND collaboration reported in AGUILAR 01 a signal which is consistent with $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ oscillations. In a three neutrino framework, this would be a measurement of θ_{12} and Δm_{21}^2 . This does not appear to be consistent with most of the other neutrino data. The following listings include results from $\nu_\mu \rightarrow \nu_e$, $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ appearance and ν_μ , $\bar{\nu}_\mu$, ν_e , and $\bar{\nu}_e$ disappearance experiments, and searches for CPT violation.

$\Delta(m^2)$ for $\sin^2(2\theta) = 1$ ($\nu_\mu \rightarrow \nu_e$)

1 AGUILAR-AREVALO 21 result is based on a total of 18.75×10^{20} POT in neutrino mode, and 11.27×10^{20} POT in anti-neutrino mode. Best fit at 0.043 eV^2 . The allowed region does not extend to large Δm^2 . The quoted value is the entire allowed region of Δm^2 at 90% C.L. for all values of $\sin^2(2\theta)$. Supersedes AGUILAR-AREVALO 18c.				
2 AGUILAR-AREVALO 18c result is based on $\nu_\mu \rightarrow \nu_e$ appearance of 460.5 ± 99.0 events; The best fit value is $\Delta m^2 = 0.041 \text{ eV}^2$. Superseded by AGUILAR-AREVALO 21.				
3 AGUILAR-AREVALO 13A result is based on $\nu_\mu \rightarrow \nu_e$ appearance of 162.0 ± 47.8 events; marginally compatible with twoneutrino oscillations. The best fit value is $\Delta m^2 = 3.14 \text{ eV}^2$.				
4 MAHN 12 is a combined spectral fit of MiniBooNE and SciBooNE neutrino data with the range of Δm^2 up to 25 eV^2 . The best limit is 0.04 at 7 eV^2 .				

Lepton Particle Listings

Neutrino Mixing

⁵ AGUILAR 01 is the final analysis of the LSND full data set. Search is made for the $\nu_\mu \rightarrow \nu_e$ oscillations using ν_μ from π^+ decay in flight by observing beam-on electron events from $\nu_e C \rightarrow e^- X$. Present analysis results in $8.1 \pm 12.2 \pm 1.7$ excess events in the $60 < E_e < 200$ MeV energy range, corresponding to oscillation probability of $0.10 \pm 0.16 \pm 0.04\%$. This is consistent, though less significant, with the previous result of ATHANASSOPOULOS 98, which it supersedes. The present analysis uses selection criteria developed for the decay at rest region, and is less effective in removing the background above 60 MeV than ATHANASSOPOULOS 98.

⁶ ATHANASSOPOULOS 98 is a search for the $\nu_\mu \rightarrow \nu_e$ oscillations using ν_μ from π^+ decay in flight. The 40 observed beam-on electron events are consistent with $\nu_e C \rightarrow e^- X$; the expected background is 21.9 ± 2.1 . Authors interpret this excess as evidence for an oscillation signal corresponding to oscillations with probability $(0.26 \pm 0.10 \pm 0.05)\%$. Although the significance is only 2.3σ , this measurement is an important and consistent cross check of ATHANASSOPOULOS 96 who reported evidence for $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ oscillations from μ^+ decay at rest. See also ATHANASSOPOULOS 98b.

⁷ LOVERRE 96 uses the charged-current to neutral-current ratio from the combined CHARM (ALLABY 86) and CDHS (ABRAMOWICZ 86) data from 1986.

¹ AGUILAR-AREVALO 21 result is based on a total of 18.75×10^{20} POT in neutrino mode, and 11.27×10^{20} POT in anti-neutrino mode. The best fit value is $\sin^2(2\theta) = 0.807$. The allowed region does not extend to large Δm^2 . The quoted value is the entire allowed region of $\sin^2(2\theta)$ at 90% C.L. for all values of Δm^2 . Supersedes AGUILAR-AREVALO 18c.

² AGUILAR-AREVALO 18c result is based on $\nu_\mu \rightarrow \nu_e$ appearance of 460.5 ± 99.0 events; The best fit value is $\sin^2(2\theta) = 0.92$. The quoted limit for the two-neutrino mixing angle θ is valid above $\Delta m^2 = 0.59$ eV². Superseded by AGUILAR-AREVALO 21.

³ AGUILAR-AREVALO 13A result is based on $\nu_\mu \rightarrow \nu_e$ appearance of 162.0 ± 47.8 events; marginally compatible with two neutrino oscillations. The best fit value is $\sin^2(2\theta) = 0.002$.

⁴ ANTONELLO 13 use the ICARUS T600 detector at LNGS and ~ 20 GeV beam of ν_μ from CERN 730 km away to search for an excess of ν_e events. Two events are found with 3.7 ± 0.6 expected from conventional sources. This result excludes some parts of the parameter space expected by LSND. Superseded by ANTONELLO 13A.

⁵ Based on four events with a background of 6.4 ± 0.9 from conventional sources with an average energy of 20 GeV and 730 km from the source of ν_μ .

⁶ MAHN 12 is a combined fit of MiniBooNE and SciBooNE neutrino data.

⁷ The limit is $\sin^2 2\theta < 0.9 \times 10^{-3}$ at $\Delta m^2 = 2$ eV². That value of Δm^2 corresponds to the smallest mixing angle consistent with the reported signal from LSND in AGUILAR 01.

⁸ The limit becomes $\sin^2 2\theta < 0.15$ at $\Delta m^2 = 2.8 \times 10^{-3}$ eV², the best-fit value of the ν_μ disappearance analysis in K2K.

⁹ AGUILAR 01 is the final analysis of the LSND full data set of the search for the $\nu_\mu \rightarrow \nu_e$ oscillations. See footnote in preceding table for further details.

¹⁰ ATHANASSOPOULOS 98 report $(0.26 \pm 0.10 \pm 0.05)\%$ for the oscillation probability; the value of $\sin^2 2\theta$ for large Δm^2 is deduced from this probability. See footnote in preceding table for further details, and see the paper for a plot showing allowed regions. If effect is due to oscillation, it is most likely to be intermediate $\sin^2 2\theta$ and Δm^2 . See also ATHANASSOPOULOS 98b.

¹¹ LOVERRE 96 uses the charged-current to neutral-current ratio from the combined CHARM (ALLABY 86) and CDHS (ABRAMOWICZ 86) data from 1986.

¹² VILAIN 94c limit derived by combining the ν_μ and $\bar{\nu}_\mu$ data assuming CP conservation.

$\Delta(m^2)$ for $\sin^2(2\theta) = 1$ ($\bar{\nu}_\mu \rightarrow \bar{\nu}_e$)

¹ Based on $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ appearance of 78.4 ± 28.5 events. The best fit values are $\Delta m^2 = 0.043$ eV² and $\sin^2 2\theta = 0.88$.

² CHENG 12 is a combined fit of MiniBooNE and SciBooNE antineutrino data.

³ This value is for a two neutrino oscillation analysis for excess antineutrino events with $E_\nu > 475$ MeV. The best fit is at 0.07. The allowed region is consistent with LSND reported by AGUILAR 01. Supersedes AGUILAR-AREVALO 09b.

⁴ This value is for a two neutrino oscillation analysis for excess antineutrino events with $E_\nu > 200$ MeV with subtraction of the expected 12 events low energy excess seen in the neutrino component of the beam. The best fit value is 0.007 for $\Delta(m^2) = 4.4$ eV².

⁵ ARMBRUSTER 02 is the final analysis of the KARMEN 2 data for 17.7 m distance from the ISIS stopped pion and muon neutrino source. It is a search for $\bar{\nu}_e$, detected by the inverse β -decay reaction on protons and ¹²C. 15 candidate events are observed, and 15.8 ± 0.5 background events are expected, hence no oscillation signal is detected. The results exclude large regions of the parameter area favored by the LSND experiment.

⁶ AGUILAR 01 is the final analysis of the LSND full data set. It is a search for $\bar{\nu}_e$ 30 m from LAMPF beam stop. Neutrinos originate mainly from π^+ decay at rest. $\bar{\nu}_e$ are detected through $\bar{\nu}_e p \rightarrow e^+ n$ ($20 < E_{e^+} < 60$ MeV) in delayed coincidence with $np \rightarrow d\gamma$. Authors observe $87.9 \pm 22.4 \pm 6.0$ total excess events. The observation is attributed to $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ oscillations with the oscillation probability of $0.264 \pm 0.067 \pm 0.045\%$, consistent with the previously published result. Taking into account all constraints, the most favored allowed region of oscillation parameters is a band of $\Delta(m^2)$ from $0.2-2.0$ eV². Supersedes ATHANASSOPOULOS 95, ATHANASSOPOULOS 96, and ATHANASSOPOULOS 98.

⁷ ATHANASSOPOULOS 96 is a search for $\bar{\nu}_e$ 30 m from LAMPF beam stop. Neutrinos originate mainly from π^+ decay at rest. $\bar{\nu}_e$ could come from either $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ or $\nu_e \rightarrow \bar{\nu}_e$; our entry assumes the first interpretation. They are detected through $\bar{\nu}_e p \rightarrow e^+ n$ (20 MeV $< E_{e^+} < 60$ MeV) in delayed coincidence with $np \rightarrow d\gamma$. Authors observe $51 \pm 20 \pm 8$ total excess events over an estimated background 12.5 ± 2.9 . ATHANASSOPOULOS 96b is a shorter version of this paper.

⁸ ATHANASSOPOULOS 95 error corresponds to the 1.6σ band in the plot. The expected background is 2.7 ± 0.4 events. Corresponds to an oscillation probability of $(0.34 \pm 0.20 \pm 0.16 \pm 0.07)\%$. For a different interpretation, see HILL 95. Replaced by ATHANASSOPOULOS 96.

⁹ HILL 95 is a report by one member of the LSND Collaboration, reporting a different conclusion from the analysis of the data of this experiment (see ATHANASSOPOULOS 95). Contrary to the rest of the LSND Collaboration, Hill finds no evidence for the neutrino oscillation $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ and obtains only upper limits.

¹⁰ FREEDMAN 93 is a search at LAMPF for $\bar{\nu}_e$ generated from any of the three neutrino types $\nu_\mu, \bar{\nu}_\mu$, and ν_e which come from the beam stop. The $\bar{\nu}_e$'s would be detected by the reaction $\bar{\nu}_e p \rightarrow e^+ n$. FREEDMAN 93 replaces DURKIN 88.

$\sin^2(2\theta)$ for "Large" $\Delta(m^2)$ ($\bar{\nu}_\mu \rightarrow \bar{\nu}_e$)

¹ ANTONELLO 13A obtained the limit by assuming $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ oscillation from the $\sim 2\%$ of $\bar{\nu}_\mu$ events contamination in the CNRS beam.

² CHENG 12 is a combined fit of MiniBooNE and SciBooNE antineutrino data.

³ This value is for a two neutrino oscillation analysis for excess antineutrino events with $E_\nu > 475$ MeV. At 90% CL there is no solution at high $\Delta(m^2)$. The best fit is at maximal mixing. The allowed region is consistent with LSND reported by AGUILAR 01. Supersedes AGUILAR-AREVALO 09b.

⁴ This value is for a two neutrino oscillation analysis for excess antineutrino events with $E_\nu > 200$ MeV with subtraction of the expected 12 events low energy excess seen in the neutrino component of the beam. At 90% CL there is no solution at high $\Delta(m^2)$. The best fit value is 0.007 for $\Delta(m^2) = 4.4$ eV².

⁵ This result is inconclusive with respect to small amplitude mixing suggested by LSND.

⁶ ARMBRUSTER 02 is the final analysis of the KARMEN 2 data. See footnote in the preceding table for further details, and the paper for the exclusion plot.

⁷ AGUILAR 01 is the final analysis of the LSND full data set. The deduced oscillation probability is $0.264 \pm 0.067 \pm 0.045\%$; the value of $\sin^2 2\theta$ for large $\Delta(m^2)$ is twice this probability (although these values are excluded by other constraints). See footnote in preceding table for further details, and the paper for a plot showing allowed regions. Supersedes ATHANASSOPOULOS 95, ATHANASSOPOULOS 96, and ATHANASSOPOULOS 98.

See key on page 1127

Lepton Particle Listings

Neutrino Mixing

⁸ATHANASSOPOULOS 96 reports $(0.31 \pm 0.12 \pm 0.05)\%$ for the oscillation probability; the value of $\sin^2 2\theta$ for large $\Delta(m^2)$ should be twice this probability. See footnote in preceding table for further details, and see the paper for a plot showing allowed regions.

⁹ATHANASSOPOULOS 95 error corresponds to the 1.6σ band in the plot. The expected background is 2.7 ± 0.4 events. Corresponds to an oscillation probability of $(0.34 \pm 0.20 \pm 0.07)\%$. For a different interpretation, see HILL 95. Replaced by ATHANASSOPOULOS 96.

¹⁰HILL 95 is a report by one member of the LSND Collaboration, reporting a different conclusion from the analysis of the data of this experiment (see ATHANASSOPOULOS 95). Contrary to the rest of the LSND Collaboration, Hill finds no evidence for the neutrino oscillation $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ and obtains only upper limits.

¹ANDRIAMIRADO 21 reports a search for $\bar{\nu}_e \rightarrow \bar{\nu}_s$ oscillations at the HFIR research reactor, at baselines from 6.7 to 9.2 m. The reactor has a ²³⁵U core. 4 tons of ⁶Li-doped liquid scintillator are used in a segmented detector. Oscillations into sterile neutrinos are disfavored. The stated limit for $\sin^2(2\theta_{14})$ is for $\Delta m_{41}^2 \sim 2 \text{ eV}^2$ where the sensitivity is maximal.

²SEREBROV 21 searches for $\bar{\nu}_e \rightarrow \bar{\nu}_s$ oscillations with a moveable detector with baseline 6–12 m from the SM-3 research reactor with highly enriched ²³⁵U fuel. Analyzing the L/E dependence a χ^2 minimum is found at $\Delta m_{41}^2 = 7.3 \pm 0.13 \pm 1.16 \text{ eV}^2$ and $\sin^2(2\theta_{14}) = 0.36 \pm 0.12$. The quoted limit of 0.005 for $\sin^2(2\theta_{14})$ corresponds to $\Delta m_{41}^2 \sim 2 \text{ eV}^2$. This is the result from 720 days of reactor ON and 860 days of reactor OFF measurements. The significance of the χ^2 minimum is 2.9 σ . Supersedes SEREBROV 20, SEREBROV 19 and SEREBROV 18a.

³SKROBOVA 20 searches for $\bar{\nu}_e - \bar{\nu}_s$ oscillations using the DANSS detector at 10.7, 11.2, and 12.7 m from the 3.1 GW_{th} power reactor. The DANSS detector is highly segmented and moveable; the positions are changed usually 3 times a week. The analysis is based on the ratio of the events at top and bottom position; the middle position is used for checks of consistency. No evidence for sterile neutrinos is found. The quoted limit 0.008, the smallest excluded $\sin^2(2\theta_{14})$, corresponds to $\Delta m_{41}^2 \sim 1.0 \text{ eV}^2$. Supersedes ALEKSEEV 18.

⁴ALEKSEEV 18 searches for $\bar{\nu}_e \rightarrow \bar{\nu}_s$ oscillations using the DANSS detector at 10.7, 11.2, and 12.7 m from the 3.1 GW_{th} power reactor. The DANSS detector is highly segmented and moveable; the positions are changed usually 3 times a week. The analysis is based on the ratio of the events at top and bottom position; the middle position is used for checks of consistency. The best fit point is at $\Delta m_{41}^2 = 1.4 \text{ eV}^2$ and $\sin^2(2\theta_{14}) = 0.05$ with $\Delta\chi^2 = 13.1$ (statistical errors only) compared to the fit with 3 active neutrinos only. The quoted limit of 0.01 for $\sin^2(2\theta_{14})$ corresponds to $\Delta m_{41}^2 \sim 1.0 \text{ eV}^2$. Superseded by SKROBOVA 20.

⁵ALMAZAN 18 searches for the $\bar{\nu}_e \rightarrow \bar{\nu}_s$ oscillations with baseline from 9.4 to 11.1 m from the ILL research reactor with highly enriched ²³⁵U fuel. The STEREO detector consists of six separated cells with Gd loaded scintillator, with 15 m water equivalent overburden. The detected rate is $396.3 \pm 4.7 \bar{\nu}_e/\text{day}$ with signal to background ratio of about 0.9. The reported results corresponds to 66 days of reactor-on. The analysis uses the relative rates normalized to the cell number 1_i . No indication of the oscillation to the sterile neutrinos is found, the stated limit on $\sin^2(2\theta_{14})$ correspond to $\Delta m_{41}^2 \sim 3.5 \text{ eV}^2$ where the exclusion is maximal.

⁶ASHENFELTER 18 searches for the $\bar{\nu}_e \rightarrow \bar{\nu}_s$ oscillations at baseline from 6.7 to 9.2 m from the 85 MW research reactor with pure ²³⁵U core. The segmented 4 ton ⁶Li-doped liquid scintillator is operated with about 1 m water equivalent overburden and recorded $25461 \pm 283 \text{ IBD}$ events. No indication of oscillations into sterile neutrinos was observed. The stated limit for $\sin^2(2\theta_{14})$ is for $\Delta m_{41}^2 \sim 2 \text{ eV}^2$ where the sensitivity is maximal.

⁷AARTSEN 17b uses three years of upward-going atmospheric neutrino data in the energy range of 10-60 GeV to constrain their disappearance into light sterile neutrinos. The reported limit $\sin^2\theta_{24} < 0.11$ at 90% C.L. is for $\Delta m_{41}^2 = 1.0 \text{ eV}^2$. We convert the result to $\sin^2 2\theta_{24}$ for the listing. AARTSEN 17b also reports $\cos^2\theta_{24} \cdot \sin^2\theta_{34} < 0.15$ at 90% C.L. for $\Delta m_{41}^2 = 1.0 \text{ eV}^2$.

⁸ABDURASHITOV 17 use the Troitsk nu-mass experiment to search for sterile neutrinos with mass 0.1 - 2 keV. We convert the reported limit from $U_{e4}^2 < 0.002$ to $\sin^2 2\theta_{14} < 0.008$ assume $U_{e4} \sim \sin\theta_{14}$. The stated limit corresponds to the smallest U_{e4}^2 . The exclusion curve begins at U_{e4}^2 of 0.02 for $m_4 = 0.1 \text{ keV}$.

⁹KO 17 reports on short baseline reactor oscillation search ($\bar{\nu}_e \rightarrow \bar{\nu}_s$), motivated by the so-called "reactor antineutrino anomaly". The experiment is conducted at 23.7 m from the core of unit 5 of the Hanbit Nuclear Power Complex in Korea. The reported limited on $\sin^2(2\theta_{41})$ for sterile neutrinos was determined using the reactor antineutrino spectrum determined by the Daya Bay experiment for Δm_{41}^2 around 0.55 eV² where the sensitivity is maximal. A fraction of the parameter space derived from the "reactor antineutrino anomaly" is excluded by this work. Compared to reactor models an event excess is observed at about 5 MeV, in agreement with other experiments.

¹⁰AARTSEN 16 use one year of upward-going atmospheric muon neutrino data in the energy range of 320 GeV to 20 TeV to constrain their disappearance into light sterile neutrinos. Sterile neutrinos are expected to produce distinctive zenith distribution for these energies for $0.01 \leq \Delta m^2 \leq 10 \text{ eV}^2$. The stated limit is for $\sin^2 2\theta_{24}$ at Δm^2 around 0.3 eV².

¹¹ADAMSON 16b combine the results of AN 16b, ADAMSON 16c, and Bugey-3 reactor experiments to constrain ν_μ to ν_e mixing through oscillations into light sterile neutrinos. The stated limit for $\sin^2 2\theta_{\mu e}$ is at $|\Delta m_{41}^2| = 1.2 \text{ eV}^2$.

¹²ADAMSON 16c use the NuMI beam and exposure of 10.56×10^{20} protons on target to search for the oscillation of ν_μ dominated beam into light sterile neutrinos with detectors at 1.04 and 735 km. The reported limit $\sin^2(\theta_{24}) < 0.022$ at 95% C.L. is for $|\Delta m_{41}^2| = 0.5 \text{ eV}^2$. We convert the result to $\sin^2(2\theta_{24})$ for the listing.

¹³AN 16b utilize 621 days of data to place limits on the $\bar{\nu}_e$ disappearance into a light sterile neutrino. The stated limit corresponds to the smallest $\sin^2(2\theta_{14})$ at $|\Delta m_{41}^2| \sim 3 \times 10^{-2} \text{ eV}^2$ (obtained from Figure 3 in AN 16b). The exclusion curve begins at $|\Delta m_{41}^2| \sim 1.5 \times 10^{-4} \text{ eV}^2$ and extends to $\sim 0.25 \text{ eV}^2$. The analysis assumes $\sin^2(2\theta_{12}) = 0.846 \pm 0.021$, $\Delta m_{21}^2 = (7.53 \pm 0.18) \times 10^{-5} \text{ eV}^2$, and $|\Delta m_{32}^2| = (2.44 \pm 0.06) \times 10^{-3} \text{ eV}^2$.

¹⁴AMBROSIO 01 tested the pure 2-flavor $\nu_\mu \rightarrow \nu_s$ hypothesis using matter effects which change the shape of the zenith-angle distribution of upward through-going muons. With maximum mixing and Δm^2 around 0.0024 eV², the $\nu_\mu \rightarrow \nu_s$ oscillation is disfavored with 99% confidence level with respect to the $\nu_\mu \rightarrow \nu_\tau$ hypothesis.

¹⁵FUKUDA 00 tested the pure 2-flavor $\nu_\mu \rightarrow \nu_s$ hypothesis using three complementary atmospheric-neutrino data samples. With this hypothesis, zenith-angle distributions are expected to show characteristic behavior due to neutral currents and matter effects. In the

Lepton Particle Listings

Neutrino Mixing

Δm^2 and $\sin^2 2\theta$ region preferred by the Super-Kamiokande data, the $\nu_\mu \rightarrow \nu_s$ hypothesis is rejected at the 99% confidence level, while the $\nu_\mu \rightarrow \nu_\tau$ hypothesis consistently fits all of the data sample.

1 Search in electron capture decay ${}^7\text{Be} \rightarrow {}^7\text{Li}\nu_x$. Kinematic threshold is ~ 850 keV.					
2 Search for $K^+ \rightarrow e^+\nu_x$. Assumes lifetime of $\nu_x > 50$ ns.					
3 Limit from prompt lepton number violating trilepton search.					
4 $K^+ \rightarrow e^+\nu_x$, with ν_x decay through U_{eX} . ABE 19B also considers bounds on $ U_{eX} U_{e'X} $ for combinations of lepton flavors in the ν_x decay final state.					
5 Searches for a Majorana Heavy Neutral Lepton producing a $\pi^- e^+$ resonance in the same sign dilepton decay $D \rightarrow K\pi^- e^+ e^+$.					
6 Search for $\pi^+ \rightarrow e^+\nu_x$.					
7 Search for $K^+ \rightarrow e^+\nu_x$.					
8 PARK 16 quotes an approximate limit $B(B^+ \rightarrow e^+\nu_x) < 3 \times 10^{-6}$ in the mass range $m_{\nu_x} \sim 0.2\text{--}1.4$ GeV.					
9 Search for $B^+ \rightarrow e^+\nu_x$.					
10 Search for prompt ν_x decay signatures.					
11 Search for displaced ν_x decay signatures.					
12 Searches for K or $\pi \rightarrow e^+\nu_x, \nu_x \rightarrow e^+e^-\nu_e$ using a beam dump experiment at the 70 GeV Serpukhov proton synchrotron. BARANOV 93 also considers limits for $ U_{eX} U_{\mu X} $ from K or $\pi \rightarrow \mu^+\nu_x, \nu_x \rightarrow e^+e^-\nu_e$.					
13 $\pi^+ \rightarrow e^+\nu_x$, with ν_x decay through U_{eX} .					
14 BERNARDI 88 also considers bounds on $ U_{eX} U_{\mu X} $.					
15 $K^+ \rightarrow e^+\nu_x$, with ν_x decay through U_{eX} .					
16 $D^+ \rightarrow e^+\nu_x$, with $\nu_x \rightarrow e^-\ell^+\nu_\ell$.					
17 $D^+ \rightarrow e^+\nu_x$, with $\nu_x \rightarrow e^-\ell^+\nu_\ell$ or $\nu_x \rightarrow e^-\pi^+$.					

Heavy Neutral Leptons, Searches for

OMITTED FROM SUMMARY TABLE

We define searches for Heavy Neutral Leptons (HNLs) as searches for Dirac or Majorana fermions with sterile neutrino quantum numbers, that are heavy enough to not disrupt the simplest Big Bang Nucleosynthesis bounds and/or unstable on cosmological timescales: Typically HNLs have mass \sim MeV or higher.

Searches for these particles generically set bounds on the mixing between the HNL and the active neutrinos, as parametrized by the extended 3×4 PMNS matrix elements $U_{\ell X}$ (see the "Neutrino mass, mixing and oscillations" review) where $\ell = e, \mu$ or τ , and we denote the HNL as ν_x . While many measurements may be interpreted to place bounds on various combinations of these matrix elements, we quote below limits only for those cases in which one matrix element is assumed to be much larger than the other two, i.e. $|U_{\ell X}| \gg |U_{\ell' X}|$ for $\ell' \neq \ell$.

Experimental searches make use of various different strategies, including e.g. resonance searches in missing mass decay distributions or specific final states, searches for lepton number violating decays, and trilepton signatures. The resulting bounds on $U_{\ell X}$ are typically dependent on the HNL mass. The quoted limits below are either the best limit near an experimental kinematic threshold, or a characteristic value in the mass range of the experimental sensitivity.

Limits on heavy neutral lepton mixing parameters

Limits on $|U_{eX}|^2$

Quoted limits are either the best limit near the kinematic threshold of the experiment, or a characteristic value in the mass range of the experimental sensitivity

1 Limit from prompt lepton number conserving $W \rightarrow \mu\mu j$ search.

2 Limit from prompt lepton number violating $W \rightarrow \mu\mu j$ search.

3 Search for $K^+ \rightarrow \mu^+\nu_x$.

4 Assumes a lifetime exceeding 50 ns, and searches over m_{ν_x} range 200–384 MeV.

Lepton Particle Listings

Heavy Neutral Leptons, Searches for

- ⁵ $K^+ \rightarrow \mu^+ \nu_X$, with $\nu_X \rightarrow \mu^- \pi^+$, in the mass range $m_{\nu_X} \sim 260\text{--}385$ MeV. ABRATENKO 20 also considers $\nu_X \rightarrow \mu^+ \pi^-$ for the case of Majorana HNL.
- ⁶ Search for $B^+ \rightarrow \mu^+ \nu_X$ in the mass range $m_{\nu_X} \sim 0\text{--}1.5$ GeV.
- ⁷ Limit from prompt lepton number violating trilepton search.
- ⁸ Limit from displaced lepton violating or conserving trilepton searches.
- ⁹ $K^+ \rightarrow \mu^+ \nu_X$, with ν_X decay through $U_{\mu X}$. ABE 19B also considers bounds on $|U_{\ell X} U_{\ell' X}|$ for combinations of lepton flavors in the ν_X decay final state.
- ¹⁰ Limit requires muon kinetic energy > 1.2 MeV.
- ¹¹ Search for $\pi^+ \rightarrow \mu^+ \nu_X$.
- ¹² PARK 16 quotes an approximate limit $B(B^+ \rightarrow \mu^+ \nu_X) < 3 \times 10^{-6}$ in the mass range $m_{\nu_X} \sim 0.2\text{--}1.4$ GeV.
- ¹³ Search for $B^+ \rightarrow \mu^+ \nu_X$.
- ¹⁴ DAUM 00 quotes a branching ratio bound $B(\pi^+ \rightarrow \mu^+ \nu_X) < 6.0 \times 10^{-10}$ at 95% CL.
- ¹⁵ $K^+ \rightarrow \mu^+ \nu_X$, with $\nu_X \rightarrow \mu X$.
- ¹⁶ $D_s \rightarrow \mu^+ \nu_X$, with $\nu_X \rightarrow \mu X$.
- ¹⁷ Search for prompt ν_X decay signatures.
- ¹⁸ Search for displaced ν_X decay signatures.
- ¹⁹ Search for Heavy Neutral Leptons produced by neutral current muon neutrino interactions, with $\nu_X \rightarrow \mu^+ \mu^- \nu_\mu$.
- ²⁰ $K^+ \rightarrow \mu^+ \nu_X$, with ν_X decay through $U_{\mu X}$ and $m_{\nu_X} < m_\mu + m_\pi$.
- ²¹ BERNARDI 88 also considers bounds on $|U_{eX} U_{\mu X}|$.
- ²² $K^+ \rightarrow \mu^+ \nu_X$, with $\nu_X \rightarrow \mu^- \pi^+$.
- ²³ $D^+ \rightarrow \mu^+ \nu_X$, with $\nu_X \rightarrow \mu^- \ell^+ \nu_\ell$.
- ²⁴ $D^+ \rightarrow \mu^+ \nu_X$, with $\nu_X \rightarrow \mu^- \ell^+ \nu_\ell$ or $\nu_X \rightarrow \mu^- \pi^+$.

Limits on $|U_{\tau X}|^2$

Quoted limits are either the best limit near the kinematic threshold of the experiment, or a characteristic value in the mass range of the experimental sensitivity

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
$< 3 \times 10^{-4}$	90	¹ ACCIARRI 21	ARNT	Near $m_{\nu_X} \lesssim 970$ MeV

OMITTED FROM SUMMARY TABLE

u-QUARK MASS

The u -, d -, and s -quark masses are estimates of so-called “current-quark masses,” in a mass-independent subtraction scheme such as \overline{MS} . The ratios m_u/m_d and m_s/m_d are extracted from pion and kaon masses using chiral symmetry. The estimates of d and u masses are not without controversy and remain under active investigation. Within the literature there are even suggestions that the u quark could be essentially massless. The s -quark mass is estimated from SU(3) splittings in hadron masses.

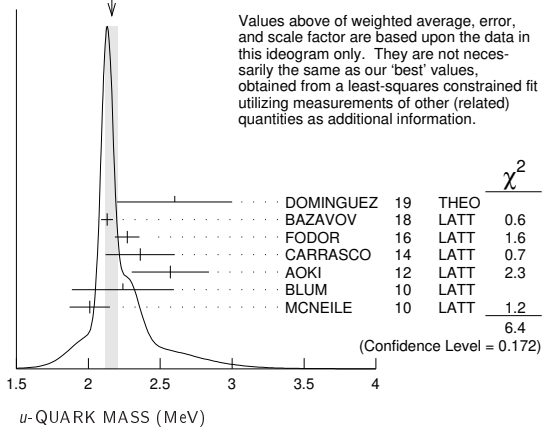

We have normalized the \overline{MS} masses at a renormalization scale of $\mu = 2$ GeV. Results quoted in the literature at $\mu = 1$ GeV have been rescaled by dividing by 1.35. The values of “Our Evaluation” were determined in part via Figures 1 and 2.

- DOMINGUEZ 19 determine the quark mass from a QCD finite energy sum rule for the divergence of the axial current.
- BAZAVOV 18 determine the quark masses using a lattice computation with staggered fermions and four active quark flavors.
- FODOR 16 is a lattice simulation with $n_f = 2 + 1$ dynamical flavors and includes partially quenched QED effects.
- CARRASCO 14 is a lattice QCD computation of light quark masses using $2 + 1 + 1$ dynamical quarks, with $m_u = m_d \neq m_s \neq m_c$. The u and d quark masses are obtained separately by using the K meson mass splittings and lattice results for the electromagnetic contributions.
- AOKI 12 is a lattice computation using $1 + 1 + 1$ dynamical quark flavors.
- BLUM 10 determines light quark masses using a QCD plus QED lattice computation of the electromagnetic mass splittings of the low-lying hadrons. The lattice simulations use $2+1$ dynamical quark flavors.
- DAVIES 10 and MCNEILE 10 determine $\overline{m}_c(\mu)/\overline{m}_s(\mu) = 11.85 \pm 0.16$ using a lattice computation with $n_f = 2 + 1$ dynamical fermions of the pseudoscalar meson masses.

- Mass m_u is obtained from this using the value of m_c from ALLISON 08 or MCNEILE 10 and the BAZAVOV 10 values for the light quark mass ratios, m_s/\overline{m} and m_u/m_d .
- DURR 11 determine quark mass from a lattice computation of the meson spectrum using $n_f = 2 + 1$ dynamical flavors. The lattice simulations were done at the physical quark mass, so that extrapolation in the quark mass was not needed. The individual m_u, m_d values are obtained using the lattice determination of the average mass m_{ud} and of the ratio m_s/m_{ud} and the value of $Q = (m_s^2 - m_{ud}^2) / (m_d^2 - m_u^2)$ as determined from $\eta \rightarrow 3\pi$ decays.
 - BAZAVOV 10 is a lattice computation using $2+1$ dynamical quark flavors.
 - DOMINGUEZ 09 use QCD finite energy sum rules for the two-point function of the divergence of the axial vector current computed to order α_s^4 .
 - DEANDREA 08 determine $m_u - m_d$ from $\eta \rightarrow 3\pi^0$, and combine with the PDG 06 lattice average value of $m_u + m_d = 7.6 \pm 1.6$ to determine m_u and m_d .
 - BLUM 07 determine quark masses from the pseudoscalar meson masses using a QED plus QCD lattice computation with two dynamical quark flavors.
 - JAMIN 06 determine $m_u(2 \text{ GeV})$ by combining the value of m_s obtained from the spectral function for the scalar $K\pi$ form factor with other determinations of the quark mass ratios.
 - MASON 06 extract light quark masses from a lattice simulation using staggered fermions with an improved action, and three dynamical light quark flavors with degenerate u and d quarks. Perturbative corrections were included at NNLO order. The quark masses m_u and m_d were determined from their $(m_u + m_d)/2$ measurement and AUBIN 04A m_u/m_d value.
 - NARISON 06 uses sum rules for $e^+ e^- \rightarrow$ hadrons to order α_s^3 to determine m_s combined with other determinations of the quark mass ratios.
 - AUBIN 04A employ a partially quenched lattice calculation of the pseudoscalar meson masses.

- FODOR 16 is a lattice simulation with $n_f = 2 + 1$ dynamical flavors and includes partially quenched QED effects.

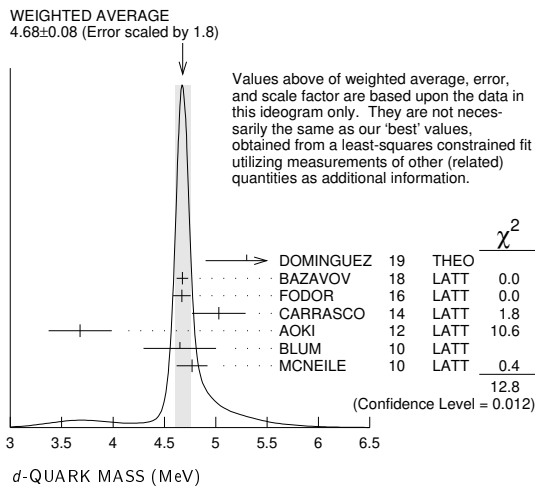

Quark Particle Listings

Light Quarks (*u, d, s*)

- ⁴ CARRASCO 14 is a lattice QCD computation of light quark masses using 2 + 1 + 1 dynamical quarks, with $m_u = m_d \neq m_s \neq m_c$. The *u* and *d* quark masses are obtained separately by using the *K* meson mass splittings and lattice results for the electromagnetic contributions.
- ⁵ AOKI 12 is a lattice computation using 1 + 1 + 1 dynamical quark flavors.
- ⁶ BLUM 10 determines light quark masses using a QCD plus QED lattice computation of the electromagnetic mass splittings of the low-lying hadrons. The lattice simulations use 2+1 dynamical quark flavors.
- ⁷ DAVIES 10 and MCNEILE 10 determine $\overline{m}_c(\mu)/\overline{m}_s(\mu) = 11.85 \pm 0.16$ using a lattice computation with $n_f = 2 + 1$ dynamical fermions of the pseudoscalar meson masses. Mass m_d is obtained from this using the value of m_c from ALLISON 08 or MCNEILE 10 and the BAZAVOV 10 values for the light quark mass ratios, m_s/\overline{m} and m_u/m_d .
- ⁸ DURR 11 determine quark mass from a lattice computation of the meson spectrum using $n_f = 2 + 1$ dynamical flavors. The lattice simulations were done at the physical quark mass, so that extrapolation in the quark mass was not needed. The individual m_u, m_d values are obtained using the lattice determination of the average mass m_{ud} and of the ratio m_s/m_{ud} and the value of $Q = (m_s^2 - m_{ud}^2) / (m_d^2 - m_u^2)$ as determined from $\eta \rightarrow 3\pi$ decays.
- ⁹ BAZAVOV 10 is a lattice computation using 2+1 dynamical quark flavors.
- ¹⁰ DOMINGUEZ 09 use QCD finite energy sum rules for the two-point function of the divergence of the axial vector current computed to order α_s^4 .
- ¹¹ DEANDREA 08 determine $m_u - m_d$ from $\eta \rightarrow 3\pi^0$, and combine with the PDG 06 lattice average value of $m_u + m_d = 7.6 \pm 1.6$ to determine m_u and m_d .
- ¹² BLUM 07 determine quark masses from the pseudoscalar meson masses using a QED plus QCD lattice computation with two dynamical quark flavors.
- ¹³ JAMIN 06 determine m_d (2 GeV) by combining the value of m_s obtained from the spectral function for the scalar $K\pi$ form factor with other determinations of the quark mass ratios.
- ¹⁴ MASON 06 extract light quark masses from a lattice simulation using staggered fermions with an improved action, and three dynamical light quark flavors with degenerate *u* and *d* quarks. Perturbative corrections were included at NNLO order. The quark masses m_u and m_d were determined from their $(m_u + m_d)/2$ measurement and AUBIN 04A m_u/m_d value.
- ¹⁵ NARISON 06 uses sum rules for $e^+e^- \rightarrow$ hadrons to order α_s^3 to determine m_s combined with other determinations of the quark mass ratios.
- ¹⁶ AUBIN 04A perform three flavor dynamical lattice calculation of pseudoscalar meson masses, with continuum estimate of electromagnetic effects in the kaon masses, and one-loop perturbative renormalization constant.

- ¹ ALEXANDROU 21 determines the quark mass using a lattice calculation of the meson and baryon masses with a twisted mass fermion action. The simulations are carried out using 2+1+1 dynamical quarks with $m_u = m_d \neq m_s \neq m_c$, including gauge ensembles close to the physical pion point.
- ² BRUNO 20 determines the light quark mass using a lattice calculation with $n_f = 2+1$ flavors of Wilson fermions. The scale has been set from f_π and f_K . The tuning was done using the masses of the lightest (π) and strange (*K*) pseudoscalar mesons.
- ³ DOMINGUEZ 19 determine the quark mass from a QCD finite energy sum rule for the divergence of the axial current.
- ⁴ YUAN 17 determine \overline{m} using QCD sum rules in the isospin $I=0$ scalar channel. At the end of the "Numerical Results" section of YUAN 17 the authors discuss the significance of their larger value of the light quark mass compared to previous determinations.
- ⁵ CARRASCO 14 is a lattice QCD computation of light quark masses using 2 + 1 + 1 dynamical quarks, with $m_u = m_d \neq m_s \neq m_c$. The *u* and *d* quark masses are obtained separately by using the *K* meson mass splittings and lattice results for the electromagnetic contributions.
- ⁶ ARTHUR 13 is a lattice computation using 2+1 dynamical domain wall fermions. Masses at $\mu = 3$ GeV have been converted to $\mu = 2$ GeV using conversion factors given in their paper.
- ⁷ DURR 11 determine quark mass from a lattice computation of the meson spectrum using $n_f = 2 + 1$ dynamical flavors. The lattice simulations were done at the physical quark mass, so that extrapolation in the quark mass was not needed.
- ⁸ BLOSSIER 10 determines quark masses from a computation of the hadron spectrum using $n_f=2$ dynamical twisted-mass Wilson fermions.
- ⁹ DAVIES 10 and MCNEILE 10 determine $\overline{m}_c(\mu)/\overline{m}_s(\mu) = 11.85 \pm 0.16$ using a lattice computation with $n_f = 2 + 1$ dynamical fermions of the pseudoscalar meson masses. Mass \overline{m} is obtained from this using the value of m_c from ALLISON 08 or MCNEILE 10 and the BAZAVOV 10 values for the light quark mass ratio, m_s/\overline{m} .
- ¹⁰ AOKI 11A determine quark masses from a lattice computation of the hadron spectrum using $n_f = 2 + 1$ dynamical flavors of domain wall fermions.
- ¹¹ DOMINGUEZ 09 use QCD finite energy sum rules for the two-point function of the divergence of the axial vector current computed to order α_s^4 .
- ¹² ALLTON 08 use a lattice computation of the $\pi, K,$ and Ω masses with 2+1 dynamical flavors of domain wall quarks, and non-perturbative renormalization.
- ¹³ BLOSSIER 08 use a lattice computation of pseudoscalar meson masses and decay constants with 2 dynamical flavors and non-perturbative renormalization.
- ¹⁴ DOMINGUEZ-CLARIMON 08B obtain an inequality from sum rules for the scalar two-point correlator.

