$\psi(4040)$ DECAY MODES

Due to the complexity of the $c\bar{c}$ threshold region, in this listing, “seen” (“not seen”) means that a cross section for the mode in question has been measured at effective \sqrt{s} near this particle’s central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in \sqrt{s} or absence thereof. See mode listing(s) for details and references.

$\psi(4160)$

$\psi(4160)$ DECAY MODES

Due to the complexity of the $c\bar{c}$ threshold region, in this listing, "seen" ("not seen") means that a cross section for the mode in question has been measured at effective \sqrt{s} near this particle's central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in \sqrt{s} or absence thereof. See mode listing(s) for details and references.

1 Reanalysis of data presented in BAI 02c. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta = (293 \pm 57)^\circ$.
 2 Reanalysis of data presented in BAI 00 and BAI 02c. From a global fit over the center-of-mass energy 3.8–4.8 GeV covering the $\psi(4040)$, $\psi(4160)$ and $\psi(4415)$ resonances and including interference effects. Four sets of solutions are obtained with the same fit quality, mass and total width, but with different e^+e^- partial widths. We quote only the range of values.
 3 From a fit to Crystal Ball (OSTERHELD 86) data.
 4 From a fit to BES (BAI 02c) data.

$\Gamma(\mu^+\mu^-)$ Γ_2

VALUE (keV)	DOCUMENT ID	TECN	COMMENT
2.45 ± 1.24 ± 0.94	1,2 ABLIKIM	20A BES3	$e^+e^- \rightarrow \mu^+\mu^-$
1 From a fit to the $e^+e^- \rightarrow \mu^+\mu^-$ cross section between 3.8 and 4.6 GeV to the coherent sum of four resonant amplitudes assuming $\Gamma(\mu^+\mu^-) = \Gamma(e^+e^-)$.			
2 From solution I of 8 with equal fit quality. Other solutions range from $2.08 \pm 0.99 \pm 0.80$ to $2.45 \pm 1.24 \pm 0.94$ keV.			

$\psi(4160) \Gamma(i) \times \Gamma(e^+e^-)/\Gamma(\text{total})$

$X(4160)$

$$J^G(J^{PC}) = ?^?(???)$$

OMITTED FROM SUMMARY TABLE

Seen by PAKHLOV 08 in $e^+ e^- \rightarrow J/\psi X$, $X \rightarrow D^* \bar{D}^*$

A state with consistent mass and width is seen by AAIJ 21E in $B^+ \rightarrow X(4160) K^+$ with $X(4160) \rightarrow J/\psi \phi$ using an amplitude analysis of $B^+ \rightarrow J/\psi \phi K^+$ with a significance (accounting for systematic uncertainties) of 4.8σ . The $J^{PC} = 2^- 1^+$ assignment is favored over other assignments with a significance of more than 4σ .

$Z_c(4200)$

$$J^G(J^{PC}) = 1^+(1^+ -)$$

I, G, C need confirmation.

OMITTED FROM SUMMARY TABLE

was $X(4200)^+$

This state shows properties different from a conventional $q\bar{q}$ state. A candidate for an exotic structure. See the review on non- $q\bar{q}$ states.

Reported by CHILIKIN 14 in $J/\psi \pi^+$ at a significance of 6.2σ . Assignments of 0^- , 1^- , 2^- , and 2^+ excluded at 6.1σ , 7.4σ , 4.4σ , and 7.0σ level, respectively. Needs confirmation.

ψ(4230)

$$J^G(J^{PC}) = 0^-(1^{--})$$

also known as Y(4230); was ψ(4260)

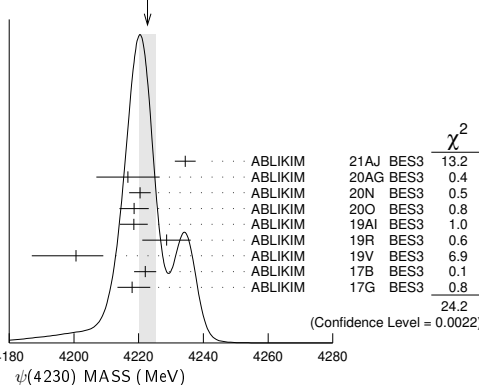

The original ψ(4260) (also known as Y(4260)) was observed by AUBERT, B 05i as a peak in the energy dependence of the e⁺e⁻ → π⁺π⁻J/ψ cross section and was confirmed by HE 06B, YUAN 07, LEES 12AC, and LIU 13B in the same process. A higher-statistics analysis by ABLIKIM 17B revealed an asymmetry in the cross section and resulted in a shift of the peak position to a lower mass. The ψ(4260) was therefore renamed ψ(4230). The energy-dependent cross sections for e⁺e⁻ to other channels also exhibit peaks in the same mass region. The parameters corresponding to those peaks are also listed here, but the number of states in this region remains to be determined.

For details see the review on "Spectroscopy of mesons containing two heavy quarks."

$\psi(4360)$

$$J^G(J^{PC}) = 0^-(1^{--})$$

also known as $Y(4360)$; was $X(4360)$

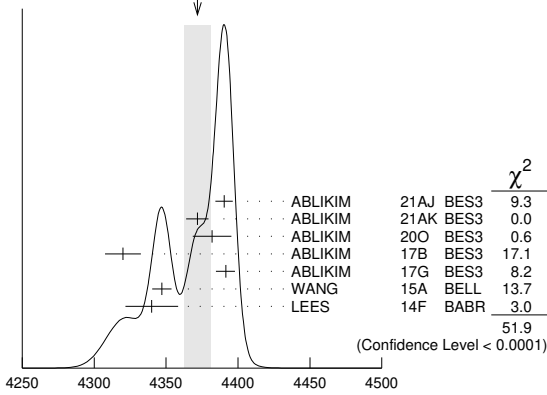

This state shows properties different from a conventional $q\bar{q}$ state. A candidate for an exotic structure. See the review on non- $q\bar{q}$ states.

Seen in radiative return from e^+e^- collisions at $\sqrt{s} = 9.54\text{--}10.58$ GeV by AUBERT 07s, WANG 07D, and LEES 14F. See also the review on "Spectroscopy of mesons containing two heavy quarks."

$\psi(4415)$ DECAY MODES

Due to the complexity of the $c\bar{c}$ threshold region, in this listing, “seen” (“not seen”) means that a cross section for the mode in question has been measured at effective \sqrt{s} near this particle’s central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in \sqrt{s} or absence thereof. See mode listing(s) for details and references.

¹¹ Reanalysis of data presented in BAI 02c. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta = (234 \pm 88)^\circ$.

¹² Reanalysis of data presented in BAI 00 and BAI 02c. From a global fit over the center-of-mass energy 3.8–4.8 GeV covering the $\psi(4040)$, $\psi(4160)$ and $\psi(4415)$ resonances and including interference effects. Four sets of solutions are obtained with the same fit quality, mass and total width, but with different e^+e^- partial widths. We quote only the range of values.

¹³ From a fit to Crystal Ball (OSTERHELD 86) data.

¹⁴ From a fit to BES (BAI 02c) data.

$$I^G(J^{PC}) = 0^+(?^{?+})$$

OMITTED FROM SUMMARY TABLE

This state shows properties different from a conventional $q\bar{q}$ state. A candidate for an exotic structure. See the review on "Heavy Non- $q\bar{q}$ Mesons."

Seen by AAIJ 21E in $B^+ \rightarrow X(4630) K^+$ with $X(4630) \rightarrow J/\psi \phi$ using an amplitude analysis of $B^+ \rightarrow J/\psi \phi K^+$ with a significance (accounting for systematic uncertainties) of 5.5 σ . The $J^P = 1^-$ assignment is favored over 2^- with a significance of 3 σ and other assignments are disfavored by more than 5 σ .

$b\bar{b}$ MESONS
(including possibly non- $q\bar{q}$ states)

Updated July 2021.

The level scheme of meson states containing a minimal quark content of $b\bar{b}$. The name of a state is determined by its quantum numbers $I^G J^{PC}$ (see the review “Naming Scheme for Hadrons”). States included in the Summary Tables are shown with solid lines; those requiring confirmation are shown with dotted lines. The arrows indicate the most dominant hadronic transitions. Single photon transitions, including $\Upsilon(nS) \rightarrow \gamma\eta_b(mS)$, $\Upsilon(nS) \rightarrow \gamma\chi_{bJ}(mP)$, and $\chi_{bJ}(nP) \rightarrow \gamma\Upsilon(mS)$, are omitted for clarity. For orientation, the location of the thresholds related to a pair of ground state open bottom mesons is indicated in the figure.

WIDTH DETERMINATIONS OF THE Υ STATES

As is the case for the $J/\psi(1S)$ and $\psi(2S)$, the full widths of the $b\bar{b}$ states $\Upsilon(1S)$, $\Upsilon(2S)$, and $\Upsilon(3S)$ are not directly measurable, since they are much narrower than the energy resolution of the e^+e^- storage rings where these states are produced. The common indirect method to determine Γ starts from

$$\Gamma = \Gamma_{\ell\ell}/B_{\ell\ell} \tag{1}$$

where $\Gamma_{\ell\ell}$ is one leptonic partial width and $B_{\ell\ell}$ is the corresponding branching fraction ($\ell = e, \mu, \text{ or } \tau$). One then assumes $e\text{-}\mu\text{-}\tau$ universality and uses

$$\Gamma_{\ell\ell} = \Gamma_{ee}$$

$$B_{\ell\ell} = \text{average of } B_{ee}, B_{\mu\mu}, \text{ and } B_{\tau\tau} \tag{2}$$

The electronic partial width Γ_{ee} is also not directly measurable at e^+e^- storage rings, only in the combination $\Gamma_{ee}\Gamma_{\text{had}}/\Gamma$, where Γ_{had} is the hadronic partial width and

$$\Gamma_{\text{had}} + 3\Gamma_{ee} = \Gamma \tag{3}$$

This combination is obtained experimentally from the energy-integrated hadronic cross section

$$\int_{\text{resonance}} \sigma(e^+e^- \rightarrow \Upsilon \rightarrow \text{hadrons})dE$$

$$= \frac{6\pi^2 \Gamma_{ee}\Gamma_{\text{had}}}{M^2 \Gamma} C_r = \frac{6\pi^2 \Gamma_{ee}^{(0)}\Gamma_{\text{had}}}{M^2 \Gamma} C_r^{(0)} \tag{4}$$

where M is the Υ mass, and C_r and $C_r^{(0)}$ are radiative correction factors. C_r is used for obtaining Γ_{ee} as defined in Eq. (1), and contains corrections from all orders of QED for describing $(b\bar{b}) \rightarrow e^+e^-$. The lowest order QED value $\Gamma_{ee}^{(0)}$, relevant for comparison with potential-model calculations, is defined by the lowest order QED graph (Born term) alone, and is about 7% lower than Γ_{ee} .

The Listings give experimental results on B_{ee} , $B_{\mu\mu}$, $B_{\tau\tau}$, and $\Gamma_{ee}\Gamma_{\text{had}}/\Gamma$. The entries of the last quantity have been re-evaluated consistently using the correction procedure of KURAEV 85 [1]. The partial width Γ_{ee} is obtained from the average values for $\Gamma_{ee}\Gamma_{\text{had}}/\Gamma$ and $B_{\ell\ell}$ using

$$\Gamma_{ee} = \frac{\Gamma_{ee}\Gamma_{\text{had}}}{\Gamma(1 - 3B_{\ell\ell})} \tag{5}$$

The total width Γ is then obtained from Eq. (1). We do not list Γ_{ee} and Γ values of individual experiments. The Γ_{ee} values in the Meson Summary Table are also those defined in Eq. (1).

 $\Upsilon(1S)$

Table with columns: Particle, Value, Error, Units, CL. Rows include decays like $\Upsilon(1S) \to \gamma \phi \phi$, $\Upsilon(1S) \to \gamma \eta_c(1S)$, $\Upsilon(1S) \to \gamma \eta_c(2S)$, $\Upsilon(1S) \to \gamma \chi_{c0}$, $\Upsilon(1S) \to \gamma \chi_{c1}$, $\Upsilon(1S) \to \gamma \chi_{c2}$, $\Upsilon(1S) \to \gamma \chi_{c1}(3872)$, $\Upsilon(1S) \to \gamma \chi_{c1}(3872), \chi_{c1} \to \pi^+ \pi^- \pi^0 J/\psi$, $\Upsilon(1S) \to \gamma \chi_{c0}(3915) \to \omega J/\psi$, $\Upsilon(1S) \to \gamma \chi_{c1}(4140) \to \phi J/\psi$, $\Upsilon(1S) \to \gamma X$, $\Upsilon(1S) \to \gamma X \bar{X} (m_X < 3.1 \text{ GeV})$, $\Upsilon(1S) \to \gamma X \bar{X} (m_X < 4.5 \text{ GeV})$, $\Upsilon(1S) \to \gamma X \to \gamma + \ge 4 \text{ prongs}$, $\Upsilon(1S) \to \gamma a_0^0 \to \gamma \mu^+ \mu^-$, $\Upsilon(1S) \to \gamma a_1^0 \to \gamma \tau^+ \tau^-$, $\Upsilon(1S) \to \gamma a_1^0 \to \gamma g g$, $\Upsilon(1S) \to \gamma a_1^0 \to \gamma S \bar{S}$.

Lepton Family number (LF) violating modes

Table with columns: Particle, Value, Error, Units, CL. Row: $\Upsilon(1S) \to \mu^+ \tau^\mp$ LF < 6.0 x 10^-6 CL=95%

Other decays

Table with columns: Particle, Value, Error, Units, CL. Rows: $\Upsilon(1S)$ invisible < 3.0 x 10^-4 CL=90%; $\Upsilon(1S)$ hadrons (97 +/- 5) %

- [a] $2m_\tau < M(\tau^+ \tau^-) < 9.2 \text{ GeV}$
[b] $2 \text{ GeV} < m_{K^+ K^-} < 3 \text{ GeV}$
[c] X = scalar with $m < 8.0 \text{ GeV}$
[d] $X \bar{X}$ = vectors with $m < 3.1 \text{ GeV}$
[e] X and \bar{X} = zero spin with $m < 4.5 \text{ GeV}$
[f] $1.5 \text{ GeV} < m_X < 5.0 \text{ GeV}$
[g] $201 \text{ MeV} < M(\mu^+ \mu^-) < 3565 \text{ MeV}$
[h] $0.5 \text{ GeV} < m_X < 9.0 \text{ GeV}$, where m_X is the invariant mass of the hadronic final state.

$\Upsilon(1S) \Gamma(\eta) \Gamma(e^+ e^-) / \Gamma(\text{total})$

Table with columns: Particle, Value, Error, Units, CL. Row: $\Gamma(\mu^+ \mu^-) \times \Gamma(e^+ e^-) / \Gamma(\text{total})$ 31.2 +/- 1.6 +/- 1.7

Table with columns: Particle, Value, Error, Units, CL. Row: $\Gamma(\text{hadrons}) \times \Gamma(e^+ e^-) / \Gamma(\text{total})$ 1.240 +/- 0.016 OUR AVERAGE. Includes sub-rows for various decays like $\Upsilon(1S) \to \mu^+ \mu^-$, $\Upsilon(1S) \to \text{hadrons}$, etc.

1 Radiative corrections evaluated following KURAEV 85.
2 Radiative corrections reevaluated by BUCHMUELLER 88 following KURAEV 85.
3 Radiative corrections reevaluated by ALEXANDER 89 using $B(\mu\mu) = 0.026$.

$\Upsilon(1S)$ PARTIAL WIDTHS

Table with columns: Particle, Value, Error, Units, CL. Row: $\Gamma(e^+ e^-)$ 1.340 +/- 0.018 OUR EVALUATION

$\Upsilon(1S)$ BRANCHING RATIOS

Table with columns: Particle, Value, Error, Units, CL. Row: $\Gamma(\tau^+ \tau^-) / \Gamma(\text{total})$ 2.60 +/- 0.10 OUR AVERAGE. Includes sub-rows for $\Upsilon(1S) \to \tau^+ \tau^-$, $\Upsilon(1S) \to \pi^+ \pi^- \tau^+ \tau^-$, etc.

