<27.0	90	⁷ ALBRECHT	88k ARG	$e^+e^- \rightarrow \Upsilon(4S)$

¹ Measured using isobar formalism in the decay chain $B^0 \rightarrow \bar{D}^0 \rho(770)$, $\rho \rightarrow \pi^+ \pi^-$ assuming $B(\rho(770) \rightarrow \pi^+ \pi^-) = 1$. The second uncertainty combines in quadrature all systematic uncertainties quoted in the paper.

² Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
³ Our second uncertainty combines systematics and model errors quoted in the paper.
⁴ NEMATI 98 assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and use the PDG 96 values for D^0 , D^{*0} , η , η' , and ω branching fractions.

⁵ ALAM 94 assume equal production of B^+ and B^0 at the $\Upsilon(4S)$ and use the CLEOII absolute $B(D^0 \rightarrow K^- \pi^+)$ and the PDG 1992 $B(D^0 \rightarrow K^- \pi^+ \pi^0)/B(D^0 \rightarrow K^- \pi^+)$ and $B(D^0 \rightarrow K^- 2\pi^+ \pi^-)/B(D^0 \rightarrow K^- \pi^+)$.

⁶ BORTOLETTO 92 assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D .

⁷ ALBRECHT 88k reports < 0.003 assuming $B^0 \bar{B}^0 : B^+ B^-$ production ratio is 45:55. We rescale to 50%.

- 1 AUBERT 07AV reports $[\Gamma(B^0 \rightarrow J/\psi(1S) K^*(892)^0)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow p\bar{p})] = (2.82^{+0.30+0.36}_{-0.28-0.35}) \times 10^{-6}$ which we divide by our best value B(J/ψ(1S) → p \bar{p}) = (2.120 ± 0.029) × 10⁻³. Our first error is their experiment's error and our second error is the systematic error from using our best value.
 - 2 Assumes equal production of B⁺ and B⁰ at the $\Upsilon(4S)$.
 - 3 ABE 98O reports $[B(B^0 \rightarrow J/\psi(1S) K^*(892)^0)]/[B(B^+ \rightarrow J/\psi(1S) K^+)] = 1.76 \pm 0.14 \pm 0.15$. We multiply by our best value B(B⁺ → J/ψ(1S) K⁺) = (9.9 ± 1.0) × 10⁻⁴. Our first error is their experiment's error and our second error is the systematic error from using our best value.
 - 4 Assumes equal production of B⁺ and B⁰ at the $\Upsilon(4S)$.
 - 5 BORTOLETTO 92 reports (1.1 ± 0.5 ± 0.3) × 10⁻³ from a measurement of $[\Gamma(B^0 \rightarrow J/\psi(1S) K^*(892)^0)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow e^+e^-)]$ assuming B(J/ψ(1S) → e⁺e⁻) = 0.069 ± 0.009, which we rescale to our best value B(J/ψ(1S) → e⁺e⁻) = (5.971 ± 0.032) × 10⁻². Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B⁺ and B⁰ at the $\Upsilon(4S)$.
 - 6 ALBRECHT 90J reports (1.1 ± 0.5 ± 0.2) × 10⁻³ from a measurement of $[\Gamma(B^0 \rightarrow J/\psi(1S) K^*(892)^0)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow e^+e^-)]$ assuming B(J/ψ(1S) → e⁺e⁻) = 0.069 ± 0.009, which we rescale to our best value B(J/ψ(1S) → e⁺e⁻) = (5.971 ± 0.032) × 10⁻². Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B⁺ and B⁰ at the $\Upsilon(4S)$.
 - 7 BEBEK 87 reports (3.5 ± 1.6 ± 0.3) × 10⁻³ from a measurement of $[\Gamma(B^0 \rightarrow J/\psi(1S) K^*(892)^0)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow e^+e^-)]$ assuming B(J/ψ(1S) → e⁺e⁻) = 0.069 ± 0.009, which we rescale to our best value B(J/ψ(1S) → e⁺e⁻) = (5.971 ± 0.032) × 10⁻². Our first error is their experiment's error and our second error is the systematic error from using our best value. Updated in BORTOLETTO 92 to use the same assumptions.
 - 8 ABE 96H assumes that B(B⁺ → J/ψ K⁺) = (1.02 ± 0.14) × 10⁻³.
 - 9 The neutral and charged B events together are predominantly longitudinally polarized. $\Gamma_{\perp}/\Gamma = 0.080 \pm 0.08 \pm 0.05$. This can be compared with a prediction using HQET, 0.73 (KRAMER 92). This polarization indicates that the B → ψ K* decay is dominated by the CP = -1 CP eigenstate. Assumes equal production of B⁺ and B⁰ at the $\Upsilon(4S)$.
 - 10 ALBRECHT 94G measures the polarization in the vector-vector decay to be predominantly longitudinal, $\Gamma_{\perp}/\Gamma = 0.03 \pm 0.16 \pm 0.15$ making the neutral decay a CP eigenstate when the K*⁰ decays through K_S⁰π⁰.
 - 11 ALBAJAR 91E assumes B_d⁰ production fraction of 36%.
 - 12 ALBRECHT 87D assume B⁺B⁻/B⁰ \bar{B}^0 ratio is 55/45. Superseded by ALBRECHT 90J.
 - 13 ALAM 86 assumes B[±]B⁰ ratio is 60/40. The observation of the decay B⁺ → J/ψ K*(892)⁺ (HAAS 85) has been retracted in this paper.

¹ AAIJ 18F uses Dalitz plot analysis of the $B^0 \rightarrow K_S^0\pi^+\pi^-$ final state decays. For the branching fraction of the reference mode, the PDG 18 average $B(B^0 \rightarrow K_S^0\pi^+\pi^-) = (4.96 \pm 0.20) \times 10^{-5}$ is used. We compute $B(B^0 \rightarrow \chi_{c0}K^0)$ using the PDG value $B(\chi_{c0} \rightarrow \pi\pi) = (8.51 \pm 0.33) \times 10^{-3}$ and 2/3 for the $\pi^+\pi^-$ fraction. Our first error is their experiment's error and the second error is systematic error from using our best value.

² Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

³ LEES 12i reports $[\Gamma(B^0 \rightarrow \chi_{c0}K^0)/\Gamma_{total}] \times [B(\chi_{c0}(1P) \rightarrow K_S^0K_S^0)] = (0.46 \pm 0.25 \pm 0.21) \times 10^{-6}$ which we divide by our best value $B(\chi_{c0}(1P) \rightarrow K_S^0K_S^0) = (3.16 \pm 0.17) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁴ Measured in the $B^0 \rightarrow K_S^0K^+K^-$ decay.

⁵ Uses Dalitz plot analysis of the $B^0 \rightarrow K^0\pi^+\pi^-$ final state decays.

⁶ EDWARDS 01 assumes equal production of B^0 and B^+ at the $\Upsilon(4S)$. The correlated uncertainties (28.3%) from $B(J/\psi(1S) \rightarrow \gamma\eta_c)$ in those modes have been accounted for.

- ² Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
- ³ AUBERT 02 reports $(4.8 \pm 1.4 \pm 0.9) \times 10^{-4}$ from a measurement of $[\Gamma(B^0 \rightarrow \chi_{c1} K^*(892)^0)/\Gamma_{\text{total}}] \times [B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S))]$ assuming $B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S)) = 0.273 \pm 0.016$, which we rescale to our best value $B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S)) = (34.3 \pm 1.0) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
- ⁴ BORTOLETTO 92 assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

 $\Gamma(\chi_{c1} K^*(892)^0)/\Gamma(J/\psi(1S) K^*(892)^0)$ $\Gamma_{260}/\Gamma_{202}$

- Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
- ABE 00c assumes $B(Z \rightarrow b\bar{D}) = (21.7 \pm 0.1)\%$ and the B fractions $f_{B^0} = f_{B^+} = (39.7^{+1.8}_{-2.2})\%$ and $f_{B_s} = (10.5^{+1.8}_{-2.2})\%$.
- ADAM 96D assumes $f_{B^0} = f_{B^-} = 0.39$ and $f_{B_s} = 0.12$. Contributions from B^0 and B_s decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral B mesons.
- BUSKULIC 96v assumes PDG 96 production fractions for B^0, B^+, B_s, b baryons.
- Assumes a B^0, B^- production fraction of 0.39 and a B_s production fraction of 0.12. Contributions from B^0 and B_s^0 decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral B mesons.
- Assumes $B(Z \rightarrow b\bar{D}) = 0.217$ and $B_D^0(B_s^0)$ fraction 39.5% (12%).
- BATTLE 93 assumes equal production of $B^0\bar{B}^0$ and B^+B^- at $\Upsilon(4S)$.
- Assumes the $\Upsilon(4S)$ decays 43% to $B^0\bar{B}^0$.

- ¹ Corresponds to a 95% CL upper limit of $< 2.6 \times 10^{-10}$.
² Corresponds to a 95% CL upper limit of $< 2.1 \times 10^{-10}$.
³ Uses normalization mode $B(B^+ \rightarrow J/\psi K^+) = (1.010 \pm 0.029) \times 10^{-3}$ and B production ratio $f(b \rightarrow B_s^0)/f(b \rightarrow B^0) = 0.256 \pm 0.013$.
⁴ Uses normalization mode $B(B^+ \rightarrow J/\psi K^+) = (1.01 \pm 0.03) \times 10^{-3}$.
⁵ Corresponds to a 95% CL upper limit of $< 3.4 \times 10^{-10}$.
⁶ This value is obtained from a profile-likelihood fit, see Fig. 9. It corresponds to an upper limit of $< 0.42 \times 10^{-9}$ at 95% C.L.
⁷ Derived from the combined fit to CMS and LHCb data. Uncertainty includes both statistical and systematic component. Also reports $B(B^0 \rightarrow \mu^+ \mu^-)/B(B_s \rightarrow \mu^+ \mu^-) = 0.14^{+0.08}_{-0.06}$.
⁸ Uses $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.01 \pm 0.21) \times 10^{-5}$ and $B(B^0 \rightarrow K^+ \pi^-) = (1.94 \pm 0.06) \times 10^{-5}$ for normalization.
⁹ Reports also a limit of $< 7.4 \times 10^{-10}$ at 95% CL. Uses normalization modes $B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+$ and $B^0 \rightarrow K^+ \pi^-$.
¹⁰ Uses normalization mode $B(B^+ \rightarrow J/\psi K^+) = (10.22 \pm 0.35) \times 10^{-4}$.
¹¹ Reports also a limit of $< 9.2 \times 10^{-10}$ at 90% CL. and uses $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.0 \pm 0.2) \times 10^{-5}$ for normalization.
¹² Uses $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.01 \pm 0.21) \times 10^{-5}$.
¹³ Uses B production ratio $f(\bar{b} \rightarrow B^+)/f(\bar{b} \rightarrow B_s^0) = 3.71 \pm 0.47$ and three normalization modes.

Polarization in B Decays

POLARIZATION IN B^0 DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal (L) or both are transverse and parallel (||) or perpendicular (\perp) to each other with the parameters Γ_L/Γ , Γ_{\perp}/Γ , and the relative phases $\phi_{||}$ and ϕ_{\perp} . See the definitions in the note on "Polarization in B Decays" review in the B^0 Particle Listings.

$B^0 - \bar{B}^0$ Mixing

$B^0 - \bar{B}^0$ MIXING PARAMETERS

For a discussion of $B^0 - \bar{B}^0$ mixing see the note on " $B^0 - \bar{B}^0$ Mixing" in the B^0 Particle Listings above.

χ_d is a measure of the time-integrated $B^0 - \bar{B}^0$ mixing probability that a produced $B^0(\bar{B}^0)$ decays as a $\bar{B}^0(B^0)$. Mixing violates $\Delta B \neq 2$ rule.

$$\chi_d = \frac{x_d^2}{2(1+x_d^2)}$$

$$\chi_d = \frac{\Delta m_{B^0}}{\Gamma_{B^0}} = (m_{B_H^0} - m_{B_L^0}) \tau_{B^0}$$

where H, L stand for heavy and light states of two B^0 CP eigenstates and $\tau_{B^0} = \frac{1}{0.5(\Gamma_{B_H^0} + \Gamma_{B_L^0})}$.

χ_d

This $B^0 - \bar{B}^0$ mixing parameter is the probability (integrated over time) that a produced B^0 (or \bar{B}^0) decays as a \bar{B}^0 (or B^0), e.g. for inclusive lepton decays

$$\chi_d = \frac{\Gamma(B^0 \rightarrow \ell^+ X \text{ (via } \bar{B}^0)) / \Gamma(B^0 \rightarrow \ell^+ X)}{\Gamma(\bar{B}^0 \rightarrow \ell^+ X \text{ (via } B^0)) / \Gamma(\bar{B}^0 \rightarrow \ell^+ X)}$$

Where experiments have measured the parameter $r = \chi/(1-\chi)$, we have converted to χ . Mixing violates the $\Delta B \neq 2$ rule.

Note that the measurement of χ at energies higher than the $\Upsilon(4S)$ have not separated χ_d from χ_s where the subscripts indicate $B^0(\bar{B}^0 d)$ or $B_s^0(\bar{B}_s^0)$. They are listed in the $B^\pm/B_s^0/B_s^0/b$ -baryon ADMIXTURE section.

The experiments at $\Upsilon(4S)$ make an assumption about the $B^0 - \bar{B}^0$ fraction and about the ratio of the B^\pm and B^0 semileptonic branching ratios (usually that it equals one).

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements, includes χ_d calculated from Δm_{B^0} and τ_{B^0} .

<0.27	90	10 AVERY	84 CLEO $e^+ e^- \rightarrow \Upsilon(4S)$

¹ BEHRENS 00B uses high-momentum lepton tags and partially reconstructed $\bar{B}^0 \rightarrow D^* \pi^-$, ρ^- decays to determine the flavor of the B meson.
² ALBRECHT 94 reports $r=0.194 \pm 0.062 \pm 0.054$. We convert to χ for comparison. Uses tagged events (lepton + pion from D^*).
³ BARTELT 93 analysis performed using tagged events (lepton+pion from D^*). Using dilepton events they obtain $0.157 \pm 0.016^{+0.033}_{-0.028}$.
⁴ ALBRECHT 92L is a combined measurement employing several lepton-based techniques. It uses all previous ARGUS data in addition to new data and therefore supersedes ALBRECHT 87I. A value of $r = 20.6 \pm 7.0\%$ is directly measured. The value can be used to measure $x = \Delta M/\Gamma = 0.72 \pm 0.15$ for the B_d meson. Assumes $f_{+-}/f_0 = 1.0 \pm 0.05$ and uses $\tau_{B^\pm}/\tau_{B^0} = (0.95 \pm 0.14) (f_{+-}/f_0)$.
⁵ Uses $D^* + K^\pm$ correlations.
⁶ Uses $(D^* + \ell^-) K^\pm$ correlations.
⁷ These experiments see a combination of B_s and B_d mesons.
⁸ ALBRECHT 87I is inclusive measurement with like-sign dileptons, with tagged B decays plus leptons, and one fully reconstructed event. Measures $r=0.21 \pm 0.08$. We convert to χ for comparison. Superseded by ALBRECHT 92L.
⁹ BEAN 87B measured $r < 0.24$; we converted to χ .
¹⁰ Same-sign dilepton events. Limit assumes semileptonic BR for B^+ and B^0 equal. If B^0/B^\pm ratio < 0.58 , no limit exists. The limit was corrected in BEAN 87B from < 0.30 to $r < 0.37$. We converted this limit to χ .

$\Delta m_{B^0} = m_{B_H^0} - m_{B_L^0}$

Δm_{B^0} is a measure of 2π times the $B^0 - \bar{B}^0$ oscillation frequency in time-dependent mixing experiments.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements and includes Δm_d calculated from χ_d measured at $\Upsilon(4S)$.

- Uses semileptonic decays of $B^0 \rightarrow D^-\mu^+\nu_\mu X$ and $B^0 \rightarrow D^{(*)-}\mu^+\nu_\mu X$, where the D mesons are reconstructed in $D^- \rightarrow K^+\pi^-\pi^-$ and $D^{(*)-} \rightarrow \bar{D}^0\pi^-$ with $\bar{D}^0 \rightarrow K^+\pi^-$.
- Uses semileptonic decays of $B^0 \rightarrow D^-\mu^+\nu_\mu X$ where the D^- mesons are reconstructed in $D^- \rightarrow K^+K^-\pi^-$.
- Measured using $B^0 \rightarrow D^-\pi^+$ and $B^0 \rightarrow J/\psi K^*(892)^0$ decays.
- Measured using $B^0 \rightarrow D^-\pi^+$.
- Uses opposite-side flavor-tagging with $B \rightarrow D^{(*)}\mu\nu_\mu X$ events.
- Measured using a simultaneous fit of the B^0 lifetime and $\bar{B}^0 B^0$ oscillation frequency Δm_d in the partially reconstructed $B^0 \rightarrow D^{*-}\ell\nu$ decays.
- Measurement performed using a combined fit of CP -violation, mixing and lifetimes.
- Events with a high transverse momentum lepton were removed and an inclusively reconstructed vertex was required.
- AUBERT 03C uses a sample of approximately 14,000 exclusively reconstructed $B^0 \rightarrow D^*(2010)^-\ell\nu$ and simultaneously measures the lifetime and oscillation frequency.
- HASTINGS 03 measurement based on the time evolution of dilepton events. It also reports $f_+/f_0 = 1.01 \pm 0.03 \pm 0.09$ and CPT violation parameters in $B^0\text{-}\bar{B}^0$ mixing.
- ZHENG 03 data analyzed using partially reconstructed $\bar{B}^0 \rightarrow D^{*-}\pi^+$ decay and a flavor tag based on the charge of the lepton from the accompanying B decay.
- Uses a tagged sample of fully-reconstructed neutral B decays at $\Upsilon(4S)$.
- Measured based on the time evolution of dilepton events in $\Upsilon(4S)$ decays.
- Data analyzed using partially reconstructed $\bar{B}^0 \rightarrow D^{*+}\ell^-\bar{\nu}$ decay and a combination of flavor tags from the rest of the event.
- Uses di-muon events.
- Uses jet-charge and lepton-flavor tagging.
- Uses $\ell^- D^{*+} \ell^-$ events.
- Uses $\pi^- B$ in the same side.
- Uses ℓ^- .
- Uses $\ell^- Q_{\text{hem}}$.
- Uses $\ell^- \ell^-$ with impact parameters.
- Uses $D^{*\pm} Q_{\text{hem}}$.
- Uses $\pi_s^\pm \ell^- Q_{\text{hem}}$.
- Uses $D^{*\pm} \ell^- / Q_{\text{hem}}$.
- Uses $D^{*\pm} \ell^- Q_{\text{hem}}$.
- Uses $D^{*\pm} \ell^-$.
- AUBERT 02N result based on the same analysis and data sample reported in AUBERT 02I.
- Uses a tagged sample of B^0 decays reconstructed in the mode $B^0 \rightarrow D^* \ell \nu$.
- Uses a tagged sample of fully-reconstructed hadronic B^0 decays at $\Upsilon(4S)$.
- ACCIARRI 98D combines results from $\ell^- \ell^-$, $\ell^- Q_{\text{hem}}$, and $\ell^- \ell^-$ with impact parameters.
- ABREU 97N combines results from $D^{*\pm} Q_{\text{hem}}$, $\ell^- Q_{\text{hem}}$, $\pi_s^\pm \ell^- Q_{\text{hem}}$, and $D^{*\pm} \ell^-$.
- ACKERSTAFF 97V combines results from $\ell^- \ell^-$, $\ell^- Q_{\text{hem}}$, $D^{*\pm} \ell^-$, and $D^{*\pm} Q_{\text{hem}}$.
- BUSKULIC 97D combines results from $D^{*\pm} \ell^- / Q_{\text{hem}}$, $\ell^- Q_{\text{hem}}$, and $\ell^- \ell^-$.
- ABREU 96Q analysis performed using lepton, kaon, and jet-charge tags.
- ALEXANDER 96V combines results from $D^{*\pm} \ell^-$ and $D^{*\pm} \ell^- Q_{\text{hem}}$.
- AKERS 95J combines results from charge measurement, $D^{*\pm} \ell^- Q_{\text{hem}}$ and $\ell^- \ell^-$.

 $\chi_d = \Delta m_{B^0} / \Gamma_{B^0}$

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements and includes Δm_d calculated from χ_d measured at $\Upsilon(4S)$.

- Measurement uses decays $B^0/\bar{B}^0 \rightarrow c\bar{c}K_S^0/K_L^0$.
- Measured using $B^0 \rightarrow J/\psi K_S^0, J/\psi K_L^0, D^-\pi^+, D^{*-}\pi^+, D^{*-}\rho^+$, and $D^{*-}\ell^+\nu$ decays.
- Measurement uses $B^0/\bar{B}^0 \rightarrow \ell^+ X/\ell^- X$ decays. Assuming $\Delta\Gamma = 0$, the result becomes $\text{Im}(z) = (-0.37 \pm 0.54) \times 10^{-2}$.
- Corresponds to 90% confidence range $[-0.028, 0.104]$.
- Measured using inclusive dilepton events from B^0 decay.

CP VIOLATION PARAMETERS

 $\text{Re}(\epsilon_{B^0})/(1+|\epsilon_{B^0}|^2)$

CP impurity in B_d^0 system. It is obtained from either $a_{\ell\ell}$, the charge asymmetry in like-sign dilepton events or a_{CP} , the time-dependent asymmetry of inclusive B^0 and \bar{B}^0 decays.

"OUR EVALUATION" is an average obtained by the Heavy Flavor Averaging Group (HFLAV) and described at <https://hflav.web.cern.ch/>. It is the result of a fit to B_d and B_s CP asymmetries, which includes the B_d measurements listed below and the B_s measurements listed in the B_s section, taking into account correlations between those measurements.

- AAIJ 15F uses semileptonic B^0 decays in the inclusive final states $D^-\mu^+$ and $D^{*-}\mu^+$, where the D^- meson decays into the $K^+\pi^-\pi^-$ final state, and the D^{*-} meson into the $\bar{D}^0(\rightarrow K^+\pi^-\pi^-)$ final state. Reports $A_{SL}^d = (-0.02 \pm 0.19 \pm 0.30)\%$, which equals to $4\text{Re}(\epsilon_{B^0})/(1+|\epsilon_{B^0}|^2)$.
- Uses the charge asymmetry in like-sign dilepton events. LEES 15A reports $A_{SL}^d = (-3.9 \pm 3.5 \pm 1.9) \times 10^{-3}$.
- ABAZOV 14 uses the dimuon charge asymmetry with different impact parameters from which it reports $A_{SL}^d = (-0.62 \pm 0.42) \times 10^{-2}$.
- Uses $B^0 \rightarrow D^{*-} X \ell^+ \nu_\ell$ and a kaon-tagged sample which yields measurement of $A_{SL}^d = (0.06 \pm 0.17 +0.38 -0.32)\%$, corresponding to $\Delta_{CP} = 1-|q/p| = (0.29 \pm 0.84 +1.88 -1.61) \times 10^{-3}$.
- ABAZOV 12AC uses $B^0 \rightarrow D^-\mu^+ X$ and $B^0 \rightarrow D^*(2010)^-\mu^+ X$ decays without initial state flavor tagging which yields measurement of $A_{SL}^d = (6.8 \pm 4.5 \pm 1.4) \times 10^{-3}$.
- AUBERT 06T reports $|q/p|-1 = (-0.8 \pm 2.7 \pm 1.9) \times 10^{-3}$. We convert to $(1-|q/p|^2)/4$.