See key on page 1127

Quark Particle Listings

Light Quarks (*u, d, s*)

- ¹⁵ ISHIKAWA 08 use a lattice computation of the light meson spectrum with 2+1 dynamical flavors of $\mathcal{O}(a)$ improved Wilson quarks, and one-loop perturbative renormalization.
- ¹⁶ NAKAMURA 08 do a lattice computation using quenched domain wall fermions and non-perturbative renormalization.
- ¹⁷ BLUM 07 determine quark masses from the pseudoscalar meson masses using a QED plus QCD lattice computation with two dynamical quark flavors.
- ¹⁸ GOCKELER 06 use an unquenched lattice computation of the axial Ward Identity with $n_f = 2$ dynamical light quark flavors, and non-perturbative renormalization, to obtain $\overline{m}(2 \text{ GeV}) = 4.08 \pm 0.25 \pm 0.19 \pm 0.23 \text{ MeV}$, where the first error is statistical, the second and third are systematic due to the fit range and force scale uncertainties, respectively. We have combined the systematic errors linearly.
- ¹⁹ GOCKELER 06A use an unquenched lattice computation of the pseudoscalar meson masses with $n_f = 2$ dynamical light quark flavors, and non-perturbative renormalization.
- ²⁰ MASON 06 extract light quark masses from a lattice simulation using staggered fermions with an improved action, and three dynamical light quark flavors with degenerate *u* and *d* quarks. Perturbative corrections were included at NNLO order.
- ²¹ NARISON 06 uses sum rules for $e^+ e^- \rightarrow \text{hadrons}$ to order α_s^3 to determine m_s combined with other determinations of the quark mass ratios.
- ²² AUBIN 04 perform three flavor dynamical lattice calculation of pseudoscalar meson masses, with one-loop perturbative renormalization constant.
- ²³ AOKI 03 uses quenched lattice simulation of the meson and baryon masses with degenerate light quarks. The extrapolations are done using quenched chiral perturbation theory.
- ²⁴ The errors given in AOKI 03B were $^{+0.046}_{-0.069}$. We changed them to ± 0.3 for calculating the overall best values. AOKI 03B uses lattice simulation of the meson and baryon masses with two dynamical light quarks. Simulations are performed using the $\mathcal{O}(a)$ improved Wilson action.
- ²⁵ BECIREVIC 03 perform quenched lattice computation using the vector and axial Ward identities. Uses $\mathcal{O}(a)$ improved Wilson action and nonperturbative renormalization.
- ²⁶ CHIU 03 determines quark masses from the pion and kaon masses using a lattice simulation with a chiral fermion action in quenched approximation.

- ⁵ BAZAVOV 10 is a lattice computation using 2+1 dynamical quark flavors.
- ⁶ BLUM 10 is a lattice computation using 2+1 dynamical quark flavors.
- ⁷ BLUM 07 determine quark masses from the pseudoscalar meson masses using a QED plus QCD lattice computation with two dynamical quark flavors.
- ⁸ AUBIN 04A perform three flavor dynamical lattice calculation of pseudoscalar meson masses, with continuum estimate of electromagnetic effects in the kaon masses.
- ⁹ NELSON 03 computes coefficients in the order p^4 chiral Lagrangian using a lattice calculation with three dynamical flavors. The ratio m_u/m_d is obtained by combining this with the chiral perturbation theory computation of the meson masses to order p^4 .
- ¹⁰ LEUTWYLER 96 uses a combined fit to $\eta \rightarrow 3\pi$ and $\psi' \rightarrow J/\psi(\pi, \eta)$ decay rates, and the electromagnetic mass differences of the π and K .

s-QUARK MASS

See the comment for the *u* quark above.

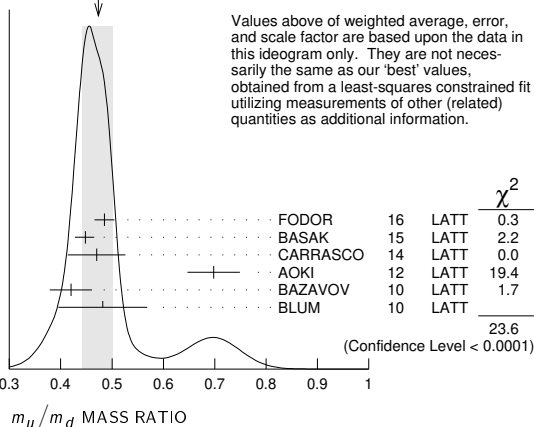

We have normalized the \overline{MS} masses at a renormalization scale of $\mu = 2 \text{ GeV}$. Results quoted in the literature at $\mu = 1 \text{ GeV}$ have been rescaled by dividing by 1.35.

- ³ CARRASCO 14 is a lattice QCD computation of light quark masses using 2 + 1 + 1 dynamical quarks, with $m_u = m_d \neq m_s \neq m_c$. The *u* and *d* quark masses are obtained separately by using the *K* meson mass splittings and lattice results for the electromagnetic contributions.
- ⁴ AOKI 12 is a lattice computation using 1 + 1 + 1 dynamical quark flavors.

WEIGHTED AVERAGE
93.7 \pm 0.7 (Error scaled by 1.5)

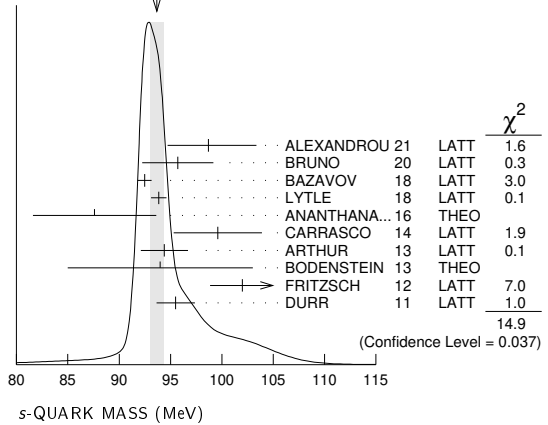

Quark Particle Listings

Light Quarks (u, d, s)

- 1 ALEXANDROU 21 determines the quark mass using a lattice calculation of the meson and baryon masses with a twisted mass fermion action. The simulations are carried out using 2+1+1 dynamical quarks with $m_u = m_d \neq m_s \neq m_c$, including gauge ensembles close to the physical pion point.
- 2 BRUNO 20 determines the light quark mass using a lattice calculation with $n_f = 2+1$ flavors of Wilson fermions. The scale has been set from f_π and f_K . The tuning was done using the masses of the lightest (π) and strange (K) pseudoscalar mesons.
- 3 BAZAVOV 18 determine the quark masses using a lattice computation with staggered fermions and four active quark flavors.
- 4 LYTLE 18 combined with CHAKRABORTY 2015 determine $\overline{m}_s(3 \text{ GeV}) = 84.78 \pm 0.65$ MeV from a lattice simulation with $n_f = 2+1+1$ flavors. They also determine the quoted value $\overline{m}_s(2 \text{ GeV})$ for $n_f = 4$ dynamical flavors.
- 5 ANANTHANARAYAN 16 determine $\overline{m}_s(2 \text{ GeV}) = 106.70 \pm 9.36$ MeV and 74.47 ± 7.77 MeV from fits to ALEPH and OPAL τ decay data, respectively. We have used the weighted average of the two.
- 6 CARRASCO 14 is a lattice QCD computation of light quark masses using 2 + 1 + 1 dynamical quarks, with $m_u = m_d \neq m_s \neq m_c$. The u and d quark masses are obtained separately by using the K meson mass splittings and lattice results for the electromagnetic contributions.
- 7 ARTHUR 13 is a lattice computation using 2+1 dynamical domain wall fermions. Masses at $\mu = 3 \text{ GeV}$ have been converted to $\mu = 2 \text{ GeV}$ using conversion factors given in their paper.
- 8 BODENSTEIN 13 determines m_s from QCD finite energy sum rules, and the perturbative computation of the pseudoscalar correlator to five-loop order.
- 9 FRITZSCH 12 determine m_s using a lattice computation with $n_f = 2$ dynamical flavors.
- 10 DURR 11 determine quark mass from a lattice computation of the meson spectrum using $n_f = 2 + 1$ dynamical flavors. The lattice simulations were done at the physical quark mass, so that extrapolation in the quark mass was not needed.
- 11 CHAKRABORTY 15 is a lattice QCD computation that determines m_c and m_c/m_s using pseudoscalar meson masses tuned on gluon field configurations with 2+1+1 dynamical flavors of HISQ quarks with u/d masses down to the physical value.
- 12 AOKI 11A determine quark masses from a lattice computation of the hadron spectrum using $n_f = 2 + 1$ dynamical flavors of domain wall fermions.
- 13 BLOSSIER 10 determines quark masses from a computation of the hadron spectrum using $n_f=2$ dynamical twisted-mass Wilson fermions.
- 14 BLUM 10 determines light quark masses using a QCD plus QED lattice computation of the electromagnetic mass splittings of the low-lying hadrons. The lattice simulations use 2+1 dynamical quark flavors.
- 15 DAVIES 10 and MCNEILE 10 determine $\overline{m}_c(\mu)/\overline{m}_s(\mu) = 11.85 \pm 0.16$ using a lattice computation with $n_f = 2 + 1$ dynamical fermions of the pseudoscalar meson masses. Mass m_s is obtained from this using the value of m_c from ALLISON 08 or MCNEILE 10.
- 16 ALLTON 08 use a lattice computation of the π , K , and Ω masses with 2+1 dynamical flavors of domain wall quarks, and non-perturbative renormalization.
- 17 BLOSSIER 08 use a lattice computation of pseudoscalar meson masses and decay constants with 2 dynamical flavors and non-perturbative renormalization.
- 18 DOMINGUEZ 08A make determination from QCD finite energy sum rules for the pseudoscalar two-point function computed to order α_s^4 .
- 19 ISHIKAWA 08 use a lattice computation of the light meson spectrum with 2+1 dynamical flavors of $\mathcal{O}(a)$ improved Wilson quarks, and one-loop perturbative renormalization.
- 20 NAKAMURA 08 do a lattice computation using quenched domain wall fermions and non-perturbative renormalization.
- 21 BLUM 07 determine quark masses from the pseudoscalar meson masses using a QED plus QCD lattice computation with two dynamical quark flavors.
- 22 CHETYSKIN 06 use QCD sum rules in the pseudoscalar channel to order α_s^4 .
- 23 GOCKELER 06 use an unquenched lattice computation of the axial Ward Identity with $n_f = 2$ dynamical light quark flavors, and non-perturbative renormalization, to obtain $\overline{m}_s(2 \text{ GeV}) = 111 \pm 6 \pm 4 \pm 6$ MeV, where the first error is statistical, the second and third are systematic due to the fit range and force scale uncertainties, respectively. We have combined the systematic errors linearly.
- 24 GOCKELER 06A use an unquenched lattice computation of the pseudoscalar meson masses with $n_f = 2$ dynamical light quark flavors, and non-perturbative renormalization.
- 25 JAMIN 06 determine $\overline{m}_s(2 \text{ GeV})$ from the spectral function for the scalar $K\pi$ form factor.
- 26 MASON 06 extract light quark masses from a lattice simulation using staggered fermions with an improved action, and three dynamical light quark flavors with degenerate u and d quarks. Perturbative corrections were included at NNLO order.
- 27 NARISON 06 uses sum rules for $e^+e^- \rightarrow$ hadrons to order α_s^3 .
- 28 NARISON 06 obtains the quoted range from positivity of the spectral functions.
- 29 BAIKOV 05 determines $\overline{m}_s(M_\tau) = 100^{+5}_{-3} +^{17}_{-19}$ from sum rules using the strange spectral function in τ decay. The computations were done to order α_s^3 , with an estimate of the α_s^5 terms. We have converted the result to $\mu = 2 \text{ GeV}$.
- 30 GAMIZ 05 determines $\overline{m}_s(2 \text{ GeV})$ from sum rules using the strange spectral function in τ decay. The computations were done to order α_s^2 , with an estimate of the α_s^3 terms.
- 31 GORBUNOV 05 use hadronic tau decays to N3LO, including power corrections.
- 32 NARISON 05 determines $\overline{m}_s(2 \text{ GeV})$ from sum rules using the strange spectral function in τ decay. The computations were done to order α_s^3 .
- 33 AUBIN 04 perform three flavor dynamical lattice calculation of pseudoscalar meson masses, with one-loop perturbative renormalization constant.
- 34 AOKI 03 uses quenched lattice simulation of the meson and baryon masses with degenerate light quarks. The extrapolations are done using quenched chiral perturbation theory. Determines $m_s = 113.8 \pm 2.3 \pm 5.8$ using K mass as input and $m_s = 142.3 \pm 5.8 \pm 2.2$ using ϕ mass as input. We have performed a weighted average of these values.
- 35 AOKI 03B uses lattice simulation of the meson and baryon masses with two dynamical light quarks. Simulations are performed using the $\mathcal{O}(a)$ improved Wilson action.
- 36 BICEVIC 03 perform quenched lattice computation using the vector and axial Ward identities. Uses $\mathcal{O}(a)$ improved Wilson action and nonperturbative renormalization. They also quote $\overline{m}/m_s = 24.3 \pm 0.2 \pm 0.6$.
- 37 CHIU 03 determines quark masses from the pion and kaon masses using a lattice simulation with a chiral fermion action in quenched approximation.
- 38 GAMIZ 03 determines m_s from SU(3) breaking in the τ hadronic width. The value of V_{us} is chosen to satisfy CKM unitarity.

- 39 GAMIZ 03 determines m_s from SU(3) breaking in the τ hadronic width. The value of V_{us} is taken from the PDG.

18 to 23	5 LEUTWYLER 90B	THEO	

1 GAO 97 uses electromagnetic mass splittings of light mesons.
 2 LEUTWYLER 96 uses a combined fit to $\eta \rightarrow 3\pi$ and $\psi' \rightarrow J/\psi(\pi, \eta)$ decay rates, and the electromagnetic mass differences of the π and K .
 3 DONOGHUE 92 result is from a combined analysis of meson masses, $\eta \rightarrow 3\pi$ using second-order chiral perturbation theory including nonanalytic terms, and $(\psi(2S) \rightarrow J/\psi(1S)\pi)/(\psi(2S) \rightarrow J/\psi(1S)\eta)$.
 4 GERARD 90 uses large N and η - η' mixing.
 5 LEUTWYLER 90B determines quark mass ratios using second-order chiral perturbation theory for the meson and baryon masses, including nonanalytic corrections. Also uses Weinberg sum rules to determine L_7 .

- 2 BRUNO 20 determines the light quark mass using a lattice calculation with $n_f = 2+1$ flavors of Wilson fermions. The scale has been set from f_π and f_K . The tuning was done using the masses of the lightest (π) and strange (K) pseudoscalar mesons.
- 3 BAZAVOV 14A is a lattice computation using 4 dynamical flavors of HISQ fermions.
- 4 CARRASCO 14 is a lattice QCD computation of light quark masses using 2 + 1 + 1 dynamical quarks, with $m_u = m_d \neq m_s \neq m_c$. The u and d quark masses are obtained separately by using the K meson mass splittings and lattice results for the electromagnetic contributions.
- 5 ARTHUR 13 is a lattice computation using 2+1 dynamical domain wall fermions.
- 6 DURR 11 determine quark mass from a lattice computation of the meson spectrum using $n_f = 2 + 1$ dynamical flavors. The lattice simulations were done at the physical quark mass, so that extrapolation in the quark mass was not needed.
- 7 AOKI 11A determine quark masses from a lattice computation of the hadron spectrum using $n_f = 2 + 1$ dynamical flavors of domain wall fermions.
- 8 BLOSSIER 10 determines quark masses from a computation of the hadron spectrum using $n_f=2$ dynamical twisted-mass Wilson fermions.

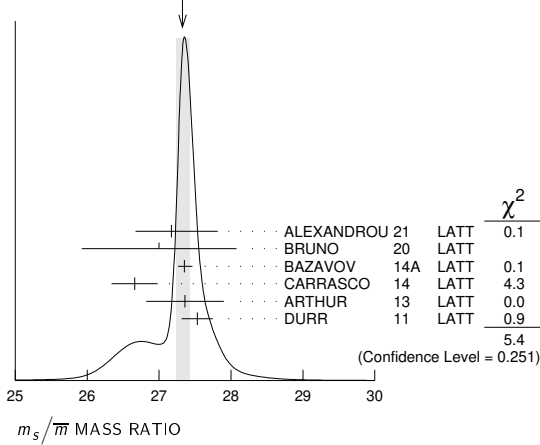

See key on page 1127

c-QUARK MASS

The c -quark mass corresponds to the "running" mass $m_c(\mu = m_c)$ in the \overline{MS} scheme. We have converted masses in other schemes to the \overline{MS} scheme using two-loop QCD perturbation theory with $\alpha_s(\mu=m_c) = 0.38 \pm 0.03$. The value 1.27 ± 0.02 GeV for the \overline{MS} mass corresponds to 1.67 ± 0.07 GeV for the pole mass (see the "Note on Quark Masses").

¹ ALEXANDROU 21 determines the quark mass using a lattice calculation of the meson and baryon masses with a twisted mass fermion action. We have converted $\overline{m}_c(3 \text{ GeV}) = 1.036 \pm 0.017 \pm 0.015 / \pm 0.008$ to $\overline{m}_c(\overline{m}_c)$. The simulations are carried out using 2+1+1 dynamical quarks with $m_u = m_d \neq m_s \neq m_c$, including gauge ensembles close to the physical pion point.

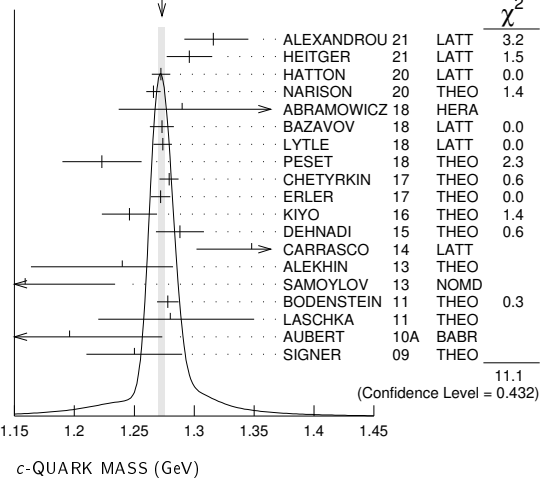

Quark Particle Listings

C

- 2 HEITGER 21 determines the charm quark mass using a $n_f = 2+1$ flavor lattice QCD simulation with non-perturbatively O(a) improved Wilson fermions. They also determine $\overline{m}_c(3 \text{ GeV}) = 1.007 \pm 0.016 \text{ GeV}$.
- 3 HATTON 20 determine the charm quark mass using a $n_f = 2+1+1$ flavor lattice simulation with the HISQ action of ground state charmonium mesons. They also determine $\overline{m}_c(3 \text{ GeV}) = 0.9841 \pm 0.0051 \text{ GeV}$.
- 4 NARISON 20 determines the quark mass using QCD Laplace sum rules from the B_c mass, combined with previous determinations of the QCD condensates and c and b masses.
- 5 ABRAMOWICZ 18 determine $\overline{m}_c(\overline{m}_c) = 1.290^{+0.046+0.062+0.003}_{-0.041-0.014-0.031}$ from the production of c quarks in $e p$ collisions at HERA using combined H1 and ZEUS data. The experimental/fitting errors, and those from modeling and parameterization have been combined in quadrature.
- 6 BAZAVOV 18 determine the quark masses using a lattice computation with staggered fermions and four active quark flavors.
- 7 LYTLE 18 combined with CHAKRABORTY 15 determine $\overline{m}_c(3 \text{ GeV}) = 0.9874(48) \text{ GeV}$ from a lattice simulation with $n_f = 2+1+1$ flavors. They also determine the quoted value $\overline{m}_c(\overline{m}_c)$ for $n_f = 4$ dynamical flavors.
- 8 PESET 18 determine $\overline{m}_c(\overline{m}_c)$ and $\overline{m}_b(\overline{m}_b)$ using an N3LO calculation of the η_c , η_b and B_c masses.
- 9 CHETYRKIN 17 determine $\overline{m}_c(\mu = 3 \text{ GeV}) = 0.993 \pm 0.008 \text{ GeV}$ and $\overline{m}_c(\overline{m}_c)$ from a four-loop sum-rule computation of the cross-section for $e^+ e^- \rightarrow$ hadrons in the charm threshold region.
- 10 ERLER 17 determine $\overline{m}_c(\overline{m}_c) = 1.272 \pm 0.008 \text{ GeV}$ from a three-loop QCD sum-rule computation of the vector current correlator. This result is for fixed $\alpha_s(M_Z) = 0.1182$. Including an α_s uncertainty of ± 0.0016 , the charm mass error increases from 8 to 9 MeV.
- 11 KIYO 16 determine $\overline{m}_c(\overline{m}_c)$ from the $J/\psi(1S)$ mass at order α_s^3 (N3LO).
- 12 DEHNADI 15 determine $\overline{m}_c(\overline{m}_c)$ using sum rules for $e^+ e^- \rightarrow$ hadrons at order α_s^3 (N3LO), and fitting to both experimental data and lattice results.
- 13 CARRASCO 14 is a lattice QCD computation of light quark masses using $2 + 1 + 1$ dynamical quarks, with $m_u = m_d \neq m_s \neq m_c$. The u and d quark masses are obtained separately by using the K meson mass splittings and lattice results for the electromagnetic contributions.
- 14 ALEKHIN 13 determines m_c from charm production in deep inelastic scattering at HERA using approximate NNLO QCD.
- 15 SAMOYLOV 13 determines m_c from a study of charm dimuon production in neutrino-iron scattering using the NLO QCD result for the charm quark production cross section.
- 16 BODENSTEIN 11 determine $\overline{m}_c(3 \text{ GeV}) = 0.987 \pm 0.009 \text{ GeV}$ and $\overline{m}_c(\overline{m}_c) = 1.278 \pm 0.009 \text{ GeV}$ using QCD sum rules for the charm quark vector current correlator.
- 17 LASCHKA 11 determine the c mass from the charmonium spectrum. The theoretical computation uses the heavy $Q\overline{Q}$ potential to order $1/m_Q$ obtained by matching the short-distance perturbative result onto lattice QCD result at larger scales.
- 18 AUBERT 10A determine the b - and c -quark masses from a fit to the inclusive decay spectra in semileptonic B decays in the kinetic scheme (and convert it to the \overline{MS} scheme).
- 19 SIGNER 09 determines the c -quark mass using non-relativistic sum rules to analyze the $e^+ e^- \rightarrow c\overline{c}$ cross-section near threshold. Also determine the PS mass $m_{PS}(M_F = 0.7 \text{ GeV}) = 1.50 \pm 0.04 \text{ GeV}$.
- 20 NARISON 18A determines simultaneously $\overline{m}_c(\overline{m}_c)$ and the 4-dimension gluon condensate using QCD exponential sum rules and their ratios evaluated at the optimal scale $\mu = 2.85 \text{ GeV}$ at N2LO-N3LO of perturbative QCD and including condensates up to dimension 6-8 in the (axial-)vector and (pseudo-)scalar charmonium channels.
- 21 NARISON 18B determines $\overline{m}_c(\overline{m}_c)$ using QCD vector moment sum rules and their ratios at N2LO-N3LO of perturbative QCD and including condensates up to dimension 8.
- 22 BERTONE 16 determine $\overline{m}_c(\overline{m}_c)$ from HERA deep inelastic scattering data using the FONLL scheme. Also determine $\overline{m}_c(\overline{m}_c) = 1.318 \pm 0.054^{+0.490}_{-0.022}$ using the fixed flavor number scheme.
- 23 CHAKRABORTY 15 is a lattice QCD computation using $2+1+1$ dynamical flavors. Moments of pseudoscalar current-current correlators are matched to α_s^3 -accurate QCD perturbation theory with the η_c meson mass tuned to experiment.
- 24 ABRAMOWICZ 13c determines m_c from charm production in deep inelastic $e p$ scattering, using the QCD prediction at NLO order. The uncertainties from model and parameterization assumptions, and the value of α_s , of ± 0.03 , ± 0.02 , and ± 0.02 respectively, have been combined in quadrature.
- 25 DEHNADI 13 determines m_c using QCD sum rules for the charmonium spectrum and charm continuum to order α_s^3 (N3LO). The statistical and systematic experimental errors of ± 0.006 and ± 0.009 have been combined in quadrature. The theoretical uncertainties ± 0.019 from truncation of the perturbation series, ± 0.010 from α_s , and ± 0.002 from the gluon condensate have been combined in quadrature.
- 26 NARISON 13 determines m_c using QCD spectral sum rules to order α_s^2 (NNLO) and including condensates up to dimension 6.
- 27 ALEKHIN 12 determines m_c from heavy quark production in deep inelastic scattering at HERA using approximate NNLO QCD.
- 28 NARISON 12A determines m_c using sum rules for the vector current correlator to order α_s^3 , including the effect of gluon condensates up to dimension eight.
- 29 ALEKHIN 11 determines m_c from heavy quark production in deep inelastic scattering using fixed target and HERA data, and approximate NNLO QCD.
- 30 BLOSSIER 10 determines quark masses from a computation of the hadron spectrum using $n_f=2$ dynamical twisted-mass Wilson fermions.
- 31 BODENSTEIN 10 determines $\overline{m}_c(3 \text{ GeV}) = 1.008 \pm 0.026 \text{ GeV}$ using finite energy sum rules for the vector current correlator. The authors have converted this to $\overline{m}_c(\overline{m}_c)$ using $\alpha_s(M_Z) = 0.1189 \pm 0.0020$.
- 32 MCNEILE 10 determines m_c by comparing the order α_s^3 perturbative results for the pseudo-scalar current to lattice simulations with $n_f = 2+1$ sea-quarks by the HPQCD collaboration.
- 33 NARISON 10 determines m_c from ratios of moments of vector current correlators computed to order α_s^3 and including the dimension-six gluon condensate.
- 34 CHETYRKIN 09 determine m_c and m_b from the $e^+ e^- \rightarrow Q\overline{Q}$ cross-section and sum rules, using an order α_s^3 computation of the heavy quark vacuum polarization. They also determine $m_c(3 \text{ GeV}) = 0.986 \pm 0.013 \text{ GeV}$.

- 35 ALLISON 08 determine m_c by comparing four-loop perturbative results for the pseudo-scalar current correlator to lattice simulations by the HPQCD collaboration. The result has been updated in MCNEILE 10.
- 36 KUHN 07 determine $\overline{m}_c(\mu = 3 \text{ GeV}) = 0.986 \pm 0.013 \text{ GeV}$ and $\overline{m}_c(\overline{m}_c)$ from a four-loop sum-rule computation of the cross-section for $e^+ e^- \rightarrow$ hadrons in the charm threshold region.
- 37 BOUGHEZAL 06 result comes from the first moment of the hadronic production cross-section to order α_s^3 .
- 38 BUCHMUELLER 06 determine m_b and m_c by a global fit to inclusive B decay spectra.
- 39 HOANG 06 determines $\overline{m}_c(\overline{m}_c)$ from a global fit to inclusive B decay data. The B decay distributions were computed to order $\alpha_s^2 g_0$, and the conversion between different m_c mass schemes to order α_s^3 .
- 40 AUBERT 04x obtain m_c from a fit to the hadron mass and lepton energy distributions in semileptonic B decay. The paper quotes values in the kinetic scheme. The \overline{MS} value has been provided by the BABAR collaboration.
- 41 HOANG 04 determines $\overline{m}_c(\overline{m}_c)$ from moments at order α_s^2 of the charm production cross-section in $e^+ e^-$ annihilation.
- 42 DEDIVITHIS 03 use a quenched lattice computation of heavy-heavy and heavy-light meson masses.
- 43 EIDEMULLER 03 determines m_b and m_c using QCD sum rules.
- 44 ERLER 03 determines m_b and m_c using QCD sum rules. Includes recent BES data.
- 45 ZYABLYUK 03 determines m_c by using QCD sum rules in the pseudoscalar channel and comparing with the η_c mass.

WEIGHTED AVERAGE
1.2730±0.0028 (Error scaled by 1.0)

 m_c/m_s MASS RATIO

The ratio is that of the \overline{MS} masses at a common scale, for four dynamical quark flavors.

- 1 ALEXANDROU 21 determines the quark mass using a lattice calculation of the meson and baryon masses with a twisted mass fermion action. The simulations are carried out using $2+1+1$ dynamical quarks with $m_u = m_d \neq m_s \neq m_c$, including gauge ensembles close to the physical pion point.
- 2 BAZAVOV 18 determine the quark masses using a lattice computation with staggered fermions and four active quark flavors.
- 3 CHAKRABORTY 15 is a lattice QCD computation on gluon field configurations with $2+1+1$ dynamical flavors of HISQ quarks with u/d masses down to the physical value. m_c and m_s are tuned from pseudoscalar meson masses.
- 4 CARRASCO 14 is a lattice QCD computation of light quark masses using $2 + 1 + 1$ dynamical quarks, with $m_u = m_d \neq m_s \neq m_c$. The u and d quark masses are obtained separately by using the K meson mass splittings and lattice results for the electromagnetic contributions.
- 5 DURR 12 determine m_c/m_s using a lattice computation with $n_f = 2$ dynamical fermions. The result is combined with other determinations of m_c to obtain $m_c(2 \text{ GeV}) = 97.0 \pm 2.6 \pm 2.5 \text{ MeV}$.
- 6 DAVIES 10 determine m_c/m_s from meson masses calculated on gluon fields including u , d , and s sea quarks with lattice spacing down to 0.045 fm. The Highly Improved Staggered quark formalism is used for the valence quarks.
- 7 BAZAVOV 14A is a lattice computation using 4 dynamical flavors of HISQ fermions.

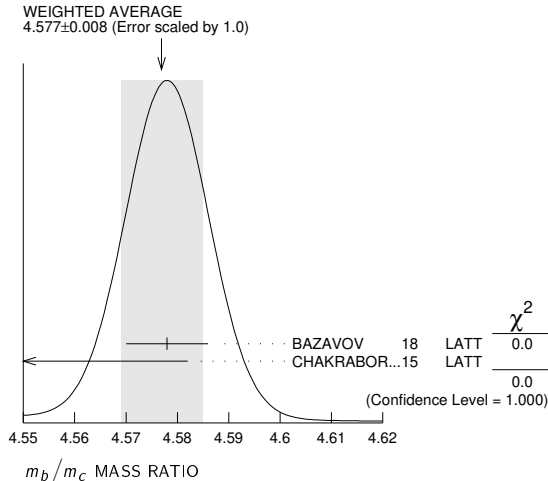

⁸ BLOSSIER 10 determine m_c/m_s from a computation of the hadron spectrum using $n_f = 2$ dynamical twisted-mass Wilson fermions.

m_b/m_c MASS RATIO

The ratio is that of the \overline{MS} masses at a common scale, for four dynamical quark flavors.

b-QUARK MASS

b -quark mass corresponds to the "running mass" $\overline{m}_b(\mu = \overline{m}_b)$ in the \overline{MS} scheme. We have converted masses in other schemes to the \overline{MS} mass using two-loop QCD perturbation theory with $\alpha_s(\mu = \overline{m}_b) = 0.223 \pm 0.008$. The value $4.18^{+0.04}_{-0.03}$ GeV for the \overline{MS} mass corresponds to 4.78 ± 0.06 GeV for the pole mass, using the two-loop conversion formula. A discussion of masses in different schemes can be found in the "Note on Quark Masses."

WEIGHTED AVERAGE
4.183 ± 0.004 (Error scaled by 1.0)

- NARISON 20 determines the quark mass using QCD Laplace sum rules from the B_c mass, combined with previous determinations of the QCD condensates and c and b masses.
- ABRAMOWICZ 18 determine $\overline{m}_b(\overline{m}_b) = 4.049^{+0.104+0.090+0.001}_{-0.109-0.032-0.031}$ from the production of b quarks in ep collisions at HERA using combined H1 and ZEUS data. The experimental/fitting errors, and those from modeling and parameterization have been combined in quadrature.
- BAZAVOV 18 determine the b mass using a lattice computation with staggered fermions and five active quark flavors.
- PESET 18 determine $\overline{m}_c(\overline{m}_c)$ and $\overline{m}_b(\overline{m}_b)$ using an N3LO calculation of the η_c , η_b and B_c masses.
- KIYO 16 determine $\overline{m}_b(\overline{m}_b)$ from the $\Upsilon(1S)$ mass at order α_s^3 (N3LO).
- ALBERTI 15 determine $\overline{m}_b(\overline{m}_b)$ from fits to inclusive $B \rightarrow X_c e \overline{\nu}$ decay. They also find $m_b^{\text{kin}}(1 \text{ GeV}) = 4.553 \pm 0.020 \text{ GeV}$.
- BENEKE 15 determine $\overline{m}_b(\overline{m}_b)$ using sum rules for $e^+e^- \rightarrow$ hadrons at order N3LO including finite m_c effects. They find $m_b^{\text{PS}}(2 \text{ GeV}) = 4.532^{+0.013}_{-0.039} \text{ GeV}$, and $\overline{m}_b(\overline{m}_b) = 4.193^{+0.022}_{-0.035} \text{ GeV}$. The value quoted is obtained using the four-loop conversion given in BENEKE 16.
- COLQUHOUN 15 determine $\overline{m}_b(\overline{m}_b)$ from moments of the vector current correlator computed with a lattice simulation using the NRQCD action.
- DEHNADI 15 determine $\overline{m}_b(\overline{m}_b)$ using sum rules for $e^+e^- \rightarrow$ hadrons at order α_s^3 (N3LO), and fitting to both experimental data and lattice results.
- BERNARDONI 14 determine m_b from $n_f = 2$ lattice calculations using heavy quark effective theory non-perturbatively renormalized and matched to QCD at $1/m$ order.
- PENIN 14 determine $\overline{m}_b(\overline{m}_b) = 4.169 \pm 0.008 \pm 0.002 \pm 0.002$ using an estimate of the order α_s^3 b -quark vacuum polarization function in the threshold region, including finite m_c effects. The errors of ± 0.008 from theoretical uncertainties, and ± 0.002 from α_s have been combined in quadrature.
- LEE 130 determines m_b using lattice calculations of the Υ and B_S binding energies in NRQCD, including three light dynamical quark flavors. The quark mass shift in NRQCD is determined to order α_s^2 , with partial α_s^3 contributions.
- LUCHA 13 determines m_b from QCD sum rules for heavy-light currents using the lattice value for f_B of $191.5 \pm 7.3 \text{ GeV}$.
- BODENSTEIN 12 determine m_b using sum rules for the vector current correlator and the $e^+e^- \rightarrow Q\overline{Q}$ total cross-section.
- DIMOPOULOS 12 determine quark masses from a lattice computation using $n_f = 2$ dynamical flavors of twisted mass fermions.
- LASCHKA 11 determine the b mass from the charmonium spectrum. The theoretical computation uses the heavy $Q\overline{Q}$ potential to order $1/m_Q$ obtained by matching the short-distance perturbative result onto lattice QCD result at larger scales.
- AUBERT 10A determine the b - and c -quark masses from a fit to the inclusive decay spectra in semileptonic B decays in the kinetic scheme (and convert it to the \overline{MS} scheme).

- CHETYRKIN 09 determine m_c and m_b from the $e^+e^- \rightarrow Q\overline{Q}$ cross-section and sum rules, using an order α_s^3 (N3LO) computation of the heavy quark vacuum polarization.
- SCHWANDA 08 measure moments of the inclusive photon spectrum in $B \rightarrow X_S \gamma$ decay to determine m_b^{1S} . We have converted this to \overline{MS} scheme.
- NARISON 18A determines $\overline{m}_b(\overline{m}_b)$ as a function of α_s using QCD exponential sum rules and their ratios evaluated at the optimal scale $\mu = 9.5 \text{ GeV}$ at N2LO-N3LO of perturbative QCD and including condensates up to dimension 6–8 in the (axial-)vector and (pseudo-)scalar bottomonium channels.
- NARISON 18B determines $\overline{m}_b(\overline{m}_b)$ using QCD vector moment sum rules and their ratios at N2LO-N3LO of perturbative QCD and including condensates up to dimension 8.
- ABRAMOWICZ 14A determine $\overline{m}_b(\overline{m}_b) = 4.07 \pm 0.14^{+0.01+0.05+0.08}_{-0.07-0.00-0.05}$ from the production of b quarks in ep collisions at HERA. The errors due to fitting, modeling, PDF parameterization, and theoretical QCD uncertainties due to the values of α_s , m_c , and the renormalization scale μ have been combined in quadrature.
- AYALA 14A determine $\overline{m}_b(\overline{m}_b)$ from the $\Upsilon(1S)$ mass computed to N3LO order in perturbation theory using a renormalon subtracted scheme.
- NARISON 13 determines m_b using QCD spectral sum rules to order α_s^2 (NNLO) and including condensates up to dimension 6.
- NARISON 13A determines m_b using HQET sum rules to order α_s^2 (NNLO) and the B meson mass and decay constant.
- HOANG 12 determine m_b using non-relativistic sum rules for the Υ system at order α_s^2 (NNLO) with renormalization group improvement.
- NARISON 12 determine m_b using exponential sum rules for the vector current correlator to order α_s^3 , including the effect of gluon condensates up to dimension eight.
- Determines m_b to order α_s^3 (N3LO), including the effect of gluon condensates up to dimension eight combining the methods of NARISON 12 and NARISON 12A.
- NARISON 12A determine m_b using sum rules for the vector current correlator to order α_s^3 , including the effect of gluon condensates up to dimension eight.
- MCNEILE 10 determines m_b by comparing order α_s^3 (N3LO) perturbative results for the pseudo-scalar current to lattice simulations with $n_f = 2+1$ sea-quarks by the HPQCD collaboration.
- NARISON 10 determines m_b from ratios of moments of vector current correlators computed to order α_s^3 and including the dimension-six gluon condensate. These values are taken from the erratum to that reference.
- ABDALLAH 08D determine $\overline{m}_b(M_Z) = 3.76 \pm 1.0 \text{ GeV}$ from a leading order study of four-jet rates at LEP.
- GUAZZINI 08 determine $\overline{m}_b(\overline{m}_b)$ from a quenched lattice simulation of heavy meson masses. The ± 0.08 is an estimate of the quenching error.
- DELLA-MORTE 07 determine $\overline{m}_b(\overline{m}_b)$ from a computation of the spin-averaged B meson mass using quenched lattice HQET at order $1/m$. The ± 0.08 is an estimate of the quenching error.
- KUHN 07 determine $\overline{m}_b(\mu = 10 \text{ GeV}) = 3.609 \pm 0.025 \text{ GeV}$ and $\overline{m}_b(\overline{m}_b)$ from a four-loop sum-rule computation of the cross-section for $e^+e^- \rightarrow$ hadrons in the bottom threshold region.
- ABDALLAH 06D determine $m_b(M_Z) = 2.85 \pm 0.32 \text{ GeV}$ from Z -decay three-jet events containing a b -quark.
- BOUGHEZAL 06 \overline{MS} scheme result comes from the first moment of the hadronic production cross-section to order α_s^3 .
- BUCHMUELLER 06 determine m_b and m_c by a global fit to inclusive B decay spectra.
- PINEDA 06 \overline{MS} scheme result comes from a partial NNLL evaluation (complete at order α_s^2 (NNLO)) of sum rules of the bottom production cross-section in e^+e^- annihilation.
- GRAY 05 determines $\overline{m}_b(\overline{m}_b)$ from a lattice computation of the Υ spectrum. The simulations have $2+1$ dynamical light flavors. The b quark is implemented using NRQCD.
- AUBERT 04x obtain m_b from a fit to the hadron mass and lepton energy distributions in semileptonic B decay. The paper quotes values in the kinetic scheme. The \overline{MS} value has been provided by the BABAR collaboration.
- BAUER 04 determine m_b , m_c and $m_b - m_c$ by a global fit to inclusive B decay spectra.
- HOANG 04 determines $\overline{m}_b(\overline{m}_b)$ from moments at order α_s^2 of the bottom production cross-section in e^+e^- annihilation.
- MCNEILE 04 use lattice QCD with dynamical light quarks and a static heavy quark to compute the masses of heavy-light mesons.
- BAUER 03 determine the b quark mass by a global fit to B decay observables. The experimental data includes lepton energy and hadron invariant mass moments in semileptonic $B \rightarrow X_c \ell \nu_\ell$ decay, and the inclusive photon spectrum in $B \rightarrow X_S \gamma$ decay. The theoretical expressions used are of order $1/m^3$, and $\alpha_s^2 \beta_0$.
- BORDES 03 determines m_b using QCD finite energy sum rules to order α_s^2 .
- CORCELLA 03 determines \overline{m}_b using sum rules computed to order α_s^2 . Includes charm quark mass effects.
- DEDIVITIS 03 use a quenched lattice computation of heavy-heavy and heavy-light meson masses.
- EIDEMULLER 03 determines \overline{m}_b and \overline{m}_c using QCD sum rules.
- ERLER 03 determines \overline{m}_b and \overline{m}_c using QCD sum rules. Includes recent BES data.
- MAHMOOD 03 determines m_b^{1S} by a fit to the lepton energy moments in $B \rightarrow X_c \ell \nu_\ell$ decay. The theoretical expressions used are of order $1/m^3$ and $\alpha_s^2 \beta_0$. We have converted their result to the \overline{MS} scheme.
- BRAMBILLA 02 determine $\overline{m}_b(\overline{m}_b)$ from a computation of the $\Upsilon(1S)$ mass to order α_s^4 , including finite m_c corrections.
- PENIN 02 determines \overline{m}_b from the spectrum of the Υ system.

 m_b/m_s MASS RATIO

VALUE	DOCUMENT ID	TECN
53.94 ± 0.12	¹ BAZAVOV	18 LATT

- BAZAVOV 18 determine the quark masses using a lattice computation with staggered fermions and four active quark flavors for the u , d , s , c quarks and five active flavors for the b quark.