1 BESSON 07 reports $[\Gamma(\Upsilon(1S) \to \tau^+ \tau^-) / \Gamma(\text{total})] / [B(\Upsilon(1S) \to \mu^+ \mu^-)] = 1.02 \pm 0.02 \pm 0.05$ which we multiply by our best value $B(\Upsilon(1S) \to \mu^+ \mu^-) = (2.48 \pm 0.05) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
2 Using $B(\Upsilon(1S) \to ee) = B(\Upsilon(1S) \to \mu\mu) = 0.0256$; not used for width evaluations.

Table with columns: Particle, Value, Error, Units, CL, DOCUMENT ID, TECN, COMMENT. Row: $\Gamma(e^+ e^-) / \Gamma(\text{total})$ 2.38 +/- 0.11 OUR AVERAGE. Includes sub-rows for ALEXANDER 98, ALBRECHT 87, BESSON 84, BERGER 80c.

Table with columns: Particle, Value, Error, Units, CL, DOCUMENT ID, TECN, COMMENT. Row: $\Gamma(\mu^+ \mu^-) / \Gamma(\text{total})$ 0.0248 +/- 0.0005 OUR AVERAGE. Includes sub-rows for ADAMS 05, ALEXANDER 98, BARU 92, KOBEL 92, CHEN 89B, KAARSBERG 89, ALBRECHT 87, BESSON 84, ANDREWS 83, ALBRECHT 82, NICZYPORUK 82, BOCK 80, BERGER 79.

1 Taking into account interference between the resonance and continuum.

Table with columns: Particle, Value, Error, Units, CL, DOCUMENT ID, TECN, COMMENT. Row: $\Gamma(\tau^+ \tau^-) / \Gamma(\mu^+ \mu^-)$ 1.008 +/- 0.023 OUR AVERAGE. Includes sub-rows for DEL-AMO-SA...10c, BESSON 07.

1 Allows any number of extra photons with total energy < 500 MeV.

Table with columns: Particle, Value, Error, Units, CL, DOCUMENT ID, TECN, COMMENT. Row: $\Gamma(g g g) / \Gamma(\text{total})$ 81.7 +/- 0.7. Includes sub-row for BESSON 06A.

1 Calculated using the value $\Gamma(\gamma g g) / \Gamma(g g g) = (2.70 \pm 0.01 \pm 0.13 \pm 0.24)\%$ from BESSON 06A and PDG 08 values of $B(\mu^+ \mu^-) = (2.48 \pm 0.05)\%$ and $R_{\text{hadrons}} = 3.51$. The statistical error is negligible and the systematic error is partially correlated with that of $\Gamma(\gamma g g) / \Gamma(\text{total})$ measurement of BESSON 06A.

Table with columns: Particle, Value, Error, Units, CL, DOCUMENT ID, TECN, COMMENT. Row: $\Gamma(\gamma g g) / \Gamma(\text{total})$ 2.20 +/- 0.60. Includes sub-row for BESSON 06A.

1 Calculated using BESSON 06A values of $\Gamma(\gamma g g) / \Gamma(g g g) = (2.70 \pm 0.01 \pm 0.13 \pm 0.24)\%$ and $\Gamma(g g g) / \Gamma(\text{total})$. The statistical error is negligible and the systematic error is partially correlated with that of $\Gamma(g g g) / \Gamma(\text{total})$ measurement of BESSON 06A.

Table with columns: Particle, Value, Error, Units, CL, DOCUMENT ID, TECN, COMMENT. Row: $\Gamma(\gamma g g) / \Gamma(g g g)$ 2.70 +/- 0.01 +/- 0.27. Includes sub-row for BESSON 06A.

Table with columns: Particle, Value, Error, Units, CL, DOCUMENT ID, TECN, COMMENT. Row: $\Gamma(\eta'(958) \text{ anything}) / \Gamma(\text{total})$ 0.0294 +/- 0.0024 OUR AVERAGE. Includes sub-rows for AQUINES 06A, ARTUSO 03.

Table with columns: Particle, Value, Error, Units, CL, DOCUMENT ID, TECN, COMMENT. Row: $\Gamma(J/\psi(1S) \text{ anything}) / \Gamma(\text{total})$ 5.4 +/- 0.4 OUR FIT. Includes sub-rows for SHEN 16, BRIERE 04, FULTON 89.

$\chi_{b0}(1P)$

$$J^{PC} = 0^+(0^+ +)$$

J needs confirmation.

Observed in radiative decay of the $\Upsilon(2S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

$\chi_{b1}(1P)$

$$J^G(JPC) = 0^+(1^{++})$$

J needs confirmation.

Observed in radiative decay of the $T(2S)$, therefore $C = +$. Branching ratio requires E1 transition. M1 is strongly disfavored, therefore $P = +$. $J = 1$ from SKWARNICKI 87.

$\chi_{b2}(1P)$

$$J^G(J^{PC}) = 0^+(2^{++})$$

J needs confirmation.

Observed in radiative decay of the $\Upsilon(2S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$. $J = 2$ from SKWARNICKI 87.

$\Upsilon_2(1D)$

$$I^G(J^{PC}) = 0^-(2^{--})$$

was $\Upsilon(1D)$

First observed by BONVICINI 04 in the decay to $\gamma\gamma \Upsilon(1S)$ and confirmed by DEL-AMO-SANCHEZ 10R in the decay to $\pi^+\pi^- \Upsilon(1S)$. Data consistent with $J^P = 2^-$. The states with $J = 1$ and 3 also possibly seen, but need confirmation.

Meson Particle Listings

$\chi_{b0}(2P)$

$\chi_{b0}(2P)$

$J^G(J^{PC}) = 0^+(0^{++})$
 J needs confirmation.

Observed in radiative decay of the $\Upsilon(3S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

$\chi_{b1}(2P)$

$J^{(PC)} = 0^+(1^+)$
 J needs confirmation.

Observed in radiative decay of the $\Upsilon(3S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

$\chi_{b2}(2P)$

$$J^G(J^{PC}) = 0^+(2^{++})$$

J needs confirmation.

Observed in radiative decay of the $\Upsilon(3S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

$\chi_{b2}(3P)$

$$I^G(J^{PC}) = 0^+(2^{++})$$

Observed in the radiative decay to $\Upsilon(3S)$, therefore $C = +$. J needs confirmation.

$\chi_{b2}(3P)$ MASS

$\Upsilon(4S)$ BRANCHING RATIOS

$B\bar{B}$ DECAYS

The ratio of branching fraction to charged and neutral B mesons is often derived assuming isospin invariance in the decays, and relies on the knowledge of the B^+/B^0 lifetime ratio. "OUR EVALUATION" is obtained based on averages of rescaled data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account the common dependence of the measurement on the value of the lifetime ratio.

 $\Upsilon(10753)$

$$I^G(J^{PC}) = ?(1^{--})$$

OMITTED FROM SUMMARY TABLE

A candidate for $\Upsilon(3D)$ state or an exotic structure.

Seen by MIZUK 19 in $e^+e^- \rightarrow \Upsilon(nS)\pi^+\pi^-$ ($n=1,2,3$) with a significance of 5.2 σ .

¹ From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 28 energy points within $\sqrt{s} = 10.6\text{--}11.05$ GeV, including the initial-state radiation at $\Upsilon(10860)$.
² From a simultaneous fit to the $h_b(nP)\pi^+\pi^-$, $n = 1, 2$ cross sections at 22 energy points within $\sqrt{s} = 10.77\text{--}11.02$ GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single relative phase, a single relative amplitude, and two overall normalization factors, one for each n). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.
³ From a fit to the dressed cross sections of AUBERT 09E by BaBar and SANTEL 16 by Belle above 10.68 GeV with a coherent sum of a continuum amplitude and three Breit-Wigner functions with constant widths.
⁴ From a fit to the total hadronic cross sections measured at 60 energy points within $\sqrt{s} = 10.82\text{--}11.05$ GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with $1/\sqrt{s}$ dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, one relative phase, and one decoherence coefficient).
⁵ Not including uncertain and potentially large systematic errors due to assumed continuum amplitude $1/\sqrt{s}$ dependence and related interference contributions.
⁶ From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 25 energy points within $\sqrt{s} = 10.6\text{--}11.05$ GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with fourteen resonance parameters (a mass, width, and three amplitudes for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single universal relative phase, and three decoherence coefficients, one for each n). Continuum contributions were measured (and therefore fixed) to be zero.
⁷ Superseded by MIZUK 19.
⁸ In a model where a flat non-resonant $b\bar{b}$ -continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.
⁹ The parameters of the $\Upsilon(11020)$ are fixed to those in AUBERT 09E.
¹⁰ In a model where a flat nonresonant $\Upsilon(1S, 2S, 3S)\pi^+\pi^-$ continuum interferes with a single Breit-Wigner resonance.
¹¹ In a model where a non-resonant $b\bar{b}$ -continuum represented by a threshold function at $\sqrt{s}=2m_B$ is incoherently added to a flat component interfering with two Breit-Wigner resonances. Not independent of other AUBERT 09E results. Systematic uncertainties not estimated.
¹² Assuming four Gaussians with radiative tails and a single step in R .
¹³ In a coupled-channel model with three resonances and a smooth step in R .

¹ From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 28 energy points within $\sqrt{s} = 10.6\text{--}11.05$ GeV, including the initial-state radiation at $\Upsilon(10860)$.

² From a simultaneous fit to the $h_b(nP)\pi^+\pi^-$, $n = 1, 2$ cross sections at 22 energy points within $\sqrt{s} = 10.77\text{--}11.02$ GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single relative phase, a single relative amplitude, and two overall normalization factors, one for each n). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.

³ From a fit to the dressed cross sections of AUBERT 09E by BaBar and SANTEL 16 by Belle above 10.68 GeV with a coherent sum of a continuum amplitude and three Breit-Wigner functions with constant widths.

⁴ From a fit to the total hadronic cross sections measured at 60 energy points within $\sqrt{s} = 10.82\text{--}11.05$ GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with $1/\sqrt{s}$ dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, one relative phase, and one decoherence coefficient).

⁵ Not including uncertain and potentially large systematic errors due to assumed continuum amplitude $1/\sqrt{s}$ dependence and related interference contributions.

⁶ From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 25energy points within $\sqrt{s} = 10.6\text{--}11.05$ GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with fourteen resonance parameters (a mass, width, and three amplitudes for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single universal relative phase, and three decoherence coefficients, one for each n). Continuum contributions were measured (and therefore fixed) to be zero.

⁷ Superseded by MIZUK 19.

⁸ In a model where a flat non-resonant $b\bar{b}$ -continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.

¹FINK 21 simultaneously measure the cyclotron frequencies of an H_2^+ ion and a deuteron in a coupled magnetron orbit. The proton mass is extracted using the precise deuteron mass value.

²The 2018 CODATA combination in TIESINGA 21 includes data from HEISSE 17, but does not include updates in HEISSE 19, which superseded HEISSE 17. Consequently, we do not average HEISSE 19 and TIESINGA 21. Updating the 2018 CODATA combination to use HEISSE 19 would shift the central value for the proton mass upwards by less than half a standard deviation. Therefore, we take the 2018 CODATA result in TIESINGA 21 as the recommended value for the proton mass.

³The value is an update of HEISSE 17; the result is shifted by 1.5×10^{-11} u, corresponding to 0.45 σ due to the corrected motional temperatures of the particles. The statistical and total systematic uncertainties are given as 16 and 29 in the last two digits.

⁴The statistical and systematic errors are 15 and 29 in the last two places of the value. Superseded by HEISSE 19.

p MASS (MeV)

The mass is known more precisely in u (atomic mass units) than in MeV. The conversion is: $1 \text{ u} = 931.494 \text{ 102 42(28) MeV}/c^2$ (2018 CODATA value, TIESINGA 21).

¹HORI 01, HORI 03, HORI 06, and HORI 11 use the more-precisely-known constraint on the \bar{p} charge-to-mass ratio of GABRIELSE 99 (see below) to get their results. Their results are not independent of the HORI 01, HORI 03, HORI 06, and HORI 11 values for $|q_p + q_{\bar{p}}|/e$, below.

²TORII 99 uses the more-precisely-known constraint on the \bar{p} charge-to-mass ratio of GABRIELSE 95 (see below) to get this result. This is not independent of the TORII 99 value for $|q_p + q_{\bar{p}}|/e$, below.

\bar{p}/p CHARGE-TO-MASS RATIO, $|q_{\bar{p}}/m_{\bar{p}}|/(q_p/m_p)$

A test of CPT invariance. Listed here are measurements involving the inertial masses. For a discussion of what may be inferred about the ratio of \bar{p} and p gravitational masses, see ERICSON 90; they obtain an upper bound of 10^{-6} – 10^{-7} for violation of the equivalence principle for \bar{p} s.

<2 × 10 ⁻⁵		³ HUGHES 92	RVUE	

¹HORI 01, HORI 03, HORI 06, and HORI 11 use the more-precisely-known constraint on the \bar{p} charge-to-mass ratio of GABRIELSE 99 (see above) to get their results. Their results are not independent of the HORI 01, HORI 03, HORI 06, and HORI 11 values for $|m_p - m_{\bar{p}}|/m_p$, above.

²TORII 99 uses the more-precisely-known constraint on the \bar{p} charge-to-mass ratio of GABRIELSE 95 (see above) to get this result. This is not independent of the TORII 99 value for $|m_p - m_{\bar{p}}|/m_p$, above.

³HUGHES 92 uses recent measurements of Rydberg-energy and cyclotron-frequency ratios.

$|q_p + q_e|/e$

See BRESSI 11 for a summary of experiments on the neutrality of matter. See also "n CHARGE" in the neutron Listings.

VALUE	DOCUMENT ID	COMMENT
<1 × 10⁻²¹	¹ BRESSI 11	Neutrality of SF ₆
• • • We do not use the following data for averages, fits, limits, etc. • • •		
<3.2 × 10 ⁻²⁰	² SENGUPTA 00	binary pulsar
<0.8 × 10 ⁻²¹	MARINELLI 84	Magnetic levitation
<1.0 × 10 ⁻²¹	¹ DYLLA 73	Neutrality of SF ₆

¹BRESSI 11 uses the method of DYLLA 73 but finds serious errors in that experiment that greatly reduce its accuracy. The BRESSI 11 limit assumes that $n \rightarrow p e^- \nu_e$ conserves charge. Thus the limit applies equally to the charge of the neutron.

²SENGUPTA 00 uses the difference between the observed rate of rotational energy loss by the binary pulsar PSR B1913+16 and the rate predicted by general relativity to set this limit. See the paper for assumptions.

p MAGNETIC MOMENT

9.8 ± 0.4 ± 1.1	HALLIN	93	CNTR γp Compton scattering
10.62 ± 1.25 ± 1.07 ± 1.19 ± 1.03	ZIEGER	92	CNTR γp Compton scattering
10.9 ± 2.2 ± 1.3	7 FEDERSPIEL	91	CNTR γp Compton scattering

1 BEANE 03 uses effective field theory and low-energy γp and γd Compton-scattering data. It also gets for the isoscalar polarizabilities (see the erratum) $\alpha_N = (13.0 \pm 1.9 \pm 3.9) \times 10^{-4}$ fm³ and $\beta_N = (-1.8 \pm 1.9 \pm 2.1 \pm 0.9) \times 10^{-4}$ fm³.

2 BLANPIED 01 gives $\alpha_p + \beta_p$ and $\alpha_p - \beta_p$. The separate α_p and β_p are provided to us by A. Sandorfi. The first error above is statistics plus systematics; the second is from the model.