- ⁷ Uses the charge asymmetry in like-sign dilepton events and reports $|q/p| = 1.0005 \pm 0.0040 \pm 0.0043$.
- ⁸ JAFFE 01 finds $a_{\ell\ell} = 0.013 \pm 0.050 \pm 0.005$ and combines with the previous BEHRENS 00b independent measurement.
- ⁹ ABAZOV 11u uses the dimuon charge asymmetry with different impact parameters from which it reports $A_{SL}^d = (-1.2 \pm 5.2) \times 10^{-3}$.
- ¹⁰ Uses the dimuon charge asymmetry.
- ¹¹ AUBERT 04c reports $|q/p| = 1.029 \pm 0.013 \pm 0.011$ and we converted it to $(1 - |q/p|^2)/4$.
- ¹² BARATE 01d measured by investigating time-dependent asymmetries in semileptonic and fully inclusive B_d^0 decays.
- ¹³ BEHRENS 00b uses high-momentum lepton tags and partially reconstructed $\bar{B}^0 \rightarrow D^{*+} \pi^-, \rho^-$ decays to determine the flavor of the B meson.
- ¹⁴ Data analyzed using the time-dependent asymmetry of inclusive B^0 decay. The production flavor of B^0 mesons is determined using both the jet charge and the charge of secondary vertex in the opposite hemisphere.
- ¹⁵ ACKERSTAFF 97u assumes CPT and is based on measuring the charge asymmetry in a sample of B^0 decays defined by lepton and Q_{hem} tags. If CPT is not invoked, $\text{Re}(\epsilon_B) = -0.006 \pm 0.010 \pm 0.006$ is found. The indirect CPT violation parameter is determined to $\text{Im}(\delta B) = -0.020 \pm 0.016 \pm 0.006$.
- ¹⁶ BARTELT 93 finds $a_{\ell\ell} = 0.031 \pm 0.096 \pm 0.032$ which corresponds to $|a_{\ell\ell}| < 0.18$, which yields the above $|\text{Re}(\epsilon_{B^0})/(1+|\epsilon_{B^0}|^2)|$.

A_{T/CP}

A_{T/CP} is defined as

$$\frac{P(\bar{B}^0 \rightarrow B^0) - P(B^0 \rightarrow \bar{B}^0)}{P(\bar{B}^0 \rightarrow B^0) + P(B^0 \rightarrow \bar{B}^0)}$$

the CPT invariant asymmetry between the oscillation probabilities $P(\bar{B}^0 \rightarrow B^0)$ and $P(B^0 \rightarrow \bar{B}^0)$.

VALUE	DOCUMENT ID	TECN	COMMENT
0.005 ± 0.012 ± 0.014	¹ AUBERT	02k	BABR e ⁺ e ⁻ → $\Upsilon(4S)$

¹ AUBERT 02k uses the charge asymmetry in like-sign dilepton events.

A_{CP}(B⁰ → D^{*(2010)⁺ D⁻)}

A_{CP} is defined as

$$\frac{B(\bar{B}^0 \rightarrow \bar{D}^+) - B(B^0 \rightarrow D^+)}{B(\bar{B}^0 \rightarrow \bar{D}^+) + B(B^0 \rightarrow D^+)}$$

the CP -violation charge asymmetry of exclusive B^0 and \bar{B}^0 decay.

C_{cτK(*)0} (B⁰ → cτK(*)⁰)

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

Table with columns: VALUE (units 10⁻²), DOCUMENT ID, TECN, COMMENT. Includes 'OUR EVALUATION' and 'OUR AVERAGE' values, and a list of experimental data points with their respective document IDs and techniques.

- 1 Measurement based on B⁰ → J/ψ K_S⁰, B⁰ → ψ(2S) K_S⁰ with J/ψ → μ⁺μ⁻, J/ψ → e⁺e⁻ and ψ(2S) → μ⁺μ⁻.
2 AAIJ 17BN provides the correlation coefficient ρ=0.42 between the uncertainties of S_{B⁰→cτK(*)0}(B⁰ → cτK(*)⁰) and C_{cτK(*)0}(B⁰ → cτK(*)⁰) measurements.
3 Measurement based on B⁰ → J/ψ K_S⁰, B⁰ → ψ(2S) K_S⁰, B⁰ → J/ψ K_L⁰, and B⁰ → χ_{c1}(1P) K_S⁰ decays.
4 Uses Dalitz plot analysis of B⁰ → K⁰π⁺π⁻ decays and the first of two equivalent solutions is used.
5 Measurement based on B⁰ → cτK(*)⁰ decays.
6 Reports value of A of B⁰ → ψ(2S) K⁰ which is equal to -C.
7 Reports value of A of B⁰ → J/ψ K⁰ which is equal to -C.
8 Measurement based on 152 × 10⁶ B⁰ B⁰ pairs.
9 Measurement based on 227 × 10⁶ B⁰ B⁰ pairs.
10 Measured with both η_f = ±1 samples.
11 Measured with the high purity of η_f = -1 samples.

sin(2β)

For a discussion of CP violation, see the review on "CP Violation" in the Reviews section. sin(2β) is a measure of the CP-violating amplitude in the B_d⁰ → J/ψ(1S) K_S⁰.

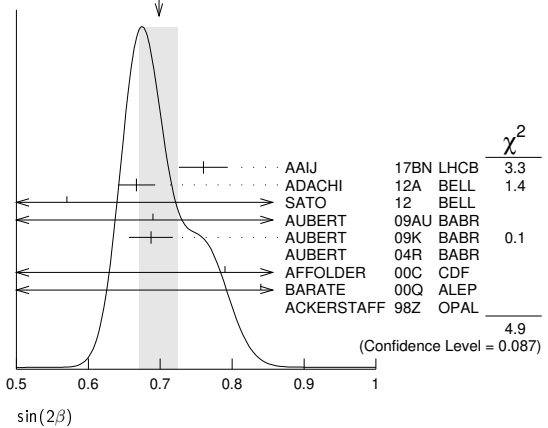

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Includes 'OUR EVALUATION' and 'OUR AVERAGE' values, and a list of experimental data points with their respective document IDs and techniques.

- 1 Measurement based on B⁰ → J/ψ K_S⁰, B⁰ → ψ(2S) K_S⁰ with J/ψ → μ⁺μ⁻, J/ψ → e⁺e⁻ and ψ(2S) → μ⁺μ⁻.
2 AAIJ 17BN provides the correlation coefficient ρ = 0.42 between the uncertainties of sin(2β) and cos(2β) measurements.
3 Measurement based on B⁰ → J/ψ K_S⁰, B⁰ → ψ(2S) K_S⁰, B⁰ → J/ψ K_L⁰, and B⁰ → χ_{c1}(1P) K_S⁰ decays.
4 SATO 12 uses 121 fb⁻¹ data collected on Υ(5S) resonance. Uses the "B - π tagging" where B⁺π⁺ and B⁻π⁻ tagged J/ψ K_S⁰ events are compared.
5 Uses Dalitz plot analysis of B⁰ → K⁰π⁺π⁻ decays and the first of two equivalent solutions.
6 Measurement based on B⁰ → cτK(*)⁰ decays.

- 7 Measurement in which the J/ψ decays to hadrons or to muons that do not satisfy the standard identification criteria.
8 AFFOLDER 00c uses about 400 B⁰ → J/ψ(1S) K_S⁰ events. The production flavor of B⁰ was determined using three tagging algorithms: a same-side tag, a jet-charge tag, and a soft-lepton tag.
9 BARATE 00q uses 23 candidates for B⁰ → J/ψ(1S) K_S⁰ decays. A combination of jet-charge, vertex-charge, and same-side tagging techniques were used to determine the B⁰ production flavor.
10 ACKERSTAFF 98z uses 24 candidates for B⁰ → J/ψ(1S) K_S⁰ decay. A combination of jet-charge and vertex-charge techniques were used to tag the B_d⁰ production flavor.
11 Based on B⁰ → ψ(2S) K_S⁰ decays.
12 Measurement based on 152 × 10⁶ B⁰ B⁰ pairs.
13 Measurement based on 227 × 10⁶ B⁰ B⁰ pairs.
14 ABE 02u result is based on the same analysis and data sample reported in ABE 01g.
15 ABE 02z result is based on 85 × 10⁶ B⁰ B⁰ pairs.
16 AUBERT 02n result based on the same analysis and data sample reported in AUBERT 01b.
17 AUBERT 02p result is based on 88 × 10⁶ B⁰ B⁰ pairs.
18 First observation of CP violation in B⁰ meson system.
19 ABE 98u uses 198 ± 17 B_d⁰ → J/ψ(1S) K⁰ events. The production flavor of B⁰ was determined using the same side tagging technique.

WEIGHTED AVERAGE 0.698±0.027 (Error scaled by 1.6)

C_{J/ψ(nS)K⁰} (B⁰ → J/ψ(nS)K⁰)

"OUR EVALUATION" is an average using rescaled values of the data listed below. - 1 Based on an isospin analysis of the $B \rightarrow \rho\rho$ system.
- 2 Obtained using the time dependent analysis of $B^0 \rightarrow a_1(1260)^\pm \pi^\mp$ and branching fraction measurements of $B \rightarrow a_1(1260) K$ and $B \rightarrow K_1 \pi$. Uses SU(3) flavor relations.
- 3 The angle α_{eff} is obtained using the measured CP parameters of $B^0 \rightarrow a_1(1260)^\pm \pi^\mp$ and choosing one of the four solutions that is compatible with the result of SM-based fits.
- 4 Obtained using isospin relation and selecting a solution closest to the CKM best fit average; the 90% CL allowed interval is $59^\circ < \phi_2 (\equiv \alpha) < 115^\circ$.
- 5 Obtained using isospin relation and selecting a solution closest to the CKM best fit average; 90% CL allowed interval is $79^\circ < \alpha < 123^\circ$.
- 6 Obtained from the measured CP parameters of the longitudinal polarization by selecting the solution closest to the CKM best fit central value of $\alpha = 95^\circ - 98^\circ$.

CP VIOLATION PARAMETERS IN $B^0 \rightarrow D^0 K^{*0}$ DECAY

The parameters r_{B^0} and δ_{B^0} are the magnitude ratio and strong phase difference between the amplitudes of $A(B^0 \rightarrow D^0 K^{*0})$ and $A(B^0 \rightarrow \bar{D}^0 K^{*0})$. The measured observables are defined as $x_\pm = r_{B^0} \cos(\delta_{B^0} \pm \gamma)$ and $y_\pm = r_{B^0} \sin(\delta_{B^0} \pm \gamma)$ where γ is the CKM angle γ .

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV). The CKM angle γ is listed in the B^+ section for "CP VIOLATION PARAMETERS IN $B^+ \rightarrow D K^+$ AND SIMILAR DECAYS."

T and CPT VIOLATION PARAMETERS

Measured values of the T -, CP -, and CPT -asymmetry parameters, defined as the differences in $S_{\alpha,\beta}^\pm$ and $C_{\alpha,\beta}^\pm$ between symmetry-transformed transitions. The indices $\alpha = \ell^+, \ell^-$ and $\beta = K_S^0, K_L^0$ stand for reconstructed flavor final state and the CP final states from $\Upsilon(4S)$ decay. The sign \pm indicates whether the decay to the flavor final state α occurs before or after the decay to the CP final state.

Alternatively, violations of CPT symmetry and Lorentz invariance are searched for by studying interference effects in B^0 mixing. Results are expressed in terms of the standard model extension parameter Δa , which describes the difference between the couplings of the valence quarks within B^0 meson with the Lorentz-violating fields.

¹ Measured for B⁰ → K_S⁰ μ⁺ μ⁻ decays. Measurements in other q² bins are also reported.
² Measured for B⁰ → K_S⁰ e⁺ e⁻ decays. Measurements in other q² bins are also reported.
³ Uses B(B⁰ → J/ψ(1S) K⁰) = (0.928 ± 0.013 ± 0.037) × 10⁻³ for normalisation and μ⁺ μ⁻ as a lepton pair. Measured in 1.1 < q² < 6.0 GeV²/c⁴.

Meson Particle Listings

B^0

$B(B^0 \rightarrow K^0 \mu^+ \mu^-) / B(B^0 \rightarrow K^0 e^+ e^-) (1.0 < q^2 < 6.0 \text{ GeV}^2/c^4)$

VALUE	DOCUMENT ID	TECN	COMMENT
$0.55^{+0.46}_{-0.34} \pm 0.01$	1 CHOUDHURY 21	BELL	$e^+e^- \rightarrow \gamma(4S)$

¹ Measured from the ratio of $K_S^0 \mu^+ \mu^-$ and $K_S^0 e^+ e^-$. Measurements in other q^2 bins are also reported.

$B(B^0 \rightarrow K^0 \ell^+ \ell^-) (0.0 < q^2 < 4.3 \text{ GeV}^2/c^4)$

VALUE (units 10^{-7})	DOCUMENT ID	TECN	COMMENT
$1.27 \pm 0.62 \pm 0.10$	AALTONEN 11A1	CDF	$p\bar{p}$ at 1.96 TeV

$B(B^0 \rightarrow K^0 \ell^+ \ell^-) (15.0 < q^2 < 22.0 \text{ GeV}^2/c^4)$

VALUE (units 10^{-7})	DOCUMENT ID	TECN	COMMENT
$0.67^{+0.11}_{-0.11} \pm 0.04$	¹ AAIJ 14M	LHCB	pp at 7, 8 TeV

¹ Uses $B(B^0 \rightarrow J/\psi(1S) K^0) = (0.928 \pm 0.013 \pm 0.037) \times 10^{-3}$ for normalisation and $\mu^+ \mu^-$ as a lepton pair.

$B(B^0 \rightarrow K_{S,L}^0(1430)^0 \mu^+ \mu^-) (1.10 < q^2 < 6.00 \text{ GeV}^2/c^4)$

VALUE (units 10^{-8})	DOCUMENT ID	TECN	COMMENT
$4.02 \pm 0.44 \pm 0.31$	^{1,2} AAIJ 16AP	LHCB	pp at 7, 8 TeV

¹ Measured the differential branching fraction and angular moments of the decay $B^0 \rightarrow K^+ \pi^- \mu^+ \mu^-$ in the $K^+ \pi^-$ invariant mass range $1330 < m(K^+ \pi^-) < 1530 \text{ MeV}/c^2$.
² The reported value is converted from the measured $dB/dq^2 = (0.82 \pm 0.09 \pm 0.063) \times 10^{-8} (\text{GeV}^2/c^4)^{-1}$ by multiplying by the $\Delta q^2 = 4.9 \text{ GeV}^2/c^4$ range.

$F_H(B^0 \rightarrow K^0 \mu^+ \mu^-) (1.1 < q^2 < 6.0 \text{ GeV}^2/c^4)$

F_H is a fractional contribution of (pseudo) scalar and tensor amplitudes to the decay width in the massless muon approximation.

VALUE	DOCUMENT ID	TECN	COMMENT
$0.76 \pm 0.46 \pm 0.09$	¹ AAIJ 14O	LHCB	pp at 7, 8 TeV

¹ AAIJ 14O reports 68% C.L. interval, which we encode as midpoint with uncertainty as half of the width of interval.

$F_H(B^0 \rightarrow K^0 \mu^+ \mu^-) (15.0 < q^2 < 22.0 \text{ GeV}^2/c^4)$

B^\pm/B^0 ADMIXTURE

B DECAY MODES

The branching fraction measurements are for an admixture of B mesons at the $\Upsilon(4S)$. The values quoted assume that $B(\Upsilon(4S) \rightarrow B\bar{B}) = 100\%$.

For inclusive branching fractions, e.g., $B \rightarrow D^\pm$ anything, the treatment of multiple D 's in the final state must be defined. One possibility would be to count the number of events with one-or-more D 's and divide by the total number of B 's. Another possibility would be to count the total number of D 's and divide by the total number of B 's, which is the definition of average multiplicity. The two definitions are identical if only one D is allowed in the final state. Even though the "one-or-more" definition seems sensible, for practical reasons inclusive branching fractions are almost always measured using the multiplicity definition. For heavy final state particles, authors call their results inclusive branching fractions while for light particles some authors call their results multiplicities. In the B sections, we list all results as inclusive branching fractions, adopting a multiplicity definition. This means that inclusive branching fractions can exceed 100% and that inclusive partial widths can exceed total widths, just as inclusive cross sections can exceed total cross section.

\bar{B} modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing.

Mode	Fraction (Γ_i/Γ)	Scale factor/ Confidence level
Semileptonic and leptonic modes		
Γ_1	$e^+ \nu_e$ anything	[a]
Γ_2	$\mu^+ \nu_\mu$ anything	[a]

[a] These values are model dependent.

[b] An ℓ indicates an e or a μ mode, not a sum over these modes.

[c] Here "anything" means at least one particle observed.

[d] This is a $B(B^0 \rightarrow D^{*-} \ell^+ \nu_\ell)$ value.

[e] D^{**} stands for the sum of the $D(1^1P_1)$, $D(1^3P_0)$, $D(1^3P_1)$, $D(1^3P_2)$, $D(2^1S_0)$, and $D(2^1S_1)$ resonances.

[f] The value is for the sum of the charge states or particle/antiparticle states indicated.

[g] $D^{(*)}\bar{D}^{(*)}$ stands for the sum of $D^* \bar{D}^*$, $D^* \bar{D}$, $D \bar{D}^*$, and $D \bar{D}$.

[h] $X(3915)$ denotes a near-threshold enhancement in the $\omega J/\psi$ mass spectrum.

[i] Inclusive branching fractions have a multiplicity definition and can be greater than 100%.

B^\pm/B^0 ADMIXTURE BRANCHING RATIOS

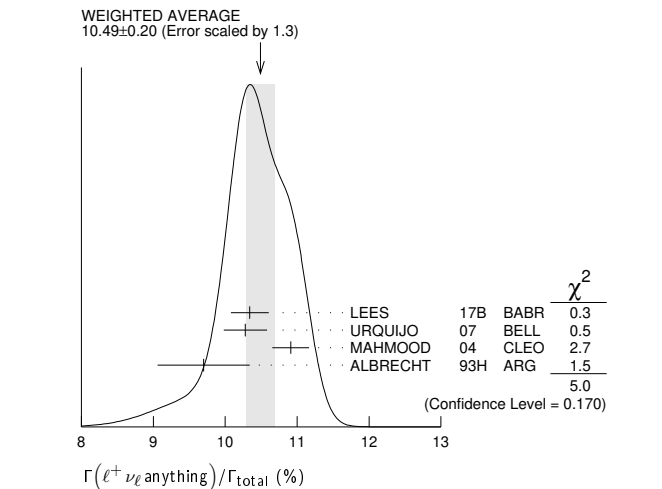

$\Gamma(\ell^+ \nu_\ell \text{ anything})/\Gamma_{\text{total}}$

These branching fraction values are model dependent.

Γ_3/Γ

"OUR EVALUATION" assumes lepton universality and is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

¹ LEES 17B measurement is obtained from semileptonic decays to electrons. The result is averaged over B^\pm and B^0 mesons, assuming lepton universality.

² URQUIJO 07 report a measurement of $(10.07 \pm 0.18 \pm 0.21)\%$ for the partial branching fraction of $B \rightarrow e \nu_e X_c$ decay with electron energy above 0.6 GeV. We converted the result to $B \rightarrow e \nu_e X$ branching fraction.

³ Uses charge and angular correlations in $\Upsilon(4S)$ events with a high-momentum lepton and an additional electron.

⁴ ALBRECHT 93H analysis performed using tagged semileptonic decays of the B . This technique is almost model independent for the lepton branching ratio.

Meson Particle Listings

B^\pm/B^0 ADMIXTURE

- ⁵ The measurements are obtained for charged and neutral B mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the B rest frame. The best precision on the ratio is achieved for a momentum threshold of 1.0 GeV: $B(B^{+\rightarrow e^+\nu_e X})/B(B^0\rightarrow e^+\nu_e X) = 1.074 \pm 0.041 \pm 0.026$.
- ⁶ The measurements are obtained for charged and neutral B mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the B rest frame, and their ratio of $B(B^{+\rightarrow e^+\nu_e X})/B(B^0\rightarrow e^+\nu_e X) = 1.08 \pm 0.05 \pm 0.02$.
- ⁷ The semileptonic branching ratio, $|V_{cb}|$ and other heavy-quark parameters are determined from a simultaneous fit to moments of the hadronic-mass and lepton-energy distribution.
- ⁸ Uses the high-momentum lepton tag method and requires the electron energy above 0.6 GeV.
- ⁹ Uses the high-momentum lepton tag method. They also report $|V_{cb}| = 0.0423 \pm 0.0007(\text{exp}) \pm 0.0020(\text{theo})$.
- ¹⁰ Uses the high-momentum lepton tag method. ABE 02Y also reports $|V_{cb}| = 0.0408 \pm 0.0010(\text{exp}) \pm 0.0025(\text{theo})$. The second error is due to uncertainties of theoretical inputs.
- ¹¹ BARISH 96B analysis performed using tagged semileptonic decays of the B . This technique is almost model independent for the lepton branching ratio.
- ¹² HENDERSON 92 measurement employs e and μ . The systematic error contains 0.004 in quadrature from model dependence. The authors average a variation of the Isgur, Scora, Grinstein, and Wise model with that of the Altarelli-Cabibbo-Corbò-Maiani-Martinelli model for semileptonic decays to correct the acceptance.
- ¹³ YANAGISAWA 91 also measures an average semileptonic branching ratio at the $\Upsilon(5S)$ of 9.6–10.5% depending on assumptions about the relative production of different B meson species.
- ¹⁴ ALBRECHT 90H uses the model of ALTARELLI 82 to correct over all lepton momenta. 0.099 ± 0.006 is obtained using ISGUR 89B.
- ¹⁵ ALBRECHT 90H uses the model of ALTARELLI 82 to correct over all lepton momenta. 0.097 ± 0.006 is obtained using ISGUR 89B.
- ¹⁶ Using data above $p(e) = 2.4$ GeV, WACHS 89 determine $\sigma(B \rightarrow e\nu\mu p)/\sigma(B \rightarrow e\nu\text{charm}) < 0.065$ at 90% CL.
- ¹⁷ Ratio $\sigma(b \rightarrow e\nu\mu p)/\sigma(b \rightarrow e\nu\text{charm}) < 0.055$ at CL = 90%.

$\Gamma(D^-\ell^+\nu_\ell \text{ anything})/\Gamma(\ell^+\nu_\ell \text{ anything})$ Γ_4/Γ_3

- The measurement is obtained from semileptonic decays to electrons $B \rightarrow X_c e \nu$, and using a theoretical model (GAMBINO 07, GAMBINO 11) to predict the contribution from $B \rightarrow X_c e \nu$. The result is averaged over B^\pm and B^0 mesons, assuming lepton universality.
- Measured the independent B^+ and B^0 partial branching fractions with electron energy above 0.4 GeV.
- Obtained from a combined fit to the moments of observed spectra in inclusive $B \rightarrow X_c \ell^+ \nu_\ell$ decay.
- The semileptonic branching ratio, $|V_{cb}|$ and other heavy-quark parameters are determined from a simultaneous fit to moments of the hadronic-mass and lepton-energy distribution.