Top Quark

t-QUARK MASS

We first list the direct measurements of the top quark mass which employ the event kinematics and then list the measurements which extract a top quark mass from the measured $t\bar{t}$ cross-section using theory calculations. A discussion of the definition of the top quark mass in these measurements can be found in the review "The Top Quark."

For earlier search limits see PDG 96, Physical Review **D54** 1 (1996). We no longer include a compilation of indirect top mass determinations from Standard Model Electroweak fits in the Listings (our last compilation can be found in the Listings of the 2007 partial update). For a discussion of current results see the reviews "The Top Quark" and "Electroweak Model and Constraints on New Physics."

t-Quark Mass (Direct Measurements)

The following measurements extract a t -quark mass from the kinematics of $t\bar{t}$ events. They are sensitive to the top quark mass used in the MC generator that is usually interpreted as the pole mass, but the theoretical uncertainty in this interpretation is hard to quantify. See the review "The Top Quark" and references therein for more information.

OUR AVERAGE of 172.69 ± 0.30 GeV is an average of top mass measurements from LHC and Tevatron Runs. The latest Tevatron average, $174.30 \pm 0.35 \pm 0.54$ GeV, was provided by the Tevatron Electroweak Working Group (TEVEWWG).

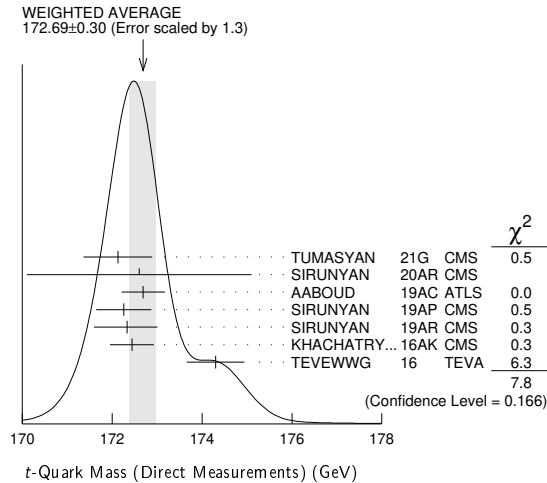

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT

- TUMASYAN 21G based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Events are selected by requiring 1 ℓ + 2jets(1b jet) final state.
- SIRUNYAN 20AR based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. The products of the hadronic decay of a top quark with $p_T > 400$ GeV, in the ℓ + jets channel of $t\bar{t}$ are reconstructed as a single jet. The top quark mass is determined from the normalized differential cross section measurement in the m_{jet} distribution.
- AABOUD 19AC is an ATLAS combination of 7 and 8 TeV top-quark mass determination in the dilepton, lepton + jets, and all jets channels.
- SIRUNYAN 19AP based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. A combined measurement using the lepton+jets and all-jets channels through a single likelihood function. See SIRUNYAN 18DE and SIRUNYAN 19AP below.
- SIRUNYAN 19AR based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Obtained from a simultaneous fit of the cross section and the top quark mass in the POWHEG simulation. The cross section is used also to extract the M_S mass and the strong coupling constant for different PDF sets.
- KHACHATRYAN 16AK based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Combination of the three top mass measurements in KHACHATRYAN 16AK and with the CMS results at $\sqrt{s} = 7$ TeV.
- TEVEWWG 16 is the latest Tevatron average (July 2016) provided by the Tevatron Electroweak Working Group. It takes correlated uncertainties into account and has a χ^2 of 10.8 for 11 degrees of freedom.
- AABOUD 19AC based on 20.2 fb⁻¹ in pp collisions at $\sqrt{s} = 8$ TeV. Uses optimized event selection to suppress less-well-reconstructed events and template fits to determine m_t together with a global jet energy scale factor and a relative b-to-light-jet energy scale factor.
- SIRUNYAN 19AP based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. A kinematical fit is applied to each event assuming the signal event topology. m_t is determined simultaneously with a jet energy scale factor (JES). The second error represents stat.+JES. Modeling uncertainties are larger than in the measurements at $\sqrt{s} = 7$ and 8 TeV because of the use of new alternative color reconnection models.
- SIRUNYAN 18DE based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. m_t is determined simultaneously with an overall jet energy scale factor constrained by the mass of the hadronically decayed W. Compared to the Run 1 analysis a more advanced treatment of modeling uncertainties are employed, in particular concerning color-reconnection models.
- AABOUD 17AH based on 20.2 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Uses template fits to the ratio of the masses of three-jets (from t candidate) and dijets (from W candidate), to suppress jet energy scale uncertainty. Large QCD background is modelled using a data-driven method.
- ABAZOV 17B is a combination of measurements of the top quark mass by D0 in the lepton+jets and dilepton channels, using all data collected in Run I (1992-1996) at $\sqrt{s} = 1.8$ TeV and Run II (2001-2011) at $\sqrt{s} = 1.96$ TeV of the Tevatron, corresponding to integrated luminosities of 0.1 fb⁻¹ and 9.7 fb⁻¹, respectively.
- SIRUNYAN 17L based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. m_t is reconstructed from a fit to the invariant mass distribution of $\mu\nu b$, where p_T^{miss} and W mass constraint are used to reconstruct ν momentum. The number of events for various contributions, except for the t-channel single top one, are fixed to the values extracted from simulation. Superseded by TUMASYAN 21G.
- SIRUNYAN 17N based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The fully hadronic decay of a highly-boosted t is reconstructed in the ℓ +jets channel and unfolded at the particle level. The sensitivity of the peak position of the m_{jet} distribution is used to test quality of the modelling by the simulation.
- SIRUNYAN 17O based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Analysis is based on the kinematical observables $M(b\ell)$, M_{T2} and $M(b\nu)$. A fit is performed to determine m_t and an overall jet energy scale factor simultaneously.
- AABOUD 16T based on 20.2 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The analysis is refined using the p_T and invariant mass distributions of ℓ +b-jet system. A combination with measurements from $\sqrt{s} = 7$ TeV data in the dilepton and lepton+jets channels gives $172.84 \pm 0.34 \pm 0.61$ GeV.

- AABOUD 16T is an ATLAS combination of 8 TeV top-quark mass in the dilepton channel with previous measurements from $\sqrt{s} = 7$ TeV data in the dilepton and lepton + jets channels.
- ABAZOV 16 based on 9.7 fb⁻¹ of data in p \bar{p} collisions at $\sqrt{s} = 1.96$ TeV. Employs improved fit to minimize statistical errors and improved jet energy calibration, using lepton + jets mode, which reduces error of jet energy scale. Based on previous determination in ABAZOV 12AB with increased integrated luminosity and improved fit and calibrations.
- ABAZOV 16D based on 9.7 fb⁻¹ of data in p \bar{p} collisions at $\sqrt{s} = 1.96$ TeV, using the matrix element technique. Based on previous determination in ABAZOV 11R with increased integrated luminosity. There is a strong correlation with the determination in ABAZOV 16. (See ABAZOV 17B.)
- KHACHATRYAN 16AK based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Combination of the three top mass measurements in KHACHATRYAN 16AK and with the CMS results at $\sqrt{s} = 7$ TeV gives $172.44 \pm 0.13 \pm 0.47$ GeV.
- The top mass and jet energy scale factor are determined by a fit.
- Uses the analytical matrix weighting technique method.
- KHACHATRYAN 16AL based on 19.7 fb⁻¹ in pp collisions at $\sqrt{s} = 8$ TeV. Determined from the invariant mass distribution of leptons and reconstructed secondary vertices from b decays using only charged particles. The uncertainty is dominated by modeling of b fragmentation and top p_T distribution.
- KHACHATRYAN 16CB based on 666 candidate reconstructed events corresponding to 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The measurement exploits correlation of m_t with $M(J/\psi\ell)$ in the same top quark decay, using a high-purity event sample. A study on modeling of b-quark fragmentation is given in Sec.3.3.
- AAD 15AW based on 4.6 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. Uses template fits to the ratio of the masses of three-jets (from t candidate) and dijets (from W candidate). Large background from multijet production is modeled with data-driven methods.
- AAD 15BF based on 4.6 fb⁻¹ in pp collisions at $\sqrt{s} = 7$ TeV. Using a three-dimensional template likelihood technique the lepton plus jets ($\geq 1b$ -tagged) channel gives $172.33 \pm 0.75 \pm 1.02$ GeV, while exploiting a one dimensional template method using $m_{\ell\ell}$ the dilepton channel (1 or 2b-tags) gives $173.79 \pm 0.54 \pm 1.30$ GeV. The results are combined.
- AALTONEN 15D based on 9.1 fb⁻¹ of p \bar{p} data at $\sqrt{s} = 1.96$ TeV. Uses a template technique to fit a distribution of a variable defined by a linear combination of variables sensitive and insensitive to jet energy scale to optimize reduction of systematic errors. b-tagged and non-b-tagged events are separately analyzed and combined.
- Based on 9.3 fb⁻¹ of p \bar{p} data at $\sqrt{s} = 1.96$ TeV. Multivariate algorithm is used to discriminate signal from backgrounds, and templates are used to measure m_t .
- Based on 9.7 fb⁻¹ of p \bar{p} data at $\sqrt{s} = 1.96$ TeV. A matrix element method is used to calculate the probability of an event to be signal or background, and the overall jet energy scale is constrained *in situ* by m_W . See ABAZOV 15G for further details.
- Based on 3.54 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. The mass is reconstructed for each event employing a kinematical fit of the jets to a ttbar hypothesis. The combination with the previous CMS measurements in the dilepton and the lepton+jets channels gives $173.54 \pm 0.33 \pm 0.96$ GeV.
- Based on 8.7 fb⁻¹ in p \bar{p} collisions at $\sqrt{s} = 1.96$ TeV. Events with an identified charged lepton or small E_T are rejected from the event sample, so that the measurement is statistically independent from those in the ℓ + jets and all hadronic channels while being sensitive to those events with a τ lepton in the final state.
- Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 13s studied events with di-lepton + $E_T > \geq 2$ b-jets, and looked for kinematical endpoints of MT2, MT2_T, and subsystem variables.
- AAD 12t based on 1.04 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. Uses 2d-template analysis (MT) with m_t and jet energy scale factor (JES) from m_W mass fit.
- Based on 8.7 fb⁻¹ of data in p \bar{p} collisions at 1.96 TeV. The JES is calibrated by using the dijet mass from the W boson decay.
- Use the ME method based on 2.2 fb⁻¹ of data in p \bar{p} collisions at 1.96 TeV.
- Combination based on up to 5.8 fb⁻¹ of data in p \bar{p} collisions at 1.96 TeV.
- Based on 5.8 fb⁻¹ of data in p \bar{p} collisions at 1.96 TeV the quoted value is $m_t = 172.5 \pm 1.4(\text{stat}) \pm 1.0(\text{JES}) \pm 1.1(\text{syst})$ GeV. The measurement is performed with a likelihood fit technique which simultaneously determines m_t and JES (Jet Energy Scale).
- Based on 4.3 fb⁻¹ of data in p-pbar collisions at 1.96 TeV. The measurement reduces the JES uncertainty by using the single lepton channel study of ABAZOV 11P.
- Combination with the result in 1 fb⁻¹ of preceding data reported in ABAZOV 09AH as well as the MWT result of ABAZOV 11R with a statistical correlation of 60%.
- Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. Uses an analytical matrix weighting technique (AMWT) and full kinematical analysis (KIN).
- Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. The first error is statistical and JES combined, and the second is systematic. Ideogram method is used to obtain 2D likelihood for the kinematical fit with two parameters mtop and JES.
- Based on 3.2 fb⁻¹ in p \bar{p} collisions at $\sqrt{s} = 1.96$ TeV. The first error is from statistics and JES combined, and the latter is from the other systematic uncertainties. The result is obtained using an unbinned maximum likelihood method where the top quark mass and the JES are measured simultaneously, with $\Delta_{JES} = 0.3 \pm 0.3(\text{stat})$.
- Based on 5.7 fb⁻¹ in p \bar{p} collisions at $\sqrt{s} = 1.96$ TeV. Events with an identified charged lepton or small E_T are rejected from the event sample, so that the measurement is statistically independent from those in the ℓ + jets and all hadronic channels while being sensitive to those events with a τ lepton in the final state. Supersedes AALTONEN 07B.
- AALTONEN 11E based on 5.6 fb⁻¹ in p \bar{p} collisions at $\sqrt{s} = 1.96$ TeV. Employs a multi-dimensional template likelihood technique where the lepton plus jets (one or two b-tags) channel gives $172.2 \pm 1.2 \pm 0.9$ GeV while the dilepton channel yields $170.3 \pm 2.0 \pm 3.1$ GeV. The results are combined. OUR EVALUATION includes the measurement in the dilepton channel only.
- Uses a likelihood fit of the lepton p_T distribution based on 2.7 fb⁻¹ in p \bar{p} collisions at $\sqrt{s} = 1.96$ TeV.
- Based on 3.6 fb⁻¹ in p \bar{p} collisions at $\sqrt{s} = 1.96$ TeV. ABAZOV 11P reports $174.94 \pm 0.83 \pm 0.78 \pm 0.96$ GeV, where the first uncertainty is from statistics, the second from JES, and the last from other systematic uncertainties. We combine the JES and systematic uncertainties. A matrix-element method is used where the JES uncertainty is constrained by the W mass. ABAZOV 11P describes a measurement based on 2.6 fb⁻¹ that is combined with ABAZOV 08AH, which employs an independent 1 fb⁻¹ of data.
- Based on a matrix-element method which employs 5.4 fb⁻¹ in p \bar{p} collisions at $\sqrt{s} = 1.96$ TeV. Superseded by ABAZOV 12AB.
- Based on 36 pb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV. A Kinematic Method using b-tagging and an analytical Matrix Weighting Technique give consistent results and are combined. Superseded by CHATRCHYAN 12BA.

- 49 Based on 5.6 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The likelihood calculated using a matrix element method gives $m_t = 173.0 \pm 0.7(\text{stat}) \pm 0.6(\text{JES}) \pm 0.9(\text{syst}) \text{ GeV}$, for a total uncertainty of 1.2 GeV.
- 50 Based on 3.4 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The result is obtained by combining the MT2 variable method and the NWA (Neutrino Weighting Algorithm). The MT2 method alone gives $m_t = 168.0^{+4.8}_{-4.0}(\text{stat}) \pm 2.9(\text{syst}) \text{ GeV}$ with smaller systematic error due to small JES uncertainty.
- 51 Based on 1.9 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The result is from the measurement using the transverse decay length of b -hadrons and that using the transverse momentum of the W decay muons, which are both insensitive to the JES (jet energy scale) uncertainty. OUR EVALUATION uses only the measurement exploiting the decay length significance which yields $166.9^{+9.5}_{-8.5}(\text{stat}) \pm 2.9(\text{syst}) \text{ GeV}$. The measurement that uses the lepton transverse momentum is excluded from the average because of a statistical correlation with other samples.
- 52 Based on 2.9 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistics and JES uncertainty, and the latter is from the other systematics. Neural-network-based kinematical selection of 6 highest E_{Tj} jets with a vtx b -tag is used to distinguish signal from background. Superseded by AALTONEN 12G.
- 53 Based on 2 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The top mass is obtained from the measurement of the invariant mass of the lepton (e or μ) from W decays and the soft μ in b -jet. The result is insensitive to jet energy scaling.
- 54 Based on 1.9 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistics and jet energy scale uncertainty, and the latter is from the other systematics. Matrix element method with effective propagators.
- 55 Based on 943 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistical and jet-energy-scale uncertainties, and the latter is from other systematics. AALTONEN 09K selected 6 jet events with one or more vertex b -tags and used the tree-level matrix element to construct template models of signal and background.
- 56 Based on 1.9 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistical and jet-energy-scale (JES) uncertainties, and the second is from other systematics. Events with lepton + jets and those with dilepton + jets were simultaneously fit to constrain m_t and JES. Lepton + jets data only give $m_t = 171.8 \pm 2.2 \text{ GeV}$, and dilepton data only give $m_t = 171.2^{+5.3}_{-5.1} \text{ GeV}$.
- 57 Based on 2 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Matrix Element method. Optimal selection criteria for candidate events with two high p_T leptons, high E_{Tj} , and two or more jets with and without b -tag are obtained by neural network with neuroevolution technique to minimize the statistical error of m_t .
- 58 Based on 2.9 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Mass m_t is estimated from the likelihood for the eight-fold kinematical solutions in the plane of the azimuthal angles of the two neutrino momenta.
- 59 Based on 1 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Events with two identified leptons, and those with one lepton plus one isolated track and a b -tag were used to constrain m_t . The result is a combination of the ν WT (ν Weighting Technique) result of $176.2 \pm 4.8 \pm 2.1 \text{ GeV}$ and the MWT (Matrix-element Weighting Technique) result of $173.2 \pm 4.9 \pm 2.0 \text{ GeV}$.
- 60 Reports measurement of $170.7^{+4.2}_{-3.9} \pm 2.6 \pm 2.4 \text{ GeV}$ based on 1.2 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The last error is due to the theoretical uncertainty on $\sigma_{t\bar{t}}$. Without the cross-section constraint a top mass of $169.7^{+5.2}_{-4.9} \pm 3.1 \text{ GeV}$ is obtained.
- 61 Template method.
- 62 Result is based on 1 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistics and jet energy scale uncertainty, and the latter is from the other systematics.
- 63 Based on 310 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- 64 Ideogram method.
- 65 Based on 311 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Events with 4 or more jets with $E_{Tj} > 15 \text{ GeV}$, significant missing E_{Tj} , and secondary vertex b -tag are used in the fit. About 44% of the signal acceptance is from $\tau\nu + 4$ jets. Events with identified e or μ are vetoed to provide a statistically independent measurement.
- 66 Based on 1.02 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Superseded by AALTONEN 12G.
- 67 Based on 955 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. m_t and JES (Jet Energy Scale) are fitted simultaneously, and the first error contains the JES contribution of 1.5 GeV.
- 68 Matrix element method.
- 69 Based on 425 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is a combination of statistics and JES (Jet Energy Scale) uncertainty, which has been measured simultaneously to give $\text{JES} = 0.989 \pm 0.029(\text{stat})$.
- 70 Based on 370 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Combined result of MWT (Matrix-element Weighting Technique) and ν WT (ν Weighting Technique) analyses is $178.1 \pm 6.7 \pm 4.8 \text{ GeV}$.
- 71 Based on 1.0 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. ABULENCIA 07D improves the matrix element description by including the effects of initial-state radiation.
- 72 Based on 695 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The transverse decay length of the b hadron is used to determine m_t , and the result is free from the JES (jet energy scale) uncertainty.
- 73 Based on $\sim 400 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error includes statistical and systematic jet energy scale uncertainties, the second error is from the other systematics. The result is obtained with the b -tagging information. The result without b -tagging is $169.2^{+5.0+1.5}_{-7.4-1.4} \text{ GeV}$. Superseded by ABAZOV 08AH.
- 74 Based on 318 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- 75 Dynamical likelihood method.
- 76 Based on 340 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- 77 Based on 360 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- 78 Based on $110.2 \pm 5.8 \text{ pb}^{-1}$ at $\sqrt{s} = 1.8 \text{ TeV}$.
- 79 Based on the all hadronic decays of $t\bar{t}$ pairs. Single b -quark tagging via the decay chain $b \rightarrow c \rightarrow \mu$ was used to select signal enriched multijet events. The result was obtained by the maximum likelihood method after bias correction.
- 80 Obtained by re-analysis of the lepton + jets candidate events that led to ABBOTT 98F. It is based upon the maximum likelihood method which makes use of the leading order matrix elements.
- 81 Based on $125 \pm 7 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.8 \text{ TeV}$.
- 82 Based on $\sim 106 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.8 \text{ TeV}$.
- 83 Obtained by combining the measurements in the lepton + jets [AFFOLDER 01], all-jets [ABE 97R, ABE 99B], and dilepton [ABE 99B] decay topologies.

- 84 Obtained by combining the D0 result $m_t (\text{GeV}) = 168.4 \pm 12.3 \pm 3.6$ from 6 di-lepton events (see also ABBOTT 98D) and $m_t (\text{GeV}) = 173.3 \pm 5.6 \pm 5.5$ from lepton+jet events (ABBOTT 98F).
- 85 Obtained by combining the CDF results of $m_t (\text{GeV}) = 167.4 \pm 10.3 \pm 4.8$ from 8 dilepton events, $m_t (\text{GeV}) = 175.9 \pm 4.8 \pm 5.3$ from lepton+jet events (ABE 98E), and $m_t (\text{GeV}) = 186.0 \pm 10.0 \pm 5.7$ from all-jet events (ABE 97R). The systematic errors in the latter two measurements are changed in this paper.
- 86 See AFFOLDER 01 for details of systematic error re-evaluation.
- 87 Based on $109 \pm 7 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.8 \text{ TeV}$.
- 88 See ABZOV 04G.
- 89 The updated systematic error is listed. See AFFOLDER 01, appendix C.
- 90 Obtained by combining the D0 results of $m_t (\text{GeV}) = 168.4 \pm 12.3 \pm 3.6$ from 6 dilepton events and $m_t (\text{GeV}) = 173.3 \pm 5.6 \pm 5.5$ from 77 lepton+jet events.
- 91 Obtained by combining the D0 results from dilepton and lepton+jet events, and the CDF results (ABE 99B) from dilepton, lepton+jet events, and all-jet events.
- 92 Based on the first observation of all hadronic decays of $t\bar{t}$ pairs. Single b -quark tagging with jet-shape variable constraints was used to select signal enriched multi-jet events. The updated systematic error is listed. See AFFOLDER 01, appendix C.

t-Quark Mass from Cross-Section Measurements

The top quark $\overline{\text{MS}}$ or pole mass can be extracted from a measurement of $\sigma(t\bar{t})$ by using theory calculations. We quote below the $\overline{\text{MS}}$ mass. See the review "The Top Quark" and references therein for more information.

1 AAD 19G based on 20.2 fb^{-1} of data in pp collisions at $\sqrt{s} = 8 \text{ TeV}$. Normalized $t\bar{t} + 1$ -jet differential cross section as a function of $t\bar{t}j$ invariant mass is measured in the $\ell + \text{jets}$ mode. The unfolded parton-level distribution is compared with the NLO QCD prediction. The three errors are from statistics, systematics, and theory.			
2 Based on 5.3 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. ABZOV 11s uses the measured $t\bar{t}$ production cross section of $8.13^{+1.02}_{-0.90} \text{ pb}$ [ABZOV 11E] in the lepton plus jets channel to obtain the top quark $\overline{\text{MS}}$ mass by using an approximate NNLO computation (MOCH 08, LANGENFELD 09). The corresponding top quark pole mass is $167.5^{+5.4}_{-4.9} \text{ GeV}$. A different theory calculation (AHRENS 10, AHRENS 10A) is also used and yields $m_t^{\overline{\text{MS}}} = 154.5^{+5.0}_{-4.3} \text{ GeV}$.			
3 Based on 1 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Uses the $\ell + \text{jets}$, $\ell\ell$, and $\ell\tau + \text{jets}$ channels. ABZOV 09AG extract the pole mass of the top quark using two different calculations that yield $169.1^{+5.9}_{-5.2} \text{ GeV}$ (MOCH 08, LANGENFELD 09) and $168.2^{+5.4}_{-5.4} \text{ GeV}$ (KIDONAKIS 08).			
4 Based on 1 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Uses the $\ell\ell$ and $\ell\tau + \text{jets}$ channels. ABZOV 09R extract the pole mass of the top quark using two different calculations that yield $173.3^{+9.8}_{-8.6} \text{ GeV}$ (MOCH 08, LANGENFELD 09) and $171.5^{+9.9}_{-8.8} \text{ GeV}$ (CACCIARI 08).

2 AAD 19G based on 20.2 fb^{-1} of data in pp collisions at $\sqrt{s} = 8 \text{ TeV}$. Normalized $t\bar{t} + 1$ -jet differential cross section as a function of $t\bar{t}j$ invariant mass is measured in the $\ell + \text{jets}$ mode. The unfolded parton-level distribution is compared with the NLO QCD prediction. The three errors are from statistics, systematics, and theory.			
3 AABOUD 17BC based on 20.2 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. The pole mass is extracted from a fit of NLO predictions to eight single lepton and dilepton differential distributions, while simultaneously constraining uncertainties due to PDFs and QCD scales. The three reported uncertainties come from statistics, experimental systematics, and theoretical sources.			
4 SIRUNYAN 17W based on 2.2 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. Events are categorized according to the jet multiplicity and the number of b -tagged jets. The pole mass is obtained from the inclusive cross section measurement and the NNLO prediction.			
5 ABZOV 16F based on 9.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The result is obtained from the inclusive cross section measurement and the NNLO+NNLL prediction.			

Quark Particle Listings

t

- ⁶ KHACHATRYAN 16AW based on 5.0 fb⁻¹ of *pp* collisions at 7 TeV and 19.7 fb⁻¹ at 8 TeV. The 7 TeV data include those used in CHATRCHYAN 14. The result is obtained from the inclusive cross sections.
- ⁷ AAD 15BW based on 4.6 fb⁻¹ of *pp* data at $\sqrt{s} = 7$ TeV. Uses normalized differential cross section for $t\bar{t} + 1$ jet as a function of the inverse of the invariant mass of the $t\bar{t} + 1$ jet system. The measured cross section is corrected to the parton level. Then a fit to the data using NLO + parton shower prediction is performed.
- ⁸ AAD 14AY used $\sigma(t\bar{t})$ for $e\mu$ events. The result is a combination of the measurements $m_t = 171.4 \pm 2.6$ GeV based on 4.6 fb⁻¹ of data at 7 TeV and $m_t = 174.1 \pm 2.6$ GeV based on 20.3 fb⁻¹ of data at 8 TeV.
- ⁹ SIRUNYAN 20BV based on 35.9 fb⁻¹ of *pp* data at $\sqrt{s} = 13$ TeV. The error accounts for both experimental and theoretical uncertainties. Events containing two oppositely charged leptons are used. The pole mass is particularly sensitive to the $t\bar{t}$ invariant mass distribution close to the threshold. However, the Coulomb and soft gluon resummation effects are not taken into account, hence, an additional theoretical uncertainty of order +1 GeV is assumed.
- ¹⁰ CHATRCHYAN 14 used $\sigma(t\bar{t})$ from *pp* collisions at $\sqrt{s} = 7$ TeV measured in CHATRCHYAN 12AX to obtain $m_t(\text{pole})$ for $\alpha_s(m_Z) = 0.1184 \pm 0.0007$. The errors have been corrected in KHACHATRYAN 14K.

$m_t - m_{\bar{t}}$

Test of *CPT* conservation. OUR AVERAGE assumes that the systematic uncertainties are uncorrelated.

- ¹ Based on 20.2 fb⁻¹ of *pp* data at $\sqrt{s} = 8$ TeV. Γ_t is measured using a template fit to the reconstructed invariant mass of the *b*-jet of the semileptonically decaying top quark and the corresponding lepton, and the angular distance between j_b and j_l in hadronic top decay. Signal templates are generated by reweighting events at parton-level to Breit-Wigner distribution with different Γ_t hypotheses for $m_t = 172.5$ GeV. The result is consistent with the NNLO SM prediction of 1.322 GeV.
- ² Based on 19.7 fb⁻¹ of *pp* data at $\sqrt{s} = 8$ TeV. The result is obtained by combining the measurement of $R = \Gamma(t \rightarrow Wb)/\Gamma(t \rightarrow Wq(q=b,s,d))$ and a previous CMS measurement of the *t*-channel single top production cross section of CHATRCHYAN 12BQ, by using the theoretical calculation of $\Gamma(t \rightarrow Wb)$ for $m_t = 172.5$ GeV.
- ³ Based on 5.4 fb⁻¹ of data in *pp* collisions at 1.96 TeV. $\Gamma(t \rightarrow bW) = 1.87^{+0.44}_{-0.40}$ GeV is obtained from the observed *t*-channel single top quark production cross section, whereas $B(t \rightarrow bW) = 0.90 \pm 0.04$ is used assuming $\sum_q B(t \rightarrow qW) = 1$. The result is valid for $m_t = 172.5$ GeV. See the paper for the values for $m_t = 170$ or 175 GeV.
- ⁴ Based on 8.7 fb⁻¹ of data. The two sided 68% CL interval is 1.10 GeV < Γ_t < 4.05 GeV for $m_t = 172.5$ GeV.
- ⁵ Based on 2.3 fb⁻¹ in *pp* collisions at $\sqrt{s} = 1.96$ TeV. ABAZOV 11B extracted Γ_t from the partial width $\Gamma(t \rightarrow Wb) = 1.92^{+0.58}_{-0.51}$ GeV measured using the *t*-channel single top production cross section, and the branching fraction $\text{br}(t \rightarrow Wb) =$

$0.962^{+0.068}(\text{stat})^{+0.064}_{-0.052}(\text{syst})$. The $\Gamma(t \rightarrow Wb)$ measurement gives the 95% CL lowerbound of $\Gamma(t \rightarrow Wb)$ and hence that of Γ_t .

⁶ Results are based on 4.3 fb⁻¹ of data in *pp* collisions at $\sqrt{s} = 1.96$ TeV. The top quark mass and the hadronically decaying *W* boson mass are reconstructed for each candidate events and compared with templates of different top quark width. The two sided 68% CL interval is 0.3 GeV < Γ_t < 4.4 GeV for $m_t = 172.5$ GeV.

⁷ Based on 955 pb⁻¹ of *pp* collision data at $\sqrt{s} = 1.96$ TeV. AALTONEN 09M selected $t\bar{t}$ candidate events for the $\ell + \cancel{E}_T +$ jets channel with one or two *b*-tags, and examine the decay width dependence of the reconstructed m_t distribution. The result is for $m_t = 175$ GeV, whereas the upper limit is lower for smaller m_t .

WEIGHTED AVERAGE
0.957 ± 0.034 (Error scaled by 1.5)

¹ Based on 8.7 fb⁻¹ of data. This measurement gives $|V_{tb}| = 0.93 \pm 0.04$ and $|V_{tb}| > 0.85$ (95% CL) in the SM.

² Based on 19.7 fb⁻¹ of *pp* data at $\sqrt{s} = 8$ TeV. The result is obtained by counting the number of *b* jets per $t\bar{t}$ signal events in the dilepton channel. The $t\bar{t}$ production cross section is measured to be $\sigma(t\bar{t}) = 238 \pm 1 \pm 15$ pb, in good agreement with the SM prediction and the latest CMS measurement of CHATRCHYAN 14F. The measurement gives $R > 0.995$ (95% CL), or $|V_{tb}| > 0.975$ (95% CL) in the SM, requiring $R \leq 1$.

³ Based on 8.7 fb⁻¹ of *pp* collisions at $\sqrt{s} = 1.96$ TeV. Measure the fraction of $t \rightarrow Wb$ decays simultaneously with the $t\bar{t}$ cross section. The correlation coefficient between

those two measurements is -0.434 . Assume unitarity of the 3×3 CKM matrix and set $|V_{tb}| > 0.89$ at 95% CL.

⁴Based on 5.4 fb^{-1} of data. The error is statistical and systematic combined. The result is a combination of 0.95 ± 0.07 from $\ell + \text{jets}$ channel and 0.86 ± 0.05 from $\ell\ell$ channel. $|V_{tb}| = 0.95 \pm 0.02$ follows from the result by assuming unitarity of the 3×3 CKM matrix.

⁵Result is based on 0.9 fb^{-1} of data. The 95% CL lower bound $R > 0.79$ gives $|V_{tb}| > 0.89$ (95% CL).

⁶ABAZOV 06k result is from the analysis of $t\bar{t} \rightarrow \ell\nu + \geq 3$ jets with 230 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. It gives $R > 0.61$ and $|V_{tb}| > 0.78$ at 95% CL. Superseded by ABAZOV 08M.

⁷ACOSTA 05A result is from the analysis of lepton + jets and di-lepton + jets final states of $t\bar{t}$ candidate events with $\sim 162 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is statistical and the second systematic. It gives $R > 0.61$, or $|V_{tb}| > 0.78$ at 95% CL.

⁸AFFOLDER 01C measures the top-quark decay width ratio $R = \Gamma(Wb)/\Gamma(Wq)$, where q is a $d, s,$ or b quark, by using the number of events with multiple b tags. The first error is statistical and the second systematic. A numerical integration of the likelihood function gives $R > 0.61$ (0.56) at 90% (95%) CL. By assuming three generation unitarity, $|V_{tb}| = 0.97 \pm 0.16$ or $|V_{tb}| > 0.78$ (0.75) at 90% (95%) CL is obtained. The result is based on 109 pb^{-1} of data at $\sqrt{s} = 1.8 \text{ TeV}$.

⁴ ABULENCIA	06R CDF	$\ell\tau + \text{jets}$
⁵ ABE	97v CDF	$\ell\tau + \text{jets}$

¹SIRUNYAN 20v based on 35.9 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. $t\bar{t}$ events are selected in the $t\bar{t} \rightarrow (\ell\nu_\ell)(\tau_h\nu_\tau)b\bar{b}$ mode, where τ_h refers to the hadronic decays of τ . The branching ratio is determined with respect to the $t\bar{t}$ inclusive cross section extrapolated from the light dilepton mode. The ratio of the $t\bar{t}$ production cross sections in the $\ell\tau_h$ and $\ell\ell$ channels yields $0.973 \pm 0.009 \pm 0.066$, consistent with lepton universality.

²AAD 15cc based on 4.6 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. The original value is given by $7.0 \pm 0.3 \pm 0.5\%$, which includes only the hadronic decay of τ leptons. It is assumed that the top branching ratios to leptons and jets add up to one and that only SM processes contribute to the background. The event selection criteria are optimized for the $\ell\tau_h + \text{jets}$ channel. We have converted the original value to include leptonic decays of τ 's, by using the AAD 15cc measurements of the branching ratios to e and μ channels, as well as the PDG values of τ branching ratios into e and μ channels.

³Based on 9 fb^{-1} of data. The measurement is in the channel $t\bar{t} \rightarrow (b\ell\nu)(b\tau\nu)$, where τ decays into hadrons (τ_h), and ℓ (e or μ) include ℓ from τ decays (τ_ℓ). The result is consistent with lepton universality.

⁴ABULENCIA 06R looked for $t\bar{t} \rightarrow (\ell\nu_\ell)(\tau\nu_\tau)b\bar{b}$ events in 194 pb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. 2 events are found where 1.00 ± 0.17 signal and 1.29 ± 0.25 background events are expected, giving a 95% CL upper bound for the partial width ratio $\Gamma(t \rightarrow \tau\nu q) / \Gamma_{SM}(t \rightarrow \tau\nu q) < 5.2$.

⁵ABE 97v searched for $t\bar{t} \rightarrow (\ell\nu_\ell)(\tau\nu_\tau)b\bar{b}$ events in 109 pb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.8 \text{ TeV}$. They observed 4 candidate events where one expects ~ 1 signal and ~ 2 background events. Three of the four observed events have jets identified as b candidates.

¹AAD 20b based on 81 fb^{-1} of data in pp collisions at $\sqrt{s} = 13 \text{ TeV}$. FCNC through single top production in association with a photon is searched for in the mode $\ell\gamma + \cancel{E}_T + 1j$ (b -tag). Anomalous FCNC left-handed and right-handed couplings are searched for, which result in different kinematical properties of top decay such as the lepton distribution. Limits are set on the $tq\gamma$ couplings in an effective field theory.

²KHACHATRYAN 16As based on 19.8 fb^{-1} of data in pp collisions at $\sqrt{s} = 8 \text{ TeV}$. FCNC through single top production in association with a photon is searched for in the mode $\mu + \gamma + \cancel{E}_T + \geq 1j$ (0,1b). Bounds on the anomalous FCNC couplings are given by $\kappa_{t\gamma u} < 0.025$ and $\kappa_{t\gamma c} < 0.091$.

³CHEKANOV 03 looked for single top production via FCNC in the reaction $e^\pm p \rightarrow e^\pm (t \text{ or } \bar{t}) X$ in 130.1 pb^{-1} of data at $\sqrt{s} = 300\text{--}318 \text{ GeV}$. No evidence for top production and its decay into bW was found. The result is obtained for $m_t = 175 \text{ GeV}$ when $B(\gamma c) = B(Zq) = 0$, where q is a u or c quark. Bounds on the effective $t\text{-}u\text{-}\gamma$ and $t\text{-}u\text{-}Z$ couplings are found in their Fig. 4. The conversion to the constraint listed is from private communication, E. Gallo, January 2004.

⁴AARON 09A looked for single top production via FCNC in $e^\pm p$ collisions at HERA with 474 pb^{-1} . The upper bound of the cross section gives the bound on the FCNC coupling $\kappa_{t\gamma u} / \Lambda < 1.03 \text{ TeV}^{-1}$, which corresponds to the result for $m_t = 175 \text{ GeV}$.

⁵ABDALLAH 04c looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{c}c$ or $\bar{u}u$ in 541 pb^{-1} of data at $\sqrt{s} = 189\text{--}208 \text{ GeV}$. No deviation from the SM is found, which leads to the bound on $B(t \rightarrow \gamma q)$, where q is a u or c quark, for $m_t = 175 \text{ GeV}$ when $B(t \rightarrow Zq) = 0$ is assumed. The conversion to the listed bound is from private communication, O. Yushchenko, April 2005. The bounds on the effective $t\text{-}q\text{-}\gamma$ and $t\text{-}q\text{-}Z$ couplings are given in their Fig. 7 and Table 4, for $m_t = 170\text{--}180 \text{ GeV}$, where most conservative bounds are found by choosing the chiral couplings to maximize the negative interference between the virtual γ and Z exchange amplitudes.