3 This OLMOSDELEON 01 result uses the TAPS data alone, and does not use the (re-evaluated) sum-rule constraint that $\alpha + \beta = (13.8 \pm 0.4) \times 10^{-4}$ fm³. See the paper for a discussion.

4 MACGIBBON 95 combine the results of ZIEGER 92, FEDERSPIEL 91, and their own experiment to get a "global average" in which model errors and systematic errors are treated in a consistent way. See MACGIBBON 95 for a discussion.

5 PASQUINI 19 fit data sets for the unpolarized proton RCS cross section, using fixed-t subtracted dispersion relations and a bootstrap-based fitting technique.

6 BARANOV 01 combines the results of 10 experiments from 1958 through 1995 to get a global average that takes into account both systematic and model errors and does not use the theoretical constraint on the sum $\alpha_p + \beta_p$.

7 FEDERSPIEL 91 obtains for the (static) electric polarizability α_p , defined in terms of the induced electric dipole moment by $\mathbf{D} = 4\pi\epsilon_0\alpha_p\mathbf{E}$, the value $(7.0 \pm 2.2 \pm 1.3) \times 10^{-4}$ fm³.

 ρ MAGNETIC POLARIZABILITY β_p

The electric and magnetic polarizabilities are subject to a dispersion sum-rule constraint $\bar{\alpha} + \bar{\beta} = (14.2 \pm 0.5) \times 10^{-4}$ fm³. Errors here are anticorrelated with those on $\bar{\alpha}_p$ due to this constraint.

3 This OLMOSDELEON 01 result uses the TAPS data alone, and does not use the (re-evaluated) sum-rule constraint that $\alpha + \beta = (13.8 \pm 0.4) \times 10^{-4}$ fm³. See the paper for a discussion.

4 MACGIBBON 95 combine the results of ZIEGER 92, FEDERSPIEL 91, and their own experiment to get a "global average" in which model errors and systematic errors are treated in a consistent way. See MACGIBBON 95 for a discussion.

5 PASQUINI 19 fit data sets for the unpolarized proton RCS cross section, using fixed-t subtracted dispersion relations and a bootstrap-based fitting technique.

6 BARANOV 01 combines the results of 10 experiments from 1958 through 1995 to get a global average that takes into account both systematic and model errors and does not use the theoretical constraint on the sum $\alpha_p + \beta_p$.

 ρ CHARGE RADIUS

This is the rms electric charge radius, $\sqrt{\langle r_E^2 \rangle}$.

There are three kinds of measurements of the proton radius: via transitions in atomic hydrogen; via electron scattering off hydrogen; and via muonic hydrogen Lamb shift. Most measurements of the radius of the proton involve electron-proton interactions, the most recent of which is the electron scattering measurement $r_p = 0.831(14)$ fm (XIONG 19), and the atomic-hydrogen value, $r_p = 0.833(10)$ fm (BEZGINOV 19). These agree well with another recent atomic-hydrogen value $r_p = 0.8335(95)$ fm (BEYER 17), and with the best measurement using muonic hydrogen $r_p = 0.84087(39)$ fm (ANTOGNINI 13), that is far more precise.

The MOHR 16 value (2014 CODATA), obtained from the electronic results available at the time, was 0.8751(61) fm. This differs by 5.6 standard deviations from the muonic hydrogen value, leading to the so-called proton charge radius puzzle. See our 2018 edition (Physical Review **D98** 030001 (2018)) for a further discussion of interpretations of this puzzle. However, reflecting the new electronic measurements, the 2018 CODATA, TIESINGA 21, recommended value is 0.8414(19) fm, and the puzzle appears to be resolved.

See our 2014 edition (Chinese Physics **C38** 070001 (2014)) for values published before 2003.

- BEZGINOV 19 measures the $2S_{1/2}$ to $2P_{1/2}$ transition frequency in atomic hydrogen using the frequency-offset separated oscillatory field (FOSOF) technique. The result agrees well with the muonic hydrogen Lamb shift value.
- THE XIONG 19 value from $ep \rightarrow ep$ scattering and supports the muonic hydrogen Lamb shift value.
- CUI 21 employ a new mathematical procedure (statistical SPM, Schlessinger point method) based on form-unbiased interpolations of existing ep scattering data.
- MIHOVLOVIC 21 reports a value of $0.878 \pm 0.011 \pm 0.031 \pm 0.002$ fm where the last uncertainty comes from the dependence on the model form factor function.
- FLEURBAEY 18 measures the 1S-3S transition frequency in hydrogen and in combination with the 1S-2S transition frequency deduces the proton radius and the Rydberg constant.
- THE BEYER 17 result is 3.3 combined standard deviations below the MOHR 16 (2014 CODATA) value. The experiment measures the 2S-4P transition in hydrogen and gets the proton radius and the Rydberg constant.
- Authors also provide values for combinations of all available data.

p MAGNETIC RADIUS

This is the rms magnetic radius, $\sqrt{\langle r_M^2 \rangle}$.

VALUE (fm)	DOCUMENT ID	TECN	COMMENT
0.851 ± 0.026	¹ LEE	15	Combination of world and Mainz data
• • • We do not use the following data for averages, fits, limits, etc. • • •			
0.817 ± 0.027	² CUI	21B	FIT use existing ep data
0.87 ± 0.02	EPSTEIN	14	Using $ep, en, \pi\pi$ data
0.867 ± 0.009 ± 0.018	ZHAN	11	SPEC Recoil polarimetry
0.777 ± 0.013 ± 0.010	BERNAUER	10	SPEC $ep \rightarrow ep$ form factor
0.876 ± 0.010 ± 0.016	BORISYUK	10	Reanalyzes old $ep \rightarrow ep$ data
0.854 ± 0.005	BELUSHKIN	07	Dispersion analysis

- In a consistent reanalysis LEE 2015 extract values separately for the Mainz 2010 data only ($0.776 \pm 0.034 \pm 0.017$) fm and for the world data without Mainz data (0.914 ± 0.035) fm. The quoted value is a simple combination of the two, which ignores possible discrepancies and unknown correlations and should be considered with caution.
- CUI 21B employ a new mathematical procedure (statistical SPM, Schlessinger point method) based on form-unbiased interpolations of existing ep scattering data.

p MEAN LIFE

A test of baryon conservation. See the "p Partial Mean Lives" section below for limits for identified final states. The limits here are to "anything" or are for "disappearance" modes of a bound proton (p) or (n). See also the 3ν modes in the "Partial Mean Lives" section. Table 1 of BACK 03 is a nice summary.

LIMIT (years)	PARTICLE	CL%	DOCUMENT ID	TECN	COMMENT

- AHMED 04 and ANDERSON 19A look for γ rays from the de-excitation of a residual $^{15}\text{O}^*$ or $^{15}\text{N}^*$ following the disappearance of a neutron or proton in ^{16}O .
- ARAKI 06 looks for signs of de-excitation of the residual nucleus after disappearance of a neutron from the s shell of ^{12}C .
- BACK 03 looks for decays of unstable nuclides left after N decays of parent ^{12}C , ^{13}C , ^{16}O nuclei. These are "invisible channel" limits.
- ZDESENKO 03 gets this limit on proton disappearance in deuterium by analyzing SNO data in AHMAD 02.
- AHMAD 02 (see its footnote 7) looks for neutrons left behind after the disappearance of the proton in deuterons.
- BERNABEI 00B looks for the decay of a $^{128}_{53}\text{Xe}$ nucleus following the disappearance of a proton in the otherwise-stable $^{129}_{54}\text{Xe}$ nucleus.
- EVANS 77 looks for the daughter nuclide ^{129}Xe from possible ^{130}Te decays in ancient Te ore samples.
- This mean-life limit has been obtained from a half-life limit by dividing the latter by $\ln(2) = 0.693$.

⁹FLEROV 58 looks for the spontaneous fission of a ^{232}Th nucleus after the disappearance of one of its nucleons.

p MEAN LIFE

Of the two astrophysical limits here, that of GEER 00D involves considerably more refinements in its modeling. The other limits come from direct observations of stored antiprotons. See also "p Partial Mean Lives" after "p Partial Mean Lives," below, for exclusive-mode limits. The best (lifetime/branching fraction) limit there is 7×10^5 years, for $\bar{p} \rightarrow e^- \gamma$. We advance only the exclusive-mode limits to our Summary Tables.

LIMIT (years)	CL%	EVTS	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •					
>5.0	90		SELLNER	17	TRAP Penning trap

¹GEER 00D uses agreement between a model of galactic \bar{p} production and propagation and the observed \bar{p}/p cosmic-ray spectrum to set this limit.

p DECAY MODES

See the "Note on Nucleon Decay" in our 1994 edition (Phys. Rev. **D50**, 1173) for a short review.

The "partial mean life" limits tabulated here are the limits on τ/B_i , where τ is the total mean life and B_i is the branching fraction for the mode in question. For N decays, p and n indicate proton and neutron partial lifetimes.

Mode	Partial mean life (10 ³⁰ years)	Confidence level

p PARTIAL MEAN LIVES

The "partial mean life" limits tabulated here are the limits on τ/B_j , where τ is the total mean life for the proton and B_j is the branching fraction for the mode in question.

Decaying particle: p = proton, n = bound neutron. The same event may appear under more than one partial decay mode. Background estimates may be accurate to a factor of two.

> 1100	n	90	19.1		ABE	14E SKAM

••• We do not use the following data for averages, fits, limits, etc. •••

Table with columns: > [value], p, [value], [value], WALL, MCGREW, BERGER, HIRATA, HAINES, KAJITA, KAJITA, PARK, BATTISTONI, BATTISTONI, KRISHNA..., CHERRY, GURR. Includes values like 16, 39, 10, 112, 13, 10, 25, 100, 6, 2, 40, 7, 7, 2, 5.8, 0.3, 0.1.

1 In estimating the background, this HIRATA 89c limit (as opposed to the later limits of WALL 00b and MCGREW 99) does not take into account present understanding that the flux of nu_mu originating in the upper atmosphere is depleted. Doing so would reduce the background and thus also would reduce the limit here.

2 We have calculated 90% CL limit from 1 confined event.

3 We have converted 2 possible events to 90% CL limit.

4 We have converted half-life to 90% CL mean life.

tau(p -> e+ eta) T4

Table with columns: LIMIT (10^30 years), PARTICLE, CL%, EVTS, BKGD EST, DOCUMENT ID, TECN. Row: >10000 p, 90, 0, 0.78, ABE, 17d, SKAM.

••• We do not use the following data for averages, fits, limits, etc. •••

Table with columns: > [value], p, [value], [value], NISHINO, WALL, MCGREW, BERGER, HIRATA, SEIDEL, HAINES, ARISAKA, BLEWITT, BLEWITT, CHERRY. Includes values like 4200, 81, 313, 44, 140, 100, 200, 64, 64, 200, 1.2.

1 We have converted 2 possible events to 90% CL limit.

tau(p -> mu+ eta) T5

Table with columns: LIMIT (10^30 years), PARTICLE, CL%, EVTS, BKGD EST, DOCUMENT ID, TECN. Row: >4700 p, 90, 2, 0.85, ABE, 17d, SKAM.

••• We do not use the following data for averages, fits, limits, etc. •••

Table with columns: > [value], p, [value], [value], NISHINO, WALL, MCGREW, BERGER, HIRATA, PHILLIPS, SEIDEL, HAINES, ARISAKA, BLEWITT, BLEWITT. Includes values like 1300, 89, 126, 26, 69, 1.3, 34, 46, 26, 17, 46.

tau(n -> nu eta) T6

Table with columns: LIMIT (10^30 years), PARTICLE, CL%, EVTS, BKGD EST, DOCUMENT ID, TECN. Row: >158 n, 90, 0, 1.2, MCGREW, 99, IMB3.

••• We do not use the following data for averages, fits, limits, etc. •••

Table with columns: > [value], n, [value], [value], WALL, BERGER, HIRATA, SEIDEL, HAINES, KAJITA, PARK, CHERRY. Includes values like 71, 29, 54, 16, 25, 30, 18, 0.6.

1 We have converted 2 possible events to 90% CL limit.

tau(N -> e+ rho) T7

Table with columns: LIMIT (10^30 years), PARTICLE, CL%, EVTS, BKGD EST, DOCUMENT ID, TECN. Row: >720 p, 90, 2, 0.64, ABE, 17d, SKAM.

$\tau(pn \rightarrow \tau^+ \nu_\tau)$ 777

Table with columns: LIMIT (10^30 years), CL%, EVTS, BKGD EST, DOCUMENT ID, TECN, COMMENT. Row: >29, 90, TAKHISTOV, 15, SKAM.

¹ BRYMAN 14 uses a MCGREW 99 limit on the $p \rightarrow e^+ \nu \nu$ lifetime to extract this value.

$\tau(nn \rightarrow \nu_e \bar{\nu}_e)$ 778
We include "invisible" modes here.

Table with columns: LIMIT (10^30 years), CL%, EVTS, BKGD EST, DOCUMENT ID, TECN, COMMENT. Row: >1.4, 90, ARAKI, 06, KLND, nn \rightarrow invisible.

¹ ARAKI 06 looks for signs of de-excitation of the residual nucleus after disappearance of two neutrons from the s shell of ¹²C.
² ANDERSON 19A looks for γ rays from the de-excitation of a residual ¹⁴O* following the disappearance of nn in ¹⁶O.
³ TRETAYAK 04 uses data from an old Homestake-mine radiochemical experiment on limits for invisible decays of ³⁹K to ³⁷Ar.
⁴ BACK 03 looks for decays of unstable nuclides left after NN decays of parent ¹²C, ¹³C, ¹⁶O nuclei. These are "invisible channel" limits.
⁵ BERNABEI 00b looks for the decay of a ¹²⁷Xe nucleus following the disappearance of an nn pair in the otherwise-stable ¹²⁹Xe nucleus. The limit here applies as well to nn $\rightarrow \nu_\mu \bar{\nu}_\mu, nn \rightarrow \nu_\tau \bar{\nu}_\tau$, or any "disappearance" mode.

$\tau(nn \rightarrow \nu_\mu \bar{\nu}_\mu)$ 779
See the preceding data block. "Invisible modes" would include any multi-neutrino mode.

Table with columns: LIMIT (10^30 years), CL%, EVTS, BKGD EST, DOCUMENT ID, TECN, COMMENT. Row: >1.4 (CL=90%), OUR LIMIT.

$\tau(pn \rightarrow \text{invisible})$ 780
This violates charge conservation as well as baryon number conservation.

Table with columns: VALUE (10^30 years), CL%, DOCUMENT ID, TECN. Row: >0.026, 90, ANDERSON, 19A, SNO+.

¹ ANDERSON 19A looks for γ rays from the de-excitation of a residual ¹⁴N* following the disappearance of pn in ¹⁶O.
² TRETAYAK 04 uses data from an old Homestake-mine radiochemical experiment on limits for invisible decays of ³⁹K to ³⁷Ar.

$\tau(pp \rightarrow \text{invisible})$ 781
This violates charge conservation as well as baryon number conservation.

Table with columns: LIMIT (10^30 years), CL%, EVTS, BKGD EST, DOCUMENT ID, TECN. Row: >0.047, 90, ANDERSON, 19A, SNO+.

¹ ANDERSON 19A looks for γ rays from the de-excitation of a residual ¹⁴C* following the disappearance of pp in ¹⁶O.
² BACK 03 looks for decays of unstable nuclides left after NN decays of parent ¹²C, ¹³C, ¹⁶O nuclei. These are "invisible channel" limits.
³ BERNABEI 00b looks for the decay of a ¹²⁷Xe nucleus following the disappearance of a pp pair in the otherwise-stable ¹²⁹Xe nucleus.

\bar{p} PARTIAL MEAN LIVES

The "partial mean life" limits tabulated here are the limits on \bar{T}/B_j , where \bar{T} is the total mean life for the antiproton and B_j is the branching fraction for the mode in question.