- Measures several partial branching fractions in different phase space regions. The most inclusive result of the full branching fraction is obtained in the region for lepton energy in B rest frame $E_\ell^* > 1$ GeV, where the measured partial branching fraction is $\Delta B = (1.59 \pm 0.07 \pm 0.16) \times 10^{-3}$. The acceptance in that region is reported to be 0.86.
- Obtained from the partial rate $\Delta B = (1.554 \pm 0.082 \pm_{-0.086}^{+0.095}) \times 10^{-3}$ for the electron momentum interval of 0.8–2.7 GeV/c based on GGOU1 method ($X_c \ell \nu$, m_c constraint fit of SF parameters).
- Measures several partial branching fractions in different phase space regions. The most precise result on the full branching fraction is obtained in the region for lepton momentum in B rest frame $p_\ell^* > 1$ GeV/c, where the measured partial branching fraction is $\Delta B = (1.80 \pm 0.13 \pm 0.15) \times 10^{-3}$. The acceptance in that region is reported in a private communication by the Authors to be 0.894. The corresponding $|V_{ub}|$ from the BLNP method is $(4.28 \pm 0.15 \pm 0.18 \pm 0.19) \times 10^{-3}$, where the last uncertainty comes from theoretical prediction.
- Determined from the partial rate $\Delta B = (4.41 \pm 0.42 \pm 0.42) \times 10^{-4}$ measured for electron energy > 2 GeV and hadronic mass squared < 3.5 GeV², and calculated acceptance 0.174 in that region. The V_{ub} is measured as $(4.41 \pm 0.30 \pm_{-0.47}^{+0.65} \pm 0.28) \times 10^{-3}$.
- Uses electrons in the momentum interval 1.9–2.6 GeV/c in the center-of-mass frame. The V_{ub} is found to be $(5.08 \pm 0.47 \pm_{-0.48}^{+0.49}) \times 10^{-3}$.
- BORNHEIM 02 uses the observed yield of leptons from semileptonic B decays in the end-point momentum interval 2.2–2.6 GeV/c with recent CLEO-2 data on $B \rightarrow X_c \gamma$. The V_{ub} is found to be $(4.08 \pm 0.34 \pm 0.53) \times 10^{-3}$.

⁷ Uses a multivariate analysis method and requires lepton momentum in the B rest frame, $p_\ell^* > 1.0$ GeV/c.

⁸ Measures several partial branching fractions in different phase space regions. The most precise result is obtained in the region for hadronic mass $M_X < 1.55$ GeV/c², and is $\Delta B = (1.18 \pm 0.09 \pm 0.07) \times 10^{-3}$. The corresponding $|V_{ub}|$ from the BLNP method is $(4.27 \pm 0.16 \pm 0.13 \pm 0.30) \times 10^{-3}$, where the last uncertainty comes from the theoretical prediction of the partial rate in the given phase-space region.

⁹ Obtained from the partial rate $\Delta B = (0.572 \pm 0.041 \pm 0.065) \times 10^{-3}$ for the electron momentum interval of 2.0–2.6 GeV/c based on BLNP method.

¹⁰ Used BaBar measurement of Semileptonic branching fraction $B(B \rightarrow X \ell \nu_\ell) = (10.87 \pm 0.18 \pm 0.30)\%$ to convert the ratio of rates to branching fraction.

¹¹ The third error includes the systematics and theoretical errors summed in quadrature.

$\Gamma(X_u \ell^+ \nu_\ell)/\Gamma(\ell^+ \nu_\ell \text{ anything})$ Γ_{23}/Γ_3

ℓ denotes e or μ , not the sum. These experiments measure this ratio in very limited momentum intervals.

<4.0	90		CHEN	84 CLEO	Direct e at $\Upsilon(4S)$
<5.5	90		KLOPFEN...	83B CUSB	Direct e at $\Upsilon(4S)$

¹ The third error includes the systematics and theoretical errors summed in quadrature.

² ALBRECHT 94C find $\Gamma(b \rightarrow c)/\Gamma(b \rightarrow \text{all}) = 0.99 \pm 0.02 \pm 0.04$.

³ BARTELT 93B (CLEO II) measures an excess of $107 \pm 15 \pm 11$ leptons in the lepton momentum interval 2.3–2.6 GeV/c which is attributed to $b \rightarrow u \ell \nu_\ell$. This corresponds to a model-dependent partial branching ratio ΔB_{ub} between $(1.15 \pm 0.16 \pm 0.15) \times 10^{-4}$, as evaluated using the KS model (KOERNER 88), and $(1.54 \pm 0.22 \pm 0.20) \times 10^{-4}$ using the ACCMM model (ARTUSO 93). The corresponding values of $|V_{ub}/V_{cb}|$ are 0.056 ± 0.006 and 0.076 ± 0.008 , respectively.

⁴ ALBRECHT 91C result supersedes ALBRECHT 90. Two events are fully reconstructed providing evidence for the $b \rightarrow u$ transition. Using the model of ALTARELLI 82, they obtain $|V_{ub}/V_{cb}| = 0.11 \pm 0.012$ from 77 leptons in the 2.3–2.6 GeV momentum range.

⁵ ALBRECHT 90 observes 41 ± 10 excess e and μ (lepton) events in the momentum interval $p = 2.3\text{--}2.6$ GeV signaling the presence of the $b \rightarrow u$ transition. The events correspond to a model-dependent measurement of $|V_{ub}/V_{cb}| = 0.10 \pm 0.01$.

⁶ FULTON 90 observe 76 ± 20 excess e and μ (lepton) events in the momentum interval $p = 2.4\text{--}2.6$ GeV signaling the presence of the $b \rightarrow u$ transition. The average branching ratio, $(1.8 \pm 0.4 \pm 0.3) \times 10^{-4}$, corresponds to a model-dependent measurement of approximately $|V_{ub}/V_{cb}| = 0.1$ using $B(b \rightarrow c \ell \nu) = 10.2 \pm 0.2 \pm 0.7\%$.

⁷ The quoted possible limits range from 0.018 to 0.04 for the ratio, depending on which model or momentum range is chosen. We select the most conservative limit they have calculated. This corresponds to a limit on $|V_{ub}/V_{cb}| < 0.20$. While the endpoint technique employed is more robust than their previous results in CHEN 84, these results do not provide a numerical improvement in the limit.

• • • We do not use the following data for averages, fits, limits, etc. • • •
4.16 ± 11.7 ± 5.2 2 AUBERT 08N BABR Repl. by LEES 12d

1 The tag-side B meson is reconstructed in a semileptonic decay mode and the signal-side τ is reconstructed in a purely leptonic decay. The Belle combination of HUSCHLE 15 and CARIA 20 yields $R(D) = (32.6 \pm 3.4) \times 10^{-2}$.
2 Uses a fully reconstructed B meson as a tag on the recoil side.
3 Uses $\tau^+ \rightarrow e^+ \nu_e \bar{\nu}_\tau$ and $\tau^+ \rightarrow \mu^+ \nu_\mu \bar{\nu}_\tau$ and e^+ or μ^+ as ℓ^+ . Obtained from simultaneous fit to B^+ and B^0 assuming isospin symmetry.

$\Gamma(\bar{D}^* \tau^+ \nu_\tau)/\Gamma(\bar{D}^* \ell^+ \nu_\ell)$ Γ_{30}/Γ_9

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

1 GIBBONS 97b reports $B(B \rightarrow D^*(2010)^\pm \text{ anything}) = 0.239 \pm 0.015 \pm 0.014 \pm 0.009$ using CLEO measured D and D^* branching fractions. We rescale to our PDG 96 values of D and D^* branching ratios. Our first error is their experiment's error and our second error is the systematic error from using our best value.
2 ALBRECHT 96d reports $B(B \rightarrow D^*(2010)^\pm \text{ anything}) = 0.196 \pm 0.019$ using CLEO measured $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.681 \pm 0.01 \pm 0.013$, $B(D^0 \rightarrow K^- \pi^+) = 0.0401 \pm 0.0014$, $B(D^0 \rightarrow K^- \pi^+ \pi^+ \pi^-) = 0.081 \pm 0.005$. We rescale to our PDG 96

See key on page 1127

Meson Particle Listings

B^\pm/B^0 ADMIXTURE

values of D and D^* branching ratios. Our first error is their experiment's error and our second error is the systematic error from using our best value.

³ BORTOLETTO 92 reports $B(B \rightarrow D^*(2010)^+ \text{ anything}) = 0.25 \pm 0.03 \pm 0.04$ using MARK II $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.57 \pm 0.06$ and $B(D^0 \rightarrow K^- \pi^+) = 0.042 \pm 0.008$. We rescale to our PDG 96 values of D and D^* branching ratios. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁴ ALBRECHT 91H reports $0.348 \pm 0.060 \pm 0.035$ from a measurement of $[\Gamma(B \rightarrow D^*(2010)^\pm \text{ anything})/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0 \pi^+)]$ assuming $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.55 \pm 0.04$, which we rescale to our best value $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = (67.7 \pm 5.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Uses the PDG 90 $B(D^0 \rightarrow K^- \pi^+) = 0.0371 \pm 0.0025$.

⁵ BORTOLETTO 87 uses old MARK III (BALTRUSAITIS 86E) branching ratios $B(D^0 \rightarrow K^- \pi^+) = 0.056 \pm 0.004 \pm 0.003$ and also assumes $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.60 \pm 0.08$. The product branching ratio for $B(B \rightarrow D^*(2010)^+) B(D^*(2010)^+ \rightarrow D^0 \pi^+)$ is $0.13 \pm 0.02 \pm 0.012$. Superseded by BORTOLETTO 92.

⁶ $V-A$ momentum spectrum used to extrapolate below $p = 1$ GeV. We correct the value assuming $B(D^0 \rightarrow K^- \pi^+) = 0.042 \pm 0.006$ and $B(D^{*+} \rightarrow D^0 \pi^+) = 0.6 \pm 0.08$. The product branching fraction is $B(B \rightarrow D^{*+} X) \cdot B(D^{*+} \rightarrow \pi^+ D^0) \cdot B(D^0 \rightarrow K^- \pi^+) = (68 \pm 15 \pm 9) \times 10^{-4}$.

2.32 ± 0.57 ± 0.35 ALAM 95 CLE2 Repl. by CHEN 01c

¹ We extrapolate the measured value to $E_\gamma > 1.6$ GeV using the method of BUCHMUELLER 06 (average of three theoretical models).

² SAITO 15 measured $(3.51 \pm 0.17 \pm 0.33) \times 10^{-4}$ using a sum-of-exclusive approach in which 38 of the hadronic final states with $m_{X_S} < 2.8$ GeV/ c^2 are reconstructed. The cut of minimum photon energy is $E_\gamma > 1.9$ GeV.

³ Reports $(3.29 \pm 0.19 \pm 0.48) \times 10^{-4}$ for $E_\gamma > 1.9$ GeV.

⁴ Reports $(3.21 \pm 0.15 \pm 0.29 \pm 0.08) \times 10^{-4}$ for $1.8 < E_\gamma < 2.8$ GeV, where the last systematic uncertainty is for model dependency. Results with other cutoffs are also reported.

⁵ The measurement reported is $(3.45 \pm 0.15 \pm 0.40) \times 10^{-4}$ for $E_\gamma > 1.7$ GeV.

⁶ Uses a fully reconstructed B meson as a tag on the recoil side. The measurement reported is $(3.66 \pm 0.85 \pm 0.60) \times 10^{-4}$ for $E_\gamma > 1.9$ GeV.

⁷ The measurement reported is $(3.21 \pm 0.43^{+0.32}_{-0.29}) \times 10^{-4}$ for $E_\gamma > 2.0$ GeV.

⁸ Measured using sums of seven exclusive final states $B \rightarrow X_{d(s)}\gamma$ where $X_{d(s)}$ is a nonstrange (strange) charmless hadronic system in mass range 0.5–2.0 GeV/ c^2 .

⁹ Measured using sums of seven exclusive final states $B \rightarrow X_{d(s)}\gamma$ where $X_{d(s)}$ is a nonstrange (strange) charmless hadronic system in mass range 0.6–1.8 GeV/ c^2 .

¹⁰ The measurement reported is $(3.67 \pm 0.29 \pm 0.45) \times 10^{-4}$ for $E_\gamma > 1.9$ GeV.

¹¹ The measurement reported is $(3.27 \pm 0.18^{+0.55}_{-0.42}) \times 10^{-4}$ for $E_\gamma > 1.9$ GeV.

¹² The measurement reported is $(3.55 \pm 0.32 \pm 0.32) \times 10^{-4}$ for $E_\gamma > 1.8$ GeV.

¹³ ABE 01F reports their systematic errors $(\pm 0.42^{+0.50}_{-0.54}) \times 10^{-4}$, where the second error is due to the theoretical uncertainty. We combine them in quadrature.

4.2 ± 0.9 OUR AVERAGE			

3.9 ± 0.8 ± 0.9 ¹ AUBERT,B 04F BABR $e^+e^- \rightarrow \Upsilon(4S)$

4.6 ± 1.1 ± 0.6 ² BONVICINI 03 CLE2 $e^+e^- \rightarrow \Upsilon(4S)$

••• We do not use the following data for averages, fits, limits, etc. •••

6.2 ± 1.6 ± 1.3
 -2.0 ³ BROWDER 98 CLE2 $e^+e^- \rightarrow \Upsilon(4S)$

¹ AUBERT,B 04F reports branching ratio $B \rightarrow \eta' X_S$ for high momentum η' between 2.0 and 2.7 GeV/ c in the $\Upsilon(4S)$ center-of-mass frame. X_S represents a recoil system consisting of a kaon and zero to four pions.

² BONVICINI 03 observed a signal of 61.2 ± 13.9 events in $B \rightarrow \eta' X_{nc}$ production for high momentum η' between 2.0 and 2.7 GeV/ c in the $\Upsilon(4S)$ center-of-mass frame. The X_{nc} denotes "charmless" hadronic states recoiling against η' . The second error combines systematic and background subtraction uncertainties in quadrature.

³ BROWDER 98 observed a signal of 39.0 ± 11.6 events in high momentum $B \rightarrow \eta' X_S$ production between 2.0 and 2.7 GeV/ c . The branching fraction is based on the interpretation of $b \rightarrow sg$, where the last error includes additional uncertainties due to the color-suppressed $b \rightarrow$ backgrounds.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- ¹ AUBERT 07c reports $0.045 \pm 0.003 \pm 0.012$ from a measurement of $[\Gamma(B \rightarrow \Lambda_c^+ / \bar{\Lambda}_c^- \text{ anything})/\Gamma_{\text{total}}] \times [B(\Lambda_c^+ \rightarrow pK^- \pi^+)]$ assuming $B(\Lambda_c^+ \rightarrow pK^- \pi^+) = (5.0 \pm 1.3) \times 10^{-2}$, which we rescale to our best value $B(\Lambda_c^+ \rightarrow pK^- \pi^+) = (6.28 \pm 0.32) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
² CRAWFORD 92 result derived from lepton baryon correlations. Assumes all charmed baryons in B^0 and B^\pm decay are Λ_c .
³ ALBRECHT 88e measured $B(B \rightarrow \Lambda_c^+ X) \cdot B(\Lambda_c^+ \rightarrow pK^- \pi^+) = (0.30 \pm 0.12 \pm 0.06)\%$ and used $B(\Lambda_c^+ \rightarrow pK^- \pi^+) = (2.2 \pm 1.0)\%$ from ABRAMS 80 to obtain above number.
⁴ Assuming all baryons result from charmed baryons, ALAM 86 conclude the branching fraction is $7.4 \pm 2.9\%$. The limit given above is model independent.

POLARIZATION IN B DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal (L) or both are transverse and parallel (\parallel) or perpendicular (\perp) to each other with the parameters Γ_L/Γ , Γ_\parallel/Γ , and the relative phases ϕ_\parallel and ϕ_\perp . See the definitions in the note on "Polarization in B Decays" review in the B^0 Particle Listings.

LEPTON (HADRON) FORWARD-BACKWARD ASYMMETRY IN $B \rightarrow K^{(*)} \ell^+ \ell^-$ ($B \rightarrow K/\pi h^+ h^-$) DECAY

The forward-backward angular asymmetry of the lepton pair in $B \rightarrow K^{(*)} \ell^+ \ell^-$ ($B \rightarrow K/\pi h^+ h^-$) decay is defined as

$$A_{FB}(s) = \frac{N(\cos\theta > 0) - N(\cos\theta < 0)}{N(\cos\theta > 0) + N(\cos\theta < 0)},$$

where $s=q^2/m_B^2$, and θ is the angle of the ℓ^- (h^-) with respect to the flight direction of the B meson, measured in the dilepton (dihadron) rest frame. In addition, the fraction of longitudinal polarization F_L of the K^* and F_S , the relative contribution from scalar and pseudoscalar penguin amplitudes in $B \rightarrow K \ell^+ \ell^-$, can be measured from the angular distribution of its decay products.

 $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE MEAN LIFE

Each measurement of the B mean life is an average over an admixture of various bottom mesons and baryons which decay weakly. Different techniques emphasize different admixtures of produced particles, which could result in a different B mean life.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. This is a weighted average of the lifetimes of the five main b -hadron species (B^+ , B^0 , B_s^0 , B_{sH}^0 , and Λ_b) that assumes the production fractions in Z decays (given at the end of this section) and equal production fractions of B_{sH}^0 and B_{sL}^0 mesons.

¹ Measurement performed using an inclusive reconstruction and B flavor identification technique.

² Measured using inclusive $J/\psi(1S) \rightarrow \mu^+\mu^-$ vertex.

³ ACCIARRI 98 uses inclusively reconstructed secondary vertex and lepton impact parameter.

⁴ ACKERSTAFF 97F uses inclusively reconstructed secondary vertices.

⁵ Combines ABREU 96E secondary vertex result with ABREU 94L impact parameter result.

⁶ BUSKULIC 96F analyzed using 3D impact parameter.

⁷ ABE,K 95B uses an inclusive topological technique.

⁸ ABREU 94L uses charged particle impact parameters. Their result from inclusively reconstructed secondary vertices is superseded by ABREU 96E.

⁹ From proper time distribution of $b \rightarrow J/\psi(1S)$ anything.

¹⁰ ABE 93J analyzed using $J/\psi(1S) \rightarrow \mu\mu$ vertices.

¹¹ ABREU 93D data analyzed using $D/D^*\ell$ anything event vertices.

¹² ABREU 93G data analyzed using charged and neutral vertices.

¹³ ACTON 93c analysed using $D/D^*\ell$ anything event vertices.

¹⁴ ACTON 93L and ADRIANI 93K analyzed using lepton (e and μ) impact parameter at Z.

¹⁵ BUSKULIC 93o analyzed using dipole method.

¹⁶ ABREU 92 is combined result of muon and hadron impact parameter analyses. Hadron tracks gave $(12.7 \pm 0.4 \pm 1.2) \times 10^{-13}$ s for an admixture of B species weighted by production fraction and mean charge multiplicity, while muon tracks gave $(13.0 \pm 1.0 \pm 0.8) \times 10^{-13}$ s for an admixture weighted by production fraction and semileptonic branching fraction.

¹⁷ ACTON 92 is combined result of muon and electron impact parameter analyses.

¹⁸ BUSKULIC 92f uses the lepton impact parameter distribution for data from the 1991 run.

¹⁹ BUSKULIC 92g use $J/\psi(1S)$ tags to measure the average b lifetime. This is comparable to other methods only if the $J/\psi(1S)$ branching fractions of the different b -flavored hadrons are in the same ratio.

²⁰ Using $Z \rightarrow e^+X$ or μ^+X , ADEVA 91H determined the average lifetime for an admixture of B hadrons from the impact parameter distribution of the lepton.

²¹ Using $Z \rightarrow J/\psi(1S)X$, $J/\psi(1S) \rightarrow \ell^+\ell^-$, ALEXANDER 91G determined the average lifetime for an admixture of B hadrons from the decay point of the $J/\psi(1S)$.

²² Using $Z \rightarrow eX$ or μX , DECAMP 91c determines the average lifetime for an admixture of B hadrons from the signed impact parameter distribution of the lepton.

²³ HAGEMANN 90 uses electrons and muons in an impact parameter analysis.

²⁴ LYONS 90 combine the results of the B lifetime measurements of ONG 89, BRAUN-SCHWEIG 89B, KLEM 88, and ASH 87, and JADE data by private communication. They use statistical techniques which include variation of the error with the mean life, and possible correlations between the systematic errors. This result is not independent of the measured results used in our average.

²⁵ We have combined an overall scale error of 15% in quadrature with the systematic error of ± 0.7 to obtain ± 2.1 systematic error.

²⁶ Statistical and systematic errors were combined by BROM 87.

 \bar{b} PRODUCTION FRACTIONS AND DECAY MODES

The branching fraction measurements are for an admixture of B mesons and baryons at energies above the $T(4S)$. Only the highest energy results (LHC, LEP, Tevatron, $SppS$) are used in the branching fraction averages. In the following, we assume that the production fractions are the same at the LHC, LEP, and at the Tevatron.

For inclusive branching fractions, e.g., $B \rightarrow D^\pm$ anything, the values usually are multiplicities, not branching fractions. They can be greater than one.

The modes below are listed for a \bar{b} initial state. b modes are their charge conjugates. Reactions indicate the weak decay vertex and do not include mixing.

Mode	Fraction (Γ_i/Γ)	Scale factor/ Confidence level
------	--------------------------------	-----------------------------------

PRODUCTION FRACTIONS

The production fractions for weakly decaying b -hadrons at high energy have been calculated from the best values of mean lives, mixing parameters, and branching fractions in this edition by the Heavy Flavor Averaging Group (HFLAV) as described in the note “ B^0/\bar{B}^0 Mixing” in the B^0 Particle Listings. We no longer provide world averages of the b -hadron production fractions, where results from LEP, Tevatron and LHC are averaged together; indeed the available data (from CDF and LHCb) shows that the fractions depend on the kinematics (in particular the p_T) of the produced b hadron. Hence we would like to list the fractions in Z decays instead, which are well-defined physics observables. The production fractions in $p\bar{p}$ collisions at the Tevatron are also listed at the end of the section. Values assume

$$\begin{aligned} B(\bar{b} \rightarrow B^+) &= B(\bar{b} \rightarrow B^0) \\ B(\bar{b} \rightarrow B^+) + B(\bar{b} \rightarrow B^0) + B(\bar{b} \rightarrow B_s^0) + B(b \rightarrow b\text{-baryon}) &= 100\%. \end{aligned}$$

The correlation coefficients between production fractions are also reported:

$$\begin{aligned} \text{cor}(B_s^0, b\text{-baryon}) &= 0.064 \\ \text{cor}(B_s^0, B^\pm=B^0) &= -0.633 \\ \text{cor}(b\text{-baryon}, B^\pm=B^0) &= -0.813. \end{aligned}$$

The notation for production fractions varies in the literature ($f_d, d_{B^0}, f(b \rightarrow \bar{B}^0), B_f(b \rightarrow \bar{B}^0)$). We use our own branching fraction notation here, $B(\bar{b} \rightarrow B^0)$.

Note these production fractions are b -hadronization fractions, not the conventional branching fractions of b -quark to a B -hadron, which may have considerable dependence on the initial and final state kinematic and production environment.

0.130 ± 0.002 ± 0.005	^{1,4,5} AAIJ	20v LHCb	pp at 13 TeV	

¹ AAIJ 20v measures the average value using the observed $B_s^0 \rightarrow J/\psi\phi$ and $B^+ \rightarrow J/\psi K^+$ yields, over the ranges b-hadron p_T of 0.5 and 40 GeV and η of 2.0 and 6.5. The value is not used in averages as BR-related systematic uncertainties are not evaluated.