⁶AKTAS 04 looked for single top production via FCNC in e^\pm collisions at HERA with 118.3 pb^{-1} , and found 5 events in the e or μ channels. By assuming that they are due to statistical fluctuation, the upper bound on the $t\gamma$ coupling $\kappa_{t\gamma u} < 0.27$ (95% CL) is obtained. The conversion to the partial width limit, when $B(\gamma c) = B(Zu) = B(Zc) = 0$, is from private communication, E. Perez, May 2005.

⁷ACHARD 02J looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{c}c$ or $\bar{u}u$ in 634 pb^{-1} of data at $\sqrt{s} = 189\text{--}209 \text{ GeV}$. No deviation from the SM is found, which leads to a bound on the top-quark decay branching fraction $B(\gamma q)$, where q is a u or c quark. The bound assumes $B(Zq) = 0$ and is for $m_t = 175 \text{ GeV}$; bounds for $m_t = 170 \text{ GeV}$ and 180 GeV and $B(Zq) \neq 0$ are given in Fig. 5 and Table 7.

⁸ABE 98c looked for $t\bar{t}$ events where one t decays into $q\gamma$ while the other decays into bW . The quoted bound is for $\Gamma(\gamma q)/\Gamma(Wb)$.

- ³ AAD 16D based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The FCNC decay is searched for in $t\bar{t}$ events in the final state (bW)(qZ) when both W and Z decay leptonically, giving 3 charged leptons.
- ⁴ CHATRCHYAN 14s combined search limit from this and CHATRCHYAN 13F data.
- ⁵ Based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The flavor changing decay is searched for in $t\bar{t}$ events in the final state (bW)(qZ) when both W and Z decay leptonically, giving 3 charged leptons.
- ⁶ Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. Search for FCNC decays of the top quark in $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu$ + jets ($\ell, \ell' = e, \mu$) final states found no excess of signal events.
- ⁷ Based on 2.1 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV.
- ⁸ Based on 4.1 fb⁻¹ of data. ABAZOV 11M searched for FCNC decays of the top quark in $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu$ + jets ($\ell, \ell' = e, \mu$) final states, and absence of the signal gives the bound.
- ⁹ Based on pp data of 1.52 fb⁻¹. AALTONEN 09AL compared $t\bar{t} \rightarrow WbWb \rightarrow \ell\nu bjjb$ and $t\bar{t} \rightarrow ZcWb \rightarrow \ell\ell cjjb$ decay chains, and absence of the latter signal gives the bound. The result is for 100% longitudinally polarized Z boson and the theoretical $t\bar{t}$ production cross section. The results for different Z polarizations and those without the cross section assumption are given in their Table XII.
- ¹⁰ Result is based on 1.9 fb⁻¹ of data at $\sqrt{s} = 1.96$ TeV. $t\bar{t} \rightarrow WbZq$ or $ZqZq$ processes have been looked for in $Z + \geq 4$ jet events with and without b -tag. No signal leads to the bound $B(t \rightarrow Zq) < 0.037$ (0.041) for $m_t = 175$ (170) GeV.
- ¹¹ ABDALLAH 04C looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{t}c$ or $\bar{t}u$ in 541 pb⁻¹ of data at $\sqrt{s} = 189$ –208 GeV. No deviation from the SM is found, which leads to the bound on $B(t \rightarrow Zq)$, where q is a u or a c quark, for $m_t = 175$ GeV when $B(t \rightarrow \gamma q) = 0$ is assumed. The conversion to the listed bound is from private communication, O. Yushchenko, April 2005. The bounds on the effective t - q - γ and t - q - Z couplings are given in their Fig. 7 and Table 4, for $m_t = 170$ –180 GeV, where most conservative bounds are found by choosing the chiral couplings to maximize the negative interference between the virtual γ and Z exchange amplitudes.
- ¹² ACHARD 02I looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{t}c$ or $\bar{t}u$ in 634 pb⁻¹ of data at $\sqrt{s} = 189$ –209 GeV. No deviation from the SM is found, which leads to a bound on the top-quark decay branching fraction $B(Zq)$, where q is a u or c quark. The bound assumes $B(\gamma q) = 0$ and is for $m_t = 175$ GeV; bounds for $m_t = 170$ GeV and 180 GeV and $B(\gamma q) \neq 0$ are given in Fig. 5 and Table 7. Table 6 gives constraints on t - c - e - e four-fermi contact interactions.
- ¹³ HEISTER 02Q looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{t}c$ or $\bar{t}u$ in 214 pb⁻¹ of data at $\sqrt{s} = 204$ –209 GeV. No deviation from the SM is found, which leads to a bound on the branching fraction $B(Zq)$, where q is a u or c quark. The bound assumes $B(\gamma q) = 0$ and is for $m_t = 174$ GeV. Bounds on the effective t -(c or u)- γ and t -(c or u)- Z couplings are given in their Fig. 2.
- ¹⁴ ABBIENDI 01T looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{t}c$ or $\bar{t}u$ in 600 pb⁻¹ of data at $\sqrt{s} = 189$ –209 GeV. No deviation from the SM is found, which leads to bounds on the branching fractions $B(Zq)$ and $B(\gamma q)$, where q is a u or c quark. The result is obtained for $m_t = 174$ GeV. The upper bound becomes 9.7% (20.6%) for $m_t = 169$ (179) GeV. Bounds on the effective t -(c or u)- γ and t -(c or u)- Z couplings are given in their Fig. 4.
- ¹⁵ BARATE 00s looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{t}c$ or $\bar{t}u$ in 411 pb⁻¹ of data at c.m. energies between 189 and 202 GeV. No deviation from the SM is found, which leads to a bound on the branching fraction. The bound assumes $B(\gamma q) = 0$. Bounds on the effective t -(c or u)- γ and t -(c or u)- Z couplings are given in their Fig. 4.
- ¹⁶ ABE 98G looked for $t\bar{t}$ events where one t decays into three jets and the other decays into qZ with $Z \rightarrow \ell\ell$. The quoted bound is for $\Gamma(Zq)/\Gamma(Wb)$.

1 AAD 20Y based on about 20 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$ for each experiment. The first error stands for the sum of the statistical and background uncertainties, and the second error for the remaining systematic uncertainties. The measurements used events with one lepton and different jet multiplicities in the final state. The result is consistent with the NNLO SM prediction of 0.687 ± 0.005 for $m_t = 172.8 \pm 1.3 \text{ GeV}$.

2 Based on 8.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ using $t\bar{t}$ events with $\ell + \cancel{E}_T + \geq 4$ jets ($\geq 1 b$), and under the constraint $F_0 + F_+ + F_- = 1$. The statistical errors of F_0 and F_+ are correlated with correlation coefficient $\rho(F_0, F_+) = -0.69$.

3 Based on 5.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. CHATRCHYAN 13BH studied tt events with large \cancel{E}_T and $\ell + \geq 4$ jets using a constrained kinematic fit.

4 Based on 1.04 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. AAD 12Bg studied tt events with large \cancel{E}_T and either $\ell + \geq 4j$ or $\ell\ell + \geq 2j$. The uncertainties are not independent, $\rho(F_0, F_-) = -0.96$.

5 Based on 2.7 and 5.1 fb^{-1} of CDF data in $\ell +$ jets and dilepton channels, and 5.4 fb^{-1} of D0 data in $\ell +$ jets and dilepton channels. $F_0 = 0.682 \pm 0.035 \pm 0.046$ if $F_+ = 0.0017(1)$, while $F_+ = -0.015 \pm 0.018 \pm 0.030$ if $F_0 = 0.688(4)$, where the assumed fixed values are the SM prediction for $m_t = 173.3 \pm 1.1 \text{ GeV}$ and $m_W = 80.399 \pm 0.023 \text{ GeV}$.

6 Results are based on 5.4 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV , including those of ABAZOV 08b. Under the SM constraint of $f_0 = 0.698$ (for $m_t = 173.3 \text{ GeV}$, $m_W = 80.399 \text{ GeV}$), $f_+ = 0.010 \pm 0.022 \pm 0.030$ is obtained.

7 AFFOLDER 00b studied the angular distribution of leptonic decays of W bosons in $t \rightarrow Wb$ events. The ratio F_0 is the fraction of the helicity zero (longitudinal) W bosons in the decaying top quark rest frame. $B(t \rightarrow W_+ b)$ is the fraction of positive helicity (right-handed) positive charge W bosons in the top quark decays. It is obtained by assuming the Standard Model value of F_0 .

8 AABOUD 17bb based on 20.2 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. Triple-differential decay rate of top quark in the t -channel single-top production is used to simultaneously determine five generalized Wtb couplings as well as the top polarization. No assumption is made for the other couplings. See this paper for constraints on other couplings not included here. The paper reported f_1 , and we converted it to F_0 .

9 KHACHATRYAN 16bu based on 19.8 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$ using $t\bar{t}$ events with $\ell + \cancel{E}_T + \geq 4$ jets ($\geq 2 b$). The errors of F_0 and F_- are correlated with a correlation coefficient $\rho(F_0, F_-) = -0.87$. The result is consistent with the NNLO SM prediction of 0.687 ± 0.005 for $m_t = 172.8 \pm 1.3 \text{ GeV}$.

10 Results are based on 2.07 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. F_0 result is obtained by assuming $F_+ = 0$, while F_+ result is obtained for $F_0 = 0.70$, the SM value. Model independent fits for the two fractions give $F_0 = 0.88 \pm 0.11 \pm 0.06$ and $F_+ = -0.15 \pm 0.07 \pm 0.06$ with correlation coefficient of -0.59 . The results are for $m_t = 175 \text{ GeV}$.

11 Results are based on 1.9 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. F_0 result is obtained assuming $F_+ = 0$, while F_+ result is obtained for $F_0 = 0.70$, the SM values. Model independent fits for the two fractions give $F_0 = 0.66 \pm 0.16 \pm 0.05$ and $F_+ = -0.03 \pm 0.06 \pm 0.03$.

12 Based on 1 fb^{-1} at $\sqrt{s} = 1.96 \text{ TeV}$.

13 Based on 318 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.

14 Based on 200 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. $t \rightarrow Wb \rightarrow \ell\nu b$ ($\ell = e$ or μ). The errors are stat + syst.

15 ABAZOV 05g studied the angular distribution of leptonic decays of W bosons in $t\bar{t}$ candidate events with lepton + jets final states, and obtained the fraction of longitudinally polarized W under the constraint of no right-handed current, $F_+ = 0$. Based on 125 pb^{-1} of data at $\sqrt{s} = 1.8 \text{ TeV}$.

1 AAD 20Y based on about 20 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$ for each experiment. The first error stands for the sum of the statistical and background uncertainties, and the second error for the remaining systematic uncertainties. The measurements used events with one lepton and different jet multiplicities in the final state. The result is consistent with the NNLO SM prediction of 0.311 ± 0.005 for $m_t = 172.8 \pm 1.3 \text{ GeV}$.

2 Based on 5.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. CHATRCHYAN 13BH studied tt events with large \cancel{E}_T and $\ell + \geq 4$ jets using a constrained kinematic fit.

3 Based on 1.04 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. AAD 12Bg studied tt events with large \cancel{E}_T and either $\ell + \geq 4j$ or $\ell\ell + \geq 2j$. The uncertainties are not independent, $\rho(F_0, F_-) = -0.96$.

4 AABOUD 17bb based on 20.2 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. Triple-differential decay rate of top quark in the t -channel single-top production is used to simultaneously determine five generalized Wtb couplings as well as the top polarization. No assumption is made for the other couplings. The authors reported $f_1 = 0.30 \pm 0.05$ and $f_1^+ < 0.120$ which we converted to $F_- = f_1(1 - f_1^+)$. See this paper for constraints on other couplings not included here.

5 KHACHATRYAN 16BU based on 19.8 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$ using $t\bar{t}$ events with $\ell + \cancel{E}_T + \geq 4$ jets ($\geq 2 b$). The errors of F_0 and F_- are correlated with a correlation coefficient $\rho(F_0, F_-) = -0.87$. The result is consistent with the NNLO SM prediction of 0.311 ± 0.005 for $m_t = 172.8 \pm 1.3 \text{ GeV}$.

1 AAD 20Y based on about 20 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$ for each experiment. The first error stands for the sum of the statistical and background uncertainties, and the second error for the remaining systematic uncertainties. The measurements used events with one lepton and different jet multiplicities in the final state. The result is estimated from the measurements of F_0 and F_- assuming unitarity. The value is consistent with the NNLO SM prediction of 0.0017 ± 0.0001 for $m_t = 172.8 \pm 1.3 \text{ GeV}$.

2 Based on 8.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ using $t\bar{t}$ events with $\ell + \cancel{E}_T + \geq 4$ jets ($\geq 1 b$), and under the constraint $F_0 + F_+ + F_- = 1$. The statistical errors of F_0 and F_+ are correlated with correlation coefficient $\rho(F_0, F_+) = -0.69$.

3 Based on 5.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. CHATRCHYAN 13BH studied tt events with large \cancel{E}_T and $\ell + \geq 4$ jets using a constrained kinematic fit.

4 Based on 1.04 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. AAD 12Bg studied tt events with large \cancel{E}_T and either $\ell + \geq 4j$ or $\ell\ell + \geq 2j$.

5 Results are based on 5.4 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV , including those of ABAZOV 08b. Under the SM constraint of $f_0 = 0.698$ (for $m_t = 173.3 \text{ GeV}$, $m_W = 80.399 \text{ GeV}$), $f_+ = 0.010 \pm 0.022 \pm 0.030$ is obtained.

6 AFFOLDER 00b studied the angular distribution of leptonic decays of W bosons in $t \rightarrow Wb$ events. The ratio F_0 is the fraction of the helicity zero (longitudinal) W bosons in the decaying top quark rest frame. $B(t \rightarrow W_+ b)$ is the fraction of positive helicity (right-handed) positive charge W bosons in the top quark decays. It is obtained by assuming the Standard Model value of F_0 .

7 AABOUD 17bb based on 20.2 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. Triple-differential decay rate of top quark in the t -channel single-top production is used to simultaneously determine five generalized Wtb couplings as well as the top polarization. No assumption is made for the other couplings. The authors reported $f_1 = 0.30 \pm 0.05$ and $f_1^+ < 0.120$ which we converted to $F_+ = f_1 f_1^+$. See this paper for constraints on other couplings not included here.

8 KHACHATRYAN 16BU based on 19.8 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$ using $t\bar{t}$ events with $\ell + \cancel{E}_T + \geq 4$ jets ($\geq 2 b$). The result is consistent with the NNLO SM prediction of 0.0017 ± 0.0001 for $m_t = 172.8 \pm 1.3 \text{ GeV}$.

9 Based on 2.7 and 5.1 fb^{-1} of CDF data in $\ell +$ jets and dilepton channels, and 5.4 fb^{-1} of D0 data in $\ell +$ jets and dilepton channels. $F_0 = 0.682 \pm 0.035 \pm 0.046$ if $F_+ = 0.0017(1)$, while $F_+ = -0.015 \pm 0.018 \pm 0.030$ if $F_0 = 0.688(4)$, where the assumed fixed values are the SM prediction for $m_t = 173.3 \pm 1.1 \text{ GeV}$ and $m_W = 80.399 \pm 0.023 \text{ GeV}$.

10 Results are based on 2.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. F_0 result is obtained by assuming $F_+ = 0$, while F_+ result is obtained for $F_0 = 0.70$, the SM value. Model independent fits for the two fractions give $F_0 = 0.88 \pm 0.11 \pm 0.06$ and $F_+ = -0.15 \pm 0.07 \pm 0.06$ with correlation coefficient of -0.59 . The results are for $m_t = 175 \text{ GeV}$.

11 Results are based on 1.9 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. F_0 result is obtained assuming $F_+ = 0$, while F_+ result is obtained for $F_0 = 0.70$, the SM values. Model independent fits for the two fractions give $F_0 = 0.66 \pm 0.16 \pm 0.05$ and $F_+ = -0.03 \pm 0.06 \pm 0.03$.

12 Based on 1 fb^{-1} at $\sqrt{s} = 1.96 \text{ TeV}$.

13 Based on 370 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$, using the $\ell +$ jets and dilepton decay channels. The result assumes $F_0 = 0.70$, and it gives $F_+ < 0.23$ at 95% CL.

14 Based on 318 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.

15 Based on 200 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. $t \rightarrow Wb \rightarrow \ell\nu b$ ($\ell = e$ or μ). The errors are stat + syst.

Quark Particle Listings

 t

- ¹⁶ ABAZOV 05L studied the angular distribution of leptonic decays of W bosons in $t\bar{t}$ events, where one of the W 's from t or \bar{t} decays into e or μ and the other decays hadronically. The fraction of the “+” helicity W boson is obtained by assuming $F_0 = 0.7$, which is the generic prediction for any linear combination of V and A currents. Based on $230 \pm 15 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- ¹⁷ ACOSTA 05D measures the $m_{\ell^+b}^2$ distribution in $t\bar{t}$ production events where one or both W 's decay leptonically to $\ell = e$ or μ , and finds a bound on the V+A coupling of the tbW vertex. By assuming the SM value of the longitudinal W fraction $F_0 = B(t \rightarrow W_0 b) = 0.70$, the bound on F_+ is obtained. If the results are combined with those of AFFOLDER 00B, the bounds become $F_{V+A} < 0.61$ (95% CL) and $F_+ < 0.18$ (95% CL), respectively. Based on $109 \pm 7 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.8 \text{ TeV}$ (run I).

Spin Correlation in $t\bar{t}$ Production in $p\bar{p}$ Collisions

C is the correlation strength parameter, f is the ratio of events with correlated t and \bar{t} spins (SM prediction: $f = 1$), and κ is the spin correlation coefficient. See "The Top Quark" review for more information.

¹ ABAZOV 16A based on 9.7 fb^{-1} of data. A matrix element method is used. It corresponds to evidence of spin correlation at 4.2σ and is in agreement with the NLO SM prediction 0.80 ± 0.01 $_{-0.02}^{+0.02}$.

² This is a combination of the lepton + jets analysis presented in ABAZOV 12B and the dilepton measurement of ABAZOV 11AE. It provides a 3.1σ evidence for the $t\bar{t}$ spin correlation.

³ Based on 5.3 fb^{-1} of data. The error is statistical and systematic combined. A matrix element method is used.

⁴ Based on 4.3 fb^{-1} of data. The measurement is based on the angular study of the top quark decay products in the helicity basis. The theory prediction is $\kappa \approx 0.40$.

⁵ Based on 5.4 fb^{-1} of data using a matrix element method. The error is statistical and systematic combined. The no-correlation hypothesis is excluded at the 97.7% CL.

⁶ Based on 5.4 fb^{-1} of data. The error is statistical and systematic combined. The NLO QCD prediction is $C = 0.78 \pm 0.03$. The neutrino weighting method is used for reconstruction of kinematics.

Spin Correlation in $t\bar{t}$ Production in pp Collisions

Spin correlation, f_{SM} , measures the strength of the correlation between the spins of the pair produced $t\bar{t}$. $f_{SM} = 1$ for the SM, while $f_{SM} = 0$ for no spin correlation.

¹ KHACHATRYAN 17G based on 5.0 and 19.7 fb^{-1} of pp data at $\sqrt{s} = 7$ and 8 TeV , respectively. t -channel single top production is used. The result corresponds to $B(t \rightarrow ug) < 2.0 \times 10^{-5}$ or $B(t \rightarrow cg) < 4.1 \times 10^{-4}$.

² AAD 16As based on 20.3 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. The results are obtained from the 95% CL upper limit on the single top-quark production $\sigma(qg \rightarrow t) \cdot B(t \rightarrow bW) < 3.4 \text{ pb}$, $B(t \rightarrow ug) < 4.0 \times 10^{-5}$ and $B(t \rightarrow cg) < 20 \times 10^{-5}$.

³ Based on 2.05 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. The results are obtained from the 95% CL upper limit on the single top-quark production $\sigma(qg \rightarrow t) \cdot B(t \rightarrow bW) < 3.9 \text{ pb}$, for $q = u$ or $q = c$, $B(t \rightarrow ug) < 5.7 \times 10^{-5}$ and $B(t \rightarrow cg) < 2.7 \times 10^{-4}$.

⁴ Based on 2.3 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Upper limit of single top quark production cross section 0.20 pb and 0.27 pb via FCNC t - u - g and t - c - g couplings, respectively, lead to the bounds without assuming the absence of the other coupling. $B(t \rightarrow ug) < 2.0 \times 10^{-4}$ and $B(t \rightarrow cg) < 3.9 \times 10^{-3}$ follow.

⁵ Based on 2.2 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Upper limit of single top quark production cross section $\sigma(u(c) + g \rightarrow t) < 1.8 \text{ pb}$ (95% CL) via FCNC t - u - g and t - c - g couplings lead to the bounds. $B(t \rightarrow ug) < 3.9 \times 10^{-4}$ and $B(t \rightarrow cg) < 5.7 \times 10^{-3}$ follow.

⁶ Result is based on 230 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Absence of single top quark production events via FCNC t - u - g and t - c - g couplings lead to the upper bounds on the dimensioned couplings, κ^{utg}/Λ and κ^{ctg}/Λ , respectively.

Quark Particle Listings

 t **t -Quark Yukawa Coupling from $t\bar{t}$ Kinematic Distributions in pp Collisions**The ratio of t -quark Yukawa coupling to its standard model predicted value.

¹ AAD 20z based on 139 fb^{-1} of pp data at 13 TeV . Assuming a CP -even coupling the $t\bar{t}H$ process is observed with a significance of 5.2σ , and the measured $\sigma_{t\bar{t}H} \cdot B_{\gamma\gamma} = 1.64^{+0.38+0.17}_{-0.36-0.14} \text{ fb}$. A CP -mixing angle $|\alpha| > 43^\circ$ is excluded at 95% CL.

² SIRUNYAN 20As based on 137 fb^{-1} of pp data at 13 TeV . The $t\bar{t}H$ process is observed with a significance of 6.6σ , and the measured $\sigma_{t\bar{t}H} \cdot B_{\gamma\gamma} = 1.56^{+0.33+0.09}_{-0.30-0.08} \text{ fb}$. The fractional contribution of the CP -odd component is measured to be $f_{CP}^{t\bar{t}H} = 0.00 \pm 0.33$.

³ SIRUNYAN 19R based on 35.9 fb^{-1} of pp data at 13 TeV . Multivariate techniques are employed to separate the signal from the dominant $t\bar{t}$ +jets background. The result is for $m_H = 125 \text{ GeV}$. The measured ratio corresponds to a signal significance of 1.6σ above the background-only hypothesis.

⁴ SIRUNYAN 18BD based on 35.9 fb^{-1} of pp data at 13 TeV . A combined fit of signal and background templates to data is performed in six event categories separated by jet and b -jet multiplicities. An upper limit of 3.8 is obtained for the cross section ratio.

⁵ SIRUNYAN 18L based on up to $5.1, 19.7$, and 35.9 fb^{-1} of pp data at $7, 8$, and 13 TeV , respectively. An excess of events is observed, with a significance of 5.2 standard deviations, over the expectation from the background-only hypothesis. The result is for the Higgs boson mass of 125.09 GeV .

⁶ Based on 4.5 fb^{-1} of data at 7 TeV and 20.3 fb^{-1} at 8 TeV . The result is for $m_H = 125.4 \text{ GeV}$. The measurement constrains the top quark Yukawa coupling strength parameter $\kappa_t = Y_t/Y_t^{SM}$ to be $-1.3 < \kappa_t < 8.0$ (95% CL).

⁷ Based on 5.1 fb^{-1} of pp data at 7 TeV and 19.7 fb^{-1} at 8 TeV . The results are obtained by assuming the SM decay branching fractions for the Higgs boson of mass 125.6 GeV . The signal strength for individual Higgs decay channels are given in Fig. 13, and the preferred region in the (κ_V, κ_f) space is given in Fig. 14.

Single t -Quark Production Cross Section in $p\bar{p}$ Collisions at $\sqrt{s} = 1.8 \text{ TeV}$ Direct probe of the $t\bar{t}W$ coupling and possible new physics at $\sqrt{s} = 1.8 \text{ TeV}$.

¹ AALTONEN 16 based on 9.5 fb^{-1} of data. This includes, as a part, the result of AALTONEN 14K. Combination of this result with that of AALTONEN 14o gives a s + t cross section of $3.02^{+0.49}_{-0.48} \text{ pb}$ and $|V_{tb}| > 0.84$ (95% CL).

² AALTONEN 15H based on 9.7 fb^{-1} of data per experiment. The result is for $m_t = 172.5 \text{ GeV}$, and is a combination of the CDF measurements (AALTONEN 16) and the D0 measurements (ABAZOV 13o) on the t -channel single t -quark production cross section. The result is consistent with the NLO+NNLL SM prediction and gives $|V_{tb}| = 1.02^{+0.06}_{-0.05}$ and $|V_{tb}| > 0.92$ (95% CL).

³ AALTONEN 15H is a combined measurement of s -channel single top cross section by CDF + D0. AALTONEN 14M is not included.

⁴ Based on 9.45 fb^{-1} of data, using neural networks to separate signal from backgrounds. The result is for $m_t = 172.5 \text{ GeV}$. Combination of this result with the CDF measurement in the 1 lepton channel AALTONEN 14L gives $1.36^{+0.37}_{-0.32} \text{ pb}$, consistent with the SM prediction, and is 4.2 sigma away from the background only hypothesis.

⁵ Based on 9.4 fb^{-1} of data, using neural networks to separate signal from backgrounds. The result is for $m_t = 172.5 \text{ GeV}$. The result is 3.8 sigma away from the background only hypothesis.

⁶ Based on 9.7 fb^{-1} of data per experiment. The result is for $m_t = 172.5 \text{ GeV}$, and is a combination of the CDF measurements AALTONEN 14L, AALTONEN 14K and the D0 measurement ABAZOV 13o on the s -channel single t -quark production cross section. The result is consistent with the SM prediction of $1.05 \pm 0.06 \text{ pb}$ and the significance of the observation is of 6.3 standard deviations.

⁷ Based on 7.5 fb^{-1} of data. Neural network is used to discriminate signals (s -, t - and Wt -channel single top production) from backgrounds. The result is consistent with the SM prediction, and gives $|V_{tb}| = 0.95 \pm 0.09(\text{stat} + \text{syst}) \pm 0.05(\text{theory})$ and $|V_{tb}| > 0.78$ (95% CL). The result is for $m_t = 172.5 \text{ GeV}$.

⁸ Based on 9.7 fb^{-1} of data. Events with $\ell + \cancel{E}_T + 2$ or 3 jets (1 or 2 b -tag) are analysed, assuming $m_t = 172.5 \text{ GeV}$. The combined s - + t -channel cross section gives $|V_{tb}| f_1^L = 1.12^{+0.09}_{-0.08}$, or $|V_{tb}| > 0.92$ at 95% CL for $f_1^L = 1$ and a flat prior within $0 \leq |V_{tb}|^2 \leq 1$.

⁹ Based on 5.4 fb^{-1} of data. The error is statistical + systematic combined. The results are for $m_t = 172.5 \text{ GeV}$. Results for other m_t values are given in Table 2 of ABAZOV 11AA.

¹⁰ Based on 5.4 fb^{-1} of data and for $m_t = 172.5 \text{ GeV}$. The error is statistical + systematic combined. Results for other m_t values are given in Table III of ABAZOV 11AD. The result is obtained by assuming the SM ratio between $t\bar{t}$ (s -channel) and $tq\bar{b}$ (t -channel) productions, and gives $|V_{tb}| f_1^L = 1.02^{+0.10}_{-0.11}$, or $|V_{tb}| > 0.79$ at 95% CL for a flat prior within $0 < |V_{tb}|^2 < 1$.

¹¹ Based on 3.2 fb^{-1} of data. For combined s - + t -channel result see AALTONEN 09AT.

¹² Result is based on 2.1 fb^{-1} of data. Events with large missing E_T and jets with at least one b -jet without identified electron or muon are selected. Result is obtained when observed 2.1σ excess over the background originates from the signal for $m_t = 175 \text{ GeV}$, giving $|V_{tb}| = 1.24^{+0.34}_{-0.29} \pm 0.07(\text{theory})$.

¹³ Result is based on 2.3 fb^{-1} of data. Events with isolated $\ell + \cancel{E}_T + 2, 3, 4$ jets with one or two b -tags are selected. The analysis assumes $m_t = 170 \text{ GeV}$.

¹⁴ Result is based on 4.8 fb^{-1} of data. Events with an isolated reconstructed tau lepton, missing $E_T + 2, 3$ jets with one or two b -tags are selected. When combined with ABAZOV 09Z result for $e + \mu$ channels, the s - and t -channels combined cross section is $3.84^{+0.89}_{-0.83} \text{ pb}$.

¹⁵ Based on 3.2 fb^{-1} of data. Events with isolated $\ell + \cancel{E}_T$ + jets with at least one b -tag are analyzed and s - and t -channel single top events are selected by using the likelihood function, matrix element, neural-network, boosted decision tree, likelihood function optimized for s -channel process, and neural-network based analysis of events with \cancel{E}_T that has sensitivity for $W \rightarrow \tau\nu$ decays. The result is for $m_t = 175 \text{ GeV}$, and the mean value decreases by 0.02 pb/GeV for smaller m_t . The signal has 5.0

Quark Particle Listings

t

- ¹ TUMASYAN 21E based on 36 fb^{-1} of data. A boosted decision tree is used to separate the signal from the dominant $t\bar{t}$ backgrounds. The result corresponds to an observation with a significance exceeding 5σ and is consistent with the NNLO QCD prediction of $71.7 \pm 1.8(\text{scale}) \pm 3.4(\text{PDF}) \text{ pb}$ or with the approximate NNNLO SM prediction of $79.5^{+1.9}_{-1.8}(\text{scale}) \pm 2.0(\text{PDF}) \text{ pb}$.
- ² AABOUD 18H based on 3.2 fb^{-1} of data. The last error is from luminosity. A multivariate analysis is used to separate the signal from the backgrounds. The result is consistent with the NLO+NNLL SM prediction of $71.7 \pm 1.8(\text{scale}) \pm 3.4(\text{PDF}) \text{ pb}$.
- ³ SIRUNYAN 18DL based on 35.9 fb^{-1} of data. The last error is from luminosity. A multivariate analysis is used to separate the signal from the backgrounds. The result is consistent with the NLO+NNLL SM prediction of $71.7 \pm 1.8(\text{scale}) \pm 3.4(\text{PDF}) \text{ pb}$.

Z t Production Cross Section in pp Collisions at $\sqrt{s} = 13 \text{ TeV}$

$123 \pm 33 \pm 29$	⁴ SIRUNYAN	18Z CMS	$3\ell + 1j + 1b_j$

- ¹ AAD 20AB based on 139 fb^{-1} of data at 13 TeV. Neural networks are used to discriminate tZq signal from backgrounds. The result is for the cross section $\sigma(pp \rightarrow t\ell^+\ell^-q)$, including non-resonant dilepton pairs, for dilepton invariant masses above 30 GeV and is consistent with the NLO SM prediction of 102^{+5}_{-2} fb .
- ² SIRUNYAN 19BF based on 77.4 fb^{-1} of data. Two BDT's are used in the analysis: one to discriminate prompt leptons from non-prompt ones; and one to discriminate tZq signal from backgrounds. The result is for the cross section $\sigma(pp \rightarrow tZq \rightarrow t\ell^+\ell^-q)$ for dilepton invariant masses above 30 GeV and is consistent with the NLO SM prediction of $94.2 \pm 3.1 \text{ fb}$.
- ³ AABOUD 18AE based on 36.1 fb^{-1} of data. A multivariate analysis is used to separate the signal from the backgrounds. The result is consistent with the NLO SM prediction of 800 fb with a scale uncertainty of $+6.1\%$.
- ⁴ SIRUNYAN 18Z based on 35.9 fb^{-1} of data. A multivariate analysis is used to separate the signal from the backgrounds. The result is for the cross section $\sigma(pp \rightarrow tZq \rightarrow Wb\ell^+\ell^-q)$ and is consistent with the NLO SM prediction of $94.2^{+1.9}_{-1.8}(\text{scale}) \pm 2.5(\text{PDF}) \text{ fb}$. Superseded by SIRUNYAN 19BF.

Single t-Quark Production Cross Section in ep Collisions

••• We do not use the following data for averages, fits, limits, etc. •••				
<0.25	95	¹ AARON	09A H1	$e^\pm p \rightarrow e^\pm tX$
<0.55	95	² AKTAS	04 H1	$e^\pm p \rightarrow e^\pm tX$
<0.225	95	³ CHEKANOV	03 ZEUS	$e^\pm p \rightarrow e^\pm tX$

- ¹ AARON 09A looked for single top production via FCNC in $e^\pm p$ collisions at HERA with 474 pb^{-1} of data at $\sqrt{s} = 301\text{--}319 \text{ GeV}$. The result supersedes that of AKTAS 04.
- ² AKTAS 04 looked for single top production via FCNC in e^\pm collisions at HERA with 118.3 pb^{-1} , and found 5 events in the e or μ channels while 1.31 ± 0.22 events are expected from the Standard Model background. No excess was found for the hadronic channel. The observed cross section of $\sigma(ep \rightarrow e tX) = 0.29^{+0.15}_{-0.14} \text{ pb}$ at $\sqrt{s} = 319 \text{ GeV}$ gives the quoted upper bound if the observed events are due to statistical fluctuation.
- ³ CHEKANOV 03 looked in 130.1 pb^{-1} of data at $\sqrt{s} = 301$ and 318 GeV . The limit is for $\sqrt{s} = 318 \text{ GeV}$ and assumes $m_t = 175 \text{ GeV}$.

 $t\bar{t}$ Production Cross Section in $p\bar{p}$ Collisions at $\sqrt{s} = 1.8 \text{ TeV}$

Only the final combined $t\bar{t}$ production cross sections obtained from Tevatron Run I by the CDF and D0 experiments are quoted below.

- ¹ ABAZOV 16F based on 9.7 fb^{-1} of data. The result is for $m_t = 172.5 \text{ GeV}$, and the m_t dependence is shown in Table V and Fig. 9. The result agrees with the NNLO+NNLL SM prediction of $7.35^{+0.23}_{-0.27} \text{ pb}$.
- ² Based on 9 fb^{-1} of data. The measurement is in the channel $t\bar{t} \rightarrow (b\ell\nu)(b\tau\nu)$, where τ decays into hadrons (τ_h), and ℓ (e or μ) include ℓ from τ decays (τ_ℓ). The result is for $m_t = 173 \text{ GeV}$.
- ³ Based on 8.8 fb^{-1} of data. Combination of CDF and D0 measurements given, respectively, by $\sigma(t\bar{t}; \text{CDF}) = 7.63 \pm 0.31 \pm 0.36 \pm 0.16 \text{ pb}$, $\sigma(t\bar{t}; \text{D0}) = 7.56 \pm 0.20 \pm 0.32 \pm 0.46 \text{ pb}$. All the results are for $m_t = 172.5 \text{ GeV}$. The m_t dependence of the mean value is parametrized in eq. (1) and shown in Fig. 2.
- ⁴ Based on 9.7 fb^{-1} of data. Differential cross sections with respect to $m_{t\bar{t}}$, $|y(\text{top})|$, $E_T(\text{top})$ are shown in Figs. 9, 10, 11, respectively, and are compared to the predictions of MC models.
- ⁵ Based on 8.8 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$.
- ⁶ Based on 8.7 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Measure the $t\bar{t}$ cross section simultaneously with the fraction of $t \rightarrow Wb$ decays. The correlation coefficient between those two measurements is -0.434 . Assume unitarity of the 3×3 CKM matrix and set $|V_{tb}| > 0.89$ at 95% CL.
- ⁷ Based on 2.2 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV. The result assumes the acceptance for $m_t = 172.5 \text{ GeV}$.
- ⁸ Based on 1.12 fb^{-1} and assumes $m_t = 175 \text{ GeV}$, where the cross section changes by $\pm 0.1 \text{ pb}$ for every $\pm 1 \text{ GeV}$ shift in m_t . AALTONEN 11D fits simultaneously the $t\bar{t}$ production cross section and the b-tagging efficiency and find improvements in both measurements.
- ⁹ Based on 2.7 fb^{-1} . The first error is from statistics and systematics, the second is from luminosity. The result is for $m_t = 175 \text{ GeV}$. AALTONEN 11W fits simultaneously a jet flavor discriminator between b-, c-, and light-quarks, and find significant reduction in the systematic error.
- ¹⁰ Based on 2.2 fb^{-1} . The result is for $m_t = 172.5 \text{ GeV}$. AALTONEN 11Y selects multi-jet events with large \cancel{E}_T , and vetoes identified electrons and muons.
- ¹¹ Based on 5.3 fb^{-1} . The error is statistical + systematic + luminosity combined. The result is for $m_t = 172.5 \text{ GeV}$. The results for other m_t values are given in Table XII and eq.(10) of ABAZOV 11E.
- ¹² Combination of a dilepton measurement presented in ABAZOV 11Z (based on 5.4 fb^{-1}), which yields $7.36^{+0.90}_{-0.79}$ (stat+syst) pb, and the lepton + jets measurement of ABAZOV 11E. The result is for $m_t = 172.5 \text{ GeV}$. The results for other m_t values is given by eq.(5) of ABAZOV 11A.
- ¹³ Based on 2.8 fb^{-1} . The result is for $m_t = 175 \text{ GeV}$.
- ¹⁴ Based on 2.9 fb^{-1} . Result is obtained from the fraction of signal events in the top quark mass measurement in the all hadronic decay channel.
- ¹⁵ Based on 1.7 fb^{-1} . The result is for $m_t = 175 \text{ GeV}$. AALTONEN 10V uses soft electrons from b-hadron decays to suppress $W + \text{jets}$ background events.
- ¹⁶ Based on 4.6 fb^{-1} . The result is for $m_t = 172.5 \text{ GeV}$. The ratio $\sigma(t\bar{t} \rightarrow \ell + \text{jets}) / \sigma(Z/\gamma^* \rightarrow \ell\ell)$ is measured and then multiplied by the theoretical $Z/\gamma^* \rightarrow \ell\ell$ cross section of $\sigma(Z/\gamma^* \rightarrow \ell\ell) = 251.3 \pm 5.0 \text{ pb}$, which is free from the luminosity error.

¹⁷ Based on 1 fb^{-1} . The result is for $m_t = 175 \text{ GeV}$. $7.9 \pm 2.3 \text{ pb}$ is found for $m_t = 170 \text{ GeV}$. ABAZOV 10i uses a likelihood discriminant to separate signal from background, where the background model was created from lower jet-multiplicity data.

¹⁸ Based on 1 fb^{-1} . The result is for $m_t = 170 \text{ GeV}$. For $m_t = 175 \text{ GeV}$, the result is $6.3^{+1.2}_{-1.1}(\text{stat}) \pm 0.7(\text{syst}) \pm 0.4(\text{lumi}) \text{ pb}$. Cross section of $t\bar{t}$ production has been measured in the $t\bar{t} \rightarrow \tau_h + \text{jets}$ topology, where τ_h denotes hadronically decaying τ leptons. The result for the cross section times the branching ratio is $\sigma(t\bar{t}) \cdot \text{B}(t\bar{t} \rightarrow \tau_h + \text{jets}) = 0.60^{+0.23+0.15}_{-0.22-0.14} \pm 0.04 \text{ pb}$ for $m_t = 170 \text{ GeV}$.

¹⁹ Based on 1.1 fb^{-1} . The result is for $\text{B}(W \rightarrow \ell\nu) = 10.8\%$ and $m_t = 175 \text{ GeV}$; the mean value is 9.8 for $m_t = 172.5 \text{ GeV}$ and 10.1 for $m_t = 170 \text{ GeV}$. AALTONEN 09AD used high p_T e or μ with an isolated track to select $t\bar{t}$ decays into dileptons including $\ell = \tau$. The result is based on the candidate event samples with and without vertex b -tag.

²⁰ Based on 2 fb^{-1} . The result is for $m_t = 175 \text{ GeV}$; the mean value is 3% higher for $m_t = 170 \text{ GeV}$ and 4% lower for $m_t = 180 \text{ GeV}$.