$\tau(\bar{p} \rightarrow e^- \gamma)$ 782

n

I(J^P) = 1/2(1/2^+) Status: ****

We have omitted some results that have been superseded by later experiments. See our earlier editions.

Anyone interested in the neutron should look at these two review articles: D. Dubbers and M.G. Schmidt, "The neutron and its role in cosmology and particle physics," Reviews of Modern Physics 83 1111 (2011); and F.E. Wietfeldt and G.L. Greene, "The neutron lifetime," Reviews of Modern Physics 83 1173 (2011).

n MASS (atomic mass units u)

The mass is known much more precisely in u (atomic mass units) than in MeV. See the next data block.

Table with columns: VALUE (u), DOCUMENT ID, TECN, COMMENT. Includes CODATA values and experimental data from MOHR and COHEN.

n MASS (MeV)

The mass is known more precisely in u (atomic mass units) than in MeV. The conversion is: 1 u = 931.494 102 42(28) MeV/c^2 (2018 CODATA value, TIESINGA 21).

Table with columns: VALUE (MeV), DOCUMENT ID, TECN, COMMENT. Includes CODATA value and various experimental measurements.

1 We use the 1998 CODATA u-to-MeV conversion factor... 2 The mass is known much more precisely in u... 3 These determinations are not independent... 4 The mass is known much more precisely in u...

pi MASS

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes CRESTI 86 HBC measurement.

1 This is a corrected result (see the erratum). The error is statistical. The maximum systematic error is 0.029 MeV.

(m_n - m_pi) / m_n

A test of CPT invariance. Calculated from the n and pi masses, above.

Table with columns: VALUE, DOCUMENT ID. Shows OUR EVALUATION (9 +/- 6) x 10^-5.

m_n - m_p

Table with columns: VALUE (MeV), DOCUMENT ID, TECN, COMMENT. Lists various experimental measurements of the neutron-proton mass difference.

- 1 The 2018 CODATA mass difference in u is m_n - m_p = 1.388 449 33(49) x 10^-3 u. 2 The 2014 CODATA mass difference in u is m_n - m_p = 1.388 449 00(51) x 10^-3 u. 3 The 2010 CODATA mass difference in u is m_n - m_p = 1.388 449 19(45) x 10^-3 u. 4 Calculated by us from the MOHR 08 ratio m_n/m_p = 1.00137841918(46). In u, m_n - m_p = 1.38844920(46) x 10^-3 u. 5 Calculated by us from the MOHR 05 ratio m_n/m_p = 1.00137841870 +/- 0.00000000058. In u, m_n - m_p = (1.3884487 +/- 0.0000006) x 10^-3 u. 6 Calculated by us from the MOHR 99 ratio m_n/m_p = 1.00137841887 +/- 0.00000000058. In u, m_n - m_p = (1.3884489 +/- 0.0000006) x 10^-3 u. 7 Calculated by us from the COHEN 87 ratio m_n/m_p = 1.001378404 +/- 0.000000009. In u, m_n - m_p = 0.001388434 +/- 0.000000009 u.

n MEAN LIFE

Limits on lifetimes for bound neutrons are given in the section "p PARTIAL MEAN LIVES."

We average seven of the best eight measurements, those made with ultracold neutrons (UCN's). If we include the one in-beam measurement with a comparable error (YUE 13), we get 879.6 +/- 0.8 s, where the scale factor is now 2.0.

For a recent discussion of the long-standing disagreement between in-beam and UCN results, see CZARNECKI 18 (Physical Review Letters 120 202002 (2018)). For a full review of all matters concerning the neutron lifetime until about 2010, see WIETFELDT 11, F.E. Wietfeldt and G.L. Greene, "The neutron lifetime," Reviews of Modern Physics 83 1173 (2011).

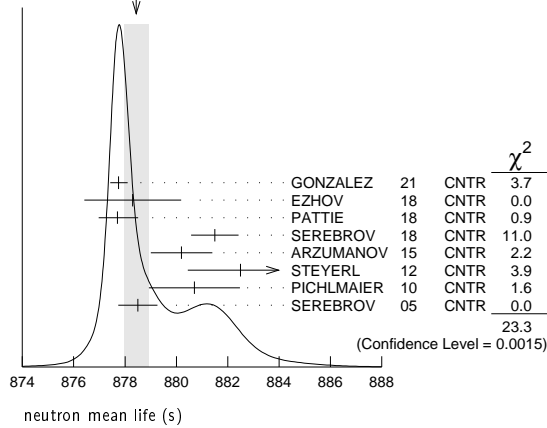

Table with columns: VALUE (s), DOCUMENT ID, TECN, COMMENT. Lists various experimental measurements of the neutron mean life.

- 1 PATTIE 18 uses a new technique, with a semi-toroidal magneto-gravitational asymmetric trap and a novel in situ n-detector. 2 ARZUMANOV 15 is a reanalysis of their 2008-2010 dataset, with improved systematic corrections of ARZUMANOV 00 and ARZUMANOV 12. 3 STEYERL 12 is a detailed reanalysis of neutron storage loss corrections to the raw data of MAMPE 89, and it replaces that value. 4 WILSON 21 extract the value from the flux of n escaping the moon using data from the Lunar Prospector Neutron Spectrometer. 5 YUE 13 differs from NICO 05 in that a different and better method was used to measure the neutron density in the fiducial volume. This shifted the lifetime by +1.4 seconds and reduced the previously largest source of systematic uncertainty by a factor of five. 6 ARZUMANOV 12 reanalyzes its systematic corrections in ARZUMANOV 00 and obtains this corrected value. 7 IGNATOVICH 95 calls into question some of the corrections and averaging procedures used by MAMPE 93. The response, BONDARENKO 96, denies the validity of the criticisms. 8 The NESVIZHEVSKII 92 measurement has been withdrawn by A. Serebrov. 9 The BYRNE 80 measurement has been withdrawn (J. Byrne, private communication, 1990).

Baryon Particle Listings

n

WEIGHTED AVERAGE
878.4±0.5 (Error scaled by 1.8)

the Bohr radius. Numerically, $\langle r_n^2 \rangle = 86.34 b_{ne}$, if we use a_0 for a nucleus with infinite mass.

VALUE (fm ²)	DOCUMENT ID	COMMENT

-0.120 ± 0.002	KOESTER 76	<i>ne</i> scattering (Bi)
-0.116 ± 0.003	KROHN 66	<i>ne</i> scattering (Ne, Ar, Kr, Xe)

¹ KROHN 73 measured $-0.112 \pm 0.003 \text{ fm}^2$. This value is as corrected by KOESTER 76.
² HEACOCK 21 extract the value from Pendeloesung interferometry to measure the neutron structure factors of silicon. This value is strongly anti-correlated with the mean-square thermal atomic displacement.
³ FILIN 20 extract the value based on their chiral-EFT calculation of the deuteron structure radius and use as input the atomic data for the difference of the deuteron and proton charge radii.

n MAGNETIC MOMENT

See the "Quark Model" review.

VALUE (μ _N)	DOCUMENT ID	TECN	COMMENT
-1.91304273 ± 0.00000045	TIESINGA 21	RVUE	2018 CODATA value
••• We do not use the following data for averages, fits, limits, etc. •••			
-1.91304273 ± 0.00000045	MOHR 16	RVUE	2014 CODATA value
-1.91304272 ± 0.00000045	MOHR 12	RVUE	2010 CODATA value
-1.91304273 ± 0.00000045	MOHR 08	RVUE	2006 CODATA value
-1.91304273 ± 0.00000045	MOHR 05	RVUE	2002 CODATA value
-1.91304272 ± 0.00000045	MOHR 99	RVUE	1998 CODATA value
-1.91304275 ± 0.00000045	COHEN 87	RVUE	1986 CODATA value
-1.91304277 ± 0.00000048	¹ GREENE 82	MRS	

¹ GREENE 82 measures the moment to be $(1.04187564 \pm 0.00000026) \times 10^{-3}$ Bohr magnetons. The value above is obtained by multiplying this by $m_p/m_e = 1836.152701 \pm 0.000037$ (the 1986 CODATA value from COHEN 87).

n ELECTRIC DIPOLE MOMENT

A nonzero value is forbidden by both *T* invariance and *P* invariance. A number of early results have been omitted. See RAMSEY 90, GOLUB 94, and LAMOREAUX 09 for reviews.

The results are upper limits on $|d_n|$.

< 16	90	ALTAREV 79	MRS	$d = (4.0 \pm 7.5) \times 10^{-25}$

¹ ABEL 20 reports $d = (0.0 \pm 1.1 \pm 0.2) \times 10^{-26}$ ecm value corresponding to the listed limit.
² SAHOO 17 develops theory to calculate this limit from the measured limit by GRANER 16 of the ¹⁹⁹Hg atom EDM.
³ PENDLEBURY 15 reports $d = (-0.21 \pm 1.82) \times 10^{-26}$ ecm value corresponding to the listed limit.
⁴ SEREBROV 14 includes the data of ALTAREV 96.
⁵ LAMOREAUX 07 faults BAKER 06 for not including in the estimate of systematic error an effect due to the Earth's rotation. BAKER 07 replies (1) that the effect was included implicitly in the analysis and (2) that further analysis confirms that the BAKER 06 limit is correct as is. See also SILENKO 07.
⁶ This HARRIS 99 result includes the result of SMITH 90. However, the averaging of the results of these two experiments has been criticized by LAMOREAUX 00.

n MEAN-SQUARE CHARGE RADIUS

The mean-square charge radius of the neutron, $\langle r_n^2 \rangle$, is related to the neutron-electron scattering length b_{ne} by $\langle r_n^2 \rangle = 3(m_e a_0 / m_n) b_{ne}$, where m_e and m_n are the masses of the electron and neutron, and a_0 is

n MAGNETIC RADIUS

This is the rms magnetic radius, $\sqrt{\langle r_M^2 \rangle}$.

12 ± 10	SCHMIEDM... 88	CNTR	<i>n</i> Pb, <i>n</i> C transmission

¹ KOSSERT 03 gets $\alpha_n - \beta_n = (9.8 \pm 3.6 ^{+2.1}/_{-1.1} \pm 2.2) \times 10^{-4} \text{ fm}^3$, and uses $\alpha_n + \beta_n = (15.2 \pm 0.5) \times 10^{-4} \text{ fm}^3$ from LEVCHUK 00. Thus the errors on α_n and β_n are anti-correlated.
² LUNDIN 03 measures $\alpha_N - \beta_N = (6.4 \pm 2.4) \times 10^{-4} \text{ fm}^3$ and uses accurate values for α_p and α_p and a precise sum-rule result for $\alpha_n + \beta_n$. The second error is a model uncertainty, and errors on α_n and β_n are anticorrelated. The data from this paper are included in the analysis of MYERS 14.
³ KOLB 00 obtains this value with a lower limit of $7.6 \times 10^{-4} \text{ fm}^3$ but no upper limit from this experiment alone. Combined with results of ROSE 90, the 1- σ range is $(7.6-14.0) \times 10^{-4} \text{ fm}^3$.
⁴ KOESTER 95 uses natural Pb and the isotopes 208, 207, and 206. See this paper for a discussion of methods used by various groups to extract α_n from data.

LIMIT ON nπ OSCILLATIONS

Mean Time for nπ Transition

A test of $\Delta B=2$ baryon number nonconservation. MOHAPATRA 80 and MOHAPATRA 89 discuss the theoretical motivations for looking for $n\pi$ oscillations. DOVER 85 give phenomenological analyses. The best limits come from looking for the decay of neutrons bound in nuclei. However, these analyses require model-dependent corrections for nuclear effects. See KABIR 83, DOVER 89, ALBERICO 91, and GAL 00 for discussions. Direct searches for $n \rightarrow \pi$ transitions using reactor neutrons are cleaner but give somewhat poorer limits. We include limits for both free and bound neutrons in the Summary Table. See MOHAPATRA 09 and PHILLIPS 16 for recent reviews.

- ² The AHARMIM 17 value is an unbounded limit (it does not assume a positive lifetime). The bounded limit is 1.23×10^8 sec.

LIMIT ON nn' OSCILLATIONS

Lee and Yang (LEE 56) proposed the existence of mirror world in an attempt to restore global parity symmetry. A possible candidate for dark matter. Limits depend on assumptions about fields *B* and *B'*. See the papers for details. See BEREZHIANI 18 for a recent discussion.

VALUE (s)	CL%	DOCUMENT ID	TECN	COMMENT
>352	95	1 ABEL 21	CNTR	UCN, scan of <i>B</i> field

>103	95	BAN 07	CNTR	UCN, <i>B</i> field on & off

- ¹ ABEL 21 determine several limits on the oscillation time as a function of the ratio mirror magnetic field *B'* to applied magnetic field *B*. The quoted limit of 352 s is for $B' = 0$. Lower limits on the oscillation time of 6 seconds are further obtained for any mirror field *B'* in the range 0.4–25.7 μT .
- ² The *B* field was set to (0.09, 0.12, 0.21) G. Limits on oscillation time are valid for any mirror field *B'* in (0.08–0.17) G, and for aligned fields *B* and *B'*. For larger values of *B'*, the limits are significantly reduced.
- ³ Losses of neutrons due to oscillations to mirror neutrons would be maximal when the magnetic fields *B* and *B'* in the two worlds were equal. Hence the scan over *B* by ALTAREV 09a: the limit applies for any *B'* over the given range. At $B' = 0$, the limit is 141 s (95% CL).

n DECAY MODES

Mode	Fraction (Γ_i/Γ)	Confidence level

λ ≡ *g*_A / *g*_V

- HASSAN 21 include earlier data of DARIUS 17. The value is extracted from the angular correlation coefficient *a*.
- BECK 20 calculates this value from the measurement of the β-decay *e*⁻*ν*_e angular correlation coefficient *a*.
- MAERKISCH 19 gets *A* = -0.11985 ± 0.00017 ± 0.00012.
- BROWN 18 gets *A* = -0.12054 ± 0.00044 ± 0.00068 and λ = -1.2783 ± 0.0022. We quote the combined values that include the earlier UCNA measurements (MENDENHALL 13).
- This MUND 13 value includes earlier PERKEO II measurements (ABELE 02 and ABELE 97D).
- MOSTOVOI 01 measures the two *P*-odd correlations *A* and *B*, or rather *SA* and *SB*, where *S* is the *n* polarization, in free neutron decay.
- YEROZOLIMSKY 97 makes a correction to the EROZOLIMSKII 91 value.
- SAUL 20 quote this value of λ under the SM assumption of the Fierz term *b* = 0. In a combined fit authors extract a value of λ = -1.2792 ± 0.0060.

- DARIUS 17 calculates this value from the measurement of the *a* parameter (see below). Data is included in HASSAN 21.
- MENDENHALL 13 gets *A* = -0.11954 ± 0.00055 ± 0.00098 and λ = -1.2756 ± 0.0030. We quote the nearly identical values that include the earlier UCNA measurement (PLASTER 12), with a correction to that result.
- This PLASTER 12 value is identical with that given in LIU 10, but the experiment is now described in detail.
- This is the combined result of ABELE 02 and ABELE 97D.
- These experiments measure the absolute value of *g*_A/*g*_V only.
- KROHN 75 includes events of CHRISTENSEN 70.
- KROPF 74 reviews all data through 1972.