² AAIJ 20v reports $[\Gamma(\bar{B} \rightarrow B_s^0)/\Gamma(\bar{B} \rightarrow B^+)] \times [B(B_s^0 \rightarrow J/\psi(1S)\phi)] / [B(B^+ \rightarrow J/\psi(1S)K^+)] = 1.0238 \pm 0.0010 \pm 0.0022$ which we multiply or divide by our best values $B(B_s^0 \rightarrow J/\psi(1S)\phi) = (1.04 \pm 0.04) \times 10^{-3}$, $B(B^+ \rightarrow J/\psi(1S)K^+) = (1.020 \pm 0.019) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best values.

³ AAIJ 20v reports $[\Gamma(\bar{B} \rightarrow B_s^0)/\Gamma(\bar{B} \rightarrow B^+)] \times [B(B_s^0 \rightarrow J/\psi(1S)\phi)] / [B(B^+ \rightarrow J/\psi(1S)K^+)] = 1.1270 \pm 0.0007 \pm 0.0022$ which we multiply or divide by our best values $B(B_s^0 \rightarrow J/\psi(1S)\phi) = (1.04 \pm 0.04) \times 10^{-3}$, $B(B^+ \rightarrow J/\psi(1S)K^+) = (1.020 \pm 0.019) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best values.

⁴ AAIJ 20v reports the results in two different data sets, and we quote here the weighted average.

⁵ AAIJ 20v reports $[\Gamma(\bar{B} \rightarrow B_s^0)/\Gamma(\bar{B} \rightarrow B^+)] \times [B(B_s^0 \rightarrow J/\psi(1S)\phi)] / [B(B^+ \rightarrow J/\psi(1S)K^+)] = 1.0326 \pm 0.0007 \pm 0.0023$ which we multiply or divide by our best values $B(B_s^0 \rightarrow J/\psi(1S)\phi) = (1.04 \pm 0.04) \times 10^{-3}$, $B(B^+ \rightarrow J/\psi(1S)K^+) = (1.020 \pm 0.019) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best values.

$\Gamma(B_s^0)/[\Gamma(B^+) + \Gamma(B^0)]$ $\Gamma_3/(\Gamma_1+\Gamma_2)$
 "OUR EVALUATION" is an average from Z decay obtained by the Heavy Flavor Averaging Group (HFLAV) as described at <https://hflav.web.cern.ch/>.

0.21 ± 0.036^{+0.038}_{-0.030}	⁶ ABE	99p CDF	$p\bar{p}$ at 1.8 TeV

¹ AAIJ 19AD measured the average value using b-hadron semileptonic decays and assuming isospin symmetry for b-hadron p_T of 4 and 25 GeV and η of 2 and 5.

² AAIJ 12j measured this value using b-hadron semileptonic decays and assuming isospin symmetry.

³ AAIJ 11f measured $f_s/f_d = 0.253 \pm 0.017 \pm 0.017 \pm 0.020$, where the errors are statistical, systematic, and theoretical. We divide their value by 2. Our second error combines systematic and theoretical uncertainties.

⁴ AALTONEN 08N reports $[\Gamma(\bar{B} \rightarrow B_s^0)/[\Gamma(\bar{B} \rightarrow B^+) + \Gamma(\bar{B} \rightarrow B^0)]] \times [B(D_s^+ \rightarrow \phi\pi^+)] = (5.76 \pm 0.18^{+0.45}_{-0.42}) \times 10^{-3}$ which we divide by our best value $B(D_s^+ \rightarrow \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁵ AFFOLDER 00E uses several electron-charm final states in $b \rightarrow ce^-X$.

⁶ ABE 99p uses the numbers of $K^*(892)^0$, $K^*(892)^+$, and $\phi(1020)$ events produced in association with the double semileptonic decays $b \rightarrow c\mu^-X$ with $c \rightarrow s\mu^+X$.

$\Gamma(B_s^0)/\Gamma(B^0)$ Γ_3/Γ_2
 "OUR EVALUATION" has been provided by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>).

VALUE	DOCUMENT ID	TECN	COMMENT
0.246 ± 0.023 OUR EVALUATION			
0.239 ± 0.016 OUR AVERAGE			
0.240 ± 0.004 ± 0.020	¹ AAD	15CM ATLAS	pp at 7 TeV
0.238 ± 0.004 ± 0.026	² AAIJ	13P LHCb	pp at 7 TeV

• • • We do not use the following data for averages, fits, limits, etc. • • •

0.2385 ± 0.0075	³ AAIJ	21Y LHCb	pp at 8 TeV
0.2539 ± 0.0079	³ AAIJ	21Y LHCb	pp at 13 TeV
0.2390 ± 0.0076	³ AAIJ	21Y LHCb	pp at 7 TeV

¹ AAD 15CM measurement is derived from the observed $B_s^0 \rightarrow J/\psi\phi$ and $B_d^0 \rightarrow J/\psi K^{*0}$ yields and a recent theory prediction of $B(B_s^0 \rightarrow J/\psi\phi)/B(B_d^0 \rightarrow J/\psi K^{*0})$. The second uncertainty combines in quadrature systematic and theoretical uncertainties.

² AAIJ 13P studies also separately the $p_T(B)$ and $\eta(B)$ dependency of $\Gamma(\bar{B} \rightarrow B_s^0)/\Gamma(\bar{B} \rightarrow B^0)$, finding $f_s/f_d(p_T) = (0.256 \pm 0.020) + (-2.0 \pm 0.6) 10^{-3} / \text{GeV}/c (p_T - \langle p_T \rangle)$ and $f_s/f_d(\eta) = (0.256 \pm 0.020) + (0.005 \pm 0.006) (\eta - \langle \eta \rangle)$, where $\langle p_T \rangle = 10.4 \text{ GeV}/c$ and $\langle \eta \rangle = 3.28$. AAIJ 13P reports the measurement as $0.238 \pm 0.004 \pm 0.015 \pm 0.021$ where the last uncertainty is theoretical.

³ AAIJ 21Y uses hadronic decays $B^0 \rightarrow D^- \pi^+$, $B^0 \rightarrow D^- K^+$, $B_s^0 \rightarrow D_s^- \pi^+$ and $B_s^0 \rightarrow J/\psi\phi$ as well as semileptonic B^0 and B_s^0 decays. Measured within the p_T range [0.5,40] GeV/c, η range [2, 6.4].

¹ Uses the combination of lepton transverse momentum spectrum and the correlation between the charge of the lepton and opposite jet charge. The first error is statistic and the second error is the total systematic error including the modeling.

² The experimental systematic and model uncertainties are combined in quadrature.

³ ABBIENDI 00E result is determined by comparing the distribution of several kinematic variables of leptonic events in a lifetime tagged $Z \rightarrow b\bar{b}$ sample using artificial neural

Meson Particle Listings

$B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE

network techniques. The first error is statistic; the second error is the total systematic error.

⁴ ACCIARRI 00 result obtained from a combined fit of $R_b = \Gamma(Z \rightarrow b\bar{b})/\Gamma(Z \rightarrow \text{hadrons})$ and $B(b \rightarrow \ell\nu X)$, using double-tagging method.

⁵ ACCIARRI 96c result obtained by a fit to the single lepton spectrum.

⁶ Assumes Standard Model value for R_B .

⁷ ABREU 95D give systematic errors ± 0.0019 (model) and 0.0012 (R_C). We combine these in quadrature.

⁸ BUSKULIC 94G uses e and μ events. This value is from a global fit to the lepton p and p_T (relative to jet) spectra which also determines the b and c production fractions, the fragmentation functions, and the forward-backward asymmetries. This branching ratio depends primarily on the ratio of dileptons to single leptons at high p_T , but the lower p_T portion of the lepton spectrum is included in the global fit to reduce the model dependence. The model dependence is ± 0.0026 and is included in the systematic error.

⁹ ABREU 93c event count includes $e\bar{e}$ events. Combining $e\bar{e}$, $\mu\mu$, and $e\mu$ events, they obtain $0.100 \pm 0.007 \pm 0.007$.

¹⁰ AKERS 93B analysis performed using single and dilepton events.

¹ ABBIENDI 00E result is determined by comparing the distribution of several kinematic variables of leptonic events in a lifetime tagged $Z \rightarrow b\bar{b}$ sample using artificial neural network techniques. The first error is statistic; the second error is the total systematic error.

² ACCIARRI 96c result obtained by a fit to the single lepton spectrum.

³ Assumes Standard Model value for R_B .

⁴ ABREU 93c event count includes $\mu\mu$ events. Combining $e\bar{e}$, $\mu\mu$, and $e\mu$ events, they obtain $0.100 \pm 0.007 \pm 0.007$.

⁵ ADEVA 91c measure the average $B(b \rightarrow eX)$ branching ratio using single and double tagged b enhanced Z events. Combining e and μ results, they obtain $0.113 \pm 0.010 \pm 0.006$. Constraining the initial number of b quarks by the Standard Model prediction (378 ± 3 MeV) for the decay of the Z into $b\bar{b}$, the muon result gives $0.123 \pm 0.003 \pm 0.006$. They obtain $0.119 \pm 0.003 \pm 0.006$ when e and μ results are combined. Used to measure the $b\bar{b}$ width itself, this muon result gives $394 \pm 9 \pm 22$ MeV and combined with the electron result gives $385 \pm 7 \pm 22$ MeV.

⁶ AKERS 93B analysis performed using single and dilepton events.

χ_b AT HIGH ENERGY

For a discussion of $B\text{-}\bar{B}$ mixing, see the note on " $B^0\text{-}\bar{B}^0$ Mixing" in the B^0 Particle Listings.

χ_b is the average $B\text{-}\bar{B}$ mixing parameter at high-energy $\chi_b = f'_d \chi_d + f'_s \chi_s$ where f'_d and f'_s are the fractions of B^0 and B_s^0 hadrons in an unbiased sample of semileptonic b -hadron decays.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

1 Uses the dimuon charge asymmetry. Averaged over the mix of b -flavored hadrons.
 2 Measurement performed using events containing a dimuon or an e/μ pair.
 3 The average B mixing parameter is determined simultaneously with b and c forward-backward asymmetries in the fit.
 4 The experimental systematic and model uncertainties are combined in quadrature.
 5 ACCIARRI 99D uses maximum-likelihood fits to extract χ_b as well as the A_{FB}^b in $Z \rightarrow b\bar{b}$ events containing prompt leptons.
 6 This ABREU 94J result is from 5182 $\ell\ell$ and 279 $\ell\ell$ events. The systematic error includes 0.004 for model dependence.
 7 BUSKULIC 94G data analyzed using ee , $e\mu$, and $\mu\mu$ events.
 8 BUSKULIC 92B uses a jet charge technique combined with electrons and muons.
 9 ABE 91G measurement of χ is done with $e\mu$ and ee events.
 10 ALBAJAR 91D measurement of χ is done with dimuons.
 11 Uses di-muon events.
 12 ALEXANDER 96 uses a maximum likelihood fit to simultaneously extract χ as well as the forward-backward asymmetries in $e^+e^- \rightarrow Z \rightarrow b\bar{b}$ and $c\bar{c}$.
 13 UENO 96 extracted χ from the energy dependence of the forward-backward asymmetry.
 14 ABREU 94F uses the average electric charge sum of the jets recoiling against a b -quark jet tagged by a high p_T muon. The result is for $\bar{\chi} = f_d \chi_d + 0.9 f_s \chi_s$.
 15 This ABREU 94J result combines $\ell\ell$, $\ell\ell$, and jet-charge ℓ (ABREU 94F) analyses. It is for $\bar{\chi} = f_d \chi_d + 0.9 f_s \chi_s$.
 16 ALBAJAR 94 uses dimuon events. Not independent of ALBAJAR 91D.
 17 ABREU 93c data analyzed using ee , $e\mu$, and $\mu\mu$ events.

18 AKERS 93B analysis performed using dilepton events.
 19 ACTON 92c uses electrons and muons. Superseded by AKERS 93B.
 20 ADEVA 92c uses electrons and muons.
 21 DECAMP 91 done with opposite and like-sign dileptons. Superseded by BUSKULIC 92B.
 22 ADEVA 90P measurement uses ee , $\mu\mu$, and $e\mu$ events from 118k events at the Z. Superseded by ADEVA 92c.
 23 These experiments are not in the average because the combination of B_s and B_d mesons which they see could differ from those at higher energy.
 24 The WEIR 90 measurement supersedes the limit obtained in SCHAAD 85. The 90% CL are 0.06 and 0.38.
 25 ALBAJAR 87C measured $\chi = (\bar{B}^0 \rightarrow B^0 \rightarrow \mu^+ X)$ divided by the average production weighted semileptonic branching fraction for B hadrons at 546 and 630 GeV.
 26 Limit is average probability for hadron containing B quark to produce a positive lepton.

CP VIOLATION PARAMETERS in semileptonic b -hadron decays.

$\text{Re}(\epsilon_b) / (1 + |\epsilon_b|^2)$

CP impurity in semileptonic b -hadron decays.

VALUE (units 10^{-3})	DOCUMENT ID	TECN	COMMENT
$\bullet\bullet\bullet$ We do not use the following data for averages, fits, limits, etc. $\bullet\bullet\bullet$			
$-6.2 \pm 5.2 \pm 4.7$	1 AABOUD 17E	ATLS	pp at 8 TeV
$-1.24 \pm 0.38 \pm 0.18$	2 ABAZOV 14	D0	$p\bar{p}$ at 1.96 TeV
$-1.97 \pm 0.43 \pm 0.23$	3 ABAZOV 11U	D0	Repl. by ABAZOV 14
$-2.39 \pm 0.63 \pm 0.37$	4 ABAZOV 10H	D0	Repl. by ABAZOV 11U

1 AABOUD 17E reports a measurement of charge asymmetry of $A_{SL}^b = (-25 \pm 21 \pm 19) \times 10^{-3}$ in lepton + jets $t\bar{t}$ events in which a b -hadron decays semileptonically to a soft muon.
 2 ABAZOV 14 reports a measurement of like-sign dimuon charge asymmetry of $A_{SL}^b = (-4.96 \pm 1.53 \pm 0.72) \times 10^{-3}$ in semileptonic b -hadron decays.
 3 ABAZOV 11U reports a measurement of like-sign dimuon charge asymmetry of $A_{SL}^b = (-7.87 \pm 1.72 \pm 0.93) \times 10^{-3}$ in semileptonic b -hadron decays.
 4 ABAZOV 10H reports a measurement of like-sign dimuon charge asymmetry of $A_{SL}^b = (-9.57 \pm 2.51 \pm 1.46) \times 10^{-3}$ in semileptonic b -hadron decays. Using the measured production ratio of B_d^0 and B_s^0 , and the asymmetry of $B_d^0 A_{SL}^d = (-4.7 \pm 4.6) \times 10^{-3}$ measured from B -factories, they obtain the asymmetry for B_s^0 as $A_{SL}^b = (-14.6 \pm 7.5) \times 10^{-3}$.

B-HADRON PRODUCTION FRACTIONS IN $p\bar{p}$ COLLISIONS AT Tevatron

The production fractions for b -hadrons in $p\bar{p}$ collisions at the Tevatron have been calculated from the best values of mean lifetimes, mixing parameters, and branching fractions in this edition by the Heavy Flavor Averaging Group (HFLAV) (see <https://hflav.web.cern.ch/>).

The values reported below assume:

$$f(\bar{b} \rightarrow B^+) = f(\bar{b} \rightarrow B^0)$$

$$f(\bar{b} \rightarrow B^+) + f(\bar{b} \rightarrow B^0) + f(\bar{b} \rightarrow B_s^0) + f(b \rightarrow b\text{-baryon}) = 1$$

The values are:

$$f(\bar{b} \rightarrow B^+) = f(\bar{b} \rightarrow B^0) = 0.344 \pm 0.021$$

$$f(\bar{b} \rightarrow B_s^0) = 0.115 \pm 0.013$$

$$f(b \rightarrow b\text{-baryon}) = 0.198 \pm 0.046$$

$$f(\bar{b} \rightarrow B_s^0) / f(\bar{b} \rightarrow B^0) = 0.334 \pm 0.041$$

and their correlation coefficients are:

$$\text{cor}(B_s^0, b\text{-baryon}) = -0.429$$

$$\text{cor}(B_s^0, B^+ = B^0) = +0.159$$

$$\text{cor}(b\text{-baryon}, B^+ = B^0) = -0.960$$

as obtained with the Tevatron average of time-integrated mixing parameter

$$\bar{\chi} = 0.147 \pm 0.011.$$

PRODUCTION ASYMMETRIES

$A_C^{b\bar{b}}$

$$A_C^{b\bar{b}} = [N(\Delta y > 0) - N(\Delta y < 0)] / [N(\Delta y > 0) + N(\Delta y < 0)]$$

with $\Delta y = |y_b| - |y_{\bar{b}}|$ where $y_{b/\bar{b}}$ is rapidity of b or \bar{b} quarks.

Meson Particle Listings

V_{cb} and V_{ub} CKM Matrix Elements, B^*

- ¹⁰ Measured using fully reconstructed D^* sample and a simultaneous fit to the Caprini-Lellouch-Neubert form factor parameters: $\rho^2 = 1.191 \pm 0.048 \pm 0.028$, $R_1(1) = 1.429 \pm 0.061 \pm 0.044$, and $R_2(1) = 0.827 \pm 0.038 \pm 0.022$.
- ¹¹ Measurement using fully reconstructed D^* sample with a $\rho^2 = 1.29 \pm 0.03 \pm 0.27$.
- ¹² Combines with previous partial reconstructed D^* measurement with a $\rho^2 = 1.39 \pm 0.10 \pm 0.33$.
- ¹³ Measured using exclusive $B^0 \rightarrow D^*(892)^- e^+ \nu$ decays with $\rho^2 = 1.35 \pm 0.17 \pm 0.19$ and a correlation of 0.91.
- ¹⁴ BRIERE 02 result is based on the same analysis and data sample reported in ADAM 03.
- ¹⁵ ABREU 96P: measured using both inclusively and exclusively reconstructed $D^{*\pm}$ samples.
- ¹⁶ BARISH 95: measured using both exclusive reconstructed $B^0 \rightarrow D^{*-} \ell^+ \nu$ and $B^+ \rightarrow D^{*0} \ell^+ \nu$ samples. They report their experiment's uncertainties $\pm 0.0019 \pm 0.0018 \pm 0.0008$, where the first error is statistical, the second is systematic, and the third is the uncertainty in the lifetimes. We combine the last two in quadrature.

$|V_{cb}| \times G(1)$ (from $B \rightarrow D^{*-} \ell^+ \nu$)

- ¹ Obtained from a fit to the combined partially reconstructed $B \rightarrow \bar{D} \ell \nu \ell$ sample while tagged by the other fully reconstructed B meson in the event. Also reports fitted $\rho^2 = 1.09 \pm 0.05$.
- ² Obtained from a fit to the combined $B \rightarrow \bar{D} \ell^+ \nu \ell$ sample in which a hadronic decay of the second B meson is fully reconstructed and $\rho^2 = 1.20 \pm 0.09 \pm 0.04$.
- ³ Obtained from a global fit to $B \rightarrow D^{(*)} \ell \nu \ell$ events, with reconstructed $D^0 \ell$ and $D^+ \ell$ final states and $\rho^2 = 1.20 \pm 0.04 \pm 0.07$.
- ⁴ BARTELT 99: measured using both exclusive reconstructed $B^0 \rightarrow D^- \ell^+ \nu$ and $B^+ \rightarrow D^0 \ell^+ \nu$ samples.
- ⁵ BUSKULIC 97: measured using exclusively reconstructed D^\pm with a $\rho^2 = -0.05 \pm 0.53 \pm 0.38$. The statistical correlation is 0.99.
- ⁶ Using the missing energy and momentum to extract kinematic information about the undetected neutrino in the $B^0 \rightarrow D^- \ell^+ \nu$ decay.
- ⁷ ATHANAS 97: measured using both exclusive reconstructed $B^0 \rightarrow D^- \ell^+ \nu$ and $B^+ \rightarrow D^0 \ell^+ \nu$ samples with a $\rho^2 = 0.59 \pm 0.22 \pm 0.12^{+0.59}_{-0}$. They report their experiment's uncertainties $\pm 0.0044 \pm 0.0048^{+0.0053}_{-0.0012}$, where the first error is statistical, the second is systematic, and the third is the uncertainty due to the form factor model variations. We combine the last two in quadrature.

$|V_{cb}|$ (from $D_s^{*-} \mu^+ \nu_\mu$)

VALUE (units 10^{-3})	DOCUMENT ID	TECN	COMMENT
41.4 ± 0.6 ± 0.9 ± 1.2	¹ AAIJ 20E	LHCB	pp at 7, 8 TeV

¹ Measured from an inclusive sample of $D_s^{*-} \mu^+$ candidates using CNL parameterization of the form factor. AAIJ 20E provides also measurement of $|V_{cb}| = (42.3 \pm 0.8 \pm 0.9 \pm 1.2) \times 10^{-3}$ using BGL parameterization of the form factor. The third uncertainty is due to the external inputs used in the measurement.

V_{ub} MEASUREMENTS

For the discussion of V_{ub} measurements, which is not repeated here, see the review on "Determination of $|V_{cb}|$ and $|V_{ub}|$."

The CKM matrix element $|V_{ub}|$ can be determined by studying the rate of the charmless semileptonic decay $b \rightarrow u \ell \nu$. The relevant branching ratio measurements based on exclusive and inclusive decays can be found in the B Listings, and are not repeated here.

5681 ± 11	1738	AKERS	95E OPAL	$E_{\text{cm}}^{\text{e}^+e^-} = 88-94$ GeV

••• We do not use the following data for averages, fits, limits, etc. •••

¹ AFFOLDER 01F uses the reconstructed B meson through semileptonic decay channels.

The fraction of light B mesons that are produced at $L=1$ B^{**} states is measured to be $0.28 \pm 0.06 \pm 0.03$.

² BARATE 98L uses fully reconstructed B mesons to search for B^{**} production in the $B \pi^{\pm}$ system. In the framework of heavy quark symmetry (HQSS), they also measured the mass of B_2^* to be 5739^{+8+6}_{-11-4} MeV/ c^2 and the relative production rate of $B(b \rightarrow B_2^* \rightarrow B^{(*)} \pi)/B(b \rightarrow B_{u,d}) = (31 \pm 9^{+6}_{-5})\%$.

³ Using $m_{B \pi^-} - m_B = 424 \pm 4 \pm 10$ MeV.

⁴ ACCIARRI 99N uses inclusive reconstructed B mesons to search for B^{**} production in the $B^{(*)} \pi^{\pm}$ system. In the framework of HQET, they measured the mass of B_1^* and B_2^* to be $5670 \pm 10 \pm 13$ MeV and $5768 \pm 5 \pm 6$ with the $B(b \rightarrow B^{**}) = (32 \pm 3 \pm 6) \times 10^{-2}$. They also reported the evidence for the existence of an excited B -meson state or mixture of states in the region 5.9–6.0 GeV.

B_s^0 MEAN LIFE

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>).

The mean B_s^0 lifetime is defined and computed as $1/\Gamma_{B_s^0}$, where $\Gamma_{B_s^0}$ is the average decay width of the B_s^0 mass eigenstates.