²¹ Result is based on 1 fb^{-1} of data. The result is for $m_t = 170 \text{ GeV}$, and the mean value decreases with increasing m_t ; see their Fig. 2. The result is obtained after combining $\ell + \text{jets}$, $\ell\ell$, and $\ell\tau$ final states, and the ratios of the extracted cross sections are $R^{\ell\ell/\ell j} = 0.86^{+0.19}_{-0.17}$ and $R^{\ell\tau/\ell\ell-\ell j} = 0.97^{+0.32}_{-0.29}$, consistent with the SM expectation of $R = 1$. This leads to the upper bound of $\text{B}(t \rightarrow bH^+)$ as a function of m_{H^+} . Results are shown in their Fig. 1 for $\text{B}(H^+ \rightarrow \tau\nu) = 1$ and $\text{B}(H^+ \rightarrow c\bar{s}) = 1$ cases. Comparison of the m_t dependence of the extracted cross section and a partial NNLO prediction gives $m_t = 169.1^{+5.9}_{-5.2} \text{ GeV}$.

²² Result is based on 1 fb^{-1} of data. The result is for $m_t = 170 \text{ GeV}$, and the mean value changes by $-0.07 [m_t(\text{GeV}) - 170] \text{ pb}$ near the reference m_t value. Comparison of the m_t dependence of the extracted cross section and a partial NNLO QCD prediction gives $m_t = 171.5^{+9.9}_{-8.8} \text{ GeV}$. The $\ell\tau$ channel alone gives $7.6^{+4.9+3.5+1.4}_{-4.3-3.4-0.9} \text{ pb}$ and the $\ell\ell$ channel gives $7.5^{+1.2+0.7+0.7}_{-1.1-0.6-0.5} \text{ pb}$.

²³ Result is based on 0.9 fb^{-1} of data. The first error is from stat + syst, while the latter error is from luminosity. The result is for $m_t = 175 \text{ GeV}$, and the mean value changes by $-0.09 \text{ pb} [m_t(\text{GeV}) - 175]$.

²⁴ Result is based on 0.9 fb^{-1} of data. The cross section is obtained from the $\ell + \geq 3$ jet event rates with 1 or 2 b -tag, and also from the kinematical likelihood analysis of the $\ell + 3, 4$ jet events. The result is for $m_t = 172.6 \text{ GeV}$, and its m_t dependence shown in Fig. 3 leads to the constraint $m_t = 170 \pm 7 \text{ GeV}$ when compared to the SM prediction.

²⁵ Result is based on 360 pb^{-1} of data. Events with high p_T oppositely charged dileptons $\ell^+\ell^-$ ($\ell = e, \mu$) are used to obtain cross sections for $t\bar{t}$, W^+W^- , and $Z \rightarrow \tau^+\tau^-$ production processes simultaneously. The other cross sections are given in Table IV.

²⁶ Based on 1.02 fb^{-1} of data. Result is for $m_t = 175 \text{ GeV}$. Secondary vertex b -tag and neural network selections are used to achieve a signal-to-background ratio of about 1/2.

²⁷ Based on 425 pb^{-1} of data. Result is for $m_t = 175 \text{ GeV}$. For $m_t = 170.9 \text{ GeV}$, $7.8 \pm 1.8(\text{stat} + \text{syst}) \text{ pb}$ is obtained.

²⁸ Based on $405 \pm 25 \text{ pb}^{-1}$ of data. Result is for $m_t = 175 \text{ GeV}$. The last error is for luminosity. Secondary vertex b -tag and neural network are used to separate the signal events from the background.

²⁹ Based on 425 pb^{-1} of data. Assumes $m_t = 175 \text{ GeV}$.

³⁰ Based on $\sim 425 \text{ pb}^{-1}$. Assuming $m_t = 175 \text{ GeV}$. The first error is combined statistical and systematic, the second one is luminosity.

³¹ Based on $\sim 318 \text{ pb}^{-1}$. Assuming $m_t = 178 \text{ GeV}$. The cross section changes by $\pm 0.08 \text{ pb}$ for each $\mp \text{ GeV}$ change in the assumed m_t . Result is for at least one b -tag. For at least two b -tagged jets, $t\bar{t}$ signal of significance greater than 5σ is found, and the cross section is $10.1^{+1.6+2.0}_{-1.4-1.3} \text{ pb}$ for $m_t = 178 \text{ GeV}$.

³² Based on $\sim 311 \text{ pb}^{-1}$. Assuming $m_t = 178 \text{ GeV}$. For $m_t = 175 \text{ GeV}$, the result is $6.0 \pm 1.2^{+0.9}_{-0.7}$. This is the first CDF measurement without lepton identification, and hence it has sensitivity to the $W \rightarrow \tau\nu$ mode.

³³ ABULENCIA 06E measures the $t\bar{t}$ production cross section in the all hadronic decay mode by selecting events with 6 to 8 jets and at least one b -jet. $S/B = 1/5$ has been achieved. Based on 311 pb^{-1} . Assuming $m_t = 178 \text{ GeV}$.

³⁴ Based on $\sim 318 \text{ pb}^{-1}$. Assuming $m_t = 178 \text{ GeV}$. Result is for at least one b -tag. For at least two b -tagged jets, the cross section is $11.1^{+2.3+2.5}_{-1.9-1.9} \text{ pb}$.

³⁵ ABAZOV 05q measures the top-quark pair production cross section with $\sim 230 \text{ pb}^{-1}$ of data, based on the analysis of W plus n -jet events where W decays into e or μ plus neutrino, and at least one of the jets is b -jet like. The first error is statistical and systematic, and the second accounts for the luminosity uncertainty. The result assumes $m_t = 175 \text{ GeV}$; the mean value changes by $(175 - m_t(\text{GeV})) \times 0.06 \text{ pb}$ in the mass range 160 to 190 GeV.

³⁶ ABAZOV 05r measures the top-quark pair production cross section with $224\text{--}243 \text{ pb}^{-1}$ of data, based on the analysis of events with two charged leptons in the final state. The result assumes $m_t = 175 \text{ GeV}$; the mean value changes by $(175 - m_t(\text{GeV})) \times 0.08 \text{ pb}$ in the mass range 160 to 190 GeV.

³⁷ Based on 230 pb^{-1} . Assuming $m_t = 175 \text{ GeV}$.

³⁸ Based on 194 pb^{-1} . Assuming $m_t = 175 \text{ GeV}$.

³⁹ Based on $194 \pm 11 \text{ pb}^{-1}$. Assuming $m_t = 175 \text{ GeV}$.

⁴⁰ Based on $162 \pm 10 \text{ pb}^{-1}$. Assuming $m_t = 175 \text{ GeV}$.

⁴¹ ACOSTA 05v measures the top-quark pair production cross section with $\sim 162 \text{ pb}^{-1}$ data, based on the analysis of W plus n -jet events where W decays into e or μ plus neutrino, and at least one of the jets is b -jet like. Assumes $m_t = 175 \text{ GeV}$.

⁴² ACOSTA 04i measures the top-quark pair production cross section with $197 \pm 12 \text{ pb}^{-1}$ data, based on the analysis of events with two charged leptons in the final state. Assumes $m_t = 175 \text{ GeV}$.

Ratio of the Production Cross Sections of $t\bar{t}\gamma$ to $t\bar{t}$ at $\sqrt{s} = 1.96 \text{ TeV}$

VALUE	DOCUMENT ID	TECN	COMMENT
-------	-------------	------	---------

• • • We do not use the following data for averages, fits, limits, etc. • • •
 0.024 ± 0.009 ¹AALTONEN 11z CDF $E_T(\gamma) > 10 \text{ GeV}$, $|\eta(\gamma)| < 1.0$

¹ Based on 6.0 fb^{-1} of data. The error is statistical and systematic combined. Events with lepton + $E_T \geq 3 \text{ jets} (\geq 1b)$ with and without central, high E_T photon are measured. The result is consistent with the SM prediction of 0.024 ± 0.005 . The absolute production cross section is measured to be $0.18 \pm 0.08 \text{ fb}$. The statistical significance is 3.0 standard deviations.

¹ KHACHATRYAN 17B based on 5.0 fb^{-1} of data, using a binned likelihood fit of templates to the data. Also the ratio $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.43 \pm 0.04 \pm 0.07 \pm 0.05$ is reported. The results are in agreement with NNLO SM predictions.

² KHACHATRYAN 16AW based on 5.0 fb^{-1} of data, using a binned likelihood fit to differential distributions of b -tagged and non- b -tagged jets. The result is in good agreement with NNLO SM predictions.

³ Based on 4.6 fb^{-1} of data. Uses a template fit to distributions of E_{T+} and jet multiplicities to measure simultaneously $t\bar{t}$, WW , and $Z/\gamma^* \rightarrow \tau\tau$ cross sections, assuming $m_t = 172.5 \text{ GeV}$.

⁴ AAD 15CC based on 4.6 fb^{-1} of data. The event selection criteria are optimized for the $\ell\tau_h + \text{jets}$ channel. Using only this channel $183 \pm 9 \pm 23 \pm 3 \text{ pb}$ is derived for the cross section.

⁵ AAJJ 15R, based on 1.0 fb^{-1} of data, reports $0.239 \pm 0.053 \pm 0.033 \pm 0.024 \text{ pb}$ cross section for the forward fiducial region $p_T(\mu) > 25 \text{ GeV}$, $2.0 < \eta(\mu) < 4.5$, $50 \text{ GeV} < p_T(b) < 100 \text{ GeV}$, $2.2 < \eta(b) < 4.2$, $\Delta R(\mu, b) > 0.5$, and $p_T(\mu+b) > 20 \text{ GeV}$. The three errors are from statistics, systematics, and theory. The result agrees with the SM NNLO prediction.

⁶ AAD 14AY reports $182.9 \pm 3.1 \pm 4.2 \pm 3.6 \pm 3.3 \text{ pb}$ value based on 4.6 fb^{-1} of data. The four errors are from statistics, systematic, luminosity, and the 0.66% beam energy uncertainty. We have combined the systematic uncertainties in quadrature. The result is for $m_t = 172.5 \text{ GeV}$; for other m_t , $\sigma(m_t) = \sigma(172.5 \text{ GeV}) \times [1 - 0.0028 \times (m_t - 172.5 \text{ GeV})]$. The result is consistent with the SM prediction at NNLO.

⁷ Based on 1.67 fb^{-1} of data. The result uses the acceptance for $m_t = 172.5 \text{ GeV}$.

⁸ Based on 3.54 fb^{-1} of data.

⁹ Based on 2.3 fb^{-1} of data.

¹⁰ Based on 3.9 fb^{-1} of data.

¹¹ Based on 35 pb^{-1} of data for an assumed top quark mass of $m_t = 172.5 \text{ GeV}$.

¹² Based on 0.70 fb^{-1} of data. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for $m_t = 172.5 \text{ GeV}$.

¹³ Based on 35 pb^{-1} of data. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for $m_t = 172.5 \text{ GeV}$ and $173 \pm 17^{+18}_{-16} \pm 6 \text{ pb}$ is found without the b -tag.

¹⁴ Based on 2.05 fb^{-1} of data. The hadronic τ candidates are selected using a BDT technique. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for $m_t = 172.5 \text{ GeV}$.

¹⁵ Based on 2.0 fb^{-1} and 2.2 fb^{-1} of data for $\ell = e$ and $\ell = \mu$, respectively. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for $m_t = 172.5 \text{ GeV}$.

Quark Particle Listings

 t

- ¹⁶Based on 2.3 fb^{-1} of data. The 3 errors are from statistics, systematics, and luminosity. The result uses the profile likelihood-ratio (PLB) method and an assumed m_t of 172.5 GeV.
- ¹⁷Based on 2.9 pb^{-1} of data. The result for single lepton channels is $142 \pm 34^{+50}_{-31} \text{ pb}$, while for the dilepton channels is $151^{+78+37}_{-62-24} \text{ pb}$.
- ¹⁸Result is based on 36 pb^{-1} of data. The first uncertainty corresponds to the statistical and systematic uncertainties, and the second corresponds to the luminosity.
- ¹⁹Based on 36 pb^{-1} of data. The ratio of $t\bar{t}$ and Z/γ^* cross sections is measured as $\sigma(pp \rightarrow t\bar{t})/\sigma(pp \rightarrow Z/\gamma^* \rightarrow e^+e^-/\mu^+\mu^-) = 0.175 \pm 0.018(\text{stat}) \pm 0.015(\text{syst})$ for $60 < m_{\ell\ell} < 120 \text{ GeV}$, for which they use an NNLO prediction for the denominator cross section of $972 \pm 42 \text{ pb}$.
- ²⁰Result is based on 36 pb^{-1} of data. The first error is from statistical and systematic uncertainties, and the second from luminosity. This is a combination of a measurement in the dilepton channel (CHATRCHYAN 11F) and the measurement in the $\ell + \text{jets}$ channel (CHATRCHYAN 11Z) which yields $150 \pm 9 \pm 17 \pm 6 \text{ pb}$.
- ²¹Result is based on $3.1 \pm 0.3 \text{ pb}^{-1}$ of data.

 $t\bar{t}$ Production Cross Section in pp Collisions at $\sqrt{s} = 8 \text{ TeV}$

Unless otherwise noted the first quoted error is from statistics, the second from systematic uncertainties, and the third from luminosity. If only two errors are quoted the luminosity is included in the systematic uncertainties.

- ¹AABOUD 18BH based on 20.2 fb^{-1} of data. The result is for $m_t = 172.5 \text{ GeV}$. To reduce effects of uncertainties in the jet energy scale and b -tagging efficiency, they are included as nuisance parameters in the fit of discriminant distributions, after separating selected events into three regions. Furthermore the $W + \text{jets}$ background distribution is modelled using $Z + \text{jets}$ event data.
- ²AABOUD 17Z based on 20.2 fb^{-1} of data, using the mode $t\bar{t} \rightarrow \tau\nu q'\bar{q}b\bar{b}$ with τ decaying hadronically. Single prong and 3 prong decays of τ are separately analyzed. The result is consistent with the SM. The third quoted uncertainty is due to luminosity.
- ³KHACHATRYAN 17B based on 19.6 fb^{-1} of data, using a binned likelihood fit of templates to the data. Also the ratio $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.43 \pm 0.04 \pm 0.07 \pm 0.05$ is reported. The results are in agreement with NNLO SM predictions.
- ⁴AAD 16BK is an update of the value from AAD 14AY using the improved luminosity calibration. The value $242.9 \pm 1.7 \pm 5.5 \pm 5.1 \pm 4.2 \text{ pb}$ is reported, where we have combined the systematic uncertainties in quadrature. Also the ratio $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.328 \pm 0.024 \pm 0.015 \pm 0.038 \pm 0.001$ has been updated. The former result is consistent with the SM predictions at NNLO, while the latter result is 2.1σ below the expectation.
- ⁵KHACHATRYAN 16AW based on 19.7 fb^{-1} of data, using a binned likelihood fit to differential distributions of b -tagged and non- b -tagged jets. The result is in good agreement with NNLO SM predictions.
- ⁶KHACHATRYAN 16BC based on 18.4 fb^{-1} of data. The last uncertainty is due to luminosity. Cuts on kinematical fit probability and $\Delta R(b, b)$ are imposed. The major QCD background is determined from the data. The result is for $m_t = 172.5 \text{ GeV}$ and in agreement with the SM prediction. The top quark p_T spectra, also measured, are significantly softer than theoretical predictions.
- ⁷AAD 15BP based on 20.3 fb^{-1} of data. The result is for $m_t = 172.5 \text{ GeV}$ and in agreement with the SM prediction $253^{+13}_{-15} \text{ pb}$ at NNLO+NNLL. Superseded by AABOUD 18BH.
- ⁸AALJ 15R, based on 2.0 fb^{-1} of data, reports $0.289 \pm 0.043 \pm 0.040 \pm 0.029 \text{ pb}$ cross section for the forward fiducial region $p_T(\mu) > 25 \text{ GeV}$, $2.0 < \eta(\mu) < 4.5$, $50 \text{ GeV} < p_T(b) < 100 \text{ GeV}$, $2.2 < \eta(b) < 4.2$, $\Delta R(\mu, b) > 0.5$, and $p_T(\mu + b) > 20 \text{ GeV}$. The three errors are from statistics, systematics, and theory. The result agrees with the SM NNLO prediction.
- ⁹AAD 14AY reports $242.4 \pm 1.7 \pm 5.5 \pm 7.5 \pm 4.2 \text{ pb}$ value based on 20.3 fb^{-1} of data. The four errors are from statistics, systematic, luminosity, and the 0.66% beam energy uncertainty. We have combined the systematic uncertainties in quadrature. The result is for $m_t = 172.5 \text{ GeV}$; for other m_t , $\sigma(m_t) = \sigma(172.5 \text{ GeV}) \times [1 - 0.0028 \times (m_t - 172.5 \text{ GeV})]$. Also measured is the ratio $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.326 \pm 0.024 \pm 0.015 \pm 0.049 \pm 0.001$. The results are consistent with the SM predictions at NNLO.
- ¹⁰Based on 5.3 fb^{-1} of data. The result is for $m_t = 172.5 \text{ GeV}$, and a parametrization is given in eq.(6.1) for the mean value at other m_t values. The result is in agreement with the SM prediction $252.9^{+6.4}_{-8.6} \text{ pb}$ at NNLO.
- ¹¹Based on 19.6 fb^{-1} of data. The measurement is in the channel $t\bar{t} \rightarrow (b\ell\nu)(b\tau\nu)$, where τ decays into hadrons (τ_h). The result is for $m_t = 172.5 \text{ GeV}$. For $m_t = 173.3 \text{ GeV}$, the cross section is lower by 3.1 pb.

 $t\bar{t}$ Production Cross Section in pp Collisions at $\sqrt{s} = 13 \text{ TeV}$

- ¹TUMASYAN 21J result is based on 137 fb^{-1} of data. The last uncertainty is due to the beam luminosity. The result is in agreement with the SM prediction of $832^{+40}_{-46} \text{ pb}$ at NNLO+NNLL. Measurements of differential and double-differential cross sections are also presented.
- ²AAD 20AH based on 139 fb^{-1} of data. The last quoted uncertainty is due to the beam luminosity. The result is for $m_t = 172.5 \text{ GeV}$ and in agreement with the SM prediction of $832^{+20}_{-29}(\text{scale}) \pm 35(\text{PDF}+\alpha(s)) \text{ pb}$ at NNLO+NNLL.
- ³AAD 20Q reports $826.4 \pm 3.6 \pm 11.5 \pm 15.7 \pm 1.9 \text{ pb}$ based on 36.1 fb^{-1} of data at 13 TeV . The four errors stem from statistics, systematic effects, luminosity, and beam energy, respectively. We have combined luminosity and beam energy uncertainties in quadrature. The result is in agreement with the SM prediction $832^{+20}_{-29}(\text{scale}) \pm 35(\text{PDF}+\alpha(s)) \text{ pb}$ at NNLO+NNLL for $m_t = 172.5 \text{ GeV}$.
- ⁴SIRUNYAN 20V based on 35.9 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. The last uncertainty is due to beam luminosity. The $t\bar{t}$ production cross section is measured in the $t\bar{t} \rightarrow (\ell\nu_\ell)(\tau_h\nu_\tau)b\bar{b}$ final state, where τ_h refers to the hadronic decays of τ . The result is for $m_t = 172.5 \text{ GeV}$ and in agreement with the SM prediction at NNLO+NNLL.
- ⁵SIRUNYAN 19AR based on 35.9 fb^{-1} of data. Obtained from the visible cross section measured using a template fit to multidifferential distributions categorized according to the b -tagged jet multiplicity. The result is for $m_t = 172.5 \text{ GeV}$ and in agreement with the SM prediction at NNLO+NNLL.
- ⁶SIRUNYAN 19P reports differential $t\bar{t}$ cross sections measured using dilepton events at 13 TeV with 35.9 fb^{-1} and compared to NLO predictions.
- ⁷KHACHATRYAN 17N based on 2.2 fb^{-1} of data. The last quoted uncertainty is due to the beam luminosity. This measurement supersedes that of KHACHATRYAN 16J.
- ⁸SIRUNYAN 17W based on 2.2 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. Events are categorized according to the jet multiplicity and the number of b -tagged jets. A likelihood fit is performed to the event distributions to compare to the NNLO+NNLL prediction.
- ⁹AABOUD 16R reported value $818 \pm 8 \pm 27 \pm 19 \pm 12 \text{ pb}$ based on 3.2 fb^{-1} of data. The four errors are from statistics, systematic, luminosity, and beam energy. We have combined the systematic uncertainties in quadrature. The result is in agreement with the SM prediction $832^{+20}_{-29}(\text{scale}) \pm 35(\text{PDF}+\alpha(s)) \text{ pb}$ at NNLO+NNLL for $m_t = 172.5 \text{ GeV}$.
- ¹⁰KHACHATRYAN 16J based on 43 pb^{-1} of data. The last uncertainty is due to luminosity. The result is for $m_t = 172.5 \text{ GeV}$ and in agreement with the SM prediction $832^{+20}_{-29}(\text{scale}) \pm 35(\text{PDF}+\alpha(s)) \text{ pb}$ at NNLO+NNLL.

 $t\bar{t}$ Production Cross Section in Nucleus-Nucleus Collisions

- AAD 21BC result is based on 139 fb^{-1} of data. The events are categorized according to the number of jets and how likely to contain b -hadrons and a multivariate analysis is used to discriminate the signal from backgrounds. The result corresponds to observed significance of 1.9σ .
- AAD 21BC combines the results of the four-top-quark production cross section measured from the $1\ell/\text{opposite-sign } 2\ell$ channel with that from the same-sign $2\ell/3\ell$ channel (AAD 20AR). The result corresponds to observed significance of 4.7σ and is consistent within 2.0σ with the NLO (QCD+EW) SM prediction of $12.0 \pm 2.4 \text{ fb}$.
- AAD 20AR based on 139 fb^{-1} of data. Jet multiplicity, jet flavor and event kinematics are used in a multivariate analysis to discriminate the signal from backgrounds. The result corresponds to observed significance of 4.3σ and is consistent within 1.7σ with the NLO (QCD+EW) SM prediction of $12.0 \pm 2.4 \text{ fb}$.
- SIRUNYAN 20C based on 137 fb^{-1} of data. Both cut-based and multivariate approaches are taken to discriminate the signal from backgrounds. The result is in agreement with the NLO (QCD+EW) SM prediction of $12.0^{+2.2}_{-2.5} \text{ fb}$. The measurement constrains the top quark Yukawa coupling strength parameter to be $|Y_t/Y_t^{SM}| < 1.7$ (95% CL). It is also used to constrain an oblique parameter of the Higgs boson.
- AABOUD 19AP based on 36.1 fb^{-1} of data. The upper limit corresponds to 5.1 times the NLO SM cross section.
- AABOUD 19AP limit from data combined with AABOUD 18CE. The upper limit corresponds to 5.3 times the NLO SM cross section. Also a limit on the four-top-quark contact interaction $|C_{4t}|/\Lambda^2 < 1.9 \text{ TeV}^{-2}$ (95% CL) is obtained in an EFT model.
- SIRUNYAN 19CN based on 35.8 fb^{-1} of data, combined with SIRUNYAN 18BU. The results are also interpreted in the effective field theory framework.
- SIRUNYAN 19CN based on 35.8 fb^{-1} of data. A multivariate analysis using global event and jet properties is performed to discriminate from $t\bar{t}$ background.
- AABOUD 18CE based on 36.1 fb^{-1} of proton-proton data taken at $\sqrt{s} = 13 \text{ TeV}$. Events including a same-sign lepton pair are used. The result is consistent with the NLO SM cross section of 9.2 fb .
- SIRUNYAN 18BU based on 35.9 fb^{-1} of proton-proton data taken at $\sqrt{s} = 13 \text{ TeV}$. Yields from signal regions and control regions defined based on N_{jets} , N_b and N_l are combined in a maximum-likelihood fit. The result is in agreement with the NLO SM prediction $9.2^{+2.9}_{-2.4} \text{ fb}$. The measurement constrains the top quark Yukawa coupling strength parameter to be $|Y_t/Y_t^{SM}| < 2.1$ (95% CL).
- SIRUNYAN 17AB based on 2.6 fb^{-1} of data. A multivariate analysis is used to discriminate between $t\bar{t}t\bar{t}$ signal and $t\bar{t}$ background. A combination with a previous search (CMS, KHACHATRYAN 16Bj) in the same-sign dilepton channel gives an upper limit of 69 fb (95% CL), corresponding to $7.4 \cdot \text{SM}$ prediction).
- SIRUNYAN 17s based on 35.9 fb^{-1} . The limit is in agreement with the NLO SM prediction $9.2^{+2.9}_{-2.4} \text{ fb}$. Superseded by SIRUNYAN 18BU. The signal events are also used to constrain various new physics models.

- Based on 2.05 fb^{-1} of data. The $t\bar{t}$ events are selected in the dilepton decay channel with two identified b -jets.

Fraction of $t\bar{t} + \text{multi-jet}$ Events in pp Collisions at $\sqrt{s} = 7 \text{ TeV}$

VALUE (%)	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •			
0.332 ± 0.090	1 AAD	15D ATLS	$\ell + \cancel{E}_T + n_j$ ($n=3$ to 8)
0.436 ± 0.098	2 CHATRCHYAN14AE	CMS	$t\bar{t}(\ell\ell) + 0 \text{ jet}$ ($E_T > 30 \text{ GeV}$)
0.232 ± 0.125	2 CHATRCHYAN14AE	CMS	$t\bar{t}(\ell\ell) + 1 \text{ jet}$ ($E_T > 30 \text{ GeV}$)
	2 CHATRCHYAN14AE	CMS	$t\bar{t}(\ell\ell) + \geq 2 \text{ jet}$ ($E_T > 30 \text{ GeV}$)

- Based on 4.6 fb^{-1} of data. Fiducial $t\bar{t}$ production cross section is presented as a function of the jet multiplicity for up to eight jets with the jet p_T threshold of 25, 40, 60, and 80 GeV, and as a function of jet p_T up to the 5th jet. MC models can be discriminated by using data for high jet multiplicity and by p_T distributions of the leading and 5th jet.
- Based on 5.0 fb^{-1} of data. Events with two oppositely charged leptons, large \cancel{E}_T and jets with at least 1 b -tag are used to measure the fraction of $t\bar{t}$ plus additional jets. The gap fraction ($n=0$ jet rate) as a function of the jet p_T and that of H_T , the scalar sum of the p_T 's of additional jets, is shown in Fig. 8.

$t\bar{t}$ Charge Asymmetry (A_C) in pp Collisions at $\sqrt{s} = 7 \text{ TeV}$

$A_C = (N(\Delta|y| > 0) - N(\Delta|y| < 0)) / (N(\Delta|y| > 0) + N(\Delta|y| < 0))$ where $\Delta|y| = |y_t| - |y_{\bar{t}}|$ is the difference between the absolute values of the top and antitop rapidities and N is the number of events with $\Delta|y|$ positive or negative.

$0.10 \pm 0.68 \pm 0.37$	⁷ KHACHATRYAN..16T	CMS	$\ell + \cancel{E}_T + \geq 4j$ ($\geq 1b$)

¹ATLAS and CMS combination based on the data of AAD 16AZ and KHACHATRYAN 16AH. It takes into account the correlations of the measurements and systematic errors. A combination of the differential measurements of the charge asymmetry is also presented. The results are in agreement with the SM prediction (NNLO QCD + NLO EW).

²AAD 16AE is based on 20.3 fb^{-1} of data. After kinematic reconstruction, the top quark momenta are corrected for detector resolution and acceptance effects by unfolding, using parton level information of the MC generators. The lepton charge asymmetry is measured as $A_C^{\ell} = 0.008 \pm 0.006$. All the measurements are consistent with the SM predictions.

³AAD 16AZ based on 20.3 fb^{-1} of data. All the differential and inclusive measurements are statistically limited and consistent with the SM predictions.

⁴AAD 16T based on 20.3 fb^{-1} of data. Uses reconstruction techniques for the decay topology of highly boosted top quarks. The observed asymmetry is transformed by unfolding to a parton-level result in the shown fiducial region. The result is consistent with the NLO SM prediction.

⁵KHACHATRYAN 16AD based on 19.5 fb^{-1} of data. The lepton charge asymmetry is measured as $A_C^{\ell} = 0.003 \pm 0.006 \pm 0.003$. All the measurements are consistent with the SM predictions.

⁶KHACHATRYAN 16AH based on 19.6 fb^{-1} of data. The same data set as in KHACHATRYAN 16T is used. A template technique is used, which is sensitive to the charge anti-symmetric component of the $t\bar{t}$ rapidity distributions and statistically advantageous. The result is consistent with the SM predictions.

⁷KHACHATRYAN 16T based on 19.7 fb^{-1} of data. The same data set as in KHACHATRYAN 16AH is used. After kinematic reconstruction the top quark momenta are corrected for detector resolution and acceptance effects by unfolding, using parton level information of the MC generators. All the measurements are consistent with the SM predictions.

⁴ABAZOV 15K based on 9.7 fb^{-1} of data. The value is top quark polarization times spin analyzing power in the beam basis. The result is consistent with the SM prediction of -0.0019 ± 0.0005 .

t-quark Polarization in $t\bar{t}$ Events in pp Collisions at $\sqrt{s} = 7 \text{ TeV}$

The double differential distribution in polar angles, θ_1 (θ_2) of the decay particle of the top (anti-top) decay products, is parameterized as $(1/\sigma)d\sigma/(d\cos\theta_1 d\cos\theta_2) = (1/4)(1 + A_t \cos\theta_1 + A_{\bar{t}} \cos\theta_2 - C \cos\theta_1 \cos\theta_2)$. The charged lepton is used to tag t or \bar{t} . The coefficient A_t and $A_{\bar{t}}$ measure the average helicity of t and \bar{t} , respectively. $A_{CP}^{\ell} = A_t = A_{\bar{t}}$ assumes CP conservation, whereas $A_{CPV} = A_t = -A_{\bar{t}}$ corresponds to maximal CP violation.

¹AABOUD 17BB based on 20.2 fb^{-1} of pp data. Triple-differential decay rate of top quark is used to simultaneously determine five generalized Wtb couplings as well as the top polarization. α_{ℓ} denotes the spin analyzing power of charged lepton, and the spin axis of the top polarization P is taken along the spectator-quark momentum in the top rest frame. The value is compatible with the SM prediction of about 0.9.

²AABOUD 17I based on 20.2 fb^{-1} of pp data. A cut-based analysis is used to discriminate between signal and backgrounds. α_{ℓ} denotes the spin analyzing power of charged lepton, and the spin axis of the top polarization P is taken along the spectator-quark momentum in the top rest frame. See this paper for a number of other asymmetries and measurements that are not included here.

³AABOUD 17I based on 20.2 fb^{-1} of pp data. A cut-based analysis is used to discriminate between signal and backgrounds. F_{\pm} denotes W helicity fraction, and the spin axis of the top polarization P is taken along the spectator-quark momentum in the top rest frame. See this paper for a number of other asymmetries and measurements that are not included here.

⁴KHACHATRYAN 16B0 based on 19.7 fb^{-1} of data. A high-purity sample with a muon is selected by a multivariate analysis. The value is the top spin asymmetry, given by one half of the spin analyzing power α_{μ} ($=1$ at LO of SM) times the top polarization, P , where the spin axis is defined as the direction of the untagged jet in the top rest frame. The value is compatible with the SM prediction of 0.44 with a 2.0σ deviation.

t-quark Polarization in Single Top Events in pp Collisions at $\sqrt{s} = 13 \text{ TeV}$

• • • We do not use the following data for averages, fits, limits, etc. • • •			
0.440 ± 0.070	¹ SIRUNYAN	20R CMS	$(\alpha_{\ell} P)/2$; t-channel

¹SIRUNYAN 20R based on 36.1 fb^{-1} of data. Differential cross sections for t -channel single top production are measured using $1\ell + 2,3$ -jet mode and found to be in good agreement with SM predictions. The value is the top spin asymmetry, given by $1/2$ of the spin analyzing power α_{ℓ} ($=1$ at LO of SM) times the top polarization P , where the spin axis is defined as the direction of the spectator quark in the top rest frame at the parton level. It is in good agreement with the NLO SM prediction of 0.436.

 $gg \rightarrow t\bar{t}$ Fraction in $p\bar{p}$ Collisions at $\sqrt{s} = 1.96 \text{ TeV}$

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •				
<0.33	68	¹ AALTONEN	09F CDF	$t\bar{t}$ correlations
$0.07 \pm 0.14 \pm 0.07$		² AALTONEN	08AG CDF	low p_T number of tracks

¹Based on 955 pb^{-1} . AALTONEN 09F used differences in the $t\bar{t}$ production angular distribution and polarization correlation to discriminate between $gg \rightarrow t\bar{t}$ and $q\bar{q} \rightarrow t\bar{t}$ subprocesses. The combination with the result of AALTONEN 08AG gives $0.07 \pm 0.15 \pm 0.07$.

²Result is based on 0.96 fb^{-1} of data. The contribution of the subprocesses $gg \rightarrow t\bar{t}$ and $q\bar{q} \rightarrow t\bar{t}$ is distinguished by using the difference between quark and gluon initiated jets in the number of small p_T ($0.3 \text{ GeV} < p_T < 3 \text{ GeV}$) charged particles in the central region ($|\eta| < 1.1$).

 A_{FB}^{ℓ} of $t\bar{t}$ in $p\bar{p}$ Collisions at $\sqrt{s} = 1.96 \text{ TeV}$

A_{FB}^{ℓ} = Forward-backward asymmetry.

- ¹ AALTONEN 18 based on $9\text{--}10 \text{ fb}^{-1}$ of $p\bar{p}$ data at $\sqrt{s} = 1.96$ TeV. The value is the asymmetry in the number of reconstructed $t\bar{t}$ events with rapidity $y_t > y_{\bar{t}}$ and those with $y_t < y_{\bar{t}}$. The combined fits to CDF and D0 single lepton and $\ell\ell$ asymmetries give $A_{FB}^{\ell} = 0.073 \pm 0.016 \pm 0.012$ and $A_{FB}^{\ell\ell} = 0.108 \pm 0.043 \pm 0.016$, respectively. The results are consistent with the SM predictions.
- ² ABAZOV 15k based on 9.7 fb^{-1} of data. The result is consistent with the SM predictions. By combining with the previous D0 measurement in the $\ell +$ jet channel ABAZOV 14h, $A_{FB}^{\ell} = 0.118 \pm 0.025 \pm 0.013$ is obtained.
- ³ AALTONEN 14f based on 9.1 fb^{-1} of data. A_{FB}^{ℓ} and $A_{FB}^{\ell\ell}$ denote, respectively, the asymmetries $(N(x>0) - N(x<0)) / N_{tot}$ for $x = q\eta/q$ (q is the charge of ℓ) and $x = \eta_{\ell^+} - \eta_{\ell^-}$. Both results are consistent with the SM predictions. By combining with the previous CDF measurement in the $\ell +$ jet channel AALTONEN 13x, $A_{FB}^{\ell} = 0.098^{+0.028}_{-0.026}$ is obtained. The combined result is about two sigma larger than the SM prediction of $A_{FB}^{\ell} = 0.038 \pm 0.003$.
- ⁴ Based on 9.7 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 1.96$ TeV. The asymmetry is corrected for the production level for events with $|y_t| < 1.5$. Asymmetry as functions of $E_{T,t}(\ell)$ and $|y_t|$ are given in Figs. 7 and 8, respectively. Combination with the asymmetry measured in the dilepton channel [ABAZOV 13p] gives $A_{FB}^{\ell} = 4.2 \pm 2.0 \pm 1.4$ %, in agreement with the SM prediction of 2.0%.
- ⁵ Based on 9.7 fb^{-1} of data of $p\bar{p}$ data at $\sqrt{s} = 1.96$ TeV. The measured asymmetry is in agreement with the SM predictions of 8.8 ± 0.9 % [BERNREUTHER 12], which includes the EW effects. The dependences of the asymmetry on $|y(t) - y(\bar{t})|$ and $m_{t\bar{t}}$ are shown in Figs. 9 and 10, respectively.
- ⁶ Based on 9.4 fb^{-1} of data. Reported A_{FB} values come from the determination of a_i coefficients of $d\sigma/d(\cos\theta_i) = \sum_i a_i P_i(\cos(\theta_i))$ measurement. The result of $a_1/a_0 = (40 \pm 12)\%$ seems higher than the NLO SM prediction of $(15^{+7}_{-3})\%$.
- ⁷ Based on 9.4 fb^{-1} of data. The quoted result is the asymmetry at the parton level.
- ⁸ Based on 9.4 fb^{-1} of data. The observed asymmetry is to be compared with the SM prediction of $A_{FB}^{\ell} = 0.038 \pm 0.003$.
- ⁹ Based on 5.4 fb^{-1} of data. ABAZOV 13a studied the dilepton channel of the $t\bar{t}$ events and measured the leptonic forward-backward asymmetry to be $A_{FB}^{\ell} = 5.8 \pm 5.1 \pm 1.3\%$, which is consistent with the SM (QCD+EW) prediction of $4.7 \pm 0.1\%$. The result is obtained after combining the measurement $(15.2 \pm 4.0\%)$ in the $\ell +$ jets channel ABAZOV 11Ah. The top quark helicity is measured by using the neutrino weighting method to be consistent with zero in both dilepton and $\ell +$ jets channels.
- ¹⁰ Based on 5.3 fb^{-1} of data. The error is statistical and systematic combined. Events with lepton + $\cancel{E}_T + \geq 4$ jets (≥ 1 b) are used. AALTONEN 11F also measures the asymmetry as a function of the rapidity difference $|y_t - y_{\bar{t}}|$. The NLO QCD predictions [MCFM] are $(4.0 \pm 0.6)\%$ and $(8.8 \pm 1.3)\%$ for $m_{t\bar{t}} < 450$ and > 450 GeV, respectively.
- ¹¹ Based on 5.4 fb^{-1} of data. The error is statistical and systematic combined. The quoted asymmetry is obtained after unfolding to be compared with the MC@NLO prediction of $(5.0 \pm 0.1)\%$. No significant difference between the $m_{t\bar{t}} < 450$ and > 450 GeV data samples is found. A corrected asymmetry based on the lepton from a top quark decay of $(15.2 \pm 4.0)\%$ is measured to be compared to the MC@NLO prediction of $(2.1 \pm 0.1)\%$.
- ¹² Result is based on 1.9 fb^{-1} of data. The FB asymmetry in the $t\bar{t}$ events has been measured in the $\ell +$ jets mode, where the lepton charge is used as the flavor tag. The asymmetry in the $p\bar{p}$ frame is defined in terms of $\cos(\theta)$ of hadronically decaying t -quark momentum, whereas that in the $t\bar{t}$ frame is defined in terms of the t and \bar{t} rapidity difference. The results are consistent ($\leq 2\sigma$) with the SM predictions.
- ¹³ Result is based on 0.9 fb^{-1} of data. The asymmetry in the number of $t\bar{t}$ events with $y_t > y_{\bar{t}}$ and those with $y_t < y_{\bar{t}}$ has been measured in the lepton + jets final state. The observed value is consistent with the SM prediction of 0.8% by MC@NLO, and an upper bound on the $Z' \rightarrow t\bar{t}$ contribution for the SM Z-like couplings is given in Fig. 2 for $350 \text{ GeV} < m_{Z'} < 1 \text{ TeV}$.