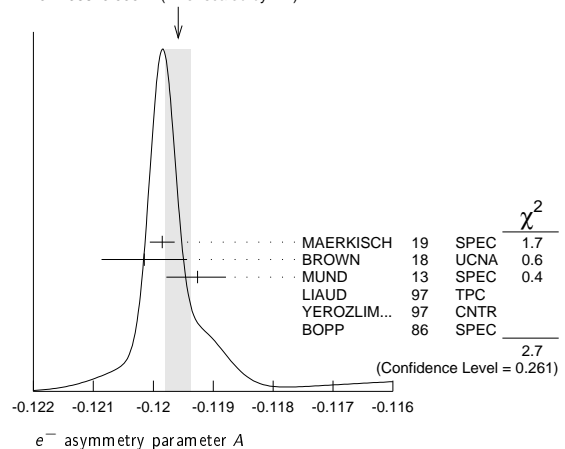

e⁻ ASYMMETRY PARAMETER *A*

This is the neutron-spin electron-momentum correlation coefficient. Unless otherwise noted, the values are corrected for radiative effects and weak magnetism. In the Standard Model, *A* is related to λ ≡ *g*_A/*g*_V by *A* = -2 λ (λ + 1) / (1 + 3λ²); this assumes that *g*_A and *g*_V are real.

- MAERKISCH 19 further derive a value for the CKM-element |*V*_{ud}| = 0.97351 ± 0.00060, using τ_{*n*} = 879.7(8) sec and the relation from CZARNECKI 18.
- BROWN 18 gets *A* = -0.12054 ± 0.00044 ± 0.00068 and λ = -1.2783 ± 0.0022. We quote the combined values that include the earlier UCNA measurements (MENDENHALL 13).
- This MUND 13 value includes earlier PERKEO II measurements (ABELE 02 and ABELE 97D), with a correction to those results.
- YEROZOLIMSKY 97 makes a correction to the EROZOLIMSKII 91 value.
- Under the SM assumption that the Fierz term *b* = 0, SAUL 20 obtain the quoted asymmetry parameter *A* and λ = -1.27607 ± 0.00068. In a combined fit authors extract the values *A* = -0.1209 ± 0.0015, λ = -1.2792 ± 0.0060, and *b* = 0.017 ± 0.021.
- MENDENHALL 13 gets *A* = -0.11954 ± 0.00055 ± 0.00098 and λ = -1.2756 ± 0.0030. We quote the nearly identical values that include the earlier UCNA measurement (PLASTER 12), with a correction to that result.
- This PLASTER 12 value is identical with that given in LIU 10, but the experiment is now described in detail.
- This is the combined result of ABELE 02 and ABELE 97D.
- MOSTOVOI 01 calculates this from its measurement of λ = *g*_A/*g*_V above.
- These results are not corrected for radiative effects and weak magnetism, but the corrections are small compared to the errors.

WEIGHTED AVERAGE
-0.11958 ± 0.00021 (Error scaled by 1.2)

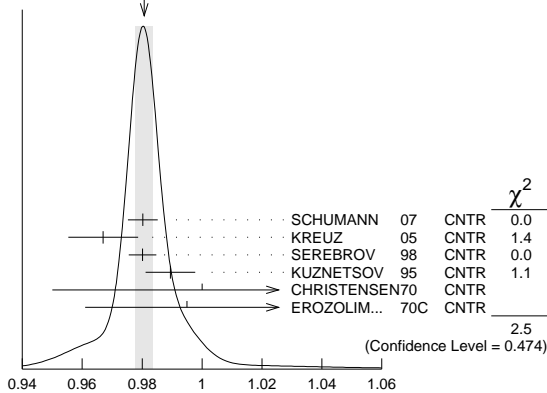

e⁻ asymmetry parameter *A*

$\bar{\nu}_e$ ASYMMETRY PARAMETER *B*

This is the neutron-spin antineutrino-momentum correlation coefficient. In the Standard Model, *B* is related to $\lambda \equiv g_A/g_V$ by $B = 2\lambda(\lambda - 1) / (1 + 3\lambda^2)$; this assumes that g_A and g_V are real.

WEIGHTED AVERAGE
0.9807 ± 0.0030 (Error scaled by 1.0)

$\bar{\nu}_e$ ASYMMETRY PARAMETER *B*

¹ MOSTOVOI 01 calculates this from its measurement of $\lambda = g_A/g_V$ above.

PROTON ASYMMETRY PARAMETER *C*

Describes the correlation between the neutron spin and the proton momentum. In the Standard Model, *C* is related to $\lambda \equiv g_A/g_V$ by $C = -x_c(A + B) = x_c 4\lambda/(1 + 3\lambda^2)$, where $x_c = 0.27484$ is a kinematic factor; this assumes that g_A and g_V are real.

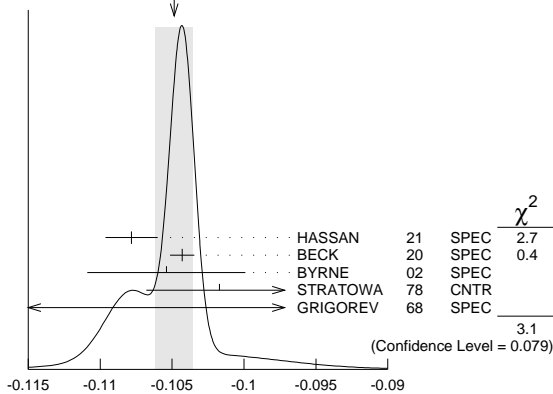

VALUE	DOCUMENT ID	TECN	COMMENT
-0.2377 ± 0.0010 ± 0.0024	SCHUMANN 08	CNTR	Cold <i>n</i> , polarized

e*- $\bar{\nu}_e$ ANGULAR CORRELATION COEFFICIENT *a

For a review of past experiments and plans for future measurements of the *a* parameter, see WIETFELDT 05. In the Standard Model, *a* is related to $\lambda \equiv g_A/g_V$ by $a = (1 - \lambda^2) / (1 + 3\lambda^2)$; this assumes that g_A and g_V are real.

VALUE	DOCUMENT ID	TECN	COMMENT

e*- $\bar{\nu}_e$ Angular correlation coefficient *a

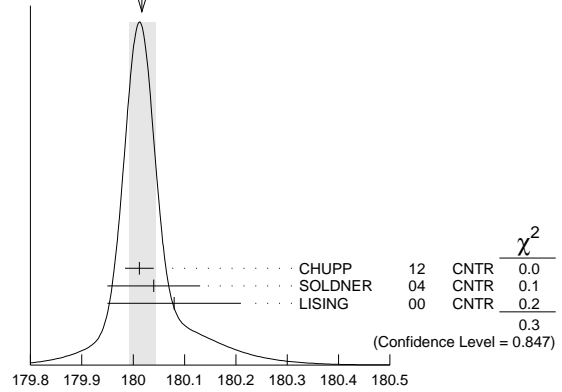

- The result of HASSAN 21 includes the data of DARIUS 17, and thus supersedes those entries. HASSAN 21 uses the asymmetry in time-of-flight between the beta electron and recoil proton in delayed coincidence.
- DARIUS 17 exploits a "wishbone" correlation, where the *p* time of flight is correlated with the momentum of the electron in delayed coincidence. Data is included in HASSAN 21.
- MOSTOVOI 01 calculates this from its measurement of $\lambda = g_A/g_V$ above.

ϕ_{AV} , PHASE OF g_A RELATIVE TO g_V

Time reversal invariance requires this to be 0 or 180°. This is related to *D* given in the next data block and $\lambda \equiv g_A/g_V$ by $\sin(\phi_{AV}) \equiv D(1+3\lambda^2)/2|\lambda|$; this assumes that g_A and g_V are real.

TRIPLE CORRELATION COEFFICIENT *D* (units 10⁻⁴)

Baryon Particle Listings

n

¹ EROZOLIMSKII 78 says asymmetric proton losses and nonuniform beam polarization may give a systematic error up to 30×10^{-4} , thus increasing the EROZOLIMSKII 74 error to 50×10^{-4} . STEINBERG 74 and STEINBERG 76 estimate these systematic errors to be insignificant in their experiment.

TRIPLE CORRELATION COEFFICIENT R

Another test of time-reversal invariance. R measures the polarization of the electron in the direction perpendicular to the plane defined by the neutron spin and the electron momentum. $R = 0$ for T invariance.

VALUE	DOCUMENT ID	TECN	COMMENT
$\pm 0.004 \pm 0.012 \pm 0.005$	¹ KOZELA 12	CNTR	Mott polarimeter

• • • We do not use the following data for averages, fits, limits, etc. • • •

$\pm 0.008 \pm 0.015 \pm 0.005$ KOZELA 09 CNTR See KOZELA 12

¹ KOZELA 12 also measures the polarization of the electron along the direction of the neutron spin. This is nonzero in the Standard Model; the correlation coefficient is $N = +0.067 \pm 0.011 \pm 0.004$.

FIERZ INTERFERENCE TERM b

The coefficient of the Fierz interference term, b , probes additional contributions to the differential decay rate of the neutron from scalar or tensor current interactions, beyond the Standard Model.

VALUE	DOCUMENT ID	TECN	COMMENT
$0.017 \pm 0.020 \pm 0.003$	¹ SAUL 20	SPEC	Cold n, polarized

¹ In a combined fit SAUL 20 extract this best fit value of the Fierz interference term b and the values $A = -0.1209 \pm 0.0015$ and $\lambda = -1.2792 \pm 0.0060$. For b it translates into a 90% CL region of $-0.018 \leq b \leq 0.052$ as a function of A .

n REFERENCES

We have omitted some papers that have been superseded by later experiments. See our earlier editions.

Baryon Particle Listings
N(1535), N(1650)

Table listing various baryon particles and their properties, including ANISOVICH, KASHEVAROV, ROENCHEN, SOKHOYAN, PDG, etc.

Table listing baryon particles and their properties, including ROENCHEN, SHKLYAR, ANISOVICH, BATINIC, ARNDT, HOEHLER.

PHASE 0 table with columns VALUE (°), DOCUMENT ID, TECN, COMMENT. Includes entries for SOKHOYAN, SVARC, CUTKOSKY, ROENCHEN, SHKLYAR, ANISOVICH, BATINIC, ARNDT, HOEHLER.

N(1650) 1/2- I(J^P) = 1/2(1/2-) Status: * * * *

Older and obsolete values are listed and referenced in the 2014 edition, Chinese Physics C38 070001 (2014).

N(1650) POLE POSITION

REAL PART table with columns VALUE (MeV), DOCUMENT ID, TECN, COMMENT. Includes entries for AFZAL, ANISOVICH, SVARC, CUTKOSKY, HUNT, ROENCHEN, SOKHOYAN, SHKLYAR, ANISOVICH, BATINIC, ARNDT, VRANA, HOEHLER.

-2xIMAGINARY PART table with columns VALUE (MeV), DOCUMENT ID, TECN, COMMENT. Includes entries for AFZAL, ANISOVICH, SVARC, CUTKOSKY, HUNT, ROENCHEN, SOKHOYAN, SHKLYAR, ANISOVICH, BATINIC, ARNDT, VRANA, HOEHLER.

N(1650) ELASTIC POLE RESIDUE

MODULUS |r| table with columns VALUE (MeV), DOCUMENT ID, TECN, COMMENT. Includes entries for SOKHOYAN, SVARC, CUTKOSKY.

N(1650) INELASTIC POLE RESIDUE

Normalized residue in N pi -> N(1650) -> N eta table with columns MODULUS, PHASE (°), DOCUMENT ID, TECN, COMMENT. Includes entries for ANISOVICH, ROENCHEN.

Normalized residue in N pi -> N(1650) -> Lambda K table with columns MODULUS, PHASE (°), DOCUMENT ID, TECN, COMMENT. Includes entries for ANISOVICH.

Normalized residue in N pi -> N(1650) -> Sigma K table with columns MODULUS, PHASE (°), DOCUMENT ID, TECN, COMMENT. Includes entry for ROENCHEN.

Normalized residue in N pi -> N(1650) -> Delta, D-wave table with columns MODULUS, PHASE (°), DOCUMENT ID, TECN, COMMENT. Includes entries for SOKHOYAN, ANISOVICH.

Normalized residue in N pi -> N(1650) -> N sigma table with columns MODULUS, PHASE (°), DOCUMENT ID, TECN, COMMENT. Includes entry for SOKHOYAN.

Normalized residue in N pi -> N(1650) -> N(1440) pi table with columns MODULUS, PHASE (°), DOCUMENT ID, TECN, COMMENT. Includes entry for SOKHOYAN.

N(1650) BREIT-WIGNER MASS

Table listing baryon particles and their properties, including GOLOVATCH, HUNT, KASHEVAROV, SOKHOYAN, SHKLYAR, ARNDT, CUTKOSKY, HOEHLER, ANISOVICH, SHRESTHA, BATINIC, PENNER, BAI, VRANA.

$N(1675)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction (Γ_i/Γ)
Γ_1 $N\pi$	38–42 %
Γ_2 $N\eta$	< 1 %
Γ_3 ΛK	< 0.04 %
Γ_4 $N\pi\pi$	25–45 %
Γ_5 $\Delta(1232)\pi, D\text{-wave}$	23–37 %
Γ_6 $N\rho$	0.1–0.9 %
Γ_7 $N\rho, S=1/2$	< 0.2 %
Γ_8 $N\rho, S=3/2, D\text{-wave}$	0.1–0.7 %
Γ_9 $N\sigma$	3–7 %
Γ_{10} $p\gamma$	0–0.02 %
Γ_{11} $p\gamma, \text{ helicity}=1/2$	0–0.01 %
Γ_{12} $p\gamma, \text{ helicity}=3/2$	0–0.01 %
Γ_{13} $n\gamma$	0–0.15 %
Γ_{14} $n\gamma, \text{ helicity}=1/2$	0–0.05 %
Γ_{15} $n\gamma, \text{ helicity}=3/2$	0–0.10 %

 $N(1680)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction (Γ_i/Γ)
Γ_1 $N\pi$	60–70 %
Γ_2 $N\eta$	<1 %
Γ_3 $N\pi\pi$	28–53 %
Γ_4 $\Delta(1232)\pi$	11–23 %
Γ_5 $\Delta(1232)\pi, P$ -wave	4–10 %
Γ_6 $\Delta(1232)\pi, F$ -wave	1–13 %
Γ_7 $N\rho$	8–11 %
Γ_8 $N\rho, S=3/2, P$ -wave	6–8 %
Γ_9 $N\rho, S=3/2, F$ -wave	2–3 %
Γ_{10} $N\sigma$	9–19 %
Γ_{11} $p\gamma$	0.21–0.32 %
Γ_{12} $p\gamma, \text{helicity}=1/2$	0.001–0.011 %
Γ_{13} $p\gamma, \text{helicity}=3/2$	0.20–0.32 %
Γ_{14} $n\gamma$	0.021–0.046 %
Γ_{15} $n\gamma, \text{helicity}=1/2$	0.004–0.029 %
Γ_{16} $n\gamma, \text{helicity}=3/2$	0.01–0.024 %

N(1860) 5/2⁺ $I(J^P) = \frac{1}{2}(\frac{5}{2}^+)$ Status: * * *

OMITTED FROM SUMMARY TABLE
 Before the 2012 Review, all the evidence for a $J^P = 5/2^+$ state with a mass above 1800 MeV was filed under a two-star N(2000). There is now some evidence from ANISOVICH 12A for two 5/2⁺ states in this region, so we have split the older data (according to mass) between two two-star 5/2⁺ states, an N(1860) and an N(2000).

$N(1875) 3/2^-$

$I(J^P) = \frac{1}{2}(3/2^-)$ Status: * * *

Before the 2012 Review, all the evidence for a $J^P = 3/2^-$ state with a mass above 1800 MeV was filed under a two-star $N(2080)$. There is now evidence from ANISOVICH 12A for two $3/2^-$ states in this region, so we have split the older data (according to mass) between a three-star $N(1875)$ and a two-star $N(2120)$.

$N(1895) 1/2^-$

$$I(J^P) = \frac{1}{2}(\frac{1}{2}^-) \text{ Status: } ***$$

Before our 2012 Review, this state appeared in our Listings as the $N(2090)$. Any structure in the S_{11} wave above 1800 MeV is listed here. A few early results that are now obsolete have been omitted.