- 1 AALTONEN 11AP combines the fully reconstructed $B_s^0 \rightarrow D_s^- \pi^+$ decays and partially reconstructed $B_s^0 \rightarrow D_s X$ decays.
- 2 Measured using $D_s \mu^+$ vertices.
- 3 Uses $D_s^- \ell^+$, and $\phi \ell^+$ vertices.
- 4 Measured using D_s hadron vertices.
- 5 Measured using $D_s^- \ell^+$ vertices.
- 6 ACKERSTAFF 98F use fully reconstructed $D_s^- \rightarrow \phi \pi^-$ and $D_s^- \rightarrow K^*0 K^-$ in the inclusive B_s^0 decay.
- 7 Combined results from $D_s^- \ell^+$ and D_s hadron.
- 8 Measured using $\phi \ell$ vertices.
- 9 Measured using inclusive D_s vertices.
- 10 Combined result for the four ABREU 96F methods.
- 11 Exclusive reconstruction of $B_s \rightarrow \psi \phi$.
- 12 ABREU 94E uses the flight-distance distribution of D_s vertices, ϕ -lepton vertices, and $D_s \mu$ vertices.

$\Gamma_{B_s^0}$

"OUR EVALUATION" is an average performed by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>) as described in our "Review on $B - \bar{B}$ Mixing" in the B^0 section of these Listings. It includes the measurements of $\Gamma_{B_s^0}$ and $\Delta \Gamma_{B_s^0}$ listed in this section, as well as constraints from effective lifetimes with pure CP modes and flavor-specific modes.

- Measured using time-dependent angular analysis of $B_s^0 \rightarrow \psi(2S) \phi$ decays.
- The error includes both statistical and systematic uncertainties.
- AAIJ 13AR result comes from a combined fit to $B_s^0 \rightarrow J/\psi K^+ K^-$ and $B_s^0 \rightarrow J/\psi \pi^+ \pi^-$ data sets. Also reports $\Delta\Gamma_s = 0.100 \pm 0.016 \pm 0.003 \text{ ps}^{-1}$ from a fit to $B_s^0 \rightarrow J/\psi K^+ K^-$ decays.
- Uses the time-dependent angular analysis of $B_s^0 \rightarrow J/\psi \phi$ decays and assuming CP-violating angle $\beta_s(B^0 \rightarrow J/\psi \phi) = 0.02$.
- Measured the angular and lifetime parameters for the time-dependent angular untagged decays $B_d^0 \rightarrow J/\psi K^{*0}$ and $B_s^0 \rightarrow J/\psi \phi$.
- Measured using the time-dependent angular analysis of $B_s^0 \rightarrow J/\psi \phi$ decays and assuming CP-violating phase $\phi_s = 0$.
- Obtains 90% CL interval $-0.06 < \Delta\Gamma_s < 0.30$.
- ABAZOV 07 reports $0.17 \pm 0.09 \pm 0.02$ with CP-violating phase ϕ_s as a free parameter.
- Combines D^0 measurements of time-dependent angular distributions in $B_s^0 \rightarrow J/\psi \phi$ and charge asymmetry in semileptonic decays. There is a 4-fold ambiguity in the solution.

$\Delta\Gamma_{B_s^0}$

"OUR EVALUATION" is an average performed by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>) as described in our "Review on $B-\bar{B}$ Mixing" in the B^0 section of these Listings. It includes the measurements of Γ_{B^0} and $\Delta\Gamma_{B^0}$ listed in this section, as well as constraints from effective lifetimes with pure CP modes and flavor-specific modes.

$\Delta\Gamma_{B_s^0}/\Gamma_{B_s^0}$

$\Gamma_{B_s^0}$ and $\Delta\Gamma_{B_s^0}$ are the decay rate average and difference between two B_s^0 CP eigenstates (light - heavy).

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>). It is derived from the averages of $\Gamma_{B_s^0}$ and $\Delta\Gamma_{B_s^0}$ (and their correlation).

- Assumes CP violation is negligible.
- Measured using the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.
- Uses the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays and assuming CP-violating angle $\beta_S(B^0 \rightarrow J/\psi\phi) = 0.02$.
- Measured using fully reconstructed $B_S \rightarrow J/\psi\phi$ decays.
- Assumes $2 B(B_S^0 \rightarrow D_S^{(*)} D_S^{(*)}) \approx \Delta\Gamma_S^{CP} / \Gamma_S$.
- Measured using the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.
- Uses $|A_0|^2 - |A_{||}|^2 = 0.355 \pm 0.066$ from ACOSTA 05.
- Uses $D_S^- \ell^+$, and $\phi\ell^+$ vertices.
- Measured using D_S hadron vertices.
- Uses $\phi\phi$ correlations from $B_S^0 \rightarrow D_S^{(*)} + D_S^{(*)-}$.
- ABE 99D assumes $\tau_{B_S^0} = 1.55 \pm 0.05$ ps.
- ACCIARRI 98S assumes $\tau_{B_S^0} = 1.49 \pm 0.06$ ps and PDG 98 values of b production fraction.

B_{sH}^0 MEAN LIFE

B_{sH}^0 is the heavy mass state of two B_S^0 CP eigenstates.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>). It is derived from the averages of $\Gamma_{B_S^0}$ and $\Delta\Gamma_{B_S^0}$ (and their correlation).

- Measured using $B_S \rightarrow \mu^+ \mu^-$ decays which, in the Standard Model, correspond to B_{sH}^0 decays. Assumes $-2 \text{Re}(\lambda)/(1 + |\lambda|^2) = 1$.
- Measured using $B_S^0 \rightarrow J/\psi\pi^+\pi^-$ decays with $0.9240 < m(\pi\pi) < 1.0204$ GeV, which is dominated by the $f_0(980)$ resonance, making it a CP-odd state.
- Measured using $J/\psi\pi^+\pi^-$ mode with $0.880 < m(\pi\pi) < 1.080$ GeV/ c^2 , which is mostly $J/\psi f_0(980)$ mode, a pure CP-odd final state.
- Measured using a pure CP-odd final state $J/\psi K_S^0$ with the assumption that contributions from penguin diagrams are small.
- Measured using $B_S \rightarrow J/\psi\pi^+\pi^-$ decays which, in the limit of $\phi_S = 0$ and $|\lambda| = 1$, correspond to B_{sH}^0 decays.
- Measured using a pure CP-odd final state $J/\psi f_0(980)$.
- Uses the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays assuming CP-violating angle $\beta_S(B^0 \rightarrow J/\psi\phi) = 0.02$.
- Obtained from $\Delta\Gamma_S$ and Γ_S fit with a correlation of 0.6.
- Measured using the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.

B_{sL}^0 MEAN LIFE

B_{sL}^0 is the light mass state of two B_S^0 CP eigenstates.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>). It is derived from the averages of $\Gamma_{B_S^0}$ and $\Delta\Gamma_{B_S^0}$ (and their correlation).

- Measured using results in SIRUNYAN 18BY for the heavy B_S^0 lifetime obtained from $B_S^0 \rightarrow J/\psi\pi^+\pi^-$ decays and the average effective $B_S^0 \rightarrow J/\psi\phi$ lifetime, and magnitude squared of the CP-odd amplitude $|A_{\perp}|^2 = 0.250 \pm 0.006$. The uncertainty includes all statistical and systematic contributions.
- Measured using $B_S^0 \rightarrow J/\psi\eta$ decays.
- Measured using $B_S^0 \rightarrow D_S^- D_S^+$. The effective lifetime is translated into a decay width of $\Gamma_L = 0.725 \pm 0.014 \pm 0.009$ ps $^{-1}$.
- Measured using $B_S^0 \rightarrow K^+ K^-$ decays. There may still be CPV in the decay.
- Uses the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays and assuming CP-violating angle $\beta_S(B^0 \rightarrow J/\psi\phi) = 0.02$.
- Obtained from $\Delta\Gamma_S$ and Γ_S fit with a correlation of 0.6.
- Measured using the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.
- Uses $\phi\phi$ correlations from $B_S^0 \rightarrow D_S^{(*)} + D_S^{(*)-}$.

B_s^0 DECAY MODES

These branching fractions all scale with $B(\bar{b} \rightarrow B_s^0)$.

The branching fraction $B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything})$ is not a pure measurement since the measured product branching fraction $B(\bar{b} \rightarrow B_s^0) \times B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything})$ was used to determine $B(\bar{b} \rightarrow B_s^0)$, as described in the note on " B^0 - \bar{B}^0 Mixing"

For inclusive branching fractions, e.g., $B \rightarrow D^\pm \text{ anything}$, the values usually are multiplicities, not branching fractions. They can be greater than one.

Mode	Fraction (Γ_i/Γ)	Scale factor/ Confidence level
Γ_1 $D_s^- \text{ anything}$	(62 ± 6) %	
Γ_2 $\ell \nu_\ell X$	(9.6 ± 0.8) %

[a] Not a pure measurement. See note at head of B_s^0 Decay Modes.
 [b] Here S and P are the hypothetical scalar and pseudoscalar particles with masses of 2.5 GeV/c² and 214.3 MeV/c², respectively.
 [c] The value is for the sum of the charge states or particle/antiparticle states indicated.

CONSTRAINED FIT INFORMATION
 An overall fit to 12 branching ratios uses 20 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 26.9$ for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

1.56 ± 0.58 ± 0.44	147	4 ACTON 92N	OPAL $e^+e^- \rightarrow Z$
1 WANG 22 selects the B_s events by tagging the accompanying B_s via partial reconstruction of the semileptonic decays $B_s \rightarrow D_s X \ell^+ \nu$. 2 The extraction of this result takes into account the correlation between the measurements of $B(\Upsilon(5S) \rightarrow D_s X)$ and $B(\Upsilon(5S) \rightarrow D^0 X)$. 3 BUSKULIC 96E separate $c\bar{c}$ and $b\bar{b}$ sources of D_s^+ mesons using a lifetime tag, subtract generic $\bar{b} \rightarrow W^+ \rightarrow D_s^+$ events, and obtain $B(\bar{b} \rightarrow B_s^0) \times B(B_s^0 \rightarrow D_s^- \text{ anything}) = 0.088 \pm 0.020 \pm 0.020$ assuming $B(D_s^- \rightarrow \phi\pi) = (3.5 \pm 0.4) \times 10^{-2}$ and PDG 1994 values for the relative partial widths to other D_s channels. We evaluate using our current values $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s^- \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_s^0)$ and $B(D_s^- \rightarrow \phi\pi)$. 4 ACTON 92N assume that excess of 147 ± 48 D_s^0 events over that expected from $B^0, B^+,$ and $c\bar{c}$ is all from B_s^0 decay. The product branching fraction is measured to be $B(\bar{b} \rightarrow B_s^0)B(B_s^0 \rightarrow D_s^- \text{ anything}) \times B(D_s^- \rightarrow \phi\pi) = (5.9 \pm 1.9 \pm 1.1) \times 10^{-3}$. We evaluate using our current values $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s^- \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_s^0)$ and $B(D_s^- \rightarrow \phi\pi)$.

1 The measurement corresponds to the average of the electron and muon branching fractions. 2 The measurement corresponds to a branching fraction where the lepton originates from bottom decay and is the average between the electron and muon branching fractions. LEES 12A uses the correlation of the production of ϕ mesons in association with a lepton in e^+e^- data taken at center-of-mass energies between 10.54 and 11.2 GeV.

 The values and averages in this section serve only to show what values result if one assumes our $B(\bar{b} \rightarrow B_s^0)$. They cannot be thought of as measurements since the underlying product branching fractions were also used to determine $B(\bar{b} \rightarrow B_s^0)$ as described in the note on "Production and Decay of b -Flavored Hadrons."

VALUE (units 10^{-2})	EVTS	DOCUMENT ID	TECN	COMMENT

7.6 ± 1.2 ± 2.1	134	2 BUSKULIC	950 ALEP	$e^+e^- \rightarrow Z$
10.7 ± 4.3 ± 2.9		3 ABREU	92M DLPH	$e^+e^- \rightarrow Z$
10.3 ± 3.6 ± 2.8	18	4 ACTON	92N OPAL	$e^+e^- \rightarrow Z$

• • • We do not use the following data for averages, fits, limits, etc. • • •

13 ± 4 ± 4 27 5 BUSKULIC 92E ALEP $e^+e^- \rightarrow Z$
 1 Obtains $B_s \rightarrow D_s X e \nu$, and $D_s X \mu \nu$ separately, then combines them by assuming systematic uncertainties are fully correlated, except for the one on lepton identification. The third uncertainty adds in quadrature systematic uncertainties from external sources (number of B_s events, and $D_s^{(*)}$ branching fractions). OSWALD 15 also measures the cross-section $\sigma(e^+e^- \rightarrow B_s^{(*)} \bar{B}_s^{(*)}) = 53.8 \pm 1.4 \pm 5.3$ pb at $\sqrt{s} = 10.86$ GeV.

2 BUSKULIC 950 use $D_s \ell$ correlations. The measured product branching ratio is $B(\bar{b} \rightarrow B_s) \times B(B_s \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything}) = (0.82 \pm 0.09^{+0.13}_{-0.14})\%$ assuming $B(D_s \rightarrow \phi\pi) = (3.5 \pm 0.4) \times 10^{-2}$ and PDG 1994 values for the relative partial widths to the six other D_s channels used in this analysis. Combined with results from $\Upsilon(4S)$ experiments this can be used to extract $B(\bar{b} \rightarrow B_s) = (11.0 \pm 1.2^{+2.5}_{-2.6})\%$. We evaluate using our current values $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$.

3 ABREU 92M measured muons only and obtained product branching ratio $B(Z \rightarrow b \text{ or } \bar{b}) \times B(\bar{b} \rightarrow B_s) \times B(B_s \rightarrow D_s \mu^+ \nu_\mu \text{ anything}) \times B(D_s \rightarrow \phi\pi) = (18 \pm 8) \times 10^{-5}$. We evaluate using our current values $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$. We use $B(Z \rightarrow b \text{ or } \bar{b}) = 2B(Z \rightarrow b \bar{b}) = 2 \times (0.2212 \pm 0.0019)$.

4 ACTON 92N is measured using $D_s \rightarrow \phi\pi^+$ and $K^*(892)^0 K^+$ events. The product branching fraction measured is measured to be $B(\bar{b} \rightarrow B_s^0)B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything}) \times B(D_s^- \rightarrow \phi\pi^-) = (3.9 \pm 1.1 \pm 0.8) \times 10^{-4}$. We evaluate using our current values $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$.

5 BUSKULIC 92E is measured using $D_s \rightarrow \phi\pi^+$ and $K^*(892)^0 K^+$ events. They use $2.7 \pm 0.7\%$ for the $\phi\pi^+$ branching fraction. The average product branching fraction is measured to be $B(\bar{b} \rightarrow B_s^0)B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything}) = 0.020 \pm 0.0055^{+0.005}_{-0.006}$. We evaluate using our current values $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$. Superseded by BUSKULIC 950.

5.4 ± 0.4 ± 1.0 1 OSWALD 15 BELL $e^+e^- \rightarrow \Upsilon(5S)$

1 Obtains $B_s \rightarrow D_s^* X e \nu$, and $D_s^* X \mu \nu$ separately, then combines them by assuming systematic uncertainties are fully correlated, except for the one on lepton identification. The third uncertainty adds in quadrature systematic uncertainties from external sources (number of B_s events, and $D_s^{(*)}$ branching fractions). OSWALD 15 also measures the cross-section $\sigma(e^+e^- \rightarrow B_s^{(*)} \bar{B}_s^{(*)}) = 53.8 \pm 1.4 \pm 5.3$ pb at $\sqrt{s} = 10.86$ GeV.

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

¹ AAIJ 21Y reports $[\Gamma(B_S^0 \rightarrow J/\psi(1S) \phi)/\Gamma_{\text{total}}] \times [B(\phi(1020) \rightarrow K^+ K^-)] = (5.01 \pm 0.16 \pm 0.17) \times 10^{-4}$ from a measurement of $[\Gamma(B_S^0 \rightarrow J/\psi(1S) \phi)/\Gamma_{\text{total}}] \times [B(\phi(1020) \rightarrow K^+ K^-)] / [B(B^+ \rightarrow J/\psi(1S) K^+)]$ assuming $B(B^+ \rightarrow J/\psi(1S) K^+) = (1.003 \pm 0.035) \times 10^{-3}$, which we rescale to our best values $B(\phi(1020) \rightarrow K^+ K^-) = (49.1 \pm 0.5) \times 10^{-2}$, $B(B^+ \rightarrow J/\psi(1S) K^+) = (1.020 \pm 0.019) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best values.

² THORNE 13 uses $f_s = (17.2 \pm 3.0)\%$ as the fraction of $\Upsilon(5S)$ decaying to $B_S^{(*)} \bar{B}_S^{(*)}$.

³ ABE 96Q reports $[\Gamma(B_S^0 \rightarrow J/\psi(1S) \phi)/\Gamma_{\text{total}}] \times [\Gamma(\bar{B} \rightarrow B_S^0) / (\Gamma(\bar{B} \rightarrow B^+) + \Gamma(\bar{B} \rightarrow B^0))] = (0.185 \pm 0.055 \pm 0.020) \times 10^{-3}$ which we divide by our best value $\Gamma(\bar{B} \rightarrow B_S^0) / [\Gamma(\bar{B} \rightarrow B^+) + \Gamma(\bar{B} \rightarrow B^0)] = 0.1230 \pm 0.0115$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁴ AAIJ 13AN uses $f_s/f_d = 0.256 \pm 0.020$ and $B(B^+ \rightarrow J/\psi K^+) = (10.18 \pm 0.42) \times 10^{-4}$.

⁵ AKERS 94J sees one event and measures the limit on the product branching fraction $f(\bar{B} \rightarrow B_S^0) \cdot B(B_S^0 \rightarrow J/\psi(1S) \phi) < 7 \times 10^{-4}$ at CL = 90%. We divide by $B(\bar{B} \rightarrow B_S^0) = 0.112$.

⁶ ABE 93F measured using $J/\psi(1S) \rightarrow \mu^+ \mu^-$ and $\phi \rightarrow K^+ K^-$.

⁷ In ACTON 92N a limit on the product branching fraction is measured to be $f(\bar{B} \rightarrow B_S^0) \cdot B(B_S^0 \rightarrow J/\psi(1S) \phi) \leq 0.22 \times 10^{-2}$.

⁴ This value corresponds to an upper limit of $< 3.0 \times 10^{-9}$ at 95% C.L. It uses $f_s/f_d = 0.24 \pm 0.02$.				
⁵ Determined from the joint fit to CMS and LHCb data. Uncertainty includes both statistical and systematic component.				

- ⁶ Uses B production ratio $f(\bar{B} \rightarrow B_s^0)/f(\bar{B} \rightarrow B_d^0) = 0.256 \pm 0.020$ and two normalization modes: $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.01 \pm 0.21) \times 10^{-5}$ and $B(B^0 \rightarrow K^+ \pi^-) = (1.94 \pm 0.06) \times 10^{-5}$.
- ⁷ Uses B production ratio $f(\bar{B} \rightarrow B_s^0)/f(\bar{B} \rightarrow B_d^0) = 0.259 \pm 0.015$ and normalization modes $B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+$ and $B^0 \rightarrow K^+ \pi^-$.
- ⁸ Uses normalization mode $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.01 \pm 0.21) \times 10^{-5}$ and B production ratio $f(\bar{B} \rightarrow B_s^0)/f(\bar{B} \rightarrow B_d^0) = 0.263 \pm 0.017$.
- ⁹ Uses B production ratio $f(\bar{B} \rightarrow B_s^0)/f(\bar{B} \rightarrow B_d^0) = 0.256 \pm 0.020$ and $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.0 \pm 0.2) \times 10^{-5}$ for normalization.
- ¹⁰ Uses B production ratio $f(\bar{B} \rightarrow B^+)/f(\bar{B} \rightarrow B_s^0) = 3.75 \pm 0.29$ and $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.0 \pm 0.2) \times 10^{-5}$.
- ¹¹ Uses B production ratio $f(\bar{B} \rightarrow B_s^0)/f(\bar{B} \rightarrow B_d^0) = 0.267^{+0.021}_{-0.020}$ and three normalization modes $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.01 \pm 0.21) \times 10^{-5}$, $B(B^0 \rightarrow K^+ \pi^-) = (1.94 \pm 0.06) \times 10^{-5}$, and $B(B_s^0 \rightarrow J/\psi \phi \rightarrow \mu^+ \mu^- K^+ K^-) = (3.4 \pm 0.9) \times 10^{-5}$.
- ¹² Uses B production ratio $f(\bar{B} \rightarrow B_s^0)/f(\bar{B} \rightarrow B_d^0) = 0.267^{+0.021}_{-0.020}$ and three normalization modes of $B^+ \rightarrow J/\psi K^+$, $B^0 \rightarrow K^+ \pi^-$, and $B_s^0 \rightarrow J/\psi \phi$.
- ¹³ Uses $f_s/f_u = 0.267 \pm 0.021$ and $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.0 \pm 0.2) \times 10^{-5}$.
- ¹⁴ Uses B production ratio $f(\bar{B} \rightarrow B^+)/f(\bar{B} \rightarrow B_s^0) = 3.71 \pm 0.47$ and three normalization modes.
- ¹⁵ Uses B production ratio $f(\bar{B} \rightarrow B^+)/f(\bar{B} \rightarrow B_s^0) = 3.55 \pm 0.47$ and $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.01 \pm 0.21) \times 10^{-5}$.
- ¹⁶ Uses B production ratio $f(\bar{B} \rightarrow B^+)/f(\bar{B} \rightarrow B_s^0) = 3.55 \pm 0.42$ and $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.0 \pm 0.2) \times 10^{-5}$.
- ¹⁷ Uses B production ratio $f(\bar{B} \rightarrow B^+)/f(\bar{B} \rightarrow B_s^0) = 3.86 \pm 0.59$, and the number of $B^+ \rightarrow J/\psi K^+$ decays.

POLARIZATION IN B_s^0 DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal (L), or both are transverse and parallel (\parallel), or perpendicular (\perp) to each other with the parameters Γ_L/Γ , $\Gamma_{\parallel}/\Gamma$, and the relative phases ϕ_{\parallel} and ϕ_{\perp} . In decays involving two tensor mesons, the transverse polarization states are described by parameters $\Gamma_{\parallel 1}$, $\Gamma_{\parallel 2}$, $\Gamma_{\perp 1}$, $\Gamma_{\perp 2}$ and their relative phases $\phi_{\parallel 1}$, $\phi_{\parallel 2}$, $\phi_{\perp 1}$, $\phi_{\perp 2}$. See also the review on "Polarization in B Decays."

¹ The non-resonant $K\pi$ background contributions are subtracted. Also reports an S -wave amplitude $|A_S|^2 = 0.07^{+0.15}_{-0.07}$.

$\Gamma_{\parallel}/\Gamma$ for $B_s^0 \rightarrow J/\psi(1S)\bar{K}^*(892)^0$

Parallel polarization fraction, equals to $1 - f_L - f_{\perp}$ using notation of "Polarization in B decays" review.

 B_s^0 - \bar{B}_s^0 MIXING

For a discussion of B_s^0 - \bar{B}_s^0 mixing see the note on " B^0 - \bar{B}^0 Mixing" in the B^0 Particle Listings above.