- ⁴ AALTONEN 10s excludes the charge $-4/3$ assignment for the top quark [CHANG 99] at 95%CL, using 2.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. Result is obtained by reconstructing $t\bar{t}$ events in the lepton + jets final state, where b -jet charges are tagged by the SLT (soft lepton tag) algorithm.
- ⁵ ABAZOV 07c reports an upper limit $\rho < 0.80$ (90% CL) on the fraction ρ of exotic quark pairs $Q\bar{Q}$ with electric charge $|q| = 4e/3$ in $t\bar{t}$ candidate events with high p_T lepton, missing E_T and ≥ 4 jets. The result is obtained by measuring the fraction of events in which the quark pair decays into $W^- + b$ and $W^+ + \bar{b}$, where b and \bar{b} jets are discriminated by using the charge and momenta of tracks within the jet cones. The maximum CL at which the model of CHANG 99 can be excluded is 92%. Based on 370 pb^{-1} of data at $\sqrt{s} = 1.96$ TeV.

t-Quark Electric Charge

VALUE	DOCUMENT ID	TECN	COMMENT
$0.64 \pm 0.02 \pm 0.08$	¹ AAD	13AY ATLS	$\ell + \cancel{E}_T + \geq 4$ jets (≥ 1 b)
• • • We do not use the following data for averages, fits, limits, etc. • • •			
	² ABAZOV	14D D0	$\ell + \cancel{E}_T + \geq 4$ jets (≥ 2 b)
	³ AALTONEN	13J CDF	$p\bar{p}$ at 1.96 TeV
	⁴ AALTONEN	10s CDF	Repl. by AALTONEN 13j
	⁵ ABAZOV	07c D0	fraction of $ q = 4e/3$ pair

- ¹ AAD 13AY result is based on 2.05 fb^{-1} of pp data at $\sqrt{s} = 7$ TeV, the result is obtained by reconstructing $t\bar{t}$ events in the lepton + jets final state, where b -jet charges are tagged by the jet-charge algorithm. This measurement excludes the charge $-4/3$ assignment to the top quark at more than 8 standard deviations.
- ² ABAZOV 14D result is based on 5.3 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 1.96$ TeV. The electric charge of $b + W$ system in $t\bar{t}$ candidate events is measured from the charges of the leptons from W decay and in b jets. Under the assumption that the $b + W$ system consists of the sum of the top quark and the charge $-4/3$ quark $b'(-4/3)$ of the same mass, the top quark fraction is found to be $f = 0.88 \pm 0.13$ (stat) ± 0.11 (syst), or the upper bound for the $b'(-4/3)$ contamination of $1 - f < 0.46$ (95% CL).
- ³ AALTONEN 13j excludes the charge $-4/3$ assignment to the top quark at 99% CL, using 5.6 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. Result is obtained by reconstructing $t\bar{t}$ events in the lepton + jets final state, where b -jet charges are tagged by the jet-charge algorithm.

- SIRUNYAN 20b1 based on 137 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Pair production of vector-like b' is searched for with each b' decaying into Zb or hb . Analysis focuses on final states consisting of jets from six quarks. Mass limits are obtained for a variety of branching ratios of b' decays.
- SIRUNYAN 19AQ based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Pair production of vector-like b' is searched for with one b' decaying into Zb and the other b' decaying into Wt, Zb, hb . Events with an opposite-sign lepton pair consistent with coming from Z and jets are used. Mass limits are obtained for a variety of branching ratios of b' .
- SIRUNYAN 19bW based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like b' using all-hadronic final state. The analysis is made for the Zb, Wt, hb modes and mass limits are obtained for a variety of branching ratios.
- AABOUD 18AW based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like b' using lepton-plus-jets final state. The search is also sensitive to the decays into Zb and Hb final states.
- AABOUD 18CE based on 36.1 fb⁻¹ of proton-proton data taken at $\sqrt{s} = 13$ TeV. Events including a same-sign lepton pair are used. The limit is for a singlet model, assuming the branching ratios of b' into Zb, Wt and Hb as predicted by the model.
- AABOUD 18CL, AABOUD 18CP based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like b' using all-hadronic final state. The analysis is particularly powerful for the $b' \rightarrow hb$ mode. Assuming the pure decay only in this mode sets a limit $m_{b'} > 1010$ GeV.
- AABOUD 18CP based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Pair and single production of vector-like b' are searched for with at least one b' decaying into Zb . In the case of $B(b' \rightarrow Zb) = 1$, the limit is $m_{b'} > 1220$ GeV.
- The limit is for the singlet model, assuming that the branching ratios into Wt, Zb, hb add up to one.
- The limit is for the doublet model, assuming that the branching ratios into Wt, Zb, hb add up to one.
- AABOUD 18CR based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. A combination of searches for the pair-produced vector-like b' in various decay channels ($b' \rightarrow Wt, Zb, hb$). Also a model-independent limit is obtained as $m_{b'} > 1.03$ TeV, assuming that the branching ratios into Zb, Wt , and hb add up to one.
- The limit is for the singlet b' .
- The limit is for b' in a weak isospin doublet (t', b') and $|V_{t'b}| \ll |V_{tb}|$. For a b' in a doublet with a charge $-4/3$ vector-like quark, the limit $m_{b'} > 1.14$ TeV is obtained.
- SIRUNYAN 18bM based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like b' . Three channels (single lepton, same-charge 2 leptons, or at least 3 leptons) are considered for various branching fraction combinations. Assuming $B(tW) = 1$, the limit is 1240 GeV and for $B(bZ) = 1$ it is 960 GeV.
- SIRUNYAN 18g based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The limit is for the pair-produced vector-like b' that couple only to light quarks. Upper cross section limits on the single production of a b' and constraints for other decay channels (Zq and Hq) are also given in the paper.
- SIRUNYAN 17AU based on 2.3-2.6 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Limit on pair-produced singlet vector-like b' using one lepton and several jets. The mass bound is given for a b' transforming as a singlet under the electroweak symmetry group, assumed to decay through W, Z or Higgs boson (which decays to jets) and to a third generation quark.
- KHACHATRYAN 16AN based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on pair-produced vector-like b' using 1, 2, and >2 leptons as well as fully hadronic final states. Other limits depending on the branching fractions to tW, bZ , and bH are given in Table IX.
- AAD 15BY based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on pair-produced vector-like b' assuming the branching fractions to W, Z , and h modes of the singlet model. Used events containing $\geq 2\ell + \cancel{E}_T + \geq 2j (\geq 1b)$ and including a same-sign lepton pair.
- AAD 15BZ based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on pair-produced chiral b' -quark. Used events containing $\geq 2\ell + \cancel{E}_T + \geq 2j (\geq 1b)$ and including a same-sign lepton pair.
- AAD 15Z based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Used events with $\ell + \cancel{E}_T + \geq 6j (\geq 1b)$ and at least one pair of jets from weak boson decay, primarily designed to select the signature $b'\bar{b}' \rightarrow WWt\bar{t} \rightarrow WWWWb\bar{b}$. This is a limit on pair-produced vector-like b' . The lower mass limit is 640 GeV for a vector-like singlet b' .
- Based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. No significant excess over SM expectation is found in the search for pair production or single production of b' in the events with dilepton from a high $p_{T,Z}$ and additional jets ($\geq 1b$ -tag). If instead of $B(b' \rightarrow Wt) = 1$ an electroweak singlet with $B(b' \rightarrow Wt) \sim 0.45$ is assumed, the limit reduces to 685 GeV.
- Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 13I looked for events with one isolated electron or muon, large \cancel{E}_T , and at least four jets with large transverse momenta, where one jet is likely to originate from the decay of a bottom quark.

Quark Particle Listings

b' (Fourth Generation) Quark

- ²²Result is based on 1.1 fb^{-1} of data. No signal is found for the search of long-lived particles which decay into final states with two electrons or photons, and upper bound on the cross section times branching fraction is obtained for $2 < c\tau < 7000 \text{ nm}$; see Fig. 3. 95% CL excluded region of b' lifetime and mass is shown in Fig. 4.
- ²³ACOSTA 03 looked for long-lived fourth generation quarks in the data sample of 90 pb^{-1} of $\sqrt{s}=1.8 \text{ TeV}$ $p\bar{p}$ collisions by using the muon-like penetration and anomalously high ionization energy loss signature. The corresponding lower mass bound for the charge $(2/3)e$ quark (t') is 220 GeV . The t' bound is higher than the b' bound because t' is more likely to produce charged hadrons than b' . The 95% CL upper bounds for the production cross sections are given in their Fig. 3.
- ²⁴AAD 15AR based on 20.3 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. Used lepton-plus-jets final state. See Fig. 24 for mass limits in the plane of $B(b' \rightarrow Wt)$ vs. $B(b' \rightarrow Hb)$ from $b'\bar{b}' \rightarrow Hb + X$ searches.
- ²⁵AAD 15CN based on 20.3 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. Limit on pair-production of chiral b' -quark. Used events with $\ell + \cancel{E}_T + \geq 4j$ (non- b -tagged). Limits on a heavy vector-like quark, which decays into Wq, Zq, hq , are presented in the plane $B(Q \rightarrow Wq)$ vs. $B(Q \rightarrow hq)$ in Fig. 12.
- ²⁶Based on 1.04 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. No signal is found for the search of heavy quark pair production that decay into W and a t quark in the events with a high p_T isolated lepton, large \cancel{E}_T , and at least 6 jets in which one, two or more dijets are from W .
- ²⁷Based on 2.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. No $b' \rightarrow Zb$ invariant mass peak is found in the search of heavy quark pair production that decay into Z and a b quark in events with $Z \rightarrow e^+e^-$ and at least one b -jet. The lower mass limit is 358 GeV for a vector-like singlet b' mixing solely with the third SM generation.
- ²⁸Based on 1.04 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. No signal is found for the search of heavy quark pair production that decay into W and a quark in the events with dileptons, large \cancel{E}_T , and ≥ 2 jets.
- ²⁹Based on 1.04 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. AAD 12BE looked for events with two isolated like-sign leptons and at least 2 jets, large \cancel{E}_T and $H_T > 350 \text{ GeV}$.
- ³⁰Based on 5 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. CHATRCHYAN 12BH searched for QCD and EW production of single and pair of degenerate 4th generation quarks that decay to bW or tW . Absence of signal in events with one lepton, same-sign dileptons or tripletons gives the bound. With a mass difference of $25 \text{ GeV}/c^2$ between $m_{b'}$ and $m_{b''}$, the corresponding limit shifts by about $\pm 20 \text{ GeV}/c^2$.
- ³¹Based on 4.9 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. CHATRCHYAN 12X looked for events with trileptons or same-sign dileptons and at least one b -jet.
- ³²Based on 4.8 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV . AALTONEN 11J looked for events with $\ell + \cancel{E}_T + \geq 5j$ ($\geq 1 b$ or c). No signal is observed and the bound $\sigma(b'\bar{b}') < 30 \text{ fb}$ for $m_{b'} > 375 \text{ GeV}$ is found for $B(b' \rightarrow Wt) = 1$.
- ³³Based on 34 pb^{-1} of data in pp collisions at 7 TeV . CHATRCHYAN 11L looked for multi-jet events with trileptons or same-sign dileptons. No excess above the SM background excludes $m_{b'}$ between 255 and 361 GeV at 95% CL for $B(b' \rightarrow Wt) = 1$.
- ³⁴Based on 2.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. AALTONEN 10H looked for pair production of heavy quarks which decay into tW^- or tW^+ , in events with same sign dileptons (e or μ), several jets and large missing E_T . The result is obtained for b' which decays into tW^- . For the charge $5/3$ quark ($T_{5/3}$) which decays into tW^+ , $m_{T_{5/3}} > 365 \text{ GeV}$ (95% CL) is found when it has the charge $-1/3$ partner B of the same mass.
- ³⁵FLACCO 10 result is obtained from AALTONEN 10H result of $m_{b'} > 338 \text{ GeV}$, by relaxing the condition $B(b' \rightarrow Wt) = 100\%$ when $m_{b'} > m_{b''}$.
- ³⁶Result is based on 1.06 fb^{-1} of data. No excess from the SM Z +jet events is found when Z decays into e^+e^- or $\mu^+\mu^-$. The $m_{b'}$ bound is found by comparing the resulting upper bound on $\sigma(b'\bar{b}') [1 - (1 - B(b' \rightarrow Zb))^2]$ and the LO estimate of the b' pair production cross section shown in Fig. 38 of the article.
- ³⁷HUANG 08 reexamined the b' mass lower bound of 268 GeV obtained in AALTONEN 07c that assumes $B(b' \rightarrow Zb) = 1$, which does not hold for $m_{b'} > 255 \text{ GeV}$. The lower mass bound is given in the plane of $\sin^2(\theta_{tb'})$ and $m_{b'}$.
- ³⁸AFFOLDER 00 looked for b' that decays into $b+Z$. The signal searched for is bbZ events where one Z decays into e^+e^- or $\mu^+\mu^-$ and the other Z decays hadronically. The bound assumes $B(b' \rightarrow Zb) = 100\%$. Between 100 GeV and 199 GeV , the 95%CL upper bound on $\sigma(b' \rightarrow \bar{b}') \times B^2(b' \rightarrow Zb)$ is also given (see their Fig. 2).
- ³⁹ABE 98n looked for $Z \rightarrow e^+e^-$ decays with displaced vertices. Quoted limit assumes $B(b' \rightarrow Zb) = 1$ and $c\tau_{b'} = 1 \text{ cm}$. The limit is lower than m_{Z+m_b} ($\sim 96 \text{ GeV}$) if $c\tau > 22 \text{ cm}$ or $c\tau < 0.009 \text{ cm}$. See their Fig. 4.
- ⁴⁰ABACHI 97D searched for b' that decays mainly via FCNC. They obtained 95%CL upper bounds on $B(b'\bar{b}' \rightarrow \gamma + 3 \text{ jets})$ and $B(b'\bar{b}' \rightarrow 2\gamma + 2 \text{ jets})$, which can be interpreted as the lower mass bound $m_{b'} > m_{Z+m_b}$.
- ⁴¹ABACHI 95F bound on the top-quark also applies to b' and t' quarks that decay predominantly into W . See FROGGATT 97.
- ⁴²MUKHOPADHYAYA 93 analyze CDF dilepton data of ABE 92G in terms of a new quark decaying via flavor-changing neutral current. The above limit assumes $B(b' \rightarrow b\ell^+\ell^-) = 1$. For an exotic quark decaying only via virtual Z [$B(b\ell^+\ell^-) = 3\%$], the limit is 85 GeV .
- ⁴³ABE 92 dilepton analysis limit of $>85 \text{ GeV}$ at $CL=95\%$ also applies to b' quarks, as discussed in ABE 90B.
- ⁴⁴ABE 90B exclude the region $28\text{--}72 \text{ GeV}$.
- ⁴⁵AKESSON 90 searched for events having an electron with $p_T > 12 \text{ GeV}$, missing momentum $> 15 \text{ GeV}$, and a jet with $E_T > 10 \text{ GeV}$, $|\eta| < 2.2$, and excluded $m_{b'}$ between 30 and 69 GeV .
- ⁴⁶For the reduction of the limit due to non-charged-current decay modes, see Fig. 19 of ALBAJAR 90B.
- ⁴⁷ALBAJAR 88 study events at $E_{cm} = 546$ and 630 GeV with a muon or isolated electron, accompanied by one or more jets and find agreement with Monte Carlo predictions for the production of charm and bottom, without the need for a new quark. The lower mass limit is obtained by using a conservative estimate for the $b'\bar{b}'$ production cross section and by assuming that it cannot be produced in W decays. The value quoted here is revised using the full $O(\alpha_s^3)$ cross section of ALTARELLI 88.

$b'(-1/3)$ mass limits from single production in $p\bar{p}$ and pp collisions

- • • We do not use the following data for averages, fits, limits, etc. • • •
- ¹AAD 16AH based on 20.3 fb^{-1} of data in pp collisions at 8 TeV . No significant excess over SM expectation is found in the search for a vector-like b' in the single-lepton and dilepton channels (ℓ or $\ell\ell$) + $1,2,3 j$ ($\geq 1b$). The model assumes that the b' has the excited quark couplings.
- ²Based on 19.7 fb^{-1} of data in pp collisions at 8 TeV . Limit on left-handed b' assuming 100% decay to tW and using all-hadronic, lepton + jets, and dilepton final states.
- ³Based on 19.7 fb^{-1} of data in pp collisions at 8 TeV . Limit on right-handed b' assuming 100% decay to tW and using all-hadronic, lepton + jets, and dilepton final states.
- ⁴Based on 19.7 fb^{-1} of data in pp collisions at 8 TeV . Limit on vector-like b' assuming 100% decay to tW and using all-hadronic, lepton+jets, and dilepton final states.
- ⁵Based on 5.4 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV . ABAZOV 11F looked for single production of b' via the W or Z coupling to the first generation up or down quarks, respectively. Model independent cross section limits for the single production processes $p\bar{p} \rightarrow b'q \rightarrow Wuq$, and $p\bar{p} \rightarrow b'q \rightarrow Zdq$ are given in Figs. 3 and 4, respectively, and the mass limits are obtained for the model of ATRE 09 with degenerate bi-doublets of vector-like quarks.
- ⁶SIRUNYAN 19AI based on 35.9 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. Exclusion limits are set on the product of the production cross section and branching fraction for the $b'(-1/3) + b$ and $b'(-1/3) + t$ modes as a function of the vector-like quark mass in Figs. 7 and 8 and in Tab. 2 for relative vector-like quark widths between 1 and 30% for left- and right-handed vector-like quark couplings. No significant deviation from the SM prediction is observed.

MASS LIMITS for b' (4th Generation) Quark or Hadron in e^+e^- Collisions

Search for hadrons containing a fourth-generation $-1/3$ quark denoted b' .

The last column specifies the assumption for the decay mode (CC denotes the conventional charged-current decay) and the event signature which is looked for.

b' (Fourth Generation) Quark, t' (Fourth Generation) Quark

t' (4th Generation) Quark, Searches for

Richardson potential, a 1S (b'b') state is excluded for the mass range 87.7-94.7 GeV. This range depends on the potential choice.

- 4 ABREU 90d assumed m_{H-} < m_{b'} - 3 GeV.
5 Superseded by ABREU 91f.
6 AKRAWY 90b search was restricted to data near the Z peak at E_{cm} = 91.26 GeV at LEP. The excluded region is between 23.6 and 41.4 GeV if no H+ decays exist.
7 AKRAWY 90j search for isolated photons in hadronic Z decay and derive B(Z -> b'b')/B(b' -> gamma X)/B(Z -> hadrons) < 2.2 x 10^-3.
8 ABE 89e search at E_{cm} = 56-57 GeV at TRISTAN for multihadron events with a spherical shape...
9 ABE 89c search was at E_{cm} = 55-60.8 GeV at TRISTAN.
10 If the photonic decay mode is large (B(b' -> b gamma) > 25%), the ABRAMS 89c limit is 45.4 GeV.
11 ADACHI 89c search was at E_{cm} = 56.5-60.8 GeV at TRISTAN using multi-hadron events...
12 ADACHI 89c also gives limits for any mixture of CC and bg decays.
13 ENO 89 search at E_{cm} = 50-60.8 at TRISTAN.
14 ENO 89 considers arbitrary mixture of the charged current, bg, and b gamma decays.
15 IGARASHI 88 searches for leptons in low-thrust events and gives Delta R(b') < 0.26 (95% CL) assuming charged current decay...
16 SAGAWA 88 set limit sigma(top) < 6.1 pb at CL=95% for top-flavored hadron production...
17 ADEVA 86 give 95%CL upper bound on an excess of the normalized cross section, Delta R, as a function of the minimum c.m. energy...
18 ALTHOFF 84c narrow state search sets limit Gamma(e+ e-) B(hadrons) < 2.4 keV CL = 95% and heavy charge 1/3 quark pair production m > 21 GeV, CL = 95%.
19 ALTHOFF 84i exclude heavy quark pair production for 7 < m < 19 GeV (1/3 charge) using aplanarity distributions (CL = 95%).

Table with columns: VALUE (GeV), CL%, DOCUMENT ID, TECN, COMMENT. Rows include search results for t' quark production in pp and pp collisions, such as SIRUNYAN 19AQ CMS, AABOUD 18CE ATLAS, and CHATRCHYAN 13I JHEP.

- We do not use the following data for averages, fits, limits, etc. •••
25 AAD 13F ATLAS B(t' -> Wb) = 1
26 CHATRCHYAN 13I CMS B(t' -> Zt) = 1
27 AAD 12AR ATLAS B(t' -> Wb) = 1
28 CHATRCHYAN 12BC CMS t't' -> W+ b W- b-bar
29 AALTONEN 11AH CDF t' -> Xt (mX < 70 GeV)
30 AALTONEN 11AL CDF t' -> Wb
31 AALTONEN 11o CDF t' -> Wq (q=d,s,b)
32 ABAZOV 11q D0 t' -> Wq (q=d,s,b)
33,34 AALTONEN 08H CDF t' -> Wq
1 SIRUNYAN 19AQ based on 35.9 fb^-1 of pp data at sqrt(s) = 13 TeV. Pair production of vector-like t' is searched for with one t' decaying into Zt and the other t' decaying into Wb, Zt, ht.
2 SIRUNYAN 19BW based on 35.9 fb^-1 of pp data at sqrt(s) = 13 TeV. The limit is for the pair-produced vector-like t' using all-hadronic final state.
3 AABOUD 18CE based on 36.1 fb^-1 of proton-proton data taken at sqrt(s) = 13 TeV. Events including a same-sign lepton pair are used.
4 AABOUD 18CL based on 36.1 fb^-1 of pp data at sqrt(s) = 13 TeV. The limit is for the pair-produced vector-like t' using all-hadronic final state.
5 AABOUD 18CP based on 36.1 fb^-1 of pp data at sqrt(s) = 13 TeV. Pair and single production of vector-like t' are searched for with at least one t' decaying into Zt.
6 The limit is for the singlet model, assuming that the branching ratios into Zt, Wb, and Ht add up to one.
7 The limit is for the doublet model, assuming that the branching ratios into Zt, Wb, and Ht add up to one.
8 AABOUD 18CR based on 36.1 fb^-1 of pp data at sqrt(s) = 13 TeV. A combination of searches for the pair-produced vector-like t' in various decay channels (t' -> Wb, Zt, ht).
9 The limit is for the singlet t'.
10 The limit is for t' in a weak isospin doublet (t', b') and |V_{tb'}| << |V_{tb}|.
11 SIRUNYAN 18BM based on 35.9 fb^-1 of pp data at sqrt(s) = 13 TeV. The limit is for the pair-produced vector-like t'.
12 SIRUNYAN 18Q based on 19.7 fb^-1 of pp data at sqrt(s) = 8 TeV. The limit is for the pair-produced vector-like t' that couple only to light quarks.
13 SIRUNYAN 18W based on 35.8 fb^-1 of pp data at sqrt(s) = 13 TeV. The limit is for the vector-like t' pair-produced by strong interaction using lepton-plus-jets mode.
14 AABOUD 17L based on 36.1 fb^-1 of pp data at sqrt(s) = 13 TeV. No signal is found in the search for heavy quark pair production that decay into Zt followed by Z -> nu nu

Quark Particle Listings

t' (Fourth Generation) Quark

- the events with one lepton, large E_T , and ≥ 4 jets. The lower mass limit 0.87 (1.05) TeV is obtained for the singlet (doublet) model with other possible decay modes.
- SIRUNYAN 17AU based on 2.3-2.6 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Limit on pair-produced singlet vector-like t' using one lepton and several jets. The mass bound is given for a t' transforming as a singlet under the electroweak symmetry group, assumed to decay through W , Z or Higgs boson (which decays to jets) and to a third generation quark. For a doublet, the limit is >830 GeV. Other limits are also given in the paper.
 - AAD 15AR based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Used lepton-plus-jets final state. See Fig. 20 for mass limits in the plane of $B(t' \rightarrow Ht)$ vs. $B(t' \rightarrow Wb)$ from a combination of $t't' \rightarrow Wb + X$ and $t't' \rightarrow Ht + X$ searches. Any branching ratio scenario is excluded for mass below 715 GeV.
 - AAD 15BY based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on pair-produced vector-like t' assuming the branching fractions to W , Z , and h modes of the singlet model. Used events containing $\geq 2\ell + \cancel{E}_T + \geq 2j$ ($\geq 1b$) and including a same-sign lepton pair.
 - KHACHATRYAN 15AI based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The search exploits all-hadronic final states by tagging boosted Higgs boson using jet substructure and b -tagging.
 - Based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. No significant excess over SM expectation is found in the search for pair production or single production of t' in the events with dilepton from a high p_T Z and additional jets ($\geq 1b$ -tag). If instead of $B(b' \rightarrow Wt) = 1$ an electroweak singlet with $B(b' \rightarrow Wt) \sim 0.45$ is assumed, the limit reduces to 685 GeV.
 - Based on 19.5 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The t' quark is pair produced and is assumed to decay into three different final states of bW , tZ , and th . The search is carried out using events with at least one isolated lepton.
 - Based on 1.04 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. No signal is found for the search of heavy quark pair production that decay into W and a quark in the events with dileptons, large E_T , and ≥ 2 jets.
 - Based on 1.04 fb⁻¹ of data in pp collisions at 7 TeV. AAD 12c looked for $t't'$ production followed by t' decaying into a top quark and X , an invisible particle, in a final state with an isolated high- p_T lepton, four or more jets, and a large missing transverse energy. No excess over the SM $t\bar{t}$ production gives the upper limit on $t't'$ production cross section as a function of $m_{t'}$ and m_X . The result is obtained for $B(t' \rightarrow Wt) = 1$.
 - Based on 5 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 12BH searched for QCD and EW production of single and pair of degenerate 4th generation quarks that decay to Wb or Wt . Absence of signal in events with one lepton, same-sign dileptons or tripletons gives the bound. With a mass difference of 25 GeV/ c^2 between $m_{t'}$ and $m_{b'}$, the corresponding limit shifts by about ± 20 GeV/ c^2 .
 - Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 12P looked for $t't'$ production events with two isolated high p_T leptons, large E_T , and 2 high p_T jets with b -tag. The absence of signal above the SM background gives the limit for $B(t' \rightarrow Wb) = 1$.
 - Based on 4.7 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. No signal is found for the search of heavy quark pair production that decay into W and a b quark in the events with a high p_T isolated lepton, large E_T and at least 3 jets ($\geq 1b$ -tag). Vector-like quark of charge $2/3$ with $400 < m_{t'} < 550$ GeV and $B(t' \rightarrow Wb) > 0.63$ is excluded at 95% CL.
 - Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 13I looked for events with one isolated electron or muon, large E_T , and at least four jets with large transverse momenta, where one jet is likely to originate from the decay of a bottom quark.
 - Based on 1.04 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. No signal is found in the search for pair produced heavy quarks that decay into W boson and a b quark in the events with a high p_T isolated lepton, large E_T and at least 3 jets ($\geq 1b$ -tag).
 - Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 12Bc looked for $t't'$ production events with a single isolated high p_T lepton, large E_T and at least 4 high p_T jets with a b -tag. The absence of signal above the SM background gives the limit for $B(t' \rightarrow Wb) = 1$.
 - Based on 5.7 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. AALTONEN 11AH looked for $t't'$ production followed by t' decaying into a top quark and X , an invisible particle, in the all hadronic decay mode of $t\bar{t}$. No excess over the SM $t\bar{t}$ production gives the upper limit on $t't'$ production cross section as a function of $m_{t'}$ and m_X . The result is obtained for $B(t' \rightarrow Xt) = 1$.
 - Based on 5.6 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. AALTONEN 11AL looked for $\ell + \geq 4j$ events and set upper limits on $\sigma(t't')$ as functions of $m_{t'}$.
 - Based on 4.8 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. AALTONEN 11O looked for $t't'$ production signal when t' decays into a top quark and X , an invisible particle, in $\ell + \cancel{E}_T + jets$ channel. No excess over the SM $t\bar{t}$ production gives the upper limit on $t't'$ production cross section as a function of $m_{t'}$ and m_X . The result is obtained for $B(t' \rightarrow Xt) = 1$.
 - Based on 5.3 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. ABZOV 11Q looked for $\ell + \cancel{E}_T + \geq 4j$ events and set upper limits on $\sigma(t't')$ as functions of $m_{t'}$.
 - Searches for pair production of a new heavy top-like quark t' decaying to a W boson and another quark by fitting the observed spectrum of total transverse energy and reconstructed t' mass in the lepton + jets events.
 - HUANG 08 reexamined the t' mass lower bound of 256 GeV obtained in AALTONEN 08H that assumes $B(b' \rightarrow qZ) = 1$ for $q = u, c$ which does not hold when $m_{b'} < m_{t'} - m_W$ or the mixing $\sin^2(\theta_{b't'})$ is so tiny that the decay occurs outside of the vertex detector. Fig. 1 gives that lower bound on $m_{t'}$ in the plane of $\sin^2(\theta_{b't'})$ and $m_{b'}$.

$t'(5/3)$ -quark/hadron mass limits in $p\bar{p}$ and pp collisions

- SIRUNYAN 19T based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Signals are searched in the final states of $t't'$ pair production, with same-sign leptons (which come from a t' decay) or a single lepton (which comes from a W out of 4Ws), along with jets, and no excess over the SM expectation is found.
- AABOUD 18AW based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Limit on $t'(5/3)$ in pair production assuming its coupling to Wt is equal to one. Lepton-plus-jets final state is used, characterized by $\ell + \cancel{E}_T + jets$ ($\geq 1b$ -tagged).
- AABOUD 18CE based on 36.1 fb⁻¹ of proton-proton data taken at $\sqrt{s} = 13$ TeV. Events including a same-sign lepton pair are used. The limit is for the pair-produced vector-like t' . With single t' production included, assuming $t't'W$ coupling of one, the limit is $m_{t'} > 1.6$ TeV.
- SIRUNYAN 17J based on 2.3 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Signals are searched in the final states of $t't'$ pair production, with same-sign leptons (which come from a t' decay) or a single lepton (which comes from a W out of 4Ws), along with jets, and no excess over the SM expectation is found.
- AAD 15BY based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on $t'(5/3)$ in pair and single production assuming its coupling to Wt is equal to one. Used events containing $\geq 2\ell + \cancel{E}_T + \geq 2j$ ($\geq 1b$) and including a same-sign lepton pair.
- AAD 15Z based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Used events with $\ell + \cancel{E}_T + \geq 6j$ ($\geq 1b$) and at least one pair of jets from weak boson decay, sensitive to the final state $b\bar{b}W^+W^-W^+W^-$.
- CHATRCHYAN 14T based on 19.5 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Non-observation of anomaly in H_T distribution in the same-sign dilepton events leads to the limit when pair produced $t'(5/3)$ quark decays exclusively into t and W^+ , resulting in the final state with $b\bar{b}W^+W^-W^+W^-$.

$t'(2/3)$ mass limits from single production in $p\bar{p}$ and pp collisions

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
>950	95	1 AAD 16AV	ATLS	$qg \rightarrow q't'b, B(t' \rightarrow Wb)=0.5$
>403	95	2 ABZOV 11F	D0	$q\bar{d} \rightarrow q't' \rightarrow q'(Wd)$ $\bar{\kappa}_{d't'}=1, B(t' \rightarrow Wd)=1$
>551	95	2 ABZOV 11F	D0	$qu \rightarrow q't' \rightarrow q(Zu)$ $\bar{\kappa}_{u't'}=\sqrt{2}, B(t' \rightarrow Zu)=1$

- AAD 16AV based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. No significant excess over SM expectation is found in the search for a fully reconstructed vector-like t' in the mode $\ell + \cancel{E}_T + \geq 2j$ ($\geq 1b$). A veto on massive large-radius jets is used to reject the $t\bar{t}$ background.
- Based on 5.4 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. ABZOV 11F looked for single production of t' via the Z or E coupling to the first generation up or down quarks, respectively. Model independent cross section limits for the single production processes $p\bar{p} \rightarrow t'q \rightarrow (Wd)q$, and $p\bar{p} \rightarrow t'q \rightarrow (Zd)q$ are given in Figs. 3 and 4, respectively, and the mass limits are obtained for the model of ATRE 09 with degenerate bi-doublets of vector-like quarks.

$t'(5/3)$ mass limits from single production in $p\bar{p}$ and pp collisions

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
•••	1 SIRUNYAN 19AI	CMS	$tW \rightarrow t'(5/3) \rightarrow tW$

1 SIRUNYAN 19AI based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Exclusion limits are set on the product of the production cross section and branching fraction for the $b'(-1/3) + t$ and $t'(5/3) + t$ modes as a function of the vector-like quark mass in Fig. 8 and Tab. 2 for relative vector-like quark widths between 1 and 30% for left- and right-handed vector-like quark couplings. No significant deviation from the SM prediction is observed.

Free Quark Searches

FREE QUARK SEARCHES

The basis for much of the theory of particle scattering and hadron spectroscopy is the construction of the hadrons from a set of fractionally charged constituents (quarks). A central element of Quantum Chromodynamics is that quarks cannot be observed as free particles but are confined to mesons and baryons. Experiments have produced no evidence for free quarks.

This compilation is only a guide to the literature, since the quoted experimental limits are often only indicative. Reviews can be found in Refs. 1-4.

Quark Flux — Accelerator Searches

The definition of FLUX depends on the experiment

- (a) is the ratio of measured free quarks to predicted free quarks if there is no "confinement."
- (b) is the probability of fractional charge on nuclear fragments. Energy is in GeV/nucleon.
- (c) is the 90%CL upper limit on fractionally-charged particles produced per interaction.
- (d) is quarks per collision.
- (e) is inclusive quark-production cross-section ratio to σ(e⁺e⁻ → μ⁺μ⁻).
- (f) is quark flux per charged particle.
- (g) is the flux per ν-event.
- (h) is quark yield per π⁻ yield.
- (i) is 2-body exclusive quark-production cross-section ratio to σ(e⁺e⁻ → μ⁺μ⁻).

- HUENTRUP 96 quote 95% CL limits for production of fragments with charge differing by as much as $\pm 1/3$ (in units of e) for charge $6 \leq Z \leq 10$.
- BUSKULIC 93c limits for inclusive quark production are more conservative if the ALEPH hadronic fragmentation function is assumed.
- CECCHINI 93 limit at 90%CL for $23/3 \leq Z \leq 40/3$, for 16A GeV O, 14.5A Si, and 200A S incident on Cu target. Other limits are 2.3×10^{-4} for $17/3 \leq Z \leq 20/3$ and 1.2×10^{-4} for $20/3 \leq Z \leq 23/3$.
- GHOSH 92 reports measurement of spallation fragment charge based on ionization in emulsion. Out of 650 measured tracks, 2 were consistent with charge $5e/3$, and 4 with $7e/3$.
- Hadronic quark.
- Leptonic quark.
- HE 91 limits are for charges of the form $N \pm 1/3$ from $23/3$ to $38/3$, and correspond to cross-section limits of $380\mu\text{b}$ (Pb) and $320\mu\text{b}$ (Cu).
- The limits apply to projectile fragment charges of 17, 19, 20, 22, 23 in units of $e/3$.
- The limits apply to projectile fragment charges of 16, 17, 19, 20, 22, 23 in units of $e/3$.
- Flux limits and mass range depend on charge.
- Bound to nuclei.
- Quark lifetimes $> 1 \times 10^{-8}$ s.
- One candidate $m < 0.17$ GeV.

- See AGNESE 15 Fig.6 for limits on vertical density as function of charge extending to $|q|/e < 1/10$.
- AMBROSIO 00c limit is below 11×10^{-15} for $0.25 < q/e < 0.5$, and is changing rapidly near $q/e=2/3$, where it is 2×10^{-14} .
- Distribution in celestial sphere was described as anisotropic.
- With telescope axis at zenith angle 40° to the south.
- Leptonic quarks.
- Lifetime $> 10^{-8}$ s; charge $\pm 0.70, 0.68, 0.42$; and mass $> 4.4, 4.8, \text{ and } 20$ GeV, respectively.
- Time delayed air shower search.
- Prompt air shower search.
- Also $e/4$ and $e/6$ charges.
- No events in subsequent experiments.

Quark Flux — Cosmic Ray Searches

Shielding values followed with an asterisk indicate altitude in km. Shielding values not followed with an asterisk indicate sea level in kg/cm^2 .

- 95% CL limit for fractional charge particles with $0.18e \leq |Q_{\text{residual}}| \leq 0.82e$ in total of 70.1 mg of silicone oil.
- 95% CL limit for particles with fractional charge $|Q_{\text{residual}}| > 0.16e$ in total of 17.4 mg of silicone oil.
- Also set limits for $Q = \pm e/6$.
- Note that in PHILLIPS 88 these authors report a subtle magnetic effect which could account for the apparent fractional charges.
- Limit inferred by JONES 77B.

Meson Particle Listings

π^\pm

LIGHT UNFLAVORED MESONS
(S = C = B = 0)

For $l = 1$ (π, b, ρ, a): $u\bar{d}, (u\bar{u}-d\bar{d})/\sqrt{2}, d\bar{u}$;
for $l = 0$ ($\eta, \eta', h, h', \omega, \phi, f, f'$): $c_1(u\bar{u} + d\bar{d}) + c_2(s\bar{s})$

π^\pm

$I^G(J^P) = 1^-(0^-)$

We have omitted some results that have been superseded by later experiments. The omitted results may be found in our 1988 edition Physics Letters **B204** 1 (1988).

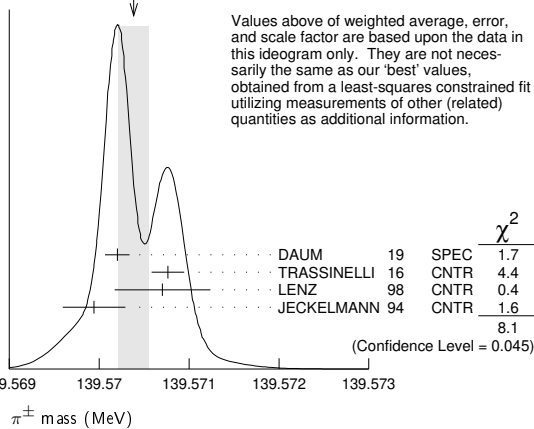

π^\pm MASS

The most accurate charged pion mass measurements are based upon x-ray wavelength measurements for transitions in π^- -mesonic atoms. The observed line is the blend of three components, corresponding to different K-shell occupancies. JECKELMANN 94 revisits the occupancy question, with the conclusion that two sets of occupancy ratios, resulting in two different pion masses (Solutions A and B), are equally probable. We chose the higher Solution B since only this solution is consistent with a positive mass-squared for the muon neutrino, given the precise muon momentum measurements now available (DAUM 91, ASSAMAGAN 94, and ASSAMAGAN 96) for the decay of pions at rest. Earlier mass determinations with p-mesonic atoms may have used incorrect K-shell screening corrections.

Measurements with an error of > 0.005 MeV have been omitted from this Listing.

WEIGHTED AVERAGE
139.57039 ± 0.00017 (Error scaled by 1.6)

Values above of weighted average, error, and scale factor are based upon the data in this ideogram only. They are not necessarily the same as our 'best' values, obtained from a least-squares constrained fit utilizing measurements of other (related) quantities as additional information.

¹ DAUM 19 value is based on their previous (1991+1996) measurements of the μ^+ momentum of 29.79200 ± 0.00011 MeV for π^+ decay at rest. It also uses $m_\mu = 105.6583745 \pm 0.0000024$ MeV, and assumes conservatively $m_{\nu_\mu} = 2.0 \pm 2.0$ MeV. It is the most precise charged pion mass determination.
² TRASSINELLI 16 use the muonic oxygen line for online energy calibration of the pionic line.
³ LENZ 98 result does not suffer K-electron configuration uncertainties as does JECKELMANN 94.
⁴ JECKELMANN 94 Solution B (dominant 2-electron K-shell occupancy), chosen for consistency with positive $m_{\nu_\mu}^2$.

⁵ ASSAMAGAN 96 measures the μ^+ momentum p_μ in $\pi^+ \rightarrow \mu^+ \nu_\mu$ decay at rest to be 29.79200 ± 0.00011 MeV/c. Combined with the μ^+ mass and the assumption $m_{\nu_\mu} = 0$, this gives the π^+ mass above; if $m_{\nu_\mu} > 0$, m_{π^+} given above is a lower limit.

Combined instead with m_μ and (assuming CPT) the π^- mass of JECKELMANN 94, p_μ gives an upper limit on m_{ν_μ} (see the ν_μ).

⁶ JECKELMANN 94 Solution A (small 2-electron K-shell occupancy) in combination with either the DAUM 91 or ASSAMAGAN 94 pion decay muon momentum measurement yields a significantly negative $m_{\nu_\mu}^2$. It is accordingly not used in our fits.

⁷ The DAUM 91 value includes the ABELA 84 result. The value is based on a measurement of the μ^+ momentum for π^+ decay at rest, $p_\mu = 29.79179 \pm 0.00053$ MeV, uses $m_\mu = 105.658389 \pm 0.000034$ MeV, and assumes that $m_{\nu_\mu} = 0$. The last assumption means that in fact the value is a lower limit.

⁸ JECKELMANN 86b gives $m_\pi/m_e = 273.12677(71)$. We use $m_e = 0.51099906(15)$ MeV from COHEN 87. The authors note that two solutions for the probability distribution of K-shell occupancy fit equally well, and use other data to choose the lower of the two possible π^\pm masses.