 $N(2000) 5/2^+$ $I(J^P) = \frac{1}{2}(\frac{5}{2}^+)$ Status: **

OMITTED FROM SUMMARY TABLE

Before the 2012 *Review*, all the evidence for a $J^P = 5/2^+$ state with a mass above 1800 MeV was filed under a two-star $N(2000)$. There is now some evidence from ANISOVICH 12A for two $5/2^+$ states in this region, so we have split the older data (according to mass) between two two-star $5/2^+$ states, an $N(1860)$ and an $N(2000)$.

Baryon Particle Listings
N(2120)

N(2120) 3/2⁻

$I(J^P) = \frac{1}{2}(\frac{3}{2}^-)$ Status: ***

Before the 2012 Review, all the evidence for a $J^P = 3/2^-$ state with a mass above 1800 MeV was filed under a two-star N(2080).

There is now evidence from ANISOVICH 12A for two 3/2⁻ states in this region, so we have split the older data (according to mass) between a three-star N(1875) and a two-star N(2120).

 Partial-Wave Analyses**

OMITTED FROM SUMMARY TABLE

We list here miscellaneous high-mass candidates for isospin-1/2 resonances found in partial-wave analyses.

Our 1982 edition had an $N(3245)$, an $N(3690)$, and an $N(3755)$, each a narrow peak seen in a production experiment. Since nothing has been heard from them since the 1960's, we declare them to be dead. There was also an $N(3030)$, deduced from total cross-section and 180° elastic cross-section measurements; it is the KOCH 80 $L_{1,15}$ state below.

$N(\sim 3000)$ BREIT-WIGNER MASS

$\Delta(1600)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction (Γ_i/Γ)
Γ_1 $N\pi$	8-24%
Γ_2 $N\pi\pi$	58-84%
Γ_3 $\Delta(1232)\pi$	58-82%
Γ_4 $\Delta(1232)\pi$, P-wave	72-82%
Γ_5 $\Delta(1232)\pi$, F-wave	<2%
Γ_6 $N(1440)\pi$	17-27%
Γ_7 $N\gamma$	0.001-0.035%
Γ_8 $N\gamma$, helicity=1/2	0.0-0.02%
Γ_9 $N\gamma$, helicity=3/2	0.001-0.015%

 $\Delta(\sim 3000)$ Region
Partial-Wave Analyses

OMITTED FROM SUMMARY TABLE

We list here miscellaneous high-mass candidates for isospin-3/2 resonances found in partial-wave analyses.

Our 1982 edition also had a $\Delta(2850)$ and a $\Delta(3230)$. The evidence for them was deduced from total cross-section and 180° elastic cross-section measurements. The $\Delta(2850)$ has been resolved into the $\Delta(2750)$ $I_{3,13}$ and $\Delta(2950)$ $K_{3,15}$. The $\Delta(3230)$ is perhaps related to the $K_{3,13}$ of HENDRY 78 and to the $L_{3,17}$ of KOCH 80.

 $\Delta(\sim 3000)$ BREIT-WIGNER MASS

Λ

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 20 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 10.5$ for 16 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

Table with columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Data row for ABLIKIM.

(α+ + α-)/(α- - α+) in Λ → pπ-, Λ → pπ+

Zero if CP is conserved; α- and α+ are the asymmetry parameters for Λ → pπ- and Λ → pπ+ decay. See also the Ξ- for a similar test involving the decay chain Ξ- → Λπ-, Λ → pπ- and the corresponding antiparticle chain.

Table with columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Includes average value and data for ABLIKIM, BARNES, CHAUVAT, BARNES.

1 CHAUVAT 85 actually gives α+(Λ)/α-(Λ) = -1.04 ± 0.29. Assumes polarization is same in pπ- → ΛX and pπ+ → ΛX. Tests of this assumption, based on C-invariance and fragmentation, are satisfied by the data.

R = |GE/GM| in Λ → pπ-, Λ → pπ+

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Data row for ABLIKIM.

1 Determined using the latest BES-III value on the asymmetry parameter α = 0.750 ± 0.010.

Δφ = φE - φM in Λ → pπ-, Λ → pπ+

Table with columns: VALUE (degrees), DOCUMENT ID, TECN, COMMENT. Data row for ABLIKIM.

1 Relative phase between GE and GM, determined using the latest BES-III value on the asymmetry parameter α = 0.750 ± 0.010.

gA / gV FOR Λ → pe-νe

Measurements with fewer than 500 events have been omitted. Where necessary, signs have been changed to agree with our conventions, which are given in the "Note on Baryon Decay Parameters" in the neutron Listings. The measurements all assume that the form factor g2 = 0. See also the footnote on DWORKIN 90.

Table with columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Includes average value and data for DWORKIN, BOURQUIN, WISE, ALTHOFF.

1 The tabulated result assumes the weak-magnetism coupling w ≡ gW(0)/gV(0) to be 0.97, as given by the CVC hypothesis and as assumed by the other listed measurements. However, DWORKIN 90 measures w to be 0.15 ± 0.30, and then gA/gV = -0.731 ± 0.016. 2 This experiment measures only the absolute value of gA/gV.

 $\Lambda(1405) 1/2^-$

$$I(J^P) = 0(\frac{1}{2}^-) \text{ Status: } ****$$

In the 1998 Note on the $\Lambda(1405)$ in PDG 98, R.H. Dalitz discussed the S-shaped cusp behavior of the intensity at the $N\bar{K}$ threshold observed in THOMAS 73 and HEMINGWAY 85. He commented that this behavior "is characteristic of S-wave coupling; the other below threshold hyperon, the $\Sigma(1385)$, has no such threshold distortion because its $N\bar{K}$ coupling is P-wave. For $\Lambda(1405)$ this asymmetry is the sole direct evidence that $J^P = 1/2^-$."

A recent measurement by the CLAS collaboration, MORIYA 14, definitively established the long-assumed $J^P = 1/2^-$ spin-parity assignment of the $\Lambda(1405)$. The experiment produced the $\Lambda(1405)$ spin-polarized in the photoproduction process $\gamma p \rightarrow K^+ \Lambda(1405)$ and measured the decay of the $\Lambda(1405)$ (polarized) $\rightarrow \Sigma^+$ (polarized) π^- . The observed isotropic decay of $\Lambda(1405)$ is consistent with spin $J = 1/2$. The polarization transfer to the Σ^+ (polarized) direction revealed negative parity, and thus established $J^P = 1/2^-$.

$\Lambda(1520) \ 3/2^-$

$\Gamma(J^P) = 0(\frac{3}{2}^-)$ Status: ***

Discovered by FERRO-LUZZI 62; the elaboration in WATSON 63 is the classic paper on the Breit-Wigner analysis of a multichannel resonance.

The measurements of the mass, width, and elasticity published before 1975 are now obsolete and have been omitted. They were last listed in our 1982 edition Physics Letters **111B** 1 (1982).

Production and formation experiments agree quite well, so they are listed together here.

$\Lambda(1820) 5/2^+$

$$I(J^P) = 0(\frac{5}{2}^+) \text{ Status: } ***$$

This resonance is the cornerstone for all partial-wave analyses in this region. Most of the results published before 1973 are now obsolete and have been omitted. They may be found in our 1982 edition Physics Letters **111B** 1 (1982).

SARANTSEV 19 EPJ A55 180 A.V. Sarantsev et al. (BONN, PNPI)

$\Lambda(2085) 7/2^+$

$I(J^P) = 0(\frac{7}{2}^+)$ Status: **

OMITTED FROM SUMMARY TABLE was $\Lambda(2020)$

In LITCHFIELD 71, need for the state rests solely on a possibly inconsistent polarization measurement at 1.784 GeV/c. HEMINGWAY 75 does not require this state. GOPAL 77 does not need it in either $N\bar{K}$ or $\Sigma\pi$. With new K^-n angular distributions included, DECLAIS 77 sees it. However, this and other new data are included in GOPAL 80 and the state is not required. BACCARI 77 weakly supports it.

 $\Lambda(2100) 7/2^-$

$$I(J^P) = 0(\frac{7}{2}^-) \text{ Status: } ****$$

Most of the results published before 1973 are now obsolete and have been omitted. They may be found in our 1982 edition Physics Letters **111B** 1 (1982).

This entry only includes results from partial-wave analyses. Parameters of peaks seen in cross sections and in invariant-mass distributions around 2100 MeV used to be listed in a separate entry immediately following. It may be found in our 1986 edition Physics Letters **170B** 1 (1986).

$\Lambda(2100)$ FOOTNOTES

- ¹ The NAKKASYAN 75 values are from the two best solutions found. Each has the $\Lambda(2100)$ and one additional resonance (P_3 or F_5).
- ² Note that the three for BACCARI 77 entries are for three different waves.
- ³ The published sign has been changed to be in accord with the baryon-first convention. The upper limit on the G_3 wave is 0.03.

$\Lambda(2325) 3/2^-$ $I(J^P) = 0(\frac{3}{2}^-)$ Status: *

OMITTED FROM SUMMARY TABLE

BACCARI 77 finds this state with either $J^P = 3/2^-$ or $3/2^+$ in a energy-dependent partial-wave analyses of $K^-p \rightarrow \Lambda\omega$ from 2070 to 2436 MeV. A subsequent semi-energy-independent analysis from threshold to 2436 MeV selects $3/2^-$. DEBELLEFON 78 (same group) also sees this state in an energy-dependent partial-wave analysis of $K^-p \rightarrow \bar{K}N$ data, and finds $J^P = 3/2^-$ or $3/2^+$. They again prefer $J^P = 3/2^-$, but only on the basis of model-dependent considerations.

$\Lambda(2350) 9/2^+$

$I(J^P) = 0(\frac{9}{2}^+)$ Status: ** *

DAUM 68 favors $J^P = 7/2^-$ or $9/2^+$. BRICMAN 70 favors $9/2^+$. LASINSKI 71 suggests three states in this region using a Pomeron + resonances model. There are now also three formation experiments from the College de France-Saclay group, DEBELLEFON 77, BACCARI 77, and DEBELLEFON 78, which find $9/2^+$ in energy-dependent partial-wave analyses of $\bar{K}N \rightarrow \Sigma\pi, \Lambda\omega$, and $N\bar{K}$.

[a] See the Listings below for the pion momentum range used in this measurement.

CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 14 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 7.7$ for 12 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

x_2	-100
x_3	12 -14
x_1	x_2

Σ^+ BRANCHING RATIOS

$\Gamma(n\pi^+)/\Gamma(N\pi)$ $\Gamma_2/(\Gamma_1+\Gamma_2)$

$$J(P) = 1(\frac{1}{2}^+) \text{ Status: } ***$$

COURANT 63 and ALFF 65, using $\Sigma^0 \rightarrow \Lambda e^+ e^-$ decays (Dalitz decays), determined the Σ^0 parity to be positive, given that $J = 1/2$ and that certain very reasonable assumptions about form factors are true. The results of experiments involving the Primakoff effect, from which the Σ^0 mean life and $\Sigma^0 \rightarrow \Lambda$ transition magnetic moment come (see below), strongly support $J = 1/2$.

Σ^0 MASS

The fit uses $\Sigma^+, \Sigma^0, \Sigma^-,$ and Λ mass and mass-difference measurements.

Σ^0 MEAN LIFE

These lifetimes are deduced from measurements of the cross sections for the Primakoff process $\Lambda \rightarrow \Sigma^0$ in nuclear Coulomb fields. An alternative expression of the same information is the Σ^0 - Λ transition magnetic moment given in the following section. The relation is $(\mu_{\Sigma\Lambda}/\mu_N)^2 \tau = 1.92951 \times 10^{-19}$ s (see DEVLIN 86).

CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 16 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 8.7$ for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

x_3	-64		
x_4	-77	0	
x_5	-5	0	0
	x_1	x_3	x_4

Σ^- BRANCHING RATIOS

$\Gamma(n\pi^- \gamma) / \Gamma(n\pi^-)$ Γ_2 / Γ_1
 The π^+ momentum cuts differ, so we do not average the results but simply use the latest value for the Summary Table.

g_A/g_V FOR $\Sigma^- \rightarrow n e^- \bar{\nu}_e$

Measurements with fewer than 500 events have been omitted. Where necessary, signs have been changed to agree with our conventions, which are given in the "Note on Baryon Decay Parameters" in the neutron Listings. What is actually listed is $|g_1/f_1 - 0.237g_2/f_1|$. This reduces to $g_A/g_V \equiv g_1(0)/f_1(0)$ on making the usual assumption that $g_2 = 0$. See also the note on HSUEH 88.

VALUE	EVTS	DOCUMENT ID	TECN	COMMENT
0.340 ± 0.017				OUR AVERAGE
$+0.327 \pm 0.007 \pm 0.019$	50k	¹ HSUEH	88	SPEC Σ^- 250 GeV

$0.17^{+0.07}_{-0.09}$	519	DECAMP	77	ELEC Hyperon beam

¹ The sign is, with our conventions, unambiguously positive. The value assumes, as usual, that $g_2 = 0$. If g_2 is included in the fit, than (with our sign convention) $g_2 = -0.56 \pm 0.37$, with a corresponding reduction of g_A/g_V to $+0.20 \pm 0.08$.

² BOURQUIN 83c favors the positive sign by at least 2.6 standard deviations.

³ TANENBAUM 74 gives 0.435 ± 0.035 , assuming no q^2 dependence in g_A and g_V . The listed result allows q^2 dependence, and is taken from HSUEH 88.

$f_2(0)/f_1(0)$ FOR $\Sigma^- \rightarrow n e^- \bar{\nu}_e$

The signs have been changed to be in accord with our conventions, given in the "Note on Baryon Decay Parameters" in the neutron Listings.

$\Sigma(1385) 3/2^+$

$I(J^P) = 1(3/2^+)$ Status: ***

Discovered by ALSTON 60. Early measurements of the mass and width for combined charge states have been omitted. They may be found in our 1984 edition Reviews of Modern Physics 56 S1 (1984).

We average only the most significant determinations. We do not average results from inclusive experiments with large backgrounds or results which are not accompanied by some discussion of experimental resolution. Nevertheless systematic differences between experiments remain. (See the ideograms in the Listings below.) These differences could arise from interference effects that change with production mechanism and/or beam momentum. They can also be accounted for in part by differences in the parametrizations employed. (See BORENSTEIN 74 for a discussion on this point.) Thus BORENSTEIN 74 uses a Breit-Wigner with energy-independent width, since a P -wave was found to give unsatisfactory fits. CAMERON 78 uses the same form. On the other hand HOLMGREN 77 obtains a good fit to their $\Lambda\pi$ spectrum with a P -wave Breit-Wigner, but includes the partial width for the $\Sigma\pi$ decay mode in the parametrization. AGUILAR-BENITEZ 81D gives masses and widths for five different Breit-Wigner shapes. The results vary considerably. Only the best-fit S -wave results are given here.

$\Sigma(1385)$ FOOTNOTES

- From fit to inclusive $\Lambda\pi$ spectrum.
- Includes data of HOLMGREN 77.
- The errors are statistical only. The resolution is not unfolded.
- The error is enlarged to Γ/\sqrt{N} . See the note on the $K^*(892)$ mass in the 1984 edition.
- From a fit to $\Lambda\pi^0$ with the width fixed at 34 MeV.
- From fit to inclusive $\Lambda\pi^0$ spectrum with the width fixed at 40 MeV.
- Redundant with data in the mass Listings.
- Results from $\Lambda\pi^+\pi^-$ and $\Lambda\pi^+\pi^-\pi^0$ combined by us.
- The error is enlarged to $4\Gamma/\sqrt{N}$. See the note on the $K^*(892)$ mass in the 1984 edition.
- Consistent with +, 0, and − widths equal.
- KELLER 12 gives $\Gamma(\Sigma^+\gamma)/\Gamma(\Sigma^+\pi^0) = (11.95 \pm 2.21_{-1.21})\%$, using 1/2 our total $\Sigma(1385) \rightarrow \Sigma\pi$ fraction for $\Sigma^+\pi^0$. We divide the KELLER 12 value by two.
- We calculate this from the MOLCHANOV 04 upper limit of 9.5 keV on the $\Sigma^-\gamma$ width.
- We calculate this from the ARIK 77 upper limit of 24 keV on the $\Sigma^-\gamma$ width.
- An extrapolation of the parametrized amplitude below threshold.