χ_s is a measure of the time-integrated B_s^0 - \bar{B}_s^0 mixing probability that produced B_s^0 (\bar{B}_s^0) decays as a \bar{B}_s^0 (B_s^0). Mixing violates $\Delta B \neq 2$ rule.

$$\chi_s = \frac{x_s^2}{2(1+x_s^2)}$$

$$x_s = \frac{\Delta m_{B_s^0}}{\Gamma_{B_s^0}} = (m_{B_{sH}^0} - m_{B_{sL}^0}) \tau_{B_s^0},$$

where H , L stand for heavy and light states of two B_s^0 CP eigenstates and

$$\tau_{B_s^0} = \frac{1}{0.5(\Gamma_{B_{sH}^0} + \Gamma_{B_{sL}^0})}.$$

$$\Delta m_{B_s^0} = m_{B_{sH}^0} - m_{B_{sL}^0}$$

$\Delta m_{B_s^0}$ is a measure of 2π times the B_s^0 - \bar{B}_s^0 oscillation frequency in time-dependent mixing experiments.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>) by taking into account correlations between measurements.

¹ Measured using $B_s^0 \rightarrow D_s^- \pi^+$ decays.² Measured using $B_s^0 \rightarrow D_s^- \pi^+ \pi^- \pi^+$ decays.³ Measured using time-dependent angular analysis of $B_s^0 \rightarrow J/\psi \phi$ decays.⁴ Measured using time-dependent angular analysis of $B_s^0 \rightarrow J/\psi K^+ K^-$ decays.⁵ Measured using $B_s^0 \rightarrow D_s^- \mu^+ \nu_\mu X$ decays.⁶ Significance of oscillation signal is 5.4σ . Also reports $|V_{td} / V_{ts}| = 0.2060 \pm 0.0007^{+0.0081}_{-0.0060}$.⁷ Measured using $B_s^0 \rightarrow D_s^- \pi^+$ and $D_s^- \pi^+ \pi^- \pi^+$ decays.⁸ A likelihood scan over the oscillation frequency, Δm_s , gives a most probable value of 19 ps^{-1} and a range of $17 < \Delta m_s < 21 \text{ (ps}^{-1})$ at 90% C.L. assuming Gaussian uncertainties. Also excludes $\Delta m_s < 14.8 \text{ ps}^{-1}$ at 95% C.L.⁹ Significance of oscillation signal is 0.2%. Also reported the value $|V_{td} / V_{ts}| = 0.208^{+0.001+0.008}_{-0.002-0.006}$.¹⁰ Uses leptons emitted with large momentum transverse to a jet and improved techniques for vertexing and flavor-tagging.¹¹ Updates of D_s -lepton analysis.¹² Combined results from all Delphi analyses.

- 13 Events with a high transverse momentum lepton were removed and an inclusively reconstructed vertex was required.
- 14 ABE 03 uses the novel "charge dipole" technique to reconstruct separate secondary and tertiary vertices originating from the $B \rightarrow D$ decay chain. The analysis excludes $\Delta m_S < 4.9 \text{ ps}^{-1}$ and $7.9 < \Delta m_S < 10.3 \text{ ps}^{-1}$.
- 15 Three analyses based on complementary event selections: (1) fully-reconstructed hadronic decays; (2) semileptonic decays with D_S exclusively reconstructed; (3) inclusive semileptonic decays.
- 16 ABE 02V uses exclusively reconstructed D_S^- mesons and excludes $\Delta m_S < 1.4 \text{ ps}^{-1}$ and $2.4 < \Delta m_S < 5.3 \text{ ps}^{-1}$ at 95% CL.
- 17 Uses fully or partially reconstructed $D_S \ell$ vertices and a mixing tag as a flavor tagging.
- 18 Replaced by ABDALLAH 04A. Uses $D_S^- \ell^+$, and $\phi \ell^+$ vertices, and a multi-variable discriminant as a flavor tagging.
- 19 Uses inclusive D_S vertices and fully reconstructed B_S decays and a multi-variable discriminant as a flavor tagging.
- 20 Uses ℓ - Q_{hem} and ℓ - ℓ .
- 21 ABE 99D assumes $\tau_{B_S^0} = 1.55 \pm 0.05 \text{ ps}$ and $\Delta\Gamma/\Delta m = (5.6 \pm 2.6) \times 10^{-3}$.
- 22 ABE 99J uses ϕ ℓ - ℓ correlation.
- 23 BARATE 99J uses combination of an inclusive lepton and D_S^- -based analyses.
- 24 BARATE 98c combines results from $D_S h$ - ℓ/Q_{hem} , $D_S h$ - K in the same side, $D_S \ell$ - ℓ/Q_{hem} and $D_S \ell$ - K in the same side.
- 25 Uses ℓ - Q_{hem} .
- 26 Uses ℓ - ℓ .
- 27 ADAM 97 combines results from $D_S \ell$ - Q_{hem} , ℓ - Q_{hem} , and ℓ - ℓ .
- 28 BUSKULIC 96M uses D_S lepton correlations and lepton, kaon, and jet charge tags.
- 29 BUSKULIC 95J uses ℓ - Q_{hem} . They find $\Delta m_S > 5.6$ [> 6.1] for $f_S = 10\%$ [12%]. We interpolate to our central value $f_S = 10.5\%$.

$x_S = \Delta m_{B_S^0} / \Gamma_{B_S^0}$
 This is derived by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>) from the results on $\Delta m_{B_S^0}$ and "OUR EVALUATION" of the B_S^0 mean lifetime.

CP VIOLATION PARAMETERS in B_S^0

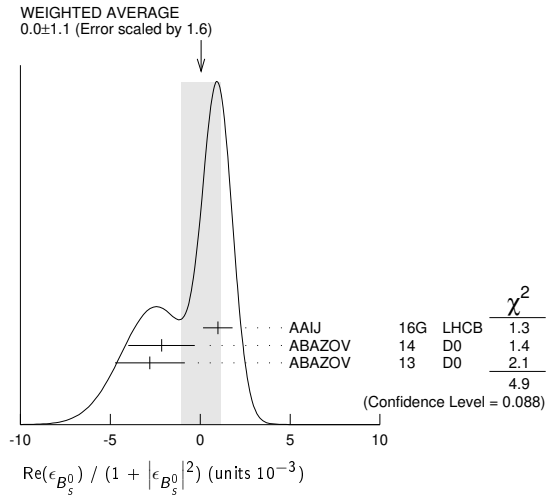

$\text{Re}(\epsilon_{B_S^0}) / (1 + |\epsilon_{B_S^0}|^2)$
 CP impurity in B_S^0 system.

"OUR EVALUATION" is an average obtained by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>) and described at <https://hflav.web.cern.ch/>. It is the result of a fit to B_d and B_s CP asymmetries, which includes the B_s measurements listed below and the B_d measurements listed in the B_d section, and takes into account correlations between those measurements.

- 1 AAIJ 16G reports a measurement of time-integrated flavor-specific asymmetry in $B_S^0 \rightarrow \mu^+ D_S^- X$ decays, $A_{SL}^S = (0.39 \pm 0.26 \pm 0.20)\%$, which is approximately equal to $4 \times \text{Re}(\epsilon_{B_S^0}) / (1 + |\epsilon_{B_S^0}|^2)$.
- 2 ABAZOV 14 uses the dimuon charge asymmetry with different impact parameters from which it reports $A_{SL}^S = (-0.86 \pm 0.74) \times 10^{-2}$.
- 3 ABAZOV 13 reports a measurement of time-integrated flavor-specific asymmetry in mixed semileptonic $B_S^0 \rightarrow \mu^+ D_S^- X$ decays $A_{SL}^S = (-1.12 \pm 0.74 \pm 0.17)\%$ which is approximately equal to $4 \times \text{Re}(\epsilon_{B_S^0}) / (1 + |\epsilon_{B_S^0}|^2)$.
- 4 AAIJ 14D reports a measurement of time-integrated flavor-specific asymmetry in $B_S^0 \rightarrow \mu^+ D_S^- X$ decays, $A_{SL}^S = (-0.06 \pm 0.50 \pm 0.36)\%$, which is approximately equal to $4 \times \text{Re}(\epsilon_{B_S^0}) / (1 + |\epsilon_{B_S^0}|^2)$.
- 5 ABAZOV 11U uses the dimuon charge asymmetry with different impact parameters from which it reports $A_{SL}^S = (-18.1 \pm 10.6) \times 10^{-3}$.

- 6 ABAZOV 10E reports a measurement of flavor-specific asymmetry in $B_{(s)}^0 \rightarrow \mu^+ D_{(s)}^{*-} X$ decays with a decay-time analysis including initial-state flavor tagging, $A_{SL}^S = (-1.7 \pm 9.1_{-1.5}^{+1.4}) \times 10^{-3}$ which is approximately equal to $4 \times \text{Re}(\epsilon_{B_S^0}) / (1 + |\epsilon_{B_S^0}|^2)$.
- 7 ABAZOV 10H reports a measurement of like-sign dimuon charge asymmetry of $A_{SL}^S = (-9.57 \pm 2.51 \pm 1.46) \times 10^{-3}$ in semileptonic b -hadron decays. Using the measured production ratio of B_d^0 and B_S^0 , and the asymmetry of B_d^0 , $A_{SL}^S = (-4.7 \pm 4.6) \times 10^{-3}$ measured from B -factories, they obtain the asymmetry for B_S^0 .
- 8 The first direct measurement of the time integrated flavor untagged charge asymmetry in semileptonic B_S^0 decays is reported as $2 \times A_{SL}^S(\text{untagged}) = A_{SL}^S = (2.45 \pm 1.93 \pm 0.35) \times 10^{-2}$.

¹ Measured in restricted phase space with $m(K^+\pi^+\pi^-) < 1950$ MeV, $m(K^+\pi^-) < 1200$ MeV and $m(\pi^+\pi^-) < 1200$ MeV. The value is modulo 180°.

² A model-independent coherence factor for the decay $B_S \rightarrow D_S K \pi \pi$ (in the restricted phase space region) is also reported.

CP Violation phase β_s

$-2\beta_s$ is the weak phase difference between B_S^0 mixing amplitude and the $B_S^0 \rightarrow J/\psi \phi$ decay amplitude driven by the $b \rightarrow c\bar{c}s$ transition (such as $B_S \rightarrow J/\psi \phi, J/\psi K^+ K^-$,

$J/\psi \pi^+ \pi^-$, and $D_S^+ D_S^-$). The Standard Model value of β_s is $\arg(-\frac{V_{ts}V_{tb}^*}{V_{cs}V_{cb}^*})$ if penguin contributions are neglected.

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>) and are described at <https://hflav.web.cern.ch/>. The averaging/scaling procedure takes into account correlation between the measurements.

¹ AAD 21AE measured $\phi_s = -2\beta_s = -0.087 \pm 0.036 \pm 0.021$ rad. using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays.

² AAIJ 21AN measured $\phi_s = -2\beta_s = 0.00 \pm 0.28 \pm 0.07$ rad, using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays with $J/\psi \rightarrow e^+e^-$.

³ SIRUNYAN 21E measured $\phi_s = -2\beta_s = -0.021 \pm 0.044 \pm 0.010$ rad. using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays.

⁴ AAIJ 19AF reports $\phi_s = -2\beta_s = 0.002 \pm 0.044 \pm 0.012$ rad. and $|\lambda| = 0.949 \pm 0.036 \pm 0.019$, when direct CP violation is allowed. Measured using a time-dependent fit to $B_S^0 \rightarrow J/\psi \pi^+ \pi^-$ decays, which is sensitive to $\phi_s(s\bar{s}s)$, not $\phi_s(c\bar{c}s)$.

⁵ AAIJ 19Q reports $\phi_s = -2\beta_s = -0.083 \pm 0.041 \pm 0.006$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ decays.

⁶ Measured $\phi_s = -2\beta_s = 0.119 \pm 0.107 \pm 0.034$ rad using time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ in the region $m(KK) > 1.05$ GeV.

⁷ AAIJ 16AK reports $\phi_s = -2\beta_s = 0.23^{+0.29}_{-0.28} \pm 0.02$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow \psi(2S) \phi$ decays.

⁸ AAIJ 15I reports $\phi_s = -2\beta_s = -0.058 \pm 0.049 \pm 0.006$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ decays. It also combines this result with that of AAIJ 14S and quotes $\phi_s = -2\beta_s = -0.010 \pm 0.039$ rad.

⁹ AAIJ 14AY reports $\phi_s = -2\beta_s = 0.02 \pm 0.17 \pm 0.02$ rad. in a time-dependent fit to $B_S^0 \rightarrow D_S^+ D_S^-$, while allowing CP violation in decay.

¹⁰ AALTONEN 12AJ reports $-\pi/2 < \beta_s < -1.51$ or $-0.06 < \beta_s < 0.30$, or $1.26 < \beta_s < \pi/2$ rad. at 68% CL. Measured using the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays.

¹¹ ABAZOV 12D reports $\phi_s = -2\beta_s = -0.55^{+0.38}_{-0.36}$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays. A single error includes both statistical and systematic uncertainties.

¹² AAIJ 19AP reports $\phi_s^{s\bar{s}s} = -0.073 \pm 0.115 \pm 0.027$ rad and $|\lambda| = 0.99 \pm 0.05 \pm 0.01$. Measured using a time-dependent fit to $B_S^0 \rightarrow \phi \phi$ decays, assuming independence of the helicity of the $\phi \phi$ decay.

¹³ AAIJ 19AP reports also polarisation-dependent results assuming that the longitudinal weak phase is CP-conserving and that there is no direct CP violation, giving $\phi_{s,\parallel} = 0.014 \pm 0.055 \pm 0.011$ rad and $\phi_{s,\perp} = 0.044 \pm 0.059 \pm 0.019$ rad.

¹⁴ AAIJ 18S reports $\phi_s = -2\beta_s = -0.10 \pm 0.13 \pm 0.14$ rad measured in $B_S^0 \rightarrow (K^+\pi^-)(K^-\pi^+)$ in the region $0.75 < m(K^\pm \pi^\mp) < 1.6$ GeV. This is a $b \rightarrow d\bar{d}s$ transition with a decay amplitude phase different from that of $b \rightarrow c\bar{c}s$ transition.

¹⁵ AAD 16AP reports $\phi_s = -2\beta_s = -0.090 \pm 0.078 \pm 0.041$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays.

¹⁶ KHACHATRYAN 16S reports $\phi_s = -2\beta_s = -0.075 \pm 0.097 \pm 0.031$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays.

¹⁷ AAIJ 15K reports $-2\beta_s = -0.12^{+0.14}_{-0.16}$ rad. The value was obtained by measuring time-dependent CP asymmetry in $B_S^0 \rightarrow K^+ K^-$ and using a U-spin relation between $B_S^0 \rightarrow K^+ K^-$ and $B^0 \rightarrow \pi^+ \pi^-$.

¹⁸ Results are also presented using additional inputs on $B^0 \rightarrow \pi^0 \pi^0$ and $B^+ \rightarrow \pi^+ \pi^0$ decays from other experiments and isospin symmetry assumptions. The dependence of the results on the maximum allowed amount of U-spin breaking up to 50% is also included.

¹⁹ AAD 14U reports $\phi_s = -2\beta_s = 0.12 \pm 0.25 \pm 0.05$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays.

²⁰ AAIJ 14AE value measured in $B_S^0 \rightarrow \phi \phi$ decays. This is a $b \rightarrow s\bar{s}s$ transition with a decay amplitude phase different from that of $b \rightarrow c\bar{c}s$ transition. Also reports $\phi_s = -0.17 \pm 0.15 \pm 0.03$ rad.

²¹ AAIJ 14S reports $\phi_s = -2\beta_s = 0.070 \pm 0.068 \pm 0.008$ rad. and $|\lambda| = 0.89 \pm 0.05 \pm 0.01$, when direct CP violation is allowed. Measured using a time-dependent fit to $B_S^0 \rightarrow J/\psi \pi^+ \pi^-$ decays.

²² AAIJ 13AR reports $\phi_s = -2\beta_s = 0.01 \pm 0.07 \pm 0.01$ rad. obtained from combined fit to $B_S^0 \rightarrow J/\psi K^+ K^-$ and $B_S^0 \rightarrow J/\psi \pi^+ \pi^-$ data sets. Also reports separate results of $\phi_s = 0.07 \pm 0.09 \pm 0.01$ rad. from $B_S^0 \rightarrow J/\psi K^+ K^-$ decays and $\phi_s = -0.14^{+0.17}_{-0.16} \pm 0.01$ rad. from $B_S^0 \rightarrow J/\psi \pi^+ \pi^-$ decays.

²³ AAIJ 13AY uses $B_S^0 \rightarrow \phi \phi$ mode, and reports the 68% CL interval of $\phi_s = -2\beta_s$ as $[-2.46, -0.76]$ rad.

²⁴ AAD 12CV reports $\phi_s = -2\beta_s = 0.22 \pm 0.41 \pm 0.10$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays.

²⁵ Reports $\phi_s = -2\beta_s = -0.44 \pm 0.44 \pm 0.02$ rad. that was measured using a time-dependent fit to $B_S^0 \rightarrow J/\psi f_0(980)$ decays.

²⁶ Reports $\phi_s = -2\beta_s = 0.15 \pm 0.18 \pm 0.06$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays.

²⁷ Reports $\phi_s = -2\beta_s = -0.019^{+0.173+0.004}_{-0.174-0.003}$ rad. which was measured using a time-dependent fit to $B_S^0 \rightarrow J/\psi \pi^+ \pi^-$ decays, with the $\pi^+ \pi^-$ mass within 775–1550 MeV. Searches for, but finds no evidence, for direct CP violation in $B_S^0 \rightarrow J/\psi \pi \pi$ decays.

²⁸ Reports $0.02 < \phi_s < 0.52$ or $1.08 < \phi_s < 1.55$ rad. at 68% C.L. confidence regions in the two-dimensional space of ϕ_s and $\Delta\Gamma_{B_S^0}$ from $B_S^0 \rightarrow J/\psi \phi$ decays.

²⁹ Reports $0.32 < 2\beta_s < 2.82$ rad. at 68% C.L. and confidence regions in the two-dimensional space of $2\beta_s$ and $\Delta\Gamma$ from the first measurement of $B_S^0 \rightarrow J/\psi \phi$ decays using flavor tagging. The probability of a deviation from SM prediction as large as the level of observed data is 15%.

³⁰ Reports $\phi_s = -2\beta_s$ and obtains 90% CL interval $-0.03 < \beta_s < 0.60$ rad.

³¹ The first direct measurement of the CP-violating mixing phase is reported from the time-dependent analysis of flavor untagged $B_S^0 \rightarrow J/\psi \phi$ decays.

³² Reports ϕ_s which equals to $-2\beta_s$.

³³ Combines D0 collaboration measurements of time-dependent angular distributions in $B_S^0 \rightarrow J/\psi \phi$ and charge asymmetry in semileptonic decays. There is a 4-fold ambiguity in the solution.

$A_{CP}(B_s \rightarrow \pi^+ K^-)$
 A_{CP} is defined as

$$\frac{B(\bar{B}_s^0 \rightarrow f) - B(B_s^0 \rightarrow \bar{f})}{B(\bar{B}_s^0 \rightarrow f) + B(B_s^0 \rightarrow \bar{f})}$$

the CP-violation asymmetry of exclusive B_s^0 and \bar{B}_s^0 decay.

$-0.98^{+0.46+0.23}_{-0.52-0.20}$	² AAIJ	17B LHCB	Repl. by AAIJ 19AE
¹ Measured in flavor tagged time dependent analysis, using tagged and un-tagged events. This result updates AAIJ 17B with better selection efficiency and other analysis improvements.			
² Measured in time dependent analysis without initial flavor tagging.			

CPT VIOLATION PARAMETERS

In the B_s^0 mixing, propagating mass eigenstates can be written as

$$\begin{aligned} |B_{sL}\rangle &\propto p \sqrt{1-\xi} |B_s^0\rangle + q \sqrt{1+\xi} |\bar{B}_s^0\rangle \\ |B_{sH}\rangle &\propto p \sqrt{1+\xi} |B_s^0\rangle - q \sqrt{1-\xi} |\bar{B}_s^0\rangle \end{aligned}$$

where parameter ξ controls CPT violation. If ξ is zero, then CPT is conserved. The parameter ξ can be written as

$$\xi = \frac{2(M_{11}-M_{22})-i(\Gamma_{11}-\Gamma_{22})}{-2\Delta m_s+i\Delta\Gamma_s} \approx \frac{-2\beta^\mu \Delta a_\mu}{2\Delta m_s-i\Delta\Gamma_s}$$

where M_{ii} , Γ_{ii} , Δm_s , and $\Delta\Gamma_s$ are parameters of Hamiltonian governing B_s oscillations, β^μ is the B_s^0 meson velocity and Δa_μ characterizes Lorentz-invariance violation.

not seen		⁶ AAIJ 16AI	LHCb	$pp \rightarrow B_s^0 \pi^\pm X$		

- With B_s mesons reconstructed in decays to $D_s^\pm \mu^\mp X$.
- Seen in $p\bar{p}$ collisions at 1.96 TeV at a rate of $(8.6 \pm 1.9 \pm 1.4)\%$ relative to inclusive B_s production in the kinematic region $10 < p_{\mathcal{T}}(B_s) < 30$ GeV/c, with B_s mesons reconstructed in decays to $J/\psi \phi$. An alternative possibility, $X(5568)^\pm \rightarrow B_s^* \pi^\pm$ with a missing γ , could not be ruled out.
- Not seen in 24.4 fb⁻¹ of pp collision data at $\sqrt{s} = 7$ and 8 TeV with B_s mesons reconstructed in decays to $J/\psi \phi$. An upper limit on the production rate times branching fraction for $X(5568)^\pm \rightarrow B_s \pi^\pm$ relative to inclusive B_s production is less than 1.5% at $p_{\mathcal{T}}(B_s) > 10$ GeV/c and less than 1.6% at $p_{\mathcal{T}}(B_s) > 15$ GeV/c at 95% CL.
- Not seen in 9.6 fb⁻¹ of $p\bar{p}$ collision data at $\sqrt{s} = 1.96$ TeV with B_s mesons reconstructed in decays to $J/\psi \phi$. An upper limit on the production rate times branching fraction for $X(5568)^\pm \rightarrow B_s \pi^\pm$ relative to inclusive B_s production is less than 6.7% at 95% CL.
- Not seen in 19.7 fb⁻¹ of pp collisions data at $\sqrt{s} = 8$ TeV with B_s mesons reconstructed in decays to $J/\psi \phi$. An upper limit on the production rate times branching fraction for $X(5568)^\pm \rightarrow B_s \pi^\pm$ relative to inclusive B_s production is less than 1.1% at $p_{\mathcal{T}}(B_s) > 10$ GeV/c and less than 1.0% at $p_{\mathcal{T}}(B_s) > 15$ GeV/c at 95% CL.
- Not seen in 3 fb⁻¹ of pp collision data at $\sqrt{s} = 7$ and 8 TeV in a scan over the $X(5568)$ mass and width, with B_s mesons reconstructed in decays to $D_s^\pm \pi^\mp$ or $J/\psi \phi$. An upper limit on the production rate times branching fraction for $X(5568)^\pm \rightarrow B_s \pi^\pm$ relative to inclusive B_s production is less than 2.1% at $p_{\mathcal{T}}(B_s) > 10$ GeV/c at 90% CL.