⁹ These values are scaled with a new wavelength-energy conversion factor $V\lambda = 1.23984244(37) \times 10^{-6}$ eV m from COHEN 87. The LU 80 screening correction relies upon a theoretical calculation of inner-shell refilling rates.

¹⁰ This MARUSHENKO 76 value used at the authors' request to use the accepted set of calibration γ energies. Error increased from 0.0017 MeV to include QED calculation error of 0.0017 MeV (12 ppm).

$m_{\pi^+} - m_{\mu^+}$

Measurements with an error > 0.05 MeV have been omitted from this Listing.

π^+ DECAY MODES

π^- modes are charge conjugates of the modes below.

For decay limits to particles which are not established, see the section on Searches for Axions and Other Very Light Bosons.

Mode	Fraction (Γ_i/Γ)	Confidence level
Γ_1 $\mu^+ \nu_\mu$	[a] (99.98770 ± 0.00004) %	
Γ_2 $\mu^+ \nu_\mu \gamma$	[b] (2.00 ± 0.25) × 10 ⁻⁴	
Γ_3 $e^+ \nu_e$	[a] (1.230 ± 0.004) × 10 ⁻⁴	
Γ_4 $e^+ \nu_e \gamma$	[b] (7.39 ± 0.05) × 10 ⁻⁷	
Γ_5 $e^+ \nu_e \pi^0$	(1.036 ± 0.006) × 10 ⁻⁸	
Γ_6 $e^+ \nu_e e^+ e^-$	(3.2 ± 0.5) × 10 ⁻⁹	
Γ_7 $\mu^+ \nu_\mu \nu \bar{\nu}$	< 9 × 10 ⁻⁶	90%
Γ_8 $e^+ \nu_e \nu \bar{\nu}$	< 1.6 × 10 ⁻⁷	90%

Lepton Family number (LF) or Lepton number (L) violating modes

Γ_9 $\mu^+ \bar{\nu}_e$	L	[c] < 1.5	× 10 ⁻³	90%
Γ_{10} $\mu^+ \nu_e$	LF	[c] < 8.0	× 10 ⁻³	90%
Γ_{11} $\mu^- e^+ e^+ \nu$	LF	< 1.6	× 10 ⁻⁶	90%

[a] Measurements of $\Gamma(e^+ \nu_e)/\Gamma(\mu^+ \nu_\mu)$ always include decays with γ 's, and measurements of $\Gamma(e^+ \nu_e \gamma)$ and $\Gamma(\mu^+ \nu_\mu \gamma)$ never include low-energy γ 's. Therefore, since no clean separation is possible, we consider the modes with γ 's to be subreactions of the modes without them, and let $[\Gamma(e^+ \nu_e) + \Gamma(\mu^+ \nu_\mu)]/\Gamma_{\text{total}} = 100\%$.

[b] See the Particle Listings below for the energy limits used in this measurement; low-energy γ 's are not included.

[c] Derived from an analysis of neutrino-oscillation experiments.

¹POCANIC 04 normalizes to $e^+ \nu_e$ decays, using the PDG 2004 value $B(\pi^+ \rightarrow e^+ \nu_e) = (1.230 \pm 0.004) \times 10^{-4}$. We add their statistical (0.004×10^{-8}) , systematic (0.004×10^{-8}) and systematic error due to the uncertainty of $B(\pi^+ \rightarrow e^+ \nu_e)$ (0.003×10^{-8}) in quadrature.
²This result can be used to calculate V_{ud} from pion beta decay: $V_{ud}^{PIBETA} = 0.9728 \pm 0.0030$.
³MCFARLANE 85 combines a measured rate $(0.394 \pm 0.015)/s$ with 1982 PDG mean life.
⁴DEPOMMIER 68 says the result of DEPOMMIER 63 is at least 10% too large because of a systematic error in the π^0 detection efficiency, and that this may be true of all the previous measurements (also V. Soergel, private communication, 1972).

π^\pm CHARGE RADIUS

The charge radius of the pion $\sqrt{\langle r_\pi^2 \rangle}$ is defined in relation to the form factor of the pion electromagnetic vertex, called vector form factor VFF, F_V . The VFF is a function of the squared four-momentum transfer t , or of the squared c.m. energy s , depending on the channel in which the photon exchange takes place. In both cases, it is related to the slope of the VFF at zero, namely

$$\langle r_\pi^2 \rangle = 6 \frac{dF_V(q^2)}{dq^2} (q=0) \text{ where } q = t, s.$$

The quantity cannot be measured directly. It can be extracted from the cross sections of three processes: pion electroproduction, $eN \rightarrow eN\pi$, and pion electron scattering $e\pi \rightarrow e\pi$, for the t channel, and positron electron annihilation into two charged pions, $e^+e^- \rightarrow \pi^+\pi^-$, for the s channel. We encode all measurements, but we do not use electroproduction data in averaging because the extraction of the pion radius involves, in this case, theoretical uncertainties that cannot be controlled at the needed level of accuracy. In case of analyses based on the same data set, as ANANTHANARAYAN 17 and COLANGELO 19, which cannot be averaged, we combine the results into a common value, with the uncertainty range chosen to cover both analyses. Note that for consistency the form factor needs to be defined in both channels with the vacuum polarisation removed. For details see COLANGELO 19 or Appendix B of ANANTHANARAYAN 16A.

- This value combines the measurements of ANANTHANARAYAN 17 and COLANGELO 19 which are based on the same data set. The uncertainty range is chosen to cover both results.
- CUI 21A perform a fit including spacelike data only. Employ a new mathematical procedure based on interpolation via continued fractions augmented by statistical sampling. Also do not impose the charge conserving normalization condition $F(0) = 1$.
- COLANGELO 19 fit existing F_V data, using an extended Omnes dispersive representation. This analysis is based on the same data set of ANANTHANARAYAN 17. Accordingly, they cannot be averaged. We combine the results into a common value, with the uncertainty range chosen to cover the uncertainty ranges of both analyses.
- ANANTHANARAYAN 17 fit existing F_V data, using a mixed phase-modulus dispersive representation. This analysis is based on the same data set of COLANGELO 19. Accordingly, they cannot be averaged. We combine the results into a common value, with the uncertainty range chosen to cover the uncertainty ranges of both analyses.
- According to the authors the uncertainty could be underestimated. The value quoted omits the BaBar data AUBERT 09.
- The extractions could contain an additional theoretical uncertainty which cannot be sufficiently quantified.
- BIJNENS 98 fits existing data.
- The extraction is based on a parametrization that does not have correct analytic properties.

π^0 MEAN LIFE

Most experiments measure the π^0 width which we convert to a lifetime. ATHERTON 85 is the only direct measurement of the π^0 lifetime. The two Primakoff measurements from 1970 have been excluded from our average because they suffered model-related systematics unknown at the time. More information on the π^0 lifetime can be found in BERNSTEIN 13.

<p>1 LARIN 20 reported this lifetime value from a measurement of $\Gamma(\pi^0 \rightarrow \gamma\gamma) = 7.802 \pm 0.052 \pm 0.105$ eV, combining data from PrimEX-II on 12C and 28Si targets with previous PrimEX-I LARIN 11 measurements. This result supersedes LARIN 11.</p> <p>2 BYCHKOV 09 obtains this using the conserved-vector-current relation between the vector form factor F_V and the π^0 lifetime.</p> <p>3 WILLIAMS 88 gives $\Gamma(\gamma\gamma) = 7.7 \pm 0.5 \pm 0.5$ eV. We give here $\tau = \hbar/\Gamma(\text{total})$.</p> <p>4 BROWMAN 74 gives a π^0 width $\Gamma = 8.02 \pm 0.42$ eV. The mean life is \hbar/Γ.</p> <p>5 LARIN 11 reported $\Gamma(\pi^0 \rightarrow \gamma\gamma) = 7.82 \pm 0.14 \pm 0.17$ eV which we converted to mean life $\tau = \hbar/\Gamma(\text{total})$.</p>				

π^0 DECAY MODES

For decay limits to particles which are not established, see the appropriate Search sections (A^0 (axion) and Other Light Boson (X^0) Searches, etc.).

Mode	Fraction (Γ_i/Γ)	Scale factor/Confidence level

Charge conjugation (C) or Lepton Family number (LF) violating modes

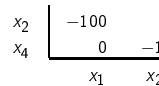

Γ_{12} 3γ	C	< 3.1	× 10 ⁻⁸	CL=90%
Γ_{13} $\mu^+ e^-$	LF	< 3.8	× 10 ⁻¹⁰	CL=90%
Γ_{14} $\mu^- e^+$	LF	< 3.2	× 10 ⁻¹⁰	CL=90%
Γ_{15} $\mu^+ e^- + \mu^- e^+$	LF	< 3.6	× 10 ⁻¹⁰	CL=90%

[a] Astrophysical and cosmological arguments give limits of order 10⁻¹³, but they are model dependent and for the summary value we use the best laboratory limit, which includes any final state of invisible particles.

CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 6 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 4.6$ for 4 degrees of freedom.

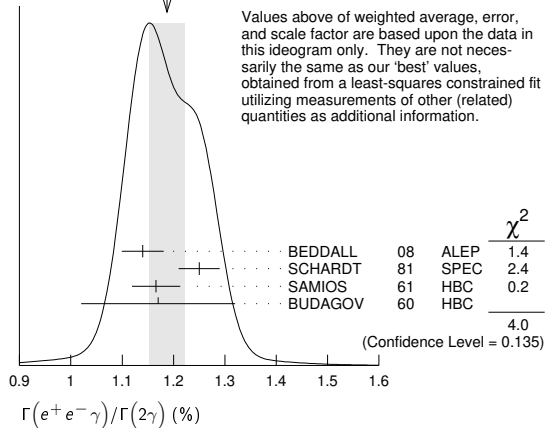

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

π^0 ELECTROMAGNETIC FORM FACTOR

The amplitude for the process $\pi^0 \rightarrow e^+e^-\gamma$ contains a form factor $F(x)$ at the $\pi^0\gamma\gamma$ vertex, where $x = [m_{e^+e^-}/m_{\pi^0}]^2$. The parameter a in the linear expansion $F(x) = 1 + ax$ is listed below.

All the measurements except that of BEHREND 91 are in the time-like region of momentum transfer.

Meson Particle Listings

π^0, η

¹ BEHREND 91 estimates that their systematic error is of the same order of magnitude as their statistical error, and so we have included a systematic error of this magnitude. The value of α is obtained by extrapolation from the region of large space-like momentum transfer assuming vector dominance.

² TUPPER 83 is a theoretical analysis of FISCHER 78 including 2-photon exchange in the corrections.

³ The FISCHER 78 error is statistical only. The result without radiation corrections is $+0.05 \pm 0.03$.

π^0 REFERENCES

We have omitted some papers that have been superseded by later experiments. The omitted papers may be found in our 1988 edition Physics Letters **B204** 1 (1988).

η

$$J^G(J^{PC}) = 0^+(0^-)$$

We have omitted some results that have been superseded by later experiments. The omitted results may be found in our 1988 edition Physics Letters **B204** (1988).

η MASS

Recent measurements resolve the obvious inconsistency in previous η mass measurements in favor of the higher value first reported by NA48 (LAI 02). We use only precise measurements consistent with this higher mass value for our η mass average.

- S-matrix pole; 8595 events.
- Applying the chiral unitary approach at NLO to the K_{e4} data of BATLEY 10 and $\pi N \rightarrow \pi\pi N$ data of HYAMS 73, GRAYER 74, and PROTOPOESCU 73.
- Uses the K_{e4} data of BATLEY 10c and the $\pi N \rightarrow \pi\pi N$ data of HYAMS 73, GRAYER 74, and PROTOPOESCU 73.
- Analytic continuation using Roy equations.
- Analytic continuation using GKP equations.
- Using Roy equations.
- Average of three variants of the analytic K-matrix model. Uses the K_{e4} data of BATLEY 08a and the $\pi N \rightarrow \pi\pi N$ data of HYAMS 73 and GRAYER 74.
- Average of the analyses of three data sets in the K-matrix model. Uses the data of BATLEY 08a, HYAMS 73, and GRAYER 74, partially of COHEN 80 or ETKIN 82b.
- From the K_{e4} data of BATLEY 08a and $\pi N \rightarrow \pi\pi N$ data of HYAMS 73.
- From the K_{e4} data of BATLEY 08a and $\pi N \rightarrow \pi\pi N$ data of PROTOPOESCU 73, GRAYER 74, and ESTABROOKS 74.
- From a mean of three different $f_0(500)$ parametrizations. Uses 40k events.
- From an isobar model using 2.6k events.
- Reanalysis of ABLIKIM 04a, PISLAK 01, and HYAMS 73 data.
- Using the N/D method.
- From the solution of the Roy equation (ROY 71) for the isoscalar S-wave and using a phase-shift analysis of HYAMS 73 and PROTOPOESCU 73 data.
- Reanalysis of the data from PROTOPOESCU 73, ESTABROOKS 74, GRAYER 74, ROSSELET 77, PISLAK 03, and AKHMETSHIN 04.
- From a mean of six different analyses and $f_0(500)$ parameterizations.
- Using data on $\psi(2S) \rightarrow J/\psi\pi\pi$ from BAI 00E and on $\Upsilon(3S) \rightarrow \Upsilon(mS)\pi\pi$ from BUTLER 94b and ALEXANDER 98.
- From a combined analysis of HYAMS 73, AUGUSTIN 89, AITALA 01b, and PISLAK 01.
- A similar analysis (KOMADA 01) finds $(580^{+79}_{-30}) - i(190^{+107}_{-49})$ MeV.
- Coupled channel reanalysis of BATON 70, BENSINGER 71, BAILLON 72, HYAMS 73, HYAMS 75, ROSSELET 77, COHEN 80, and ETKIN 82b using the uniformizing variable.
- Using the inverse amplitude method and data of ESTABROOKS 73, GRAYER 74, and PROTOPOESCU 73.
- Reanalysis of data from HYAMS 73, GRAYER 74, SRINIVASAN 75, and ROSSELET 77 using the interfering amplitude method.
- Average and spread of 4 variants ("up" and "down") of KAMINSKI 97b 3-channel model.
- Uses data from BEIER 72b, OCHS 73, HYAMS 73, GRAYER 74, ROSSELET 77, CASON 83, ASTON 88, and ARMSTRONG 91b. Coupled channel analysis with flavor symmetry and all light two-pseudoscalars systems.
- Demonstrates explicitly that $f_0(500)$ and $f_0(1370)$ are two different poles.
- Analysis of data from FALVARD 88.
- Analysis of data from OCHS 73, ESTABROOKS 75, ROSSELET 77, and MUKHIN 80.
- Analysis of data from OCHS 73, GRAYER 74, and ROSSELET 77.
- Coupled-channel analysis using data from PROTOPOESCU 73, HYAMS 73, HYAMS 75, GRAYER 74, ESTABROOKS 74, ESTABROOKS 75, FROGGATT 77, CORDEN 79, BISWAS 81.
- Analysis of data from APEL 72c, GRAYER 74, CASON 76, PAWLICKI 77. Includes spread and errors of 4 solutions.
- Analysis of data from BATON 70, BENSINGER 71, COLTON 71, BAILLON 72, PROTOPOESCU 73, and WALKER 67.

53 Using dispersive analysis with phases from GARCIA-MARTIN 11A and BUETTICKER 04 as input.

54 Using Roy-Steiner equations with $\pi\pi$ phase shifts from an update of COLANGELO 01 and from GARCIA-MARTIN 11A.

55 Using an analytic K-matrix model.

56 Using dispersion integral with phase input from Roy equations and data from MARSISKE 90, BOYER 90, BEHREND 92, UEHARA 08A, and MORI 07.

57 Used dispersion theory. The value quoted used the $f_0(500)$ pole position of $457 - i276$ MeV.

58 Using p, n polarizabilities from PDG 06 and fitting to $\pi\pi$ phase motion from GARCIA-MARTIN 07 and σ -poles from GARCIA-MARTIN 07 and CAPRINI 06.

59 Using twice-subtracted dispersion integrals.

60 Supersedes OLLER 08.

61 Solution A (preferred solution based on χ^2 -analysis).

62 Dispersion theory based amplitude analysis of BOYER 90, MARSISKE 90, BEHREND 92, and MORI 07.

63 Solution B (worse than solution A; still acceptable when systematic uncertainties are included).

64 Using unitarity and the σ pole position from CAPRINI 06.

65 This width could equally well be assigned to the $f_0(1370)$. The authors analyse data from BOYER 90 and MARSISKE 90 and report strong correlation with $\gamma\gamma$ width of $f_2(1270)$.

66 Supersedes MORGAN 90.

1 From a fit of the cross section in the energy range $0.525 < \sqrt{s} < 0.883$ GeV parameterized by the sum of the Breit-Wigner amplitudes for the $\rho(770)$, ω and $\rho(1450)$ resonances.

2 Using the GOUNARIS 68 parametrization with the complex phase of the ρ - ω interference and leaving the masses and widths of the $\rho(1450)$, $\rho(1700)$, and $\rho(2150)$ resonances as free parameters of the fit.

3 A combined fit of AKHMETSHIN 07, AULCHENKO 06, and AULCHENKO 05.

Meson Particle Listings

$\rho(770)$

- ⁴ Supersedes ACHASOV 05A.
- ⁵ A fit of the SND data from 400 to 1000 MeV using parameters of the $\rho(1450)$ and $\rho(1700)$ from a fit of the data of BARKOV 85, BISELLO 89 and ANDERSON 00A.
- ⁶ Using the GOUNARIS 68 parametrization with the complex phase of the ρ - ω interference.
- ⁷ Update of AKHMETSHIN 02.
- ⁸ Assuming $m_{\rho^+} = m_{\rho^-}$, $\Gamma_{\rho^+} = \Gamma_{\rho^-}$.
- ⁹ From the GOUNARIS 68 parametrization of the pion form factor.
- ¹⁰ Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of LEES 12G and ABLIKIM 16C.
- ¹¹ Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of ACHASOV 06, AKHMETSHIN 07, AUBERT 09AS, and AMBROSINO 11A.
- ¹² Assuming $m_{\rho^+} = m_{\rho^-} = m_{\rho^0}$, $\Gamma_{\rho^+} = \Gamma_{\rho^-} = \Gamma_{\rho^0}$.
- ¹³ Without limitations on masses and widths.
- ¹⁴ Assuming $m_{\rho^0} = m_{\rho^\pm}$, $g_{\rho^0\pi\pi} = g_{\rho^\pm\pi\pi}$.
- ¹⁵ Using the data of BARKOV 85 in the hidden local symmetry model.
- ¹⁶ From the fit to $e^+e^- \rightarrow \pi^+\pi^-$ data from the compilations of HEYN 81 and BARKOV 85, including the GOUNARIS 68 parametrization of the pion form factor.
- ¹⁷ A fit of BARKOV 85 data assuming the direct $\omega\pi\pi$ coupling.
- ¹⁸ Applying the S-matrix formalism to the BARKOV 85 data.
- ¹⁹ Includes BARKOV 85 data. Model-dependent width definition.

- ¹⁵ Of HYAMS 68 six parametrizations, this is theoretically soundest. MR

$m_{\rho(770)^0} - m_{\rho(770)^\pm}$

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes entries for SCHAEEL, ALOISIO, ACHASOV, ABELE, REYNOLDS, FOSTER, PISUT, BARTOS.

••• We do not use the following data for averages, fits, limits, etc. •••

WEIGHTED AVERAGE -0.7±0.8 (Error scaled by 1.5)

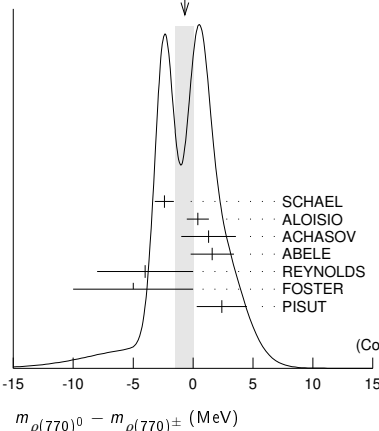

Table listing data points for the weighted average fit, including experiment names (SCHAEEL, ALOISIO, ACHASOV, ABELE, REYNOLDS, FOSTER, PISUT), TECN, CHG, and chi-squared values.

1 From the combined fit of the tau- data from ANDERSON 00A and SCHAEEL 05c and e+e- data from the compilation of BARKOV 85, AKHMETSHIN 04, and ALOISIO 05. Supersedes BARATE 97M.

2 Assuming m_rho+ = m_rho-, Gamma_rho+ = Gamma_rho-. 3 From quoted masses of charged and neutral modes.

4 Includes MALAMUD 69, ARMENISE 68, BATON 68, BACON 67, HUWE 67, MILLER 67B, ALFF-STEINBERGER 66, HAGOPIAN 66, HAGOPIAN 66B, JACOBS 66B, JAMES 66, WEST 66, BLIEDEN 65, CARMONY 64, GOLDBABER 64, ABOLINS 63.

5 Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of ACHASOV 06, AKHMETSHIN 07, AUBERT 09As, AMBROSINO 11A, and FUJIKAWA 08.

$m_{\rho(770)^+} - m_{\rho(770)^-}$

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes entry for ALOISIO.

••• We do not use the following data for averages, fits, limits, etc. •••

1 Without limitations on masses and widths.

$\rho(770)$ RANGE PARAMETER

The range parameter R enters an energy-dependent correction to the width, of the form (1 + q^2 R^2) / (1 + q^2 R^2), where q is the momentum of one of the pions in the pi-pi rest system. At resonance, q = q_r.

Table with columns: VALUE (GeV^-1), DOCUMENT ID, TECN, CHG, COMMENT. Includes entry for CHABAUD.

1 The old PISUT 68 value, properly corrected, was 3.2 ± 0.6.

$\rho(770)$ WIDTH

We no longer list S-wave Breit-Wigner fits, or data with high combinatorial background.

NEUTRAL ONLY, e+e-

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes entries for ACHASOV, LEES, AKHMETSHIN, ACHASOV.

Table with columns: VALUE, EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes entries for AKHMETSHIN, ALOISIO, ACHASOV, BARKOV, BARTOS, REYNOLDS, ALOISIO, ACHASOV, BENAYOUN, GARDNER, O'CONNELL, BERNICHA, GESHKEN...

••• We do not use the following data for averages, fits, limits, etc. •••

WEIGHTED AVERAGE 147.4±0.8 (Error scaled by 2.0)

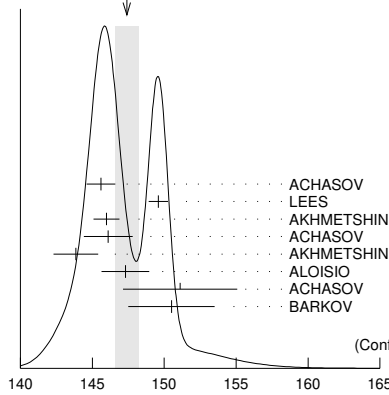

Table listing data points for the weighted average fit, including experiment names (ACHASOV, LEES, AKHMETSHIN, ACHASOV, AKHMETSHIN, ALOISIO, ACHASOV, BARKOV), TECN, CHG, and chi-squared values.

Neutral only, e+e- (MeV)

1 From a fit of the cross section in the energy range 0.525 < sqrt(s) < 0.883 GeV parameterized by the sum of the Breit-Wigner amplitudes for the rho(770), omega and rho(1450) resonances.

2 Using the GOUNARIS 68 parametrization with the complex phase of the rho-omega interference and leaving the masses and widths of the rho(1450), rho(1700), and rho(2150) resonances as free parameters of the fit.

3 A combined fit of AKHMETSHIN 07, AULCHENKO 06, and AULCHENKO 05.

4 Supersedes ACHASOV 05A.

5 A fit of the SND data from 400 to 1000 MeV using parameters of the rho(1450) and rho(1700) from a fit of the data of BARKOV 85, BISELLO 89 and ANDERSON 00A.

6 Using the GOUNARIS 68 parametrization with the complex phase of the rho-omega interference.

7 From a fit in the energy range 0.61 to 0.96 GeV. Update of AKHMETSHIN 02.

8 Assuming m_rho+ = m_rho-, Gamma_rho+ = Gamma_rho-.

9 From the GOUNARIS 68 parametrization of the pion form factor.

10 Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of LEES 12c and ABLIKIM 16c.

11 Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of ACHASOV 06, AKHMETSHIN 07, AUBERT 09As, and AMBROSINO 11A.

12 Assuming m_rho+ = m_rho- = m_rho^0, Gamma_rho+ = Gamma_rho- = Gamma_rho^0.

13 Without limitations on masses and widths.

14 Assuming m_rho^0 = m_rho^\pm, g_rho^0 pi pi = g_rho^\pm pi pi.

15 Using the data of BARKOV 85 in the hidden local symmetry model.

16 From the fit to e+e- -> pi+pi- data from the compilations of HEYN 81 and BARKOV 85, including the GOUNARIS 68 parametrization of the pion form factor.

17 A fit of BARKOV 85 data assuming the direct omega pi pi coupling.

18 Applying the S-matrix formalism to the BARKOV 85 data.

19 Includes BARKOV 85 data. Model-dependent width definition.

CHARGED ONLY, tau DECAYS and e+e-

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes entries for FUJIKAWA, SCHAEEL, ACHASOV, ANDERSON, BARTOS, ALOISIO.

••• We do not use the following data for averages, fits, limits, etc. •••

Γ_{17} $\pi^0e^+e^-$	< 1.2	$\times 10^{-5}$ CL=90%
Γ_{18} ηe^+e^-		

[a] The $\omega\rho$ interference is then due to $\omega\rho$ mixing only, and is expected to be small. If $e\mu$ universality holds, $\Gamma(\rho^0 \rightarrow \mu^+\mu^-) = \Gamma(\rho^0 \rightarrow e^+e^-) \times 0.99785$.

CONSTRAINED FIT INFORMATION

An overall fit to the total width and a partial width uses 10 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 10.7$ for 8 degrees of freedom.

Meson Particle Listings

$\rho(770)$

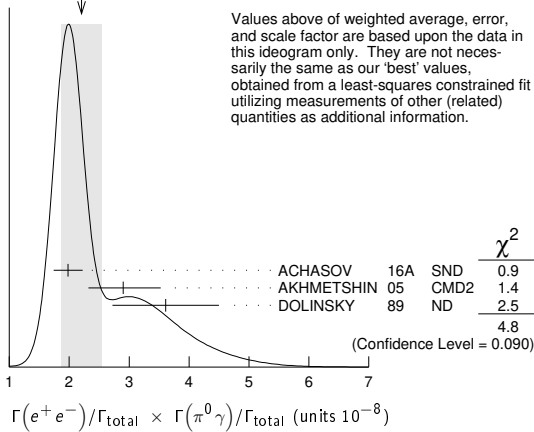

¹ From the VMD model with the $\rho(770)$, $\omega(782)$, $\phi(1020)$ resonances, and an additional resonance describing the total contribution of the $\rho(1450)$ and $\omega(1420)$ states. Supersedes ACHASOV 03.

² Recalculated by us from the cross section in the peak.

³ A simultaneous fit of $e^+e^- \rightarrow \pi^+\pi^-, \pi^+\pi^-\pi^0, \pi^0\gamma, \eta\gamma$ data.

⁴ Using $\sigma_{\phi \rightarrow \pi^0\gamma}$ from ACHASOV 00 and $m_\rho = 775.97$ MeV in the model with the energy-independent phase of ρ - ω interference equal to $(-10.2 \pm 7.0)^\circ$.

WEIGHTED AVERAGE
2.21±0.34 (Error scaled by 1.6)

Values above of weighted average, error, and scale factor are based upon the data in this ideogram only. They are not necessarily the same as our 'best' values, obtained from a least-squares constrained fit utilizing measurements of other (related) quantities as additional information.

¹ Possibly large ρ - ω interference leads us to increase the minus error.

² Result contains 11 ± 11% correction using SU(3) for central value. The error on the correction takes account of possible ρ - ω interference and the upper limit agrees with the upper limit of $\omega \rightarrow \mu^+\mu^-$ from this experiment.

³ But he even enlarges his error to take residual ω contamination into account. Since his value is high, seems the other experiments also can't have too many ω 's. But maybe Hyams has additional μ 's from $\rho \rightarrow \pi\pi$, decaying π 's.

⁴ HYAMS 67's mass resolution is 20 MeV. The ω region was excluded.

- Update of AKHMETSHIN 00c.
- From the combined fit of ANTONELLI 92, ACHASOV 01E, ACHASOV 02E, and ACHASOV 03D data on the $\pi^+ \pi^- \pi^0$ and ANTONELLI 92 on the $\omega \pi^+ \pi^-$ final states. Supersedes ACHASOV 99E and ACHASOV 02E.
- From the $\eta \rightarrow \gamma \gamma$ decay.
- From the $\eta \rightarrow 3\pi^0$ decay.
- Observed by threshold-crossing technique. Mass resolution = 4.8 MeV FWHM.
- The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization. Inclusion of vacuum polarization gives 782.736 ± 0.024 MeV.
- The ω mass was extracted from a dispersively improved Breit-Wigner parameterization, the ω width fixed at 8.49 ± 0.08 MeV. The value does not include vacuum polarization which would shift the mass to 781.81 ± 0.09 ± 0.03 MeV. The mixing parameter is assumed real valued.
- The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization.
- From the $\rho-\omega$ interference in the $\pi^+ \pi^-$ mass spectrum using the Breit-Wigner for the ω and leaving its mass and width as free parameters of the fit.
- Systematic uncertainties underestimated.
- Systematic uncertainties not estimated.
- From best-resolution sample of COYNE 71.
- From $\omega-\rho$ interference in the $\pi^+ \pi^-$ mass spectrum assuming ω width 12.6 MeV.

9.5 ± 1.0	3583		COYNE	71	HBC	3.7 $\pi^+ p \rightarrow \rho \pi^+ \pi^+ \pi^- \pi^0$

- Update of AKHMETSHIN 00c.
- From the combined fit of ANTONELLI 92, ACHASOV 01E, ACHASOV 02E, and ACHASOV 03D data on the $\pi^+ \pi^- \pi^0$ and ANTONELLI 92 on the $\omega \pi^+ \pi^-$ final states. Supersedes ACHASOV 99E and ACHASOV 02E.
- The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization. Inclusion of vacuum polarization gives 8.63 ± 0.05 MeV.
- The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization.
- From the $\rho-\omega$ interference in the $\pi^+ \pi^-$ mass spectrum using the Breit-Wigner for the ω and leaving its mass and width as free parameters of the fit.
- Systematic uncertainties underestimated.
- Relativistic Breit-Wigner includes radiative corrections. Systematic uncertainties not estimated.
- Systematic uncertainties not estimated.
- Observed by threshold-crossing technique. Mass resolution = 4.8 MeV FWHM.

CONSTRAINED FIT INFORMATION

An overall fit to 15 branching ratios uses 48 measurements and one constraint to determine 10 parameters. The overall fit has a $\chi^2 = 48.0$ for 39 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

- 7.3 ± 2.9 ^{2,4} DOLINSKY 89 ND $e^+e^- \rightarrow \eta\gamma$

¹ No flat $\eta\eta\gamma$ background assumed.
² Solution corresponding to constructive $\omega\rho$ interference.
³ ACHASOV 07B reports $[\Gamma(\omega(782) \rightarrow \eta\gamma)/\Gamma_{\text{total}}] \times [B(\omega(782) \rightarrow e^+e^-)] = (3.10 \pm 0.31 \pm 0.11) \times 10^{-8}$ which we divide by our best value $B(\omega(782) \rightarrow e^+e^-) = (7.38 \pm 0.22) \times 10^{-5}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Supersedes ACHASOV 00D and ACHASOV 06A.
⁴ Not independent of the corresponding $\Gamma(e^+e^-) \times \Gamma(\eta\gamma)/\Gamma_{\text{total}}^2$.
⁵ Using $B(\omega \rightarrow e^+e^-) = (7.14 \pm 0.13) \times 10^{-5}$ and $B(\eta \rightarrow \gamma\gamma) = 39.43 \pm 0.26\%$.
⁶ Using $B(\omega \rightarrow e^+e^-) = (7.07 \pm 0.19) \times 10^{-5}$ and using $B(\eta \rightarrow 3\pi^0) = (32.24 \pm 0.29) \times 10^{-2}$. Solution corresponding to constructive $\omega\rho$ interference. The combined fit from 600 to 1380 MeV taking into account $\rho(770)$, $\omega(782)$, $\phi(1020)$, and $\rho(1450)$ (mass and width fixed at 1450 MeV and 310 MeV respectively). Not independent of the corresponding $\Gamma(e^+e^-) \times \Gamma(\eta\gamma)/\Gamma_{\text{total}}^2$.
⁷ Depending on the degree of coherence with the flat $\eta\eta\gamma$ background and using $B(\omega \rightarrow \pi^0\gamma) = (8.5 \pm 0.5) \times 10^{-2}$.
⁸ Reanalysis of DRUZHININ 84, DOLINSKY 89, DOLINSKY 91 taking into account the triangle anomaly contributions.

PARAMETER Λ IN $\omega \rightarrow \pi^0\ell^+\ell^-$ DECAY

In the pole approximation the electromagnetic transition form factor for a resonance of mass M is given by the expression:

$$|F|^2 = (1 - M^2/\Lambda^2)^{-2},$$

where for the parameter Λ vector dominance predicts $\Lambda = M_p \approx 0.770$ GeV. The ARNALDI 09 measurement is in obvious conflict with this expectation. Note that for $\eta \rightarrow \gamma\mu^+\mu^-$ decay ARNALDI 09 and DZHELADIN 80 obtain the value of Λ consistent with vector dominance.

$\eta'(958) \rightarrow \eta\pi\pi$ DECAY PARAMETERS

$|\text{MATRIX ELEMENT}|^2 = |1 + \alpha Y|^2 + CX + DX^2$

X and Y are Dalitz variables; α is complex and C, and D are real-valued. Parameters C and D are not necessarily equal to c and d, respectively, in the generalized parameterization following this one. May be different for $\eta'(958) \rightarrow \eta\pi^+\pi^-$ and $\eta'(958) \rightarrow \eta\pi^0\pi^0$ decays. Because of different initial assumptions and strong correlations of the parameters we do not average the parameters in the section below.

Re(α) decay parameter

 $\eta'(958) \rightarrow \eta\pi\pi$ DECAY PARAMETERS

$$|\text{MATRIX ELEMENT}|^2 \propto 1 + aY + bY^2 + cX + dX^2$$

X and Y are Dalitz variables and $a, b, c,$ and d are real-valued parameters. May be different for $\eta'(958) \rightarrow \eta\pi^+\pi^-$ and $\eta'(958) \rightarrow \eta\pi^0\pi^0$ decays. We do not average measurements in the section below because parameter values from each experiment are strongly correlated.

1 Using a relativistic Breit-Wigner function and taking into account the finite D_S mass.

2 Breit-Wigner ππ width. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio $g_{f_0} K K / g_{f_0} \pi \pi = 0$.

3 Systematic errors not estimated.

4 Breit-Wigner ππ width. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio $g_{f_0} K K / g_{f_0} \pi \pi = 4.21 \pm 0.25 \pm 0.21$ from ABLIKIM 05.

5 Breit-Wigner, solution 1, PWA ambiguous.

6 K-matrix pole from combined analysis of π⁻p → π⁰π⁰n, π⁻p → K \bar{K} n, π⁺π⁻ → π⁺π⁻, $\bar{p}p$ → π⁰π⁰π⁰, π⁰ηη, π⁰π⁰η, π⁺π⁻π⁰, K⁺K⁻π⁰, K $\frac{0}{S}$ K $\frac{0}{S}$ π⁰, K⁺K $\frac{0}{S}$ π⁻ at rest, $\bar{p}n$ → π⁻π⁻π⁺, K $\frac{0}{S}$ K⁻π⁰, K $\frac{0}{S}$ K $\frac{0}{S}$ π⁻ at rest.

7 Using the data of AKHMETSHIN 99C, ACHASOV 00H, and ALOISIO 02D.

8 Breit-Wigner width.

9 Supersedes ACHASOV 98i. Using the model of ACHASOV 89.

10 Supersedes ACHASOV 98i.

11 In the "narrow resonance" approximation.

12 From the combined fit of the photon spectra in the reactions e⁺e⁻ → π⁺π⁻γ, π⁰π⁰γ.

 $f_0(980)$ WIDTH

Width determination very model dependent. Peak width in ππ is about 50 MeV, but decay width can be much larger.

Meson Particle Listings

a₀(980), ϕ(1020)

K \bar{K} ONLY

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Contains data for K \bar{K} decays and a note: 'We do not use the following data for averages, fits, limits, etc.'

a₀(980) DECAY MODES

Table with columns: Mode, Fraction (Γ_i/Γ). Lists decay modes like ηπ, K \bar{K} , η'π, ρπ, γγ, e⁺e⁻ and their relative fractions.

a₀(980) PARTIAL WIDTHS

Table with columns: Γ(γγ), VALUE (keV), DOCUMENT ID, TECN, COMMENT, Γ₅. Includes a note: 'Using Γ_{γγ}B(a₀(980) → ηπ) = 0.24 ± 0.08 keV.'

a₀(980) Γ(i)Γ(γγ)/Γ(total)

Table with columns: Γ(ηπ) × Γ(γγ)/Γtotal, VALUE (keV), EVTS, DOCUMENT ID, TECN, COMMENT, Γ₁Γ₅/Γ. Includes 'OUR AVERAGE' and data points.

Table with columns: Γ(ηπ) × Γ(e⁺e⁻)/Γtotal, VALUE (eV), CL%, DOCUMENT ID, TECN, COMMENT, Γ₁Γ₆/Γ. Includes data for e⁺e⁻ → π⁰η.

a₀(980) BRANCHING RATIOS

Table with columns: Γ(K \bar{K})/Γ(ηπ), VALUE, DOCUMENT ID, TECN, CHG, COMMENT, Γ₂/Γ₁. Includes 'OUR AVERAGE' and data for various decays.

Table with columns: Γ(η'π)/Γtotal, VALUE, EVTS, DOCUMENT ID, TECN, COMMENT, Γ₃/Γ. Includes data for η'π decays.

Table with columns: Γ(ρπ)/Γ(ηπ), VALUE, CL%, DOCUMENT ID, TECN, CHG, COMMENT, Γ₄/Γ₁. Includes data for ρπ decays.

a₀(980) REFERENCES

Large table of references for a₀(980) and ϕ(1020) decays, listing authors, document IDs, and technical details.

ϕ(1020)

I^{G(J^{PC})} = 0⁻(1⁻--)

ϕ(1020) MASS

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Lists mass measurements for ϕ(1020) with various decay channels.

1 Average of KOZYREV 16 and KOZYREV 18 values taking into account the correlated uncertainties. Supersedes individual KOZYREV 16 and KOZYREV 18 results.
 2 Using a vector meson dominance model with contribution from $\phi(1020)$ and higher mass excitations of $\rho(770)$, $\omega(782)$, and $\phi(1020)$.
 3 Using a phenomenological model based on KUHN 90 with a sum of Breit-Wigner resonances for $\rho(770)$, $\omega(782)$, $\phi(1020)$ and their higher mass excitations.
 4 Update of AKHMETS... 99d
 5 From the combined fit assuming that the total $\phi(1020)$ production cross section is saturated by those of K^+K^- , $K_S K_L$, $\pi^+\pi^-\pi^0$, and $\eta\gamma$ decays modes and using ACHASOV 00b for the $\eta\gamma$ decay mode.
 6 Using a total width of 4.43 ± 0.05 MeV. Systematic uncertainty included.
 7 Using a total width of 4.43 ± 0.05 MeV.
 8 PELLINEN 82 review includes AKERLOF 77, DAUM 81, BALDI 77, AYRES 74, DE-GROOT 74.
 9 Width fixed at 4.2 MeV.
 10 The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization. Inclusion of vacuum polarization gives 1019.457 ± 0.020 MeV.
 11 From the $D^\pm \rightarrow K^\pm K^+ K^-$ Dalitz plot fit with the Triple-M amplitude in the multi-meson model of AOUDE 18.
 12 The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization.
 13 Strongly correlated with AKHMETS... 04.
 14 Systematic errors not evaluated.
 15 Weighted and scaled average of 12 measurements of DIJKSTRA 86.
 16 Mass errors enlarged by us to Γ/\sqrt{N} ; see the note with the $K^*(892)$ mass.