$\Sigma(1580) 3/2^-$

$$I(J^P) = 1(\frac{3}{2}^-) \text{ Status: } *$$

OMITTED FROM SUMMARY TABLE

Seen in the isospin-1 $\bar{K}N$ cross section at BNL (LI 73, CARROLL 76) and in a partial-wave analysis of $K^-p \rightarrow \Lambda\pi^0$ for c.m. energies 1560–1600 MeV by LITCHFIELD 74. LITCHFIELD 74 finds $J^P = 3/2^-$. Not seen by ENGLER 78, CAMERON 78C, OLMSTED 04, nor by PRAKHOV 04.

Neither ZHANG 13A nor SARANTSEV 19 see any evidence for this state.

$$I(J^P) = 1(\frac{1}{2}^-) \text{ Status: } *$$

OMITTED FROM SUMMARY TABLE

The S_{11} state at 1697 MeV reported by VANHORN 75 is tentatively listed under the $\Sigma(1750)$. CARROLL 76 sees two bumps in the isospin-1 total cross section near this mass. GAO 12 sees no evidence for this resonance.

Production experiments are listed separately in the next entry.

$\Sigma(1750) 1/2^-$

$$I(J^P) = 1(\frac{1}{2}^-) \text{ Status: } ***$$

For most results published before 1974 (they are now obsolete), see our 1982 edition Physics Letters **111B** 1 (1982).

There is evidence for this state in many partial-wave analyses, but with wide variations in the mass, width, and couplings. The latest analyses indicated significant couplings to $N\bar{K}$ and $\Lambda\pi$, as well as to $\Sigma\eta$ whose threshold is at 1746 MeV (JONES 74).

$$\Sigma(1775) 5/2^-$$

$$I(J^P) = I(5/2^-) \text{ Status: } ***$$

Discovered by GALTIERI 63, this resonance plays the same role as cornerstone for isospin-1 analyses in this region as the $\Lambda(1820)F_{05}$ does in the isospin-0 channel.

For most results published before 1974 (they are now obsolete), see our 1982 edition Physics Letters **111B** 1 (1982).

$\Sigma(1880)$ FOOTNOTES

- The two MARTIN 77 values are from a T-matrix pole and from a Breit-Wigner fit.
- From solution 1 of BAILLON 75; not present in solution 2.
- Only unconstrained states from table 1 of LEA 73 are listed.
- The published sign has been changed to be in accord with the baryon-first convention.

Σ(1910) FOOTNOTES

- ¹ The two MARTIN 77 values are from a T-matrix pole and from a Breit-Wigner fit.
- ² The published sign has been changed to be in accord with the baryon-first convention.
- ³ Upper limits on the D₁ and D₃ waves are each 0.03.

Baryon Particle Listings

 $\Sigma(1915)$ $\Sigma(1915) 5/2^+$ $I(J^P) = 1(\frac{5}{2}^+)$ Status: ****

Discovered by COOL 66. For results published before 1974 (they are now obsolete), see our 1982 edition Physics Letters **111B** 1 (1982).

This entry only includes results from partial-wave analyses. Parameters of peaks seen in cross sections and invariant-mass distributions in this region used to be listed in a separate entry immediately following. They may be found in our 1986 edition Physics Letters **170B** 1 (1986).

$\Sigma(2030) 7/2^+$

 $I(J^P) = 1(\frac{7}{2}^+)$ Status: ***

Discovered by COOL 66 and by WOHL 66. For most results published before 1974 (they are now obsolete), see our 1982 edition Physics Letters **111B** 1 (1982).

This entry only includes results from partial-wave analyses. Parameters of peaks seen in cross sections and invariant-mass distributions around 2030 MeV may be found in our 1984 edition, Reviews of Modern Physics **56** S1 (1984).

$\Sigma(2070) 5/2^+$

$I(J^P) = 1(\frac{3}{2}^+)$ Status: *

OMITTED FROM SUMMARY TABLE

This state suggested by BERTHON 70B finds support in GOPAL 80 with new $K^- p$ polarization and $K^- n$ angular distributions. The very broad state seen in KANE 72 is not required in the later (KANE 74) analysis of $\bar{K}N \rightarrow \Sigma\pi$.

OMITTED FROM SUMMARY TABLE

Results from partial-wave analyses are too weak to warrant separating them from the production and cross-section experiments. LASINSKI 71 in $\bar{K}N$ using a Pomeron + resonances model, and DEBELLEFON 76, DEBELLEFON 77, and DEBELLEFON 78 in energy-dependent partial-wave analyses of $\bar{K}N \rightarrow \Lambda\pi$, $\Sigma\pi$, and $N\bar{K}$, respectively, suggest two resonances around this mass.

 Seen by AMIRZADEH 79 as a narrow 6.5-standard-deviation enhancement in the reaction $K^- p \rightarrow Y^{*+} \pi^-$ using data from independent high statistics bubble chamber experiments at 8.25 and 6.5 GeV/c. The dominant decay modes are multibody, multistrange final states and the production is via isospin-3/2 baryon exchange. Isospin 1 is favored.

Not seen in a $K^- p$ experiment in LASS at 11 GeV/c (ASTON 85B).

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 11 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 7.5$ for 7 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

RADIATIVE HYPERON DECAYS

Revised July 2011 by J.D. Jackson (LBNL).

The weak radiative decays of spin-1/2 hyperons, $B_i \rightarrow B_f\gamma$, yield information about matrix elements (form factors) similar to that gained from weak hadronic decays. For a polarized spin-1/2 hyperon decaying radiatively via a $\Delta Q = 0$, $\Delta S = 1$

transition, the angular distribution of the direction \hat{p} of the final spin-1/2 baryon in the hyperon rest frame is

$$\frac{dN}{d\Omega} = \frac{N}{4\pi} (1 + \alpha_\gamma \mathbf{P}_i \cdot \hat{p}). \quad (1)$$

Here \mathbf{P}_i is the polarization of the decaying hyperon, and α_γ is the asymmetry parameter. In terms of the form factors $F_1(q^2)$, $F_2(q^2)$, and $G(q^2)$ of the effective hadronic weak electromagnetic vertex,

$$F_1(q^2)\gamma_\lambda + iF_2(q^2)\sigma_{\lambda\mu}q^\mu + G(q^2)\gamma_\lambda\gamma_5,$$

 α_γ is

$$\alpha_\gamma = \frac{2 \operatorname{Re}[G(0)F_M^*(0)]}{|G(0)|^2 + |F_M(0)|^2}, \quad (2)$$

where $F_M = (m_i - m_f)[F_2 - F_1/(m_i + m_f)]$. If the decaying hyperon is unpolarized, the decay baryon has a longitudinal polarization given by $P_f = -\alpha_\gamma$ [1].

The angular distribution for the weak hadronic decay, $B_i \rightarrow B_f\pi$, has the same form as Eq. (1), but of course with a different asymmetry parameter, α_π . Now, however, if the decaying hyperon is unpolarized, the decay baryon has a longitudinal polarization given by $P_f = +\alpha_\pi$ [2,3]. The difference of sign is because the spins of the pion and photon are different.

$\Xi^0 \rightarrow \Lambda\gamma$ decay—The radiative decay $\Xi^0 \rightarrow \Lambda\gamma$ of an unpolarized Ξ^0 uses the hadronic decay $\Lambda \rightarrow p\pi^-$ as the analyzer. As noted above, the longitudinal polarization of the Λ will be $P_\Lambda = -\alpha_{\Xi\Lambda\gamma}$. Let α_- be the $\Lambda \rightarrow p\pi^-$ asymmetry parameter and $\theta_{\Lambda p}$ be the angle, as seen in the Λ rest frame, between the Λ line of flight and the proton momentum. Then the hadronic version of Eq. (1) applied to the $\Lambda \rightarrow p\pi^-$ decay gives

$$\frac{dN}{d \cos \theta_{\Lambda p}} = \frac{N}{2} (1 - \alpha_{\Xi\Lambda\gamma} \alpha_- \cos \theta_{\Lambda p}) \quad (3)$$

for the angular distribution of the proton in the Λ frame. Our current value, from the CERN NA48/1 experiment [4], is $\alpha_{\Xi\Lambda\gamma} = -0.704 \pm 0.019 \pm 0.064$.

$\Xi^0 \rightarrow \Sigma^0\gamma$ decay—The asymmetry parameter here, $\alpha_{\Xi\Sigma\gamma}$, is measured by following the decay chain $\Xi^0 \rightarrow \Sigma^0\gamma$, $\Sigma^0 \rightarrow \Lambda\gamma$, $\Lambda \rightarrow p\pi^-$. Again, for an unpolarized Ξ^0 , the longitudinal polarization of the Σ^0 will be $P_\Sigma = -\alpha_{\Xi\Sigma\gamma}$. In the $\Sigma^0 \rightarrow \Lambda\gamma$ decay, a parity-conserving magnetic-dipole transition, the polarization of the Σ^0 is transferred to the Λ , as may be seen as follows. Let $\theta_{\Sigma\Lambda}$ be the angle seen in the Σ^0 rest frame between the Σ^0 line of flight and the Λ momentum. For Σ^0 helicity +1/2, the probability amplitudes for positive and negative spin states of the Σ^0 along the Λ momentum are $\cos(\theta_{\Sigma\Lambda}/2)$ and $\sin(\theta_{\Sigma\Lambda}/2)$. Then the amplitude for a negative helicity photon and a negative helicity Λ is $\cos(\theta_{\Sigma\Lambda}/2)$, while the amplitude for positive helicities for the photon and Λ is $\sin(\theta_{\Sigma\Lambda}/2)$. For Σ^0 helicity -1/2, the amplitudes are interchanged. If the Σ^0 has longitudinal polarization P_Σ , the probabilities for Λ helicities $\pm 1/2$ are therefore

$$p(\pm 1/2) = \frac{1}{2}(1 \mp P_\Sigma) \cos^2(\theta_{\Sigma\Lambda}/2) + \frac{1}{2}(1 \pm P_\Sigma) \sin^2(\theta_{\Sigma\Lambda}/2), \quad (4)$$

and the longitudinal polarization of the Λ is

$$P_\Lambda = -P_\Sigma \cos \theta_{\Sigma\Lambda} = +\alpha_{\Xi\Sigma\gamma} \cos \theta_{\Sigma\Lambda}. \quad (5)$$

Using Eq. (1) for the $\Lambda \rightarrow p\pi^-$ decay again, we get for the joint angular distribution of the $\Sigma^0 \rightarrow \Lambda\gamma, \Lambda \rightarrow p\pi^-$ chain,

$$\frac{d^2N}{d\cos\theta_{\Sigma\Lambda}d\cos\theta_{\Lambda p}} = \frac{N}{4} (1 + \alpha_{\Xi\Sigma\gamma} \cos \theta_{\Sigma\Lambda} \alpha - \cos \theta_{\Lambda p}). \quad (6)$$

Our current average for $\alpha_{\Xi\Sigma\gamma}$ is -0.69 ± 0.06 [4,5].

References

1. R.E. Behrends, Phys. Rev. **111**, 1691 (1958); see Eq. (7) or (8).
2. In ancient times, the signs of the asymmetry term in the angular distributions of radiative and hadronic decays of polarized hyperons were sometimes opposite. For roughly 50 years, however, the overwhelming convention has been to make them the same. The aim, not always achieved, is to remove ambiguities.

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 5 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 1.0$ for 1 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

<3.7 × 10 ⁴	90	LITTENBERG 92b	HBC	Uses YEH 74 data

••• We do not use the following data for averages, fits, limits, etc. •••

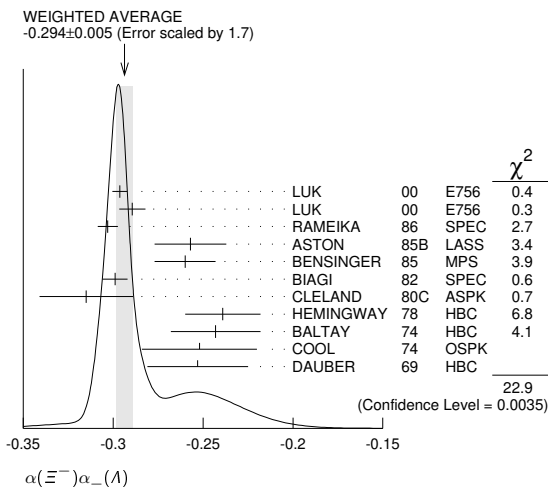

⁷This LITTENBERG 92b limit and the identical YEH 74 limits for the preceding three modes all result from nonobservance of any 3-prong decays of the Ξ^- . One could as well apply the limit to the sum of the four modes.

Ξ^- DECAY PARAMETERS

See the "Note on Baryon Decay Parameters" in the neutron Listings.

⁸This LUK 00 value is for $\alpha(\Xi^+)\alpha_+(\bar{\Lambda})$. We assume CP conservation here by including it in the average for $\alpha(\Xi^-)\alpha_-(\Lambda)$. But see the second data block below for the CP test.

α FOR $\Xi^- \rightarrow \Lambda \pi^-$
 The above average, $\alpha(\Xi^-)\alpha_-(\Lambda) = -0.294 \pm 0.005$, divided by our current average $\alpha_-(\Lambda) = 0.732 \pm 0.014$, gives the following value for $\alpha(\Xi^-)$:

-0.401 ± 0.010 OUR EVALUATION

$[\alpha(\Xi^-)\alpha_-(\Lambda) - \alpha(\Xi^+)\alpha_+(\bar{\Lambda})]$
 $[\alpha(\Xi^-)\alpha_-(\Lambda) + \alpha(\Xi^+)\alpha_+(\bar{\Lambda})]$
 This is zero if CP is conserved. The α 's are the decay-asymmetry parameters for $\Xi^- \rightarrow \Lambda \pi^-$ and $\Lambda \rightarrow p \pi^-$ and for $\Xi^+ \rightarrow \bar{\Lambda} \pi^+$ and $\bar{\Lambda} \rightarrow \bar{p} \pi^+$.

••• We do not use the following data for averages, fits, limits, etc. •••

⁹From this result and α_Ξ , HUANG 04 gets $\beta_\Xi = -0.037 \pm 0.011 \pm 0.010$ and $\gamma_\Xi = 0.888 \pm 0.0004 \pm 0.006$. And the strong p-s phase difference for $\Lambda \pi^-$ scattering is $(4.6 \pm 1.4 \pm 1.2)^\circ$.

¹⁰From this result and α_Ξ , CHAKRAVORTY 03 obtains $\beta_\Xi = -0.025 \pm 0.042 \pm 0.006$ and $\gamma_\Xi = 0.889 \pm 0.001 \pm 0.007$. And the strong p-s phase difference for $\Lambda \pi^-$ scattering is $(3.17 \pm 5.28 \pm 0.73)^\circ$.

¹¹BENSINGER 85 used $\alpha_\Lambda = 0.642 \pm 0.013$.

¹²The errors have been multiplied by 1.2 due to approximations used for the Ξ polarization; see DAUBER 69 for a discussion.

g_A/g_V FOR $\Xi^- \rightarrow \Lambda e^- \bar{\nu}_e$

VALUE	EVTS	DOCUMENT ID	TECN	COMMENT
-0.25 ± 0.05	1992	¹³ BOURQUIN 83	SPEC	SPS hyperon beam

¹³BOURQUIN 83 assumes that $g_2 = 0$. Also, the sign has been changed to agree with our conventions, given in the "Note on Baryon Decay Parameters" in the neutron Listings.

Ξ RESONANCES

Revised 2004 by C.G. Wohl, (LBNL).