B_c^+ MEAN LIFE

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

POLARIZATION IN B_C^+ DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal (L) or both are transverse and parallel (\parallel) or perpendicular (\perp) to each other with the parameters Γ_L/Γ , $\Gamma_{\parallel}/\Gamma$, and the relative phases ϕ_{\parallel} and ϕ_{\perp} . See the definitions in the note on "Polarization in B Decays" review in the B^0 Particle Listings.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- ¹ AAIJ 19Y observed $B_c(2S)^+$ in the decay mode $B_c(2S)^+ \rightarrow B_c^+ \pi^+ \pi^-$ ($B_c^+ \rightarrow J/\psi \pi^+$) with 2.2 (3.2) global (local) standard deviations significance.
- ² AAIJ 19Y reports mass difference measurement of $M(B_c(2S)^+) - M(B_c^+) = 597.2 \pm 1.3 \pm 0.1$ MeV. We have adjusted this measurement with our best value of $M(B_c^+) = 6274.47 \pm 0.32$ MeV. The first uncertainty of the $M(B_c(2S)^+)$ value is a total of uncertainties reported by the experiment and the second one comes from our best value of $M(B_c^+)$.
- ³ SIRUNYAN 19M observed $B_c(2S)^+$ in the decay mode $B_c(2S)^+ \rightarrow B_c^+ \pi^+ \pi^-$ ($B_c^+ \rightarrow J/\psi \pi^+$) with 6.5 standard deviations significance.
- ⁴ SIRUNYAN 19M reports mass difference measurement of $M(B_c(2S)^+) - M(B_c^+) = 596.1 \pm 1.2 \pm 0.8$ MeV. We have adjusted this measurement with our best value of $M(B_c^+) = 6274.47 \pm 0.32$ MeV. The first uncertainty of the $M(B_c(2S)^+)$ value is a total of uncertainties reported by the experiment and the second one comes from our best value of $M(B_c^+)$.
- ⁵ AAIJ 18AL reports an upper limit on the ratio of production cross sections for $[\sigma(B_c(2S)^+)/\sigma(B_c^+)] \cdot B(B_c(2S)^+ \rightarrow B_c^+ \pi^+ \pi^-) < 0.04-0.09$ at 95% CL for the mass value reported by AAD 14AQ.

- ⁶ Observed in the decay mode $B_c(2S)^+ \rightarrow B_c^+ \pi^+ \pi^-$ ($B_c^+ \rightarrow J/\psi \pi^+$) with 5.2 standard deviations significance.
- ⁷ Might be the $B_c^*(2S)$.

Spectroscopy of Mesons Containing Two Heavy Quarks

Meson Particle Listings

Charmonium, $\eta_c(1S)$

$c\bar{c}$ MESONS (including possibly non- $q\bar{q}$ states)

Updated March 2022.

The level scheme of meson states containing a minimal quark content of $c\bar{c}$. The name of a state is determined by its quantum numbers $I^G J^{PC}$ (see the review “Naming Scheme for Hadrons”). States with unestablished quantum numbers are called X and are drawn according to our best estimate of their likely J^{PC} . States included in the Summary Tables are shown with solid lines; selected states not in the Summary Tables, but with assigned quantum numbers, are shown with dotted lines. The arrows indicate the most dominant hadronic transitions. Single photon transitions, including $\psi(nS) \rightarrow \gamma\eta_c(mS)$, $\psi(nS) \rightarrow \gamma\chi_{cJ}(1P)$, and $\chi_{cJ}(1P) \rightarrow \gamma J/\psi$, are omitted for clarity. For orientation, the location of the thresholds related to a pair of ground state open charm mesons is indicated in the figure.

$\eta_c(1S)$

$$I^G(J^{PC}) = 0^+(0^{-+})$$

¹ AAIJ 20H report $m_{J/\psi} - m_{\eta_c(1S)} = 113.0 \pm 0.7 \pm 0.1$ MeV. We use the current value $m_{J/\psi} = 3096.900 \pm 0.006$ MeV to obtain the quoted mass.

² AAIJ 17AD report $m_{J/\psi} - m_{\eta_c(1S)} = 110.2 \pm 0.5 \pm 0.9$ MeV. We use the current value $m_{J/\psi} = 3096.900 \pm 0.006$ MeV to obtain the quoted mass.

³ From a fit of the $\phi\phi$ invariant mass with the mass and width of $\eta_c(1S)$ as free parameters.

⁴ AAIJ 15B1 reports $m_{J/\psi} - m_{\eta_c(1S)} = 114.7 \pm 1.5 \pm 0.1$ MeV from a sample of $\eta_c(1S)$ and J/ψ produced in b -hadron decays. We have used current value of $m_{J/\psi} = 3096.900 \pm 0.006$ MeV to arrive at the quoted $m_{\eta_c(1S)}$ result.

⁵ Taking into account an asymmetric photon lineshape.

⁶ With floating width.

⁷ Ignoring possible interference with the non-resonant 0^- amplitude.

⁸ Using both, $\eta \rightarrow \gamma\gamma$ and $\eta \rightarrow \pi^+\pi^-\pi^0$ decays.

⁹ From a simultaneous fit to six decay modes of the η_c .

¹⁰ Accounts for interference with non-resonant continuum.

¹¹ Taking into account interference with the non-resonant $J^P = 0^-$ amplitude.

¹² From a fit of the J/ψ recoil mass spectrum. Supersedes ABE,K 02 and ABE 04G.

¹³ Using mass of $\psi(2S) = 3686.00$ MeV.

¹⁴ Not independent from the measurements reported by LEES 10.

¹⁵ MITCHELL 09 observes a significant asymmetry in the lineshapes of $\psi(2S) \rightarrow \gamma\eta_c$ and $J/\psi \rightarrow \gamma\eta_c$ transitions. If ignored, this asymmetry could lead to significant bias whenever the mass and width are measured in $\psi(2S)$ or J/ψ radiative decays.

¹⁶ From the fit of the kaon momentum spectrum. Systematic errors not evaluated.

¹⁷ Superseded by LEES 10.

¹⁸ From a simultaneous fit of five decay modes of the η_c .

¹⁹ Superseded by VINOKUROVA 11.

²⁰ Weighted average of the $\psi(2S)$ and $J/\psi(1S)$ samples. Using an η_c width of 13.2 MeV.

²¹ Average of several decay modes. Using an η_c width of 13.2 MeV.

²² Superseded by ASNER 04.

²³ Average of several decay modes.

²⁴ $\eta_c \rightarrow \phi\phi$.

²⁵ Mass adjusted by us to correspond to $J/\psi(1S)$ mass = 3097 MeV.

1 From a fit of the $\phi\phi$ invariant mass with the mass and width of $\eta_c(1S)$ as free parameters.
 2 Taking into account an asymmetric photon lineshape.
 3 With floating mass.
 4 Ignoring possible interference with the non-resonant 0^- amplitude.
 5 Using both, $\eta \rightarrow \gamma\gamma$ and $\eta \rightarrow \pi^+ \pi^- \pi^0$ decays.
 6 From a simultaneous fit to six decay modes of the η_c .
 7 Accounts for interference with non-resonant continuum.
 8 Taking into account interference with the non-resonant $J^P = 0^-$ amplitude.
 9 Not independent from the measurements reported by LEES 10.
 10 Superseded by LEES 10.
 11 From a simultaneous fit of five decay modes of the η_c .
 12 Superseded by VINOKUROVA 11.
 13 From a fit to the 4-prong invariant mass in $\psi(2S) \rightarrow \gamma \eta_c$ and $J/\psi(1S) \rightarrow \gamma \eta_c$ decays.
 14 Superseded by ASNER 04.
 15 Positive and negative errors correspond to 90% confidence level.

CONSTRAINED FIT INFORMATION

An overall fit to the total width, 8 combinations of partial widths obtained from integrated cross section, and 19 branching ratios uses 93 measurements and one constraint to determine 13 parameters. The overall fit has a $\chi^2 = 117.8$ for 81 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

Other decays

Γ₃₄₀ invisible < 7 × 10⁻⁴ CL=90%

- [a] For E_γ > 100 MeV.
[b] The value is for the sum of the charge states or particle/antiparticle states indicated.
[c] Θ(1540) is a hypothetical pentaquark state of 1.54 GeV/c² mass and a width of less than 25 MeV/c².
[d] Includes ρπ⁺π⁻γ and excludes ρπ⁻η, ρπ⁻ω, ρπ⁻η'.
[e] For a narrow state A with mass less than 960 MeV.
[f] For a narrow scalar or pseudoscalar A⁰ with mass 0.21-3.0 GeV.
[g] For a dark photon U with mass between 100 and 2100 MeV.

J/ψ(1S) PARTIAL WIDTHS

Γ(hadrons)

Table with columns: VALUE (keV), DOCUMENT ID, TECN, COMMENT. Includes data for ANASHIN, BAI, BALDINI..., BOYARSKI, ESPOSITO.

Based on the same dataset as ANASHIN 18A and correlated to the values reported there

Γ(e⁺e⁻)

Table with columns: VALUE (keV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data for ANASHIN, HSUEH, ABLIKIM, ADAMS, AUBERT, BAI, ALEXANDER, BRANDELIK, BALDINI..., BOYARSKI, ESPOSITO.

- 1 From the cross sections of e⁺e⁻ → e⁺e⁻ and e⁺e⁻ → hadrons near the J/ψ(1S) peak.
2 Based on the same dataset as ANASHIN 20 and correlated to the values reported there.
3 From a simultaneous fit to e⁺e⁻, μ⁺μ⁻, and hadronic channels assuming Γ(e⁺e⁻) = Γ(μ⁺μ⁻).
4 Using B(J/ψ → μ⁺μ⁻) = (5.973 ± 0.007 ± 0.037)% from ABLIKIM 13R.
5 Calculated by us from the reported values of Γ(e⁺e⁻) × B(μ⁺μ⁻) using B(μ⁺μ⁻) = (5.93 ± 0.06)%.
6 Assuming equal partial widths for e⁺e⁻ and μ⁺μ⁻.

Γ(μ⁺μ⁻)

Table with columns: VALUE (keV), DOCUMENT ID, TECN, COMMENT. Includes data for BAI, BOYARSKI, ESPOSITO.

Γ(γγ)

Table with columns: VALUE (eV), CL%, DOCUMENT ID, TECN, COMMENT. Includes data for BRANDELIK.

J/ψ(1S) Γ(l)Γ(e⁺e⁻)/Γ(total)

This combination of a partial width with the partial width into e⁺e⁻ and with the total width is obtained from the integrated cross section into channel(l) in the e⁺e⁻ annihilation.

Γ(hadrons) × Γ(e⁺e⁻)/Γ_{total}

Table with columns: VALUE (keV), DOCUMENT ID, TECN, COMMENT. Includes data for ANASHIN, BALDINI..., ESPOSITO.

- 1 From the cross sections of e⁺e⁻ → e⁺e⁻ and e⁺e⁻ → hadrons near the J/ψ(1S) peak.
2 Based on the same dataset as ANASHIN 20 and correlated to the values reported there.
3 Data redundant with branching ratios or partial widths above.

Γ(e⁺e⁻) × Γ(e⁺e⁻)/Γ_{total}

Table with columns: VALUE (eV), DOCUMENT ID, TECN, COMMENT. Includes data for ANASHIN, ANASHIN, BRANDELIK, BALDINI..., ESPOSITO, FORD.

- 1 From the cross sections of e⁺e⁻ → e⁺e⁻ and e⁺e⁻ → hadrons near the J/ψ(1S) peak.
2 Based on the same dataset as ANASHIN 20 and correlated to the values reported there.
3 Data redundant with branching ratios or partial widths above.

Γ(μ⁺μ⁻) × Γ(e⁺e⁻)/Γ_{total}

Table with columns: VALUE (eV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data for ABLIKIM, ANASHIN, ADAMS, AUBERT, DASP, ESPOSITO.

- 1 Data redundant with branching ratios or partial widths above.

Γ(ηπ⁺π⁻) × Γ(e⁺e⁻)/Γ_{total}

Table with columns: VALUE (eV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data for LEES, AUBERT.

- 1 AUBERT 07AU reports [Γ(J/ψ(1S) → ηπ⁺π⁻) × Γ(J/ψ(1S) → e⁺e⁻)/Γ_{total}] × [B(η → π⁺π⁻π⁰)] = 0.51 ± 0.22 ± 0.03 eV which we divide by our best value B(η → π⁺π⁻π⁰) = (23.02 ± 0.25) × 10⁻². Our first error is their experiment's error and our second error is the systematic error from using our best value.

Γ(ηπ⁺π⁻π⁰) × Γ(e⁺e⁻)/Γ_{total}

Table with columns: VALUE (eV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data for LEES.

- 1 LEES 21c reports [Γ(J/ψ(1S) → ηπ⁺π⁻π⁰) × Γ(J/ψ(1S) → e⁺e⁻)/Γ_{total}] × [B(η → 3π⁰)] = 21.1 ± 1.7 ± 3.2 eV which we divide by our best value B(η → 3π⁰) = (32.57 ± 0.21) × 10⁻². Our first error is their experiment's error and our second error is the systematic error from using our best value.

Γ(ηK[±]K⁰π[∓]) × Γ(e⁺e⁻)/Γ_{total}

Table with columns: VALUE (eV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data for LEES.

Γ(ρ[±]π[∓]π[±]π⁻2π⁰) × Γ(e⁺e⁻)/Γ_{total}

Table with columns: VALUE (eV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data for LEES.

Γ(ρ[±]ρ[∓]π[±]π⁻π⁰) × Γ(e⁺e⁻)/Γ_{total}

Table with columns: VALUE (eV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data for LEES.

Γ(ρ[±]K[±]K⁰π[∓]) × Γ(e⁺e⁻)/Γ_{total}

Table with columns: VALUE (eV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data for LEES.

Γ(ωπ[±]π⁻) × Γ(e⁺e⁻)/Γ_{total}

Table with columns: VALUE (eV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data for AUBERT.

Γ(ωπ⁰π⁰) × Γ(e⁺e⁻)/Γ_{total}

Table with columns: VALUE (eV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data for LEES.

$\Gamma(\pi^+\pi^-\pi^0)/\Gamma_{total}$ (units 10^{-3})

¹ From $J/\psi \rightarrow \pi^+\pi^-\pi^0$ events directly.

² The quoted systematic error includes a contribution of 1.23% (added in quadrature) from the uncertainty on the number of J/ψ events.

³ AUBERT 07AU reports $[\Gamma(J/\psi(1S) \rightarrow \pi^+\pi^-\pi^0)/\Gamma_{total}] \times [\Gamma(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) \times \Gamma(\psi(2S) \rightarrow e^+e^-)]/\Gamma_{total} = (18.6 \pm 1.2 \pm 1.1) \times 10^{-3}$ keV which we divide by our best value $\Gamma(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) \times \Gamma(\psi(2S) \rightarrow e^+e^-)/\Gamma_{total} = 0.808 \pm 0.013$ keV. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁴ Mostly $\rho\pi$, see also $\rho\pi$ subsection.

⁵ Obtained comparing the rates for $\pi^+\pi^-\pi^0$ and $\mu^+\mu^-$, using J/ψ events produced via $\psi(2S) \rightarrow \pi^+\pi^-J/\psi$ and with $B(J/\psi \rightarrow \mu^+\mu^-) = 5.88 \pm 0.10\%$.

seen		16	BALTRUSAITIS...	84 MRK3	$J/\psi \rightarrow 2\phi\gamma$

1 MITCHELL 09 reports $(1.98 \pm 0.09 \pm 0.30) \times 10^{-2}$ from a measurement of $[\Gamma(J/\psi(1S) \rightarrow \gamma\eta_c(1S))/\Gamma_{total}] \times [B(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-)]$ assuming $B(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) = (35.04 \pm 0.07 \pm 0.77) \times 10^{-2}$, which we rescale to our best value $B(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) = (34.68 \pm 0.30) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
 2 Calculated by the authors using an average of $B(J/\psi \rightarrow \gamma\eta_c) \times B(\eta_c \rightarrow K\bar{K}\pi)$ from BALTRUSAITIS 86, BISELLO 91, BAL 04 and $B(\eta_c \rightarrow K\bar{K}\pi) = (8.5 \pm 1.8)\%$ from AUBERT 06E.

1 Using CLEO-c data but not authored by the CLEO Collaboration.

2 Including unknown branching fraction to $\pi\pi$.

3 There is a further $(6 \pm 2) \times 10^{-4}$ scalar contribution at 1765 MeV.

4 Assuming $J^P = 2^+$ for $f_0(1710)$.

5 There is a further $(6 \pm 2) \times 10^{-4}$ scalar contribution at 1765 MeV.

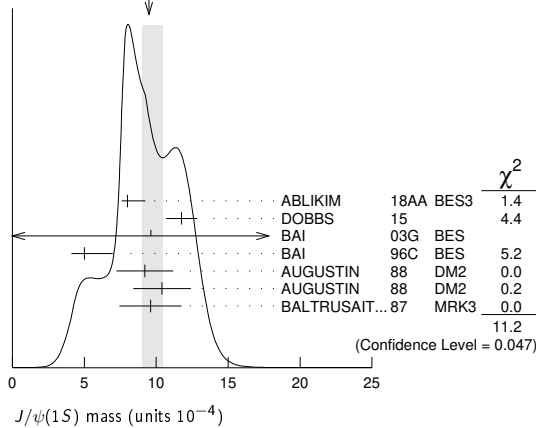

6 Assuming $J^P = 0^+$ for $f_0(1710)$.

7 Includes unknown branching fraction to $\rho^0 \rho^0$.

8 Includes unknown branching fraction to $\pi^+ \pi^-$.

9 Includes unknown branching fraction to $\eta \eta$.

WEIGHTED AVERAGE
9.5+1.0-0.5 (Error scaled by 1.5)

1 Includes unknown branching fraction to $K^+ K^-$ or $K_S^0 K_S^0$. We have multiplied $K^+ K^-$ measurement by 2, and $K_S^0 K_S^0$ by 4 to obtain $K\bar{K}$ result.
 2 Using CLEO-c data but not authored by the CLEO Collaboration.
 3 Includes unknown branching ratio to $K^+ K^-$ or $K_S^0 K_S^0$.
 4 Assuming $J^P = 2^+$ for $f_0(1710)$.
 5 There is a further $(6 \pm 2) \times 10^{-4}$ scalar contribution at 1765 MeV.
 6 Assuming $J^P = 0^+$ for $f_0(1710)$.
 7 Includes unknown branching fraction to $\rho^0 \rho^0$.
 8 Includes unknown branching fraction to $\pi^+ \pi^-$.
 9 Includes unknown branching fraction to $\eta \eta$.

---------------------------------	------	----------------------	----------	---

¹ From a fit of the measured $\pi^+ \pi^- \eta'$ lineshape that accounts for the abrupt distortion observed at the $p\bar{p}$ threshold with a Flatté formula in addition to known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner ($M \approx 1919$ MeV; $\Gamma \approx 51$ MeV) that is required for a good fit. Another explanation for the distortion provided by ABLIKIM 16J is that a second resonance near 1870 MeV interferes with the $X(1835)$; fits to this possibility yield product branching fraction values compatible with that shown within the respective systematic uncertainties.

² From a fit of the $\pi^+ \pi^- \eta'$ mass distribution to a combination of $\gamma f_1(1510)$, $\gamma X(1835)$, and two states $\gamma X(2120)$ and $\gamma X(2370)$, for $M(\pi^+ \pi^- \eta') < 2.8$ GeV, and accounting for backgrounds from non- η' events and $J/\psi \rightarrow \pi^0 \pi^+ \pi^- \eta'$.

¹ For a narrow state A with mass $m_A < 1.2$ GeV. The limit varies with m_A , reaching its largest value of 1.7×10^{-6} at 1.2 GeV and being 7.0×10^{-7} for $m_A = 0$.

² The limit varies with mass m_A of a narrow state A and is 4.3×10^{-6} for $m_A = 0$, reaches its largest value of 6.3×10^{-6} at $m_A = 500$ MeV, and is 3.6×10^{-6} at $m_A = 960$ MeV.

 $\Gamma(\gamma A^0 \rightarrow \gamma \mu^+ \mu^-) / \Gamma_{\text{total}}$ Γ_{318} / Γ

BRANCHING RATIOS OF $\psi(2S)$ AND $\chi_{c0,1,2}$

Updated March 2022 by J.J. Hernández-Rey (IFIC, Valencia), S. Navas (U. of Granada), and C. Patrignani (Bologna Univ., INFN)

Since 2002, the treatment of the branching ratios of the $\psi(2S)$ and $\chi_{c0,1,2}$ has undergone an important restructuring.

When measuring a branching ratio experimentally, it is not always possible to normalize the number of events observed in the corresponding decay mode to the total number of particles produced. Therefore, the experimenters sometimes report the number of observed decays with respect to another decay mode of the same or another particle in the relevant decay chain. This is actually equivalent to measuring combinations of branching fractions of several decay modes.

To extract the branching ratio of a given decay mode, the collaborations use some previously reported measurements of the required branching ratios. However, the values are frequently taken from the *Review of Particle Physics* (RPP), which in turn uses the branching ratio reported by the experiment in the following edition, giving rise either to correlations or to plain vicious circles, as discussed in more detail in earlier editions of this review [1,2].

The way to avoid these dependencies and correlations is to extract the branching ratios through a fit that uses the truly measured combinations of branching fractions and partial widths. This fit, in fact, should involve decays from the four concerned particles, $\psi(2S)$, χ_{c0} , χ_{c1} , and χ_{c2} , and occasionally some combinations of branching ratios of more than one of them. This is what is done since the 2002 edition [3].

The PDG policy is to quote the results of the collaborations in a manner as close as possible to what appears in their original publications. However, in order to avoid the problems mentioned above, we had in some cases to work out the values originally measured, using the number of events and detection efficiencies

Meson Particle Listings

Branching Ratios of ψ 's and χ 's, $\chi_{c0}(1P)$

given by the collaborations, or rescaling back the published results. The information was sometimes spread over several articles, and some articles referred to papers still unpublished, which in turn contained the relevant numbers in footnotes.

Even though the experimental collaborations are entitled to extract whatever branching ratios they consider appropriate by using other published results, we would like to encourage them to also quote explicitly in their articles the actual quantities measured, so that they can be used directly in averages and fits of different experimental determinations.

To inform the reader how we computed some of the values used in this edition of RPP, we use footnotes to indicate the branching ratios actually given by the experiments and the quantities they use to derive them from the true combination of branching ratios actually measured.

None of the branching ratios of the $\chi_{c0,1,2}$ are measured independently of the $\psi(2S)$ radiative decays. We tried to identify those branching ratios which can be correlated in a non-trivial way, and although we cannot preclude the existence of other cases, we are confident that the most relevant correlations have already been removed. Nevertheless, correlations in the errors of different quantities measured by the same experiment have not been taken into account.

Fit information

This is an overall fit to 4 total widths, 1 partial width, 26 combinations of partial widths, 24 branching ratios, and 108 combinations of branching ratios. Of the latter 62 involve decays of more than one particle.

The overall fit uses 248 measurements to determine 49 parameters and has a χ^2 of 379.8 for 199 degrees of freedom.

The relatively high χ^2 of the fit, 1.9 per d.o.f., can be traced back to a few specific discrepancies in the data. No scaling factors to fit uncertainties have been applied.

In the listing we provide the inter-particle correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the corresponding parameter x_i .

CONSTRAINED FIT INFORMATION

A multiparticle fit to $\chi_{c1}(1P)$, $\chi_{c0}(1P)$, $\chi_{c2}(1P)$, and $\psi(2S)$ with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 84 branching ratios uses 248 measurements to determine 49 parameters. The overall fit has a $\chi^2 = 379.8$ for 199 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{total}$.