WEIGHTED AVERAGE
3.93±0.09 (Error scaled by 1.3)

From a combined fit of $\sigma(e^+e^- \rightarrow \eta\gamma)$ with $\eta \rightarrow 3\pi^0$ and $\eta \rightarrow \pi^+\pi^-\pi^0$, and fixing $B(\eta \rightarrow 3\pi^0) / B(\eta \rightarrow \pi^+\pi^-\pi^0) = 1.44 \pm 0.04$. Recalculated by us from the cross section at the peak. Supersedes ACHASOV 00D and ACHASOV 06A.

2 From the $\eta \rightarrow 2\gamma$ decay and using $B(\eta \rightarrow \gamma\gamma) = 39.43 \pm 0.26\%$.

3 From the $\eta \rightarrow 3\pi^0$ decay and using $B(\eta \rightarrow 3\pi^0) = (32.24 \pm 0.29) \times 10^{-2}$.

4 The combined fit from 600 to 1380 MeV taking into account $\rho(770)$, $\omega(782)$, $\phi(1020)$, and $\rho(1450)$ (mass and width fixed at 1450 MeV and 310 MeV respectively).

5 From the $\eta \rightarrow 2\gamma$ decay and using $B(\eta \rightarrow 2\gamma) = (39.21 \pm 0.34) \times 10^{-2}$.

6 Recalculated by the authors from the cross section in the peak.

7 From the $\eta \rightarrow \pi^+\pi^-\pi^0$ decay and using $B(\eta \rightarrow \pi^+\pi^-\pi^0) = (23.1 \pm 0.5) \times 10^{-2}$.

8 A simultaneous fit of $e^+e^- \rightarrow \pi^+\pi^-$, $\pi^+\pi^-\pi^0$, $\pi^0\gamma$, $\eta\gamma$ data.

1 The prediction taking into account phase-space difference, radiative corrections, isospin breaking, and the Sommerfeld-Gamow-Sakharov factor gives 0.630.

2 Theoretical analysis of BRAMON 00 taking into account phase-space difference, electromagnetic radiative corrections, as well as isospin breaking, predicts 0.62. FLOREZ-BAEZ 08 predicts 0.63 considering also structure-dependent radiative corrections. FISCHBACH 02 calculates additional corrections caused by the close threshold and predicts 0.68. See also BENAYOUN 01 and DUBYNYSKIY 07. BENAYOUN 12 obtains 0.71 ± 0.01 in the HLS model.

< 20	90		DRUZHININ 87	ND	$e^+e^- \rightarrow \pi^0\pi^0\gamma$

¹ Obtained by the authors taking into account the $\pi^+\pi^-$ decay mode. Includes a component due to $\pi\pi$ production via the $f_0(500)$ meson. Supersedes ALOISIO 02D.

² From the combined fit of the photon spectra in the reactions $e^+e^- \rightarrow \pi^+\pi^-\gamma$, $\pi^0\pi^0\gamma$.

³ From the negative interference with the $f_0(500)$ meson of AITALA 01B using the ACHASOV 89 parameterization for the $f_0(980)$, a Breit-Wigner for the $f_0(500)$, and ACHASOV 01F for the $\rho\pi$ contribution. Superseded by AMBROSINO 07.

⁴ Assuming that the $\pi^0\pi^0\gamma$ final state is completely determined by the $f_0\gamma$ mechanism, neglecting the decay $B(\phi \rightarrow K\bar{K}\gamma)$ and using $B(f_0 \rightarrow \pi^+\pi^-) = 2B(f_0 \rightarrow \pi^0\pi^0)$.

⁵ Using the value $B(\phi \rightarrow \eta\gamma) = (1.338 \pm 0.053) \times 10^{-2}$.

⁶ For $E_\gamma > 20$ MeV. Supersedes AKHMETSHIN 97C.

⁷ Neglecting other intermediate mechanisms ($\rho\pi, \sigma\gamma$).

⁸ A narrow pole fit taking into account $f_0(980)$ and $f_0(1200)$ intermediate mechanisms.

⁹ For destructive interference with the Bremsstrahlung process

¹⁰ For constructive interference with the Bremsstrahlung process

PARAMETER β IN $\phi \rightarrow P e^+e^-$ DECAYS

In the one-pole approximation the electromagnetic transition form factor for $\phi \rightarrow P e^+e^-$ ($P = \pi, \eta$) is given as a function of the e^+e^- invariant mass squared, q^2 , by the expression:

$$|F(q^2)|^2 = (1 - q^2/\Lambda^2)^{-2},$$

where vector meson dominance predicts parameter $\Lambda \approx 0.770$ GeV ($\Lambda^{-2} \approx 1.687$ GeV $^{-2}$). The slope of this form factor, $\beta = dF/dq^2(q^2=0)$, equals Λ^{-2} in this approximation.

The measurements below obtain β in the one-pole approximation.

- 1 Statistical error negligible.
- 2 From the pole position. Using an amplitude analysis based on approximate three-body unitarity of τ data from SCHAEEL 05c.
- 3 Reanalysis of CLEO data using Breit-Wigner parameterization.
- 4 Superseded by AGHASYAN 2018B.
- 5 The $\rho^\pm \pi^\mp$ state can be also due to the $\pi(1300)$.
- 6 Using the Breit-Wigner parameterization; strong correlation between mass and width.
- 7 Using the data of BARATE 98R.
- 8 From a fit to the 3π mass spectrum including the $K\bar{K}^*(892)$ threshold.
- 9 Uses the model of KUHN 90.
- 10 Uses the model of ISGUR 89.
- 11 Includes the effect of a possible a_1' state.
- 12 Uses the model of FEINDT 90.
- 13 Supersedes AKERS 95P.
- 14 Average and spread of values using 2 variants of the model of BOWLER 75.
- 15 Reanalysis of RUCKSTUHL 86.
- 16 Reanalysis of SCHMIDKE 86.
- 17 Reanalysis of ALBRECHT 86B.
- 18 From a combined reanalysis of ALBRECHT 86B, SCHMIDKE 86, and RUCKSTUHL 86.
- 19 From a combined reanalysis of ALBRECHT 86B and DAUM 81B.
- 20 Uses the model of BOWLER 75.
- 21 Produced in K^- backward scattering.

- From a fit to the Dalitz plot.
- Assuming for $\rho(1450)$ mass and width of 1370 and 386 MeV respectively.
- Assuming for $f_0(500)$ (σ) mass and width of 860 and 880 MeV respectively.
- Uses multichannel Aitchison-Bowler model (BOWLER 75). Uses data from GAVILLET 77, DAUM 80, and DANKOWYCH 81.
- Assuming for $f_0(1370)$ mass and width of 1186 and 350 MeV respectively.
- Assuming for $f_2(1270)$ mass and width of 1275 and 185 MeV respectively.
- Inconsistent with observations of $\sigma\pi$, $f_0(1370)\pi$, and $f_2(1270)\pi$ decay modes.
- Using structure functions from KUHN 92 and DECKER 93A and B ($\tau^- \rightarrow K^- \pi^- K^+ \nu_\tau$) = $(0.155 \pm 0.006 \pm 0.009)\%$ from BRIERE 03.
- From a comparison to ALAM 94 assuming purely resonant production of the $K^- K^{*0}$ system.
- From a fit to the 3π mass spectrum including the $K \bar{K}^*(892)$ threshold.
- Assuming $a_1(1260)$ dominance and taking $B(\tau \rightarrow a_1(1260)\nu_\tau)$ from BUSKULIC 96.

f₂(1270)

f₂(1270)

I^G(J^{PC}) = 0⁺(2⁺⁺)

f₂(1270) MASS

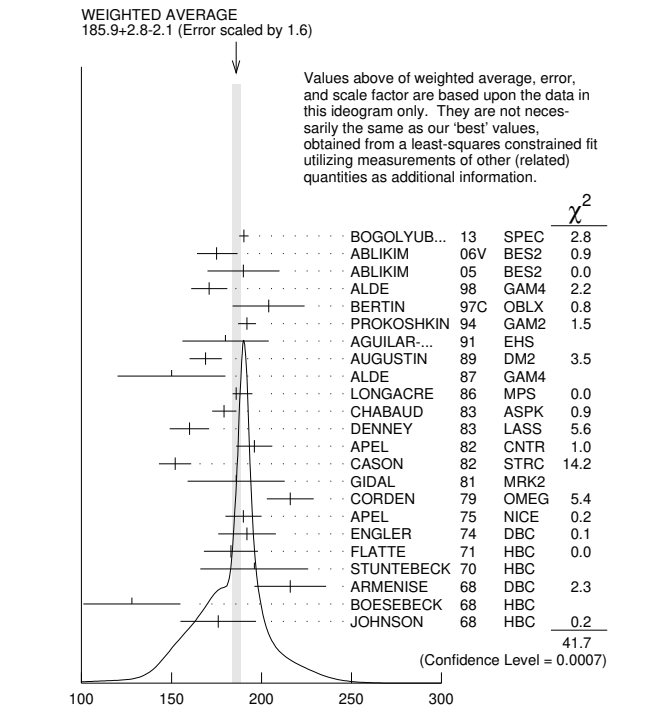

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Lists various experimental data points for the mass of f2(1270).

1 Averaged over six nuclear targets, no statistically significant dependence on target nucleus observed. 2 Breit-Wigner mass. 3 T-matrix pole. 4 Mass errors enlarged by us to Γ/√N; see the note with the K*(892) mass. 5 From a partial-wave analysis of data using a K-matrix formalism with 5 poles. 6 From an energy-independent partial-wave analysis. 7 From an amplitude analysis of the reaction π+π- → 2π0. 8 From an amplitude analysis of π+π- → π+π- scattering data. 9 T-matrix pole from coupled channel K-matrix fit to data on J/ψ → γπ0π0 (ABLIKIM 15AE) and J/ψ → γK0S K0S (ABLIKIM 18AA). 10 T-matrix pole, 5 poles, 5 channels, including scattering data from HYAMS 75 (ππ), LONGACRE 86 (K K-bar), BINON 83 (ηη). 11 Using CLEO-c data but not authored by the CLEO Collaboration. 12 From a fit to a Breit-Wigner line shape with fixed Γ = 185 MeV. 13 4-poles, 5-channel K matrix fit. 14 From analysis of L3 data at 91 and 183-209 GeV. 15 Systematic uncertainties not estimated. 16 JOHNSON 68 includes BONDAR 63, LEE 64, DERADO 65, EISNER 67.

f₂(1270) WIDTH

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Lists various experimental data points for the width of f2(1270).

Continuation of the f2(1270) MASS table, listing data from various experiments like ALDE, BERTIN, PROKOSHKIN, etc.

1 Averaged over six nuclear targets, no statistically significant dependence on target nucleus observed. 2 Breit-Wigner width. 3 T-matrix pole. 4 Width errors enlarged by us to 4Γ/√N; see the note with the K*(892) mass. 5 From a partial-wave analysis of data using a K-matrix formalism with 5 poles. 6 From an energy-independent partial-wave analysis. 7 From an amplitude analysis of the reaction π+π- → 2π0. 8 From an amplitude analysis of π+π- → π+π- scattering data. 9 JOHNSON 68 includes BONDAR 63, LEE 64, DERADO 65, EISNER 67.

CONSTRAINED FIT INFORMATION

An overall fit to the total width, 4 partial widths, a combination of partial widths obtained from integrated cross sections, and 6 branching ratios uses 45 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 83.0$ for 38 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$\Gamma(\gamma\gamma)$

The value of this width depends on the theoretical model used. Unitary approaches with scalars typically (with exception of PENNINGTON 08) give values clustering around 2.6 keV; without an S-wave contribution, values are systematically higher (typically around 3 keV).

- ¹ Based on a K-matrix analysis of BELLE data from MORI 07, UEHARA 08a, UEHARA 09 and UEHARA 13. The width is derived from the pole on the third sheet which is closest to the physical axis. Supersedes PENNINGTON 08.
- ² Solution A (preferred solution based on χ^2 -analysis).
- ³ Dispersion theory based amplitude analysis of BOYER 90, MARSISKE 90, BEHREND 92, and MORI 07.
- ⁴ Solution B (worse than solution A; still acceptable when systematic uncertainties are included).
- ⁵ From analysis of L3 data at 91 and 183–209 GeV and using SU(3) relations.
- ⁶ With a narrow scalar state around 1220 MeV.
- ⁷ Using a unitarized model with a 300–500 keV wide scalar at 1100 MeV.
- ⁸ Using the unitarized model of LYTH 85.
- ⁹ Error includes spread of different solutions. Data of MARK2 and CRYSTAL BALL used in the analysis. Authors report strong correlations with $\gamma\gamma$ width of $f_0(1370)$: $\Gamma(f_2) + 1/4 \Gamma(f^0) = 3.6 \pm 0.3$ KeV.
- ¹⁰ Radiative corrections modify the partial widths; for instance the COURAU 84 value becomes 2.66 ± 0.21 in the calculation of LANDRO 86.
- ¹¹ Using the MENNESSIER 83 model.
- ¹² Superseded by BOYER 90.
- ¹³ If helicity = 2 assumption is not made.
- ¹⁴ Using mass, width and $B(f_2(1270) \rightarrow 2\pi)$ from PDG 78.

WEIGHTED AVERAGE
1281.9±0.5 (Error scaled by 1.8)

¹Using the $2\pi^+ 2\pi^-$ and $\pi^+ \pi^- \eta$ modes of $f_1(1285)$ decay.

- ²The selected process is $J/\psi \rightarrow \omega a_0(980)\pi$.
- ³Supersedes ABATZIS 94, ARMSTRONG 89E.
- ⁴From partial wave analysis of $K^+K^0\pi^-$ system.
- ⁵No systematic error given.
- ⁶From a unitarized quark-model calculation.
- ⁷From phase shift analysis of $\eta\pi^+\pi^-$ system.
- ⁸Seen in the missing mass spectrum.

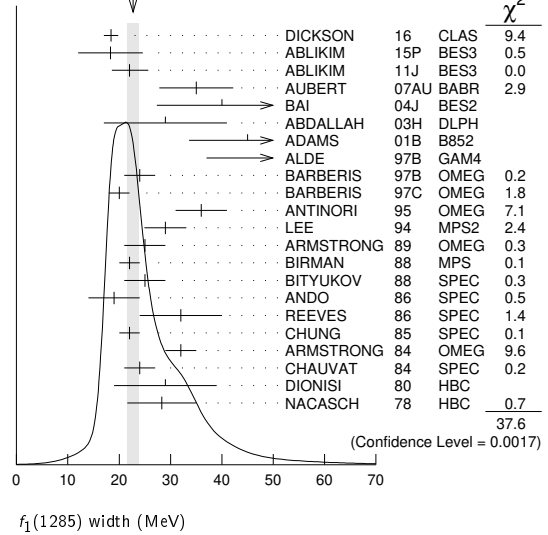

$f_1(1285)$ WIDTH

Only experiments giving width error less than 20 MeV are kept for averaging.

CONSTRAINED FIT INFORMATION

An overall fit to 6 branching ratios uses 18 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 24.0$ for 14 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

x_9	-30			
x_{10}	-12	-88		
x_{11}	22	-10	-4	
x_{15}	-25	-7	-3	-27

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 18 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 9.3$ for 15 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

WEIGHTED AVERAGE
0.15 ± 0.05 (Error scaled by 1.3)

Values above of weighted average, error, and scale factor are based upon the data in this ideogram only. They are not necessarily the same as our 'best' values, obtained from a least-squares constrained fit utilizing measurements of other (related) quantities as additional information.

¹ KARSHON 74 suggest an additional $l = 0$ state strongly coupled to $\omega\pi\pi$ which could explain discrepancies in branching ratios and masses. We use a central value and a systematic spread.

² Decays to $b_1(1040)\pi$, $b_1 \rightarrow \omega\pi$. Error increased to account for possible systematic errors of complicated analysis.

$\pi_1(1400)$

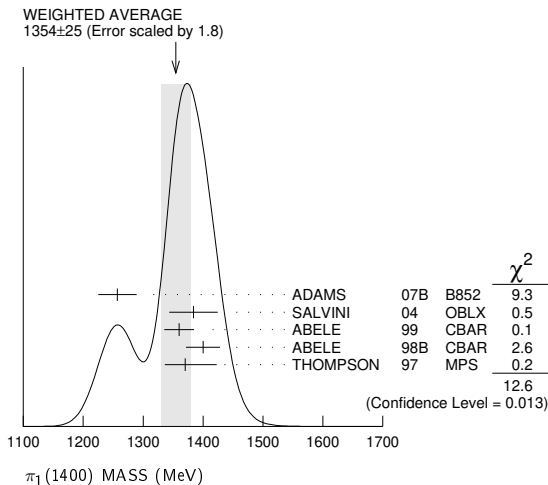

$$J^{PC} = 1^-(1^--)$$

Coupled channel analyses favor the existence of only one broad 1^-- isovector state consistent with $\pi_1(1600)$ in the 1400–1600 MeV region. See the review on "Spectroscopy of Light Meson Resonances." See also $\pi_1(1600)$.

<0.77	95	³ BAI	04J BES2 $J/\psi \rightarrow \gamma\gamma K^+K^-$

¹ Constructive interference between $X(1835)$ and $\eta(1405)/\eta(1475)$ decays to $\gamma\phi$ is assumed. Also see $\eta(1475)$. ABLIKIM 18I reports the inverse as 11.10 ± 3.5 .
² Destructive interference between $X(1835)$ and $\eta(1405)/\eta(1475)$ decays to $\gamma\phi$ is assumed. Also see $\eta(1475)$. ABLIKIM 18I reports the inverse as 7.53 ± 2.49 .
³ Calculated by us from $B(J/\psi \rightarrow \eta(1405)\gamma \rightarrow \phi\gamma\gamma) < 0.82 \times 10^{-4}$ and $B(J/\psi \rightarrow \eta(1405)\gamma \rightarrow \rho^0\gamma\gamma) = (1.07 \pm 0.17 \pm 0.11) \times 10^{-4}$.

¹ From a fit of the interfering $\omega(1420)$ and $\omega(1650)$ with a relative phase of π and other parameters floating.				
² From a fit with contributions from $\omega(782)$, $\phi(1020)$, $\omega(1420)$, and $\omega(1650)$. See ACHASOV 20A for a further analysis of the $\pi^+\pi^-\pi^0$ data.				
³ From the combined fit of ANTONELLI 92, ACHASOV 01E, ACHASOV 02E, and ACHASOV 03D data on the $\pi^+\pi^-\pi^0$ and ANTONELLI 92 on the $\omega\pi^+\pi^-$ final states. Supersedes ACHASOV 99E and ACHASOV 02E.				
⁴ Using results of CORDIER 81 and preliminary data of DOLINSKY 91 and ANTONELLI 92.				
⁵ Using the data of AKHMETSHIN 00D and ANTONELLI 92. The $\rho\pi$ dominance for the energy dependence of the $\omega(1420)$ and $\omega(1650)$ width assumed.				
⁶ Using data from BARKOV 87, DOLINSKY 91, and ANTONELLI 92.				
⁷ Using the data from ANTONELLI 92.				
⁸ Using the data from IVANOV 81 and BISELLO 88b.				
⁹ From a fit to two Breit-Wigner functions and using the data of DOLINSKY 91 and ANTONELLI 92.				
¹⁰ From a fit to two Breit-Wigner functions interfering between them and with the ω, ϕ tails with fixed (+, -, +) phases.				

$\omega(1420)$ WIDTH

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data for various decays like $\rho\pi$, $\omega\pi\pi$, $\omega\eta$, $\pi^+\pi^-\pi^0$, $\rho\pi\pi$, $\omega\pi^0\pi^0$, and $\rho\pi$.

1 From a fit with contributions from $\omega(1420)$, $\omega(1650)$, and $\phi(1680)$. The mass of $\omega(1420)$ is fixed to the PDG 18 value of 1420 MeV.
2 From a fit of the interfering $\omega(1420)$ and $\omega(1650)$ with a relative phase of π and other parameters floating.
3 From a fit with contributions from $\omega(782)$, $\phi(1020)$, $\omega(1420)$, and $\omega(1650)$. See ACHASOV 20A for a further analysis of the $\pi^+\pi^-\pi^0$ data.
4 From a fit of a VMD model with two effective resonances with masses of 1450 MeV and 1700 MeV to describe the excited vector states $\omega(1420)$, $\rho(1450)$, $\omega(1650)$, and $\rho(1700)$. Systematic errors not evaluated.
5 From the combined fit of ANTONELLI 92, ACHASOV 01E, ACHASOV 02E, and ACHASOV 03D data on the $\pi^+\pi^-\pi^0$ and ANTONELLI 92 on the $\omega\pi^+\pi^-$ final states. Supersedes ACHASOV 99E and ACHASOV 02E.
6 Using results of CORDIER 81 and preliminary data of DOLINSKY 91 and ANTONELLI 92.
7 Using the data of AKHMETSHIN 00D and ANTONELLI 92. The $\rho\pi$ dominance for the energy dependence of the $\omega(1420)$ and $\omega(1650)$ width assumed.
8 From a fit to two Breit-Wigner functions and using the data of DOLINSKY 91 and ANTONELLI 92.
9 From a fit to two Breit-Wigner functions interfering between them and with the ω,ϕ tails with fixed (+,-,+) phases.

$\omega(1420)$ DECAY MODES

Table with columns: Mode, Fraction (Γ_i/Γ). Lists decay modes like $\rho\pi$, $\omega\pi\pi$, $\omega\eta$, $b_1(1235)\pi$, e^+e^- , and $\pi^0\gamma$.

$\omega(1420)$ $\Gamma(\rho\pi)\Gamma(e^+e^-)/\Gamma^2(\text{total})$

Table with columns: VALUE (units 10^{-6}), EVTS, DOCUMENT ID, TECN, COMMENT. Shows branching ratios for $\rho\pi$ and e^+e^- decays.

1 From a fit with contributions from $\omega(782)$, $\phi(1020)$, $\omega(1420)$, and $\omega(1650)$. See ACHASOV 20A for a further analysis of the $\pi^+\pi^-\pi^0$ data.
2 Calculated by us from the cross section at the peak.
3 From the combined fit of ANTONELLI 92, ACHASOV 01E, ACHASOV 02E, and ACHASOV 03D data on the $\pi^+\pi^-\pi^0$ and ANTONELLI 92 on the $\omega\pi^+\pi^-$ final states. Supersedes ACHASOV 99E and ACHASOV 02E.
4 From a fit to two Breit-Wigner functions and using the data of DOLINSKY 91 and ANTONELLI 92.
5 From the partial and leptonic width given by the authors.
6 From a fit to two Breit-Wigner functions interfering between them and with the ω,ϕ tails with fixed (+,-,+) phases.
7 From the product of the leptonic width and partial branching ratio given by the authors.

Table with columns: VALUE (units 10^{-8}), DOCUMENT ID, TECN, COMMENT. Shows $\Gamma(\omega\pi\pi)/\Gamma_{\text{total}} \times \Gamma(e^+e^-)/\Gamma_{\text{total}}$.

1 Using the data of AKHMETSHIN 00D and ANTONELLI 92. The $\rho\pi$ dominance for the energy dependence of the $\omega(1420)$ and $\omega(1650)$ width assumed.

$\Gamma(\omega\eta)/\Gamma_{\text{total}} \times \Gamma(e^+e^-)/\Gamma_{\text{total}}$ $\Gamma_3/\Gamma \times \Gamma_5/\Gamma$

Table with columns: VALUE (units 10^{-8}), EVTS, DOCUMENT ID, TECN, COMMENT. Shows values for $\Gamma(\omega\eta)/\Gamma_{\text{total}} \times \Gamma(e^+e^-)/\Gamma_{\text{total}}$ and $\Gamma_3/\Gamma \times \Gamma_5/\Gamma$.

1 From a fit with contributions from $\omega(1420)$, $\omega(1650)$, and $\phi(1680)$. The mass of $\omega(1420)$ is fixed to the PDG 18 value of 1420 MeV. Fixing also the width of $\omega(1420)$ to the PDG 18 value of 220 MeV results in $(3.0 \pm 1.6) \times 10^{-8}$ measurement.
2 From a fit of the interfering $\omega(1420)$ and $\omega(1650)$ with a relative phase of π and other parameters floating. From an alternative fit $\Gamma(\omega(1420) \rightarrow \omega\eta)/\Gamma_{\text{total}} \times \Gamma(\omega(1420) \rightarrow e^+e^-) = 5.3 \pm 1.6$ eV.
3 From a fit with contributions from $\omega(1420)$, $\omega(1650)$, and $\phi(1680)$. The mass and the width of $\omega(1420)$ are fixed to the 2014 edition (PDG 14) of this review.

$\Gamma(\pi^0\gamma)/\Gamma_{\text{total}} \times \Gamma(e^+e^-)/\Gamma_{\text{total}}$ $\Gamma_6/\Gamma \times \Gamma_5/\Gamma$

Table with columns: VALUE (units 10^{-8}), DOCUMENT ID, TECN, COMMENT. Shows values for $\Gamma(\pi^0\gamma)/\Gamma_{\text{total}} \times \Gamma(e^+e^-)/\Gamma_{\text{total}}$ and $\Gamma_6/\Gamma \times \Gamma_5/\Gamma$.

1 From a fit of a VMD model with two effective resonances with masses of 1450 MeV and 1700 MeV to describe the excited vector states $\omega(1420)$, $\rho(1450)$, $\omega(1650)$, and $\rho(1700)$. Systematic errors not evaluated.
2 Using 1420 MeV and 220 MeV for the $\omega(1420)$ mass and width.

$\omega(1420)$ BRANCHING RATIOS

$\Gamma(\omega\pi\pi)/\Gamma_{\text{total}}$ Γ_2/Γ

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Shows $\Gamma(\omega\pi\pi)/\Gamma_{\text{total}}$ values.

$\Gamma(\omega\pi\pi)/\Gamma(b_1(1235)\pi)$ Γ_2/Γ_4

Table with columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Shows $\Gamma(\omega\pi\pi)/\Gamma(b_1(1235)\pi)$ values.

$\Gamma(\rho\pi)/\Gamma_{\text{total}}$ Γ_1/Γ

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Shows $\Gamma(\rho\pi)/\Gamma_{\text{total}}$ values.

$\Gamma(e^+e^-)/\Gamma_{\text{total}}$ Γ_5/Γ

Table with columns: VALUE (units 10^{-7}), EVTS, DOCUMENT ID, TECN, COMMENT. Shows $\Gamma(e^+e^-)/\Gamma_{\text{total}}$ values.

WEIGHTED AVERAGE
1506±6 (Error scaled by 1.4)

- T-matrix pole.
- Average between $\pi^+\pi^-2\pi^0$ and $2(\pi^+\pi^-)$.
- T-matrix pole. Coupled-channel analysis of AMSLER 95B, AMSLER 95C, and AMSLER 94D.
- T-matrix pole from coupled channel K-matrix fit to data on $J/\psi \rightarrow \gamma\pi^0\pi^0$ (ABLIKIM 15AE) and $J/\psi \rightarrow \gamma K_S^0 K_S^0$ (ABLIKIM 18AA).
- T-matrix pole, 5 poles, 5 channels, including scattering data from HYAMS 75 ($\pi\pi$), LONGACRE 86 ($K\bar{K}$), BINON 83 ($\eta\eta$), and BINON 84C ($\eta\eta'$).
- T-matrix pole of 3 channel unitary model fit to data from AAIJ 14BR and AAIJ 17V extracted using Pade approximants.
- Using CLEO-c data but not authored by the CLEO Collaboration.
- From a fit to a Breit-Wigner line shape with fixed $\Gamma = 109$ MeV.
- Solution 1, statistical error only.
- From partial wave analysis including all possible combinations of 0^{++} , 2^{++} , and 4^{++} resonances.
- Reanalysis of AITALA 01A data. This state could also be $f_0(1370)$.
- Breit-Wigner mass. May also be the $f_0(1370)$.
- Breit-Wigner mass.
- Statistical error only.
- Breit-Wigner, solution 1, PWA ambiguous.
- K-matrix pole from combined analysis of $\pi^-p \rightarrow \pi^0\pi^0 n$, $\pi^-p \rightarrow K\bar{K}n$, $\pi^+\pi^- \rightarrow \pi^+\pi^-$, $\bar{p}p \rightarrow \pi^0\pi^0\pi^0$, $\pi^0\eta\eta$, $\pi^0\pi^0\eta$, $\pi^+\pi^-\pi^0$, $K^+K^-\pi^0$, $K_S^0 K_S^0 \pi^0$, $K^+K_S^0 \pi^-$ at rest, $\bar{p}n \rightarrow \pi^-\pi^-\pi^+$, $K_S^0 K^-\pi^0$, $K_S^0 K_S^0 \pi^-$ at rest.
- Supersedes BARBERIS 99 and BARBERIS 99B.
- T-matrix pole on sheet $---+$.
- T-matrix pole, supersedes ANISOVICH 94.
- T-matrix pole, supersedes ANISOVICH 94 and AMSLER 92.
- Supersedes ABATZIS 94, ARMSTRONG 89E. Breit-Wigner mass.
- From a simultaneous analysis of the annihilations $\bar{p}p \rightarrow 3\pi^0, \pi^0\eta\eta$.
- Reanalysis of ANISOVICH 94 data.
- From central value and spread of two solutions. Breit-Wigner mass.

- T-matrix pole.
- Average between $\pi^+\pi^-2\pi^0$ and $2(\pi^+\pi^-)$.
- T-matrix pole. Coupled-channel analysis of AMSLER 95B, AMSLER 95C, and AMSLER 94D.
- T-matrix pole from coupled channel K-matrix fit to data on $J/\psi \rightarrow \gamma\pi^0\pi^0$ (ABLIKIM 15AE) and $J/\psi \rightarrow \gamma K_S^0 K_S^0$ (ABLIKIM 18AA).
- T-matrix pole, 5 poles, 5 channels, including scattering data from HYAMS 75 ($\pi\pi$), LONGACRE 86 ($K\bar{K}$), BINON 83 ($\eta\eta$), and BINON 84C ($\eta\eta'$).
- T-matrix pole of 3 channel unitary model fit to data from AAIJ 14BR and AAIJ 17V extracted using Pade approximants.
- Solution 1, statistical error only.

- ⁸ From partial wave analysis including all possible combinations of 0⁺⁺, 2⁺⁺, and 4⁺⁺ resonances.
- ⁹ Breit-Wigner width. May also be the f₀(1370).
- ¹⁰ Breit-Wigner width.
- ¹¹ Statistical error only.
- ¹² Breit-Wigner, solution 1, PWA ambiguous.
- ¹³ K-matrix pole from combined analysis of $\pi^- p \rightarrow \pi^0 \pi^0 n$, $\pi^- p \rightarrow K \bar{K} n$, $\pi^+ \pi^- \rightarrow \pi^+ \pi^-$, $\bar{p} p \rightarrow \pi^0 \pi^0 \pi^0$, $\pi^0 \eta \eta$, $\pi^0 \pi^0 \eta$, $\pi^+ \pi^- \pi^0$, $K^+ K^- \pi^0$, $K_S^0 K_S^0 \pi^0$, $K^+ K_S^0 \pi^-$ at rest, $\bar{p} n \rightarrow \pi^- \pi^- \pi^+$, $K_S^0 K^- \pi^0$, $K_S^0 K_S^0 \pi^-$ at rest.
- ¹⁴ Supersedes BARBERIS 99 and BARBERIS 99B.
- ¹⁵ T-matrix pole on sheet --+.
- ¹⁶ T-matrix pole, supersedes ANISOVICH 94.
- ¹⁷ T-matrix pole, supersedes ANISOVICH 94 and AMSLER 92.
- ¹⁸ Supersedes ABATZIS 94, ARMSTRONG 89E. Breit-Wigner mass.
- ¹⁹ From a simultaneous analysis of the annihilations $\bar{p} p \rightarrow 3\pi^0, \pi^0 \eta \eta$.
- ²⁰ Reanalysis of ANISOVICH 94 data.
- ²¹ From central value and spread of two solutions. Breit-Wigner mass.

CONSTRAINED FIT INFORMATION

An overall fit to 6 branching ratios uses 10 measurements and one constraint to determine 5 parameters. The overall fit has a χ² = 5.6 for 6 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients <δx_iδx_j>/(δx_iδx_j), in percent, from the fit to the branching fractions, x_i ≡ Γ_i/Γ_{total}. The fit constrains the x_i whose labels appear in this array to sum to one.

- PRODUCED BY K^\pm BEAM (MeV)**
- From partial wave analysis including all possible combinations of 0^{++} , 2^{++} , and 4^{++} resonances.
 - Supersedes ACCIARRI 95J.
 - From an analysis including interference with $f_0(1710)$.
 - T-matrix pole from coupled channel K-matrix fit to data on $J/\psi \rightarrow \gamma\pi^0\pi^0$ (ABLIKIM 15AE) and $J/\psi \rightarrow \gamma K_S^0K_S^0$ (ABLIKIM 18AA).
 - Using CLEO-c data but not authored by the CLEO Collaboration.
 - From a fit to a Breit-Wigner line shape with fixed $\Gamma = 73$ MeV.
 - From a fit to a Breit-Wigner line shape plus a second-order polynomial function. Systematic errors not evaluated.
 - From analysis of L3 data at 91 and 183-209 GeV.
 - From an analysis ignoring interference with $f_0(1710)$.

CONSTRAINED FIT INFORMATION

An overall fit to the total width, 2 partial widths, a combination of partial widths obtained from integrated cross sections, and 3 branching ratios uses 17 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 18.2$ for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

WEIGHTED AVERAGE
1542±19 (Error scaled by 2.2)

- 1 T-matrix pole.
- 2 On sheet II in a two-pole solution.
- 3 Supersedes the ω state of BELADIDZE 92b earlier assigned to the $f_2(1640)$.
- 4 Breit-Wigner width.
- 5 T-matrix pole, large coupling to $\rho\rho$ and $\omega\omega$, could be $f_2(1640)$.
- 6 Coupled-channel analysis of AMSLER 95b, AMSLER 95c, and AMSLER 94d.
- 7 From a simultaneous analysis of the annihilations $\bar{p}p \rightarrow 3\pi^0, \pi^0 \eta \eta$ including AKER 91 data.
- 8 J^P not determined, could be partly $f_0(1500)$.
- 9 J^P not determined.
- 10 Superseded by AMSLER 95b.

11 T-matrix pole.			
12 On sheet II in a two-pole solution.			
13 Supersedes the ω state of BELADIDZE 92b earlier assigned to the $f_2(1640)$.			
14 Breit-Wigner width.			
15 T-matrix pole, large coupling to $\rho\rho$ and $\omega\omega$, could be $f_2(1640)$.			
16 Coupled-channel analysis of AMSLER 95b, AMSLER 95c, and AMSLER 94d.			
17 From a simultaneous analysis of the annihilations $\bar{p}p \rightarrow 3\pi^0, \pi^0 \eta \eta$ including AKER 91 data.			
18 Supersedes ADAMO 92.			
19 J^P not determined, could be partly $f_0(1500)$.			
20 J^P not determined.			
21 Superseded by AMSLER 95b.

1 From a fit with contributions from $\omega(1420)$, $\omega(1650)$, and $\phi(1680)$. The mass of $\omega(1420)$ is fixed to the PDG 18 value of 1420 MeV. Fixing also the width of $\omega(1420)$ to the PDG 18 value of 220 MeV results in 1694 ± 9 MeV measurement.
 2 Could also be $\rho(1700)$. Branching ratio $J/\psi \rightarrow X\pi^0 \rightarrow K^+K^-\pi^0 = (5.3 \pm 0.3^{+0.6}_{-0.5}) \times 10^{-5}$.
 3 From a fit of the interfering $\omega(1420)$ and $\omega(1650)$ with a relative phase of π and other parameters floating.
 4 From a fit with contributions from $\omega(1420)$, $\omega(1650)$, and $\phi(1680)$.
 5 From a fit with contributions from $\omega(782)$, $\phi(1020)$, $\omega(1420)$, and $\omega(1650)$. See ACHASOV 20A for a further analysis of the $\pi^+\pi^-\pi^0$ data.
 6 From the combined fit of ANTONELLI 92, ACHASOV 01E, ACHASOV 02E, and ACHASOV 03D data on the $\pi^+\pi^-\pi^0$ and ANTONELLI 92 on the $\omega\pi^+\pi^-$ final states. Supersedes ACHASOV 99E and ACHASOV 02E.
 7 Using results of CORDIER 81 and preliminary data of DOLINSKY 91 and ANTONELLI 92.
 8 Using the data of AKHMETSHIN 00D and ANTONELLI 92. The $\rho\pi$ dominance for the energy dependence of the $\omega(1420)$ and $\omega(1650)$ width assumed.
 9 Using data from BARKOV 87, DOLINSKY 91, and ANTONELLI 92.
 10 Using the data from ANTONELLI 92.
 11 Using the data from IVANOV 81 and BISELLO 88B.
 12 Using the data from BISELLO 91C.
 13 From a fit to two Breit-Wigner functions and using the data of DOLINSKY 91 and ANTONELLI 92.
 14 From the combined fit of the $\rho\pi$ and $\omega\pi\pi$ final states.

< 60 at 90% CL		⁴ AKHMETSHIN	03B CMD2	$e^+e^- \rightarrow \eta\pi^0\gamma$

¹ From a fit with contributions from $\omega(1420)$, $\omega(1650)$, and $\phi(1680)$. The mass of $\omega(1420)$ is fixed to the PDG 18 value of 1420 MeV. Fixing also the width of $\omega(1420)$ to the PDG 18 value of 220 MeV results in $(5.4 \pm 0.6) \times 10^{-7}$ measurement.
² From a fit of the interfering $\omega(1420)$ and $\omega(1650)$ with a relative phase of π and other parameters floating. From an alternative fit $\Gamma(\omega(1650) \rightarrow \omega\eta)/\Gamma_{\text{total}} \times \Gamma(\omega(1650) \rightarrow e^+e^-) = 51 \pm 3$ eV.
³ From a fit with contributions from $\omega(1420)$, $\omega(1650)$, and $\phi(1680)$.
⁴ $\omega(1650)$ mass and width fixed at 1700 MeV and 250 MeV, respectively.

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 6 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 1.9$ for 3 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

• • • We do not use the following data for averages, fits, limits, etc. • • •

1 Seen in $\psi(2S)$ decay with branching ratio $\psi(2S) \rightarrow X \eta \rightarrow K^+ K^- \eta = (12.0 \pm 1.3^{+6.5}_{-6.9}) \times 10^{-6}$.
 2 From a fit using a vector meson dominance model with contribution from $\rho(770), \omega(782), \phi(1020), \omega(1420), \rho(1450)$.
 3 From a fit with coherent interference of the $\phi(1680)$ with a non-resonant contribution.
 4 Assuming the $K \bar{K}^*(892) + c.c.$ dynamics. Systematic uncertainties not estimated.
 5 Using a vector meson dominance model with contribution from $\phi(1020), \phi(1680)$, and higher mass excitations of $\rho(770)$ and $\omega(782)$.

6 Using events with $\pi\pi$ invariant mass less than 0.85 GeV.
 7 From a fit with two incoherent Breit-Wigners.
 8 From the simultaneous fit to the $K \bar{K}^*(892) + c.c.$ and $\phi\eta$ data from AUBERT 08s using the results of AUBERT 07AK.
 9 From the combined fit of AKHMETSHIN 03 and MANE 81 also including ρ, ω , and ϕ . Neither isospin nor flavor structure known.
 10 Using data from IVANOV 81, BARKOV 87, BISELLO 88B, DOLINSKY 91, and ANTONELLI 92.
 11 Using the data from BISELLO 91c.
 12 Using BISELLO 88B and MANE 82 data.
 13 From global fit including ρ, ω, ϕ and $\rho(1700)$ assume mass 1570 MeV and width 510 MeV for ρ radial excitation.
 14 From global fit of ρ, ω, ϕ and their radial excitations to channels $\omega \pi^+ \pi^-, K^+ K^-, K_S^0 K_L^0, K_S^0 K_{\pm}^{\pm} \pi^{\mp}$. Assume mass 1570 MeV and width 510 MeV for ρ radial excitations, mass 1570 and width 500 MeV for ω radial excitation.
 15 Fit to one channel only, neglecting interference with $\omega, \rho(1700)$.