¹ With floating width.

² Combination of exclusive and inclusive analyses for the reaction $\psi(2S) \rightarrow \pi^0 h_c \rightarrow \pi^0 \eta_c \gamma$. This result is the average of DOBBS 08A and ROSNER 05.

³ Superseded by DOBBS 08A.

⁴ Mass central value and systematic error recalculated by us according to Eq. (16) in ARMSTRONG 93B, using the value for the $\psi(2S)$ mass from AULCHENKO 03.

$$\Gamma(\chi_{c2}(1P) \rightarrow \gamma J/\psi(1S)) / \Gamma_{\text{total}} \times \Gamma(\psi(2S) \rightarrow \gamma \chi_{c2}(1P)) / \Gamma_{\text{total}}$$

(units 10^{-2})

- ¹ Uses $B(J/\psi \rightarrow e^+ e^-) = (5.971 \pm 0.032)\%$ and $B(J/\psi \rightarrow \mu^+ \mu^-) = (5.961 \pm 0.033)\%$.
- ² Recalculated by us using $B(J/\psi(1S) \rightarrow \ell^+ \ell^-) = 0.1181 \pm 0.0020$.
- ³ Recalculated by us using $B(J/\psi(1S) \rightarrow \mu^+ \mu^-) = 0.0588 \pm 0.0010$.
- ⁴ Assumes isotropic gamma distribution.
- ⁵ Superseded by ABLIKIM 17N.
- ⁶ Not independent from other measurements of MENDEZ 08.
- ⁷ Not independent from other values reported by ADAM 05A.

¹ AAIJ 17AD report $m_{\psi(2S)} - m_{\eta_c(2S)} = 52.5 \pm 1.7 \pm 0.6$ MeV. We use the current value $m_{\psi(2S)} = 3686.097 \pm 0.025$ MeV to obtain the quoted mass.

² From a fit of the $\phi\phi$ invariant mass with the width of $\eta_c(2S)$ fixed to the PDG 16 value.

³ Ignoring possible interference with continuum.

⁴ With a width fixed to 11.3 MeV.

⁵ With a width fixed to 11.3 MeV. Using both $\eta \rightarrow \gamma\gamma$ and $\eta \rightarrow \pi^+\pi^-\pi^0$ decays.

⁶ From a simultaneous fit to $K_S^0 K^\pm \pi^\mp$ and $K^+K^-\pi^0$ decay modes.

⁷ Accounts for interference with non-resonant continuum.

⁸ From a fit of the J/ψ recoil mass spectrum. Supersedes ABE,K 02 and ABE 04c.

⁹ From the fit of the kaon momentum spectrum. Systematic errors not evaluated.

¹⁰ Superseded by DEL-AMO-SANCHEZ 11M.

¹¹ Superseded by VINOKUROVA 11.

¹² Assuming mass of $\psi(2S) = 3686$ MeV.

³⁷CRONIN-HENNESSY 10 reports a limit of $< 5.9 \times 10^{-6}$ for the decay $\eta_c(2S) \rightarrow K^+ K^- \eta$ which we multiply by 2 account for isospin symmetry. It assumes $\Gamma(\eta_c(2S)) = 14$ MeV. It also gives the analytic dependence of limits on width.

$\Gamma(\eta_c(2S) \rightarrow 2\pi^+ 2\pi^-)/\Gamma_{\text{total}} \times \Gamma(\psi(2S) \rightarrow \gamma\eta_c(2S))/\Gamma_{\text{total}}$	DOCUMENT ID	TECN	COMMENT	$\Gamma_4/\Gamma \times \Gamma_{166}^{\psi(2S)}/\Gamma\psi(2S)$

3686.00 ± 0.10	413	⁵ ZHOLENTZ 80	OLYA	e^+e^-

- ¹ Supersedes AULCHENKO 03 and ANASHIN 12.
- ² Reanalysis of ZHOLENTZ 80 using new electron mass (COHEN 87) and radiative corrections (KURAEV 85).
- ³ Mass central value and systematic error recalculated by us according to Eq. (16) in ARMSTRONG 93B, using the value for the $J/\psi(1S)$ mass from AULCHENKO 03.
- ⁴ From the scans in 2004 and 2006. ANASHIN 12 reports the value $3686.114 \pm 0.007 \pm 0.011 \pm 0.002$ MeV, where the third uncertainty is due to assumptions on the interference between the resonance and hadronic continuum. We combined the two systematic uncertainties.
- ⁵ Superseded by ARTA MONOV 00.

7 ± 2 ± 4			¹ ABLIKIM	12G	BES3 $\psi(2S) \rightarrow \gamma K^0 K \pi, K K \pi^0$
< 8	90		² CRONIN-HEN..10	CLEO	$\psi(2S) \rightarrow \gamma K \bar{K} \pi$
< 20	90		ATHAR	04	CLEO $e^+ e^- \rightarrow \gamma X$
20-130	95		EDWARDS	82c	CBAL $e^+ e^- \rightarrow \gamma X$

¹ ABLIKIM 12G reports $[\Gamma(\psi(2S) \rightarrow \gamma \eta_c(2S))/\Gamma_{total}] \times [B(\eta_c(2S) \rightarrow K \bar{K} \pi)] = (1.30 \pm 0.20 \pm 0.30) \times 10^{-5}$ which we divide by our best value $B(\eta_c(2S) \rightarrow K \bar{K} \pi) = (1.9 \pm 1.2) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
² CRONIN-HENNESSY 10 reports $[\Gamma(\psi(2S) \rightarrow \gamma \eta_c(2S))/\Gamma_{total}] \times [B(\eta_c(2S) \rightarrow K \bar{K} \pi)] < 14.5 \times 10^{-6}$ which we divide by our best value $B(\eta_c(2S) \rightarrow K \bar{K} \pi) = 1.9 \times 10^{-2}$. This measurement assumes $\Gamma(\eta_c(2S)) = 14$ MeV. CRONIN-HENNESSY 10 gives the analytic dependence of limits on width.

$8.5 \pm 0.6 \pm 0.2$	873	¹ ABLIKIM	17i BES3	$\psi(2S) \rightarrow e^+ e^- \gamma J/\psi$	

¹ ABLIKIM 17i reports $(8.6 \pm 0.3 \pm 0.6) \times 10^{-4}$ from a measurement of $[\Gamma(\psi(2S) \rightarrow e^+ e^- \chi_{c1}(1P))/\Gamma_{\text{total}}] \times [B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S))]$ assuming $B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S)) = (33.9 \pm 1.2) \times 10^{-2}$, which we rescale to our best value $B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S)) = (34.3 \pm 1.0) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

Meson Particle Listings

$\psi(2S)$

$\Gamma(e^+e^- \chi_{c1}(1P))/\Gamma(\gamma\chi_{c1}(1P))$ $\Gamma_{207}/\Gamma_{163}$

VALUE (units 10^{-3})	EVTS	DOCUMENT ID	TECN	COMMENT
$8.3 \pm 0.3 \pm 0.4$	873	¹ ABLIKIM	17I BES3	$\psi(2S) \rightarrow e^+e^- \gamma J/\psi$

¹ Uses $B(\psi(2S) \rightarrow \gamma\chi_{c1}(1P)) \times B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S)) = (351.8 \pm 1.0 \pm 12.0) \times 10^{-4}$ from ABLIKIM 17N and accounts for common systematic errors.

$\Gamma(e^+e^- \chi_{c2}(1P))/\Gamma_{total}$ Γ_{208}/Γ

VALUE (units 10^{-4})	EVTS	DOCUMENT ID	TECN	COMMENT
$7.0 \pm 0.5 \pm 0.2$	227	¹ ABLIKIM	17I BES3	$\psi(2S) \rightarrow e^+e^- \gamma J/\psi$

¹ ABLIKIM 17I reports $(6.9 \pm 0.5 \pm 0.6) \times 10^{-4}$ from a measurement of $[\Gamma(\psi(2S) \rightarrow e^+e^- \chi_{c2}(1P))/\Gamma_{total}] \times [B(\chi_{c2}(1P) \rightarrow \gamma J/\psi(1S))]$ assuming $B(\chi_{c2}(1P) \rightarrow \gamma J/\psi(1S)) = (19.2 \pm 0.7) \times 10^{-2}$, which we rescale to our best value $B(\chi_{c2}(1P) \rightarrow \gamma J/\psi(1S)) = (19.0 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

$\Gamma(e^+e^- \chi_{c2}(1P))/\Gamma(\gamma\chi_{c2}(1P))$ $\Gamma_{208}/\Gamma_{164}$

VALUE (units 10^{-3})	EVTS	DOCUMENT ID	TECN	COMMENT
$6.6 \pm 0.5 \pm 0.4$	227	¹ ABLIKIM	17I BES3	$\psi(2S) \rightarrow e^+e^- \gamma J/\psi$

¹ Uses $B(\psi(2S) \rightarrow \gamma\chi_{c2}(1P)) \times B(\chi_{c2}(1P) \rightarrow \gamma J/\psi(1S)) = (199.6 \pm 0.8 \pm 7.0) \times 10^{-4}$ from ABLIKIM 17N and accounts for common systematic errors.

- Measured in prompt hadroproduction.
- Taking into account interference between the resonant and non-resonant $D\bar{D}$ production.
- From the joint analysis of the data on the $D\bar{D}$ and inclusive hadronic cross sections in the $\psi(3770)$ region from BaBar, Belle, BES-II, CLEO and KEDR.
- Reanalysis of data presented in BAI 02c. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta = 0^\circ$.
- Interference between the resonant and non-resonant $D\bar{D}$ production not taken into account.

$m_{\psi(3770)} - m_{\psi(2S)}$

OUR FIT includes measurements of $m_{\psi(2S)}$, $m_{\psi(3770)}$, and $m_{\psi(3770)} - m_{\psi(2S)}$.

CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, and 3 branching ratios uses 23 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 20.1$ for 19 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

- Solution I of the two solutions.
- Taking into account interference between the resonant and non-resonant $D\bar{D}$ production.
- Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta = 0^\circ$.
- Interference between the resonant and non-resonant $D\bar{D}$ production not taken into account.
- BESSION 06 (as corrected in BESSION 10) measure $\sigma(e^+e^- \rightarrow \psi(3770) \rightarrow \text{hadrons}) = 6.36 \pm 0.08^{+0.41}_{-0.30}$ nb at $\sqrt{s} = 3773 \pm 1$ MeV, and obtain $\Gamma_{e^+e^-}$ from the Born-level cross section calculated using $\psi(3770)$ mass and width from our 2004 edition, PDG 04.
- From the joint analysis of the data on the $D\bar{D}$ and inclusive hadronic cross sections in the $\psi(3770)$ region from BaBar, Belle, BES-II, CLEO and KEDR.
- Solution II of the two solutions.
- See also $\Gamma(e^+e^-) / \Gamma_{\text{total}}$ below.

¹ Neglecting interference.

² Obtained by comparing a measurement of the total cross section (corrected in BESSON 10) with that of $D\bar{D}$ reported by CLEO in DOBBS 07.

³ From the joint analysis of the data on the $D\bar{D}$ and inclusive hadronic cross sections in the $\psi(3770)$ region from BaBar, Belle, BES-II, CLEO and KEDR.

⁴ Using $\sigma^{obs} = 7.07 \pm 0.58$ nb and neglecting interference.

⁵ Not independent of ABLIKIM 08b.

⁶ From a measurement of $\sigma(e^+e^- \rightarrow D\bar{D})$ at $\sqrt{s} = 3773$ MeV, using the $\psi(3770)$ resonance parameters measured by ABLIKIM 06L.

$\Gamma(J/\psi X)/\Gamma_{total}$		Γ_4/Γ	
VALUE (%)	DOCUMENT ID	TECN	COMMENT
0.5 \pm 0.2 \pm 0.1	¹ ABLIKIM 21Z	BES3	$e^+e^- \rightarrow \ell^+\ell^-X$

¹ From a fit to the $e^+e^- \rightarrow J/\psi X$ cross section between 3.645 and 3.891 GeV, with $\psi(2S)$ and $\psi(3770)$ masses, total widths and leptonic widths fixed to the values from the PDG 20. An alternative fit with an improved χ^2 , corresponding to a significance of 5.3 σ , uses an additional resonance with a mass of $3766.2 \pm 3.8 \pm 0.4$ MeV/ c^2 , a total width of $22.2 \pm 5.9 \pm 1.4$ MeV, and $\Gamma(e^-e^-B/J/\psi X) = 79.4 \pm 85.5 \pm 11.7$ eV, possibly compatible with the results of ABLIKIM 08h.

$\psi_2(3823)$

was $\psi(3823)$, $X(3823)$

Seen by BHARDWAJ 13 in $B \rightarrow \chi_{c1} \gamma K$ and ABLIKIM 15S in $e^+e^- \rightarrow \pi^+\pi^-\gamma\chi_{c1}$ decays as a narrow peak in the invariant mass distribution of the $\chi_{c1} \gamma$ system. Properties consistent with the $\psi_2(1^3D_2) c\bar{c}$ state.

$$I^G(J^{PC}) = 0^-(2^- -)$$

I, J, P need confirmation.

$\psi_2(3823)$ MASS

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
3823.7 ± 0.5 OUR AVERAGE		Error includes scale factor of 1.1.		
3824.08 ± 0.53 ± 0.14	137	¹ AAIJ	20s LHCb	$B^+ \rightarrow J/\psi \pi^+ \pi^- K^+$
3821.7 ± 1.3 ± 0.7	19 ± 5	² ABLIKIM	15s BES3	$e^+e^- \rightarrow \pi^+\pi^-\chi_{c1}\gamma$
3823.1 ± 1.8 ± 0.7	33 ± 10	³ BHARDWAJ	13 BELL	$B^\pm \rightarrow \chi_{c1} \gamma K^\pm$

- ¹ Using the measured $m_{\psi_2(3823)} - m_{\psi(2S)} = 137.98 \pm 0.53 \pm 0.14$ MeV.
- ² From a simultaneous unbinned maximum likelihood fit of $e^+e^- \rightarrow \pi^+\pi^-\chi_{c1}\gamma$ data (the $\pi^+\pi^-$ recoil mass) taken at \sqrt{s} values of 4.23, 4.26, 4.36, 4.42, and 4.60 GeV to simulated events including both $\psi(2S) \rightarrow \chi_{c1}\gamma$ and $\psi_2(3823) \rightarrow \chi_{c1}\gamma$ together, with floating mass scale offset for $\psi(2S)$, floating $\psi_2(3823)$ mass, and zero $\psi_2(3823)$ width, resulting in a significance of 5.9 σ when including systematic uncertainties.
- ³ From a simultaneous fit to $B^\pm \rightarrow (\chi_{c1}\gamma)K^\pm$ and $B^0 \rightarrow (\chi_{c1}\gamma)K_S^0$ with significance 4.0 σ including systematics. Corrected for the measured $\psi(2S)$ mass using $B \rightarrow \psi(2S)K \rightarrow (\gamma\chi_{c1})K$ decays.

$m_{\psi_2(3823)} - m_{\psi(2S)}$

$\chi_{c0}(3860)$

$I^G(J^{PC}) = 0^+(0^{++})$

OMITTED FROM SUMMARY TABLE

The assignment $J^P = 0^+$ is preferred over 2^+ by 2.5 sigma.

Observed by CHILIKIN 17 using full amplitude analysis of the process $e^+e^- \rightarrow J/\psi D\bar{D}$, where $D = D^0, D^+$. Not seen by AAIJ 20A1 in the decay $B^+ \rightarrow D^+D^-K^+$.

$\chi_{c1}(3872)$

$I^G(J^{PC}) = 0^+(1^{++})$

also known as X(3872)

This state shows properties different from a conventional $q\bar{q}$ state. A candidate for an exotic structure. See the review on non- $q\bar{q}$ states.

First observed by CHOI 03 in $B \rightarrow K\pi^+\pi^-J/\psi(1S)$ decays as a narrow peak in the invariant mass distribution of the $\pi^+\pi^-J/\psi(1S)$ final state. Isovector hypothesis excluded by AUBERT 05B and CHOI 11.

AAIJ 13Q perform a full five-dimensional amplitude analysis of the angular correlations between the decay products in $B^+ \rightarrow \chi_{c1}(3872)K^+$ decays, where $\chi_{c1}(3872) \rightarrow J/\psi\pi^+\pi^-$ and $J/\psi \rightarrow \mu^+\mu^-$, which unambiguously gives the $J^{PC} = 1^{++}$ assignment under the assumption that the $\pi^+\pi^-$ and J/ψ are in an S-wave. AAIJ 15AO extend this analysis with more data to limit D-wave contributions to < 4% at 95% CL.

See the review on "Spectroscopy of Mesons Containing Two Heavy Quarks."

<0.04	90	³ AUBERT 04Y	BABR	$B \rightarrow K \eta J/\psi$

¹IWASHITA 14 reports $[\Gamma(\chi_{c1}(3872) \rightarrow \eta J/\psi)/\Gamma_{total}] \times [B(B^+ \rightarrow \chi_{c1}(3872) K^+)] < 3.8 \times 10^{-6}$ which we divide by our best value $B(B^+ \rightarrow \chi_{c1}(3872) K^+) = 2.1 \times 10^{-4}$.

²IWASHITA 14 also scans the $\eta J/\psi$ mass range 3.8–4.75 GeV and sets upper limits for $B(B^\pm \rightarrow \chi_{c1}(3872) K^\pm) \times B(\chi_{c1}(3872) \rightarrow \eta J/\psi)$ in 5 MeV intervals.

³AUBERT 04Y reports $[\Gamma(\chi_{c1}(3872) \rightarrow \eta J/\psi)/\Gamma_{total}] \times [B(B^+ \rightarrow \chi_{c1}(3872) K^+)] < 7.7 \times 10^{-6}$ which we divide by our best value $B(B^+ \rightarrow \chi_{c1}(3872) K^+) = 2.1 \times 10^{-4}$.

$Z_c(3900)$

$J^G(J^{PC}) = 1^+(1^{+-})$

was $X(3900)$
 Properties incompatible with a $q\bar{q}$ structure (exotic state). See the review on non- $q\bar{q}$ states.

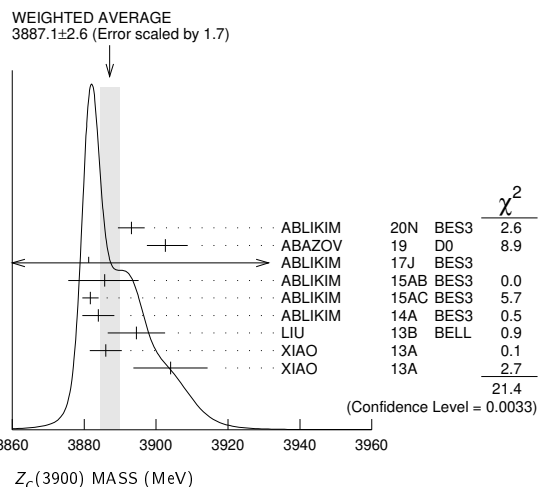

Charged $Z_c(3900)$ seen as a peak in the invariant mass distribution of the $J/\psi\pi^\pm$ system by BES III (ABLIKIM 13T) in $e^+e^- \rightarrow \pi^+\pi^-J/\psi$ at c.m. energy of 4.26 GeV and by radiative return from e^+e^- collisions at \sqrt{s} from 9.46 to 10.86 GeV at Belle (LIU 13B). Partial wave analysis of ABLIKIM 17J determines $J^P = 1^+$ with more than 7σ significance. Neutral $Z_c(3900)$ seen in the $J/\psi\pi^0$ invariant mass distribution in $e^+e^- \rightarrow \pi^0\pi^0J/\psi$ at c.m. energies of 4.23, 4.26, and 4.36 GeV by BES III (ABLIKIM 15U) and at 4.17 GeV by XIAO 13A. Peaks in $(D\bar{D}^*)^\pm$ reported by BES III (ABLIKIM 14A, ABLIKIM 15AB) are assumed to be related.

$\chi_{c0}(3915)$

$$I^G(J^{PC}) = 0^+(0^{++})$$

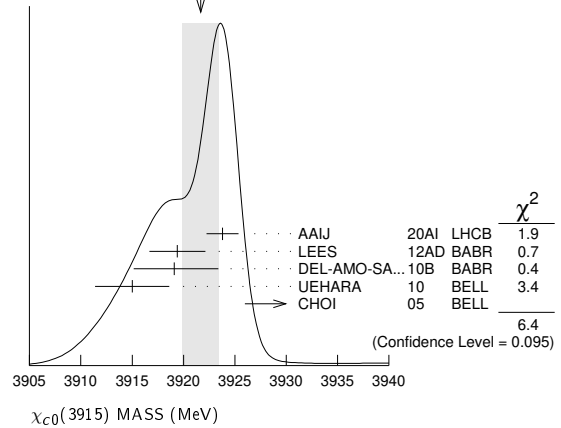

was $X(3915)$

The $\chi_{c0}(3915)$ was originally seen by BELLE in its $\omega J/\psi$ decay mode and was produced in both B decays in CHOI 05 and $\gamma\gamma$ collisions in UEHARA 10. The J^{PC} was determined to be 0^{++} by BABAR in LEES 12AD but this assignment was questioned by ZHOU 15C. In AAIJ 20AI LHCb found the $D^+ D^-$ decay mode of the $\chi_{c0}(3915)$ using B decays and determined its J^{PC} to be 0^{++} . Based on their compatible mass, width, and J^{PC} , we assume the state decaying to $\omega J/\psi$ and the state decaying to $D^+ D^-$ are both the $\chi_{c0}(3915)$. See also the $\chi_{c2}(3930)$.

WEIGHTED AVERAGE
 3921.7 ± 1.8 (Error scaled by 1.5)

- Obtained from the full amplitude analysis. Parameterized with the relativistic Breit-Wigner line shape.
- $\omega J/\psi$ threshold enhancement fitted as an S-wave Breit-Wigner resonance.
- Could also be $X(3940)$. Significance 3.1σ . Fit with additional resonance at 3963.7 ± 5.7 MeV, significance 3.4σ .

$X(4020)^\pm$

$$I^G(J^{PC}) = 1^+(?^{?^-})$$

Properties incompatible with a $q\bar{q}$ structure (exotic state). See the review on non- $q\bar{q}$ states.

Charged $X(4020)$ seen by ABLIKIM 13X from $e^+ e^- \rightarrow \pi^+ \pi^- h_c(1P)$ at c.m. energy from 3.90 to 4.42 GeV as a peak in the invariant mass distribution of the $\pi^\pm h_c(1P)$ system, and by ABLIKIM 14B from $e^+ e^- \rightarrow (D^* \bar{D}^*)^\pm \pi^\mp$ events in $(D^* \bar{D}^*)^\pm$ mass. A neutral $X(4020)$ seen by ABLIKIM 14P at three c.m. energies in the same range in $e^+ e^- \rightarrow \pi^0 \pi^0 h_c(1P)$ as a peak in the larger of the two masses recoiling against a π^0 . ABLIKIM 15AA observes a 5.9 σ signal in $(D^* \bar{D}^*)^0$ in $e^+ e^- \rightarrow (D^* \bar{D}^*)^0 \pi^0$ events using collisions at two c.m. energies. Production rates and mass values support grouping neutral and charged $X(4020)$ together as manifestations of a single $I = 1$ particle.