The accompanying table gives our evaluation of the present status of the Ξ resonances. Not much is known about Ξ resonances. This is because (1) they can only be produced as a part of a final state, and so the analysis is more complicated than if direct formation were possible, (2) the production cross sections are small (typically a few μb), and (3) the final states are topologically complicated and difficult to study with electronic techniques. Thus early information about Ξ resonances came entirely from bubble chamber experiments, where the numbers of events are small, and only in the 1980's did electronic experiments make any significant contributions. However, nothing of significance on Ξ resonances has been added since our 1988 edition.

For a detailed earlier review, see Meadows [1].

Table 1. The status of the Ξ resonances. Only those with an overall status of *** or **** are included in the Baryon Summary Table.

Particle	J^P	Overall status	Status as seen in —				
			$\Xi\pi$	ΛK	ΣK	$\Xi(1530)\pi$	Other channels
$\Xi(1318)$	1/2+	****					Decays weakly
$\Xi(1530)$	3/2+	****	****				
$\Xi(1620)$		*	*				
$\Xi(1690)$		***		***	**		
$\Xi(1820)$	3/2-	***	**	***	**	**	
$\Xi(1950)$		***	**	**		*	
$\Xi(2030)$		***		**	***		
$\Xi(2120)$		*		*			
$\Xi(2250)$		**					3-body decays
$\Xi(2370)$		**					3-body decays
$\Xi(2500)$		*		*	*		3-body decays

**** Existence is certain, and properties are at least fairly well explored.
 *** Existence ranges from very likely to certain, but further confirmation is desirable and/or quantum numbers, branching fractions, etc. are not well determined.
 ** Evidence of existence is only fair.
 * Evidence of existence is poor.

Reference

- B.T. Meadows, in *Proceedings of the IVth International Conference on Baryon Resonances* (Toronto, 1980), ed. N. Isgur, p. 283.

$\Xi(1530) 3/2^+$

$$I(J^P) = \frac{1}{2}(\frac{3}{2}^+) \text{ Status: } ****$$

This is the only Ξ resonance whose properties are all reasonably well known. Assuming that the Λ_c^+ has $J^P = 1/2^+$, AUBERT 08AK, in a study of $\Lambda_c^+ \rightarrow \Xi^- \pi^+ K^+$, finds conclusively that the spin of the $\Xi(1530)^0$ is 3/2. In conjunction with SCHLEIN 63B and BUTTON-SHAFER 66, this proves also that the parity is +.

We use only those determinations of the mass and width that are accompanied by some discussion of systematics and resolution.

$\Xi(1690)$

$J(P) = \frac{1}{2}(?)$ Status: ***

AUBERT 08AK, in a study of $\Lambda_c^+ \rightarrow \Xi^- \pi^+ K^+$, finds some evidence that the $\Xi(1690)$ has $J^P = 1/2^-$.

DIONISI 78 sees a threshold enhancement in both the neutral and negatively charged $\Sigma \bar{K}$ mass spectra in $K^- p \rightarrow (\Sigma \bar{K}) K \pi$ at 4.2 GeV/c. The data from the $\Sigma \bar{K}$ channels alone cannot distinguish between a resonance and a large scattering length. Weaker evidence at the same mass is seen in the corresponding $\Lambda \bar{K}$ channels, and a coupled-channel analysis yields results consistent with a new Ξ .

BIAGI 81 sees an enhancement at 1700 MeV in the diffractively produced ΛK^- system. A peak is also observed in the ΛK^0 mass spectrum at 1660 MeV that is consistent with a 1720 MeV resonance decaying to $\Sigma^0 \bar{K}^0$, with the γ from the Σ^0 decay not detected.

BIAGI 87 provides further confirmation of this state in diffractive dissociation of Ξ^- into ΛK^- . The significance claimed is 6.7 standard deviations.

ADAMOVIICH 98 sees a peak of 1400 ± 300 events in the $\Xi^- \pi^+$ spectrum produced by 345 GeV/c Σ^- -nucleus interactions.

 $\Xi(1820) 3/2^-$

$$I(J^P) = \frac{1}{2}(\frac{3}{2}^-) \text{ Status: } ***$$

The clearest evidence is an 8-standard-deviation peak in ΛK^- seen by GAY 76C. TEODORO 78 favors $J = 3/2$, but cannot make a parity discrimination. BIAGI 87C is consistent with $J = 3/2$ and favors negative parity for this J value.

 $\Xi(1820)$ MASS

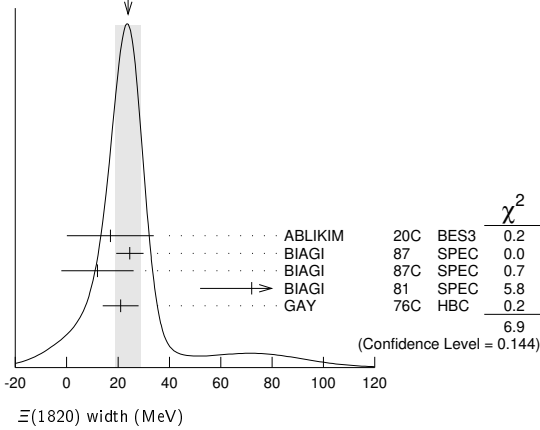

We only average the measurements that appear to us to be most significant and best determined.

$\Xi(1950)$

$I(J^P) = \frac{1}{2}(?)^?$ Status: ***

We list here everything reported between 1875 and 2000 MeV. The accumulated evidence for a Ξ near 1950 MeV seems strong enough to include a $\Xi(1950)$ in the main Baryon Table, but not much can be said about its properties. In fact, there may be more than one Ξ near this mass.

$\Xi(2030)$

$$J(J^P) = \frac{1}{2} (\geq \frac{5}{2}) \text{ status: } ***$$

The evidence for this state has been much improved by HEMINGWAY 77, who see an eight standard deviation enhancement in $\Sigma \bar{K}$ and a weaker coupling to $\Lambda \bar{K}$. ALITTI 68 and HEMINGWAY 77 observe no signals in the $\Xi \pi \pi$ (or $\Xi(1530) \pi$) channel, in contrast to DIBIANCA 75. The decay $(\Lambda/\Sigma) \bar{K} \pi$ reported by BARTSCH 69 is also not confirmed by HEMINGWAY 77.

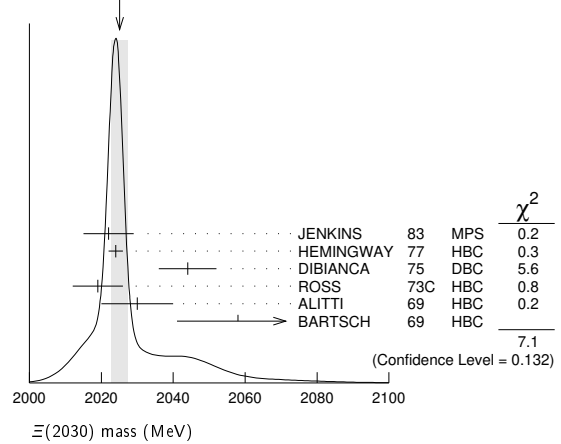

A moments analysis of the HEMINGWAY 77 data indicates at a level of three standard deviations that $J \geq 5/2$.

$\Xi(2120)$ FOOTNOTES

- ¹ CHLIAPNIKOV 79 does not uniquely identify the K^+ in the $(\bar{\Lambda} K^+)$ X final state. It also reports bumps with fewer events at 2240, 2540, and 2830 MeV.
- ² GAY 76c sees a 4-standard deviation signal. However, HEMINGWAY 77, with more events from the same experiment points out that the signal is greatly reduced if a cut is made on the 4-momentum u . This suggests an anomalous production mechanism if the $\Xi(2120)$ is real.

The evidence for this state is mixed. BARTSCH 69 sees a bump of not much statistical significance in $\Lambda\bar{K}\pi$, $\Sigma\bar{K}\pi$, and $\Xi\pi\pi$ mass spectra. GOLDWASSER 70 sees a narrower bump in $\Xi\pi\pi$ at a higher mass. Not seen by HASSALL 81 with 45 events/ μb at 6.5 GeV/c. Seen by JENKINS 83. Perhaps seen by BIAGI 87.

Ω BARYONS

($S = -3, I = 0$)

$\Omega^- = sss$

$I(J^P) = 0(\frac{3}{2}^+)$ Status: ****

The unambiguous discovery in both production and decay was by BARNES 64. The quantum numbers follow from the assignment of the particle to the baryon decuplet. DEUTSCHMANN 78 and BAUBILLIER 78 rule out $J = 1/2$ and find consistency with $J = 3/2$. AUBERT, BE 06 finds from the decay angular distributions of $\Xi_c^0 \rightarrow \Omega^- K^+$ and $\Omega_c^0 \rightarrow \Omega^- K^+$ that $J = 3/2$; this depends on the spins of the Ξ_c^0 and Ω_c^0 being $J = 1/2$, their supposed values. ABLIKIM 21E determines the Ω^- spin to be $J = 3/2$ from the decay angular distributions of the complete decay chain $\psi(3686) \rightarrow \Omega^- \bar{\Omega}^+$, with subsequent decays $\Omega^- \rightarrow K^- \Lambda$ and $\bar{\Omega}^+ \rightarrow K^+ \bar{\Lambda}$. We have omitted some results that have been superseded by later experiments. See our earlier editions.

Ω^- MASS

The fit assumes the Ω^- and $\bar{\Omega}^+$ masses are the same, and averages them together.

1675	1	⁴ EISENBERG 54	EMUL	

¹DIBIANCA 75 gives a mass for each event. We quote the average.
²The FRY 55 and FRY 55B events were identified as Ω^- by ALVAREZ 73. The masses assume decay to ΛK^- at rest. For FRY 55B, decay from an atomic orbit could Doppler shift the K^- energy and the resulting Ω^- mass by several MeV. This shift is negligible for FRY 55 because the Ω decay is approximately perpendicular to its orbital velocity, as is known because the Λ strikes the nucleus (L. Alvarez, private communication 1973). We have calculated the error assuming that the orbital n is 4 or larger.
³Excluded from the average; the Ω^- lifetimes measured by the experiments differ significantly from other measurements.
⁴The EISENBERG 54 mass was calculated for decay in flight. ALVAREZ 73 has shown that the Ω interacted with an Ag nucleus to give $K^- \Xi$ Ag.

$\bar{\Omega}^+$ MASS

The fit assumes the Ω^- and $\bar{\Omega}^+$ masses are the same, and averages them together.

OMITTED FROM SUMMARY TABLE

A peak in the $\Omega^- \pi^+ \pi^-$ mass spectrum with a signal significance claimed to be at least 5.5 standard deviations. There is no reason to seriously doubt the existence of this state, but unless the evidence is overwhelming we usually wait for confirmation from a second experiment before elevating peaks to the Summary Table.

Baryon Particle Listings

Charmed Baryons, Λ_c^+

CHARMED BARYONS

(C = +1)

$\Lambda_c^+ = udc, \Sigma_c^{++} = uuc, \Sigma_c^+ = udc, \Sigma_c^0 = ddc,$
 $\Xi_c^+ = usc, \Xi_c^0 = dsc, \Omega_c^0 = ssc$

Λ_c^+ $I(J^P) = 0(\frac{1}{2}^+)$ Status: * * * *

The parity of the Λ_c^+ is defined to be positive (as are the parities of the proton, neutron, and Λ). The quark content is udc . Results of an analysis of $pK^-\pi^+$ decays (JEZABEK 92) are consistent with $J = 1/2$. ABLIKIM 21N determines the Λ_c^+ spin to be $J = 1/2$, from an angular analysis of various 2-body Λ_c^+ decays in $e^+e^- \rightarrow \Lambda_c^+ \bar{\Lambda}_c^-$.

We have omitted some results that have been superseded by later experiments. The omitted results may be found in earlier editions.

Λ_c^+ MASS

Our value in 2004, 2284.9 ± 0.6 MeV, was the average of the measurements now filed below as "not used." The BABAR measurement is so much better that we use it alone. Note that it is about 2.6 (old) standard deviations above the 2004 value.

The fit also includes $\Sigma_c - \Lambda_c^+$ and $\Lambda_c^{*+} - \Lambda_c^+$ mass-difference measurements, but this doesn't affect the Λ_c^+ mass. The new (in 2006) Λ_c^+ mass simply pushes all those other masses higher.

¹AUBERT,B 05s uses low-Q $\Lambda_c^0 K^+$ and $\Sigma^0 K_S^0 K^+$ decays to minimize systematic errors. The error above includes systematic as well as statistical errors. Many cross checks and adjustments to properties of the BABAR detector, as well as the large number of clean events, make this by far the best measurement of the Λ_c^+ mass.

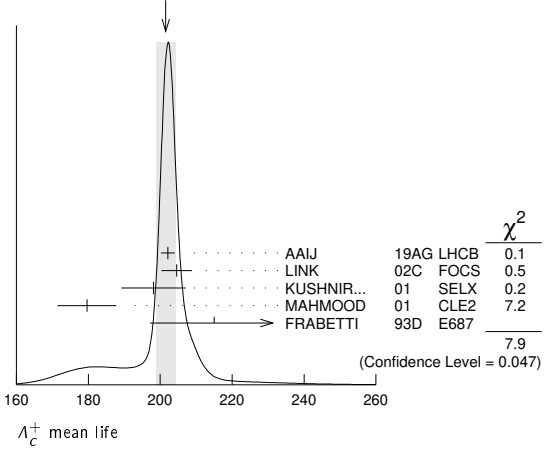

Λ_c^+ MEAN LIFE

Measurements with an error $\geq 100 \times 10^{-15}$ s or with fewer than 20 events have been omitted from the Listings.

¹AAIJ 19AG reports $[A_c^+ \text{ MEAN LIFE}] / [D^\pm \text{ MEAN LIFE}] = 0.1956 \pm 0.0010 \pm 0.0013$ which we multiply by our best value $D^\pm \text{ MEAN LIFE} = (1.033 \pm 0.005) \times 10^{-12}$ s. Our first error is their experiment's error and our second error is the systematic error from using our best value.

WEIGHTED AVERAGE
201.5±2.7 (Error scaled by 1.6)

Λ_c^+ DECAY MODES

Branching fractions marked with a footnote, e.g. [a], have been corrected for decay modes not observed in the experiments. For example, the sub-mode fraction $\Lambda_c^+ \rightarrow p\bar{K}^*(892)^0$ seen in $\Lambda_c^+ \rightarrow pK^-\pi^+$ has been multiplied up to include $\bar{K}^*(892)^0 \rightarrow \bar{K}^0\pi^0$ decays.

[a] This branching fraction includes all the decay modes of the final-state resonance.

CONSTRAINED FIT INFORMATION

An overall fit to 41 branching ratios uses 62 measurements and one constraint to determine 21 parameters. The overall fit has a $\chi^2 = 47.4$ for 42 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

Baryon Particle Listings

$\Lambda_c(2595)^+$, $\Lambda_c(2625)^+$

$\Lambda_c(2595)^+$ $J(P) = 0(\frac{1}{2}^-)$ Status: ***

The $\Lambda_c^+ \pi^+ \pi^-$ mode is largely, and perhaps entirely, $\Sigma_c \pi$, which is just at threshold; since the Σ_c has $J^P = 1/2^+$, the J^P here is almost certainly $1/2^-$. This result is in accord with the theoretical expectation that this is the charm counterpart of the strange $\Lambda(1405)$.

$\Lambda_c(2595)^+$ MASS

The mass is obtained from the $\Lambda_c(2595)^+ - \Lambda_c^+$ mass-difference measurements below.

VALUE (MeV)	DOCUMENT ID
2592.25 ± 0.28 OUR FIT	

$\Lambda_c(2595)^+ - \Lambda_c^+$ MASS DIFFERENCE

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
305.79 ± 0.24 OUR FIT				
305.79 ± 0.14 ± 0.20	3.5k	AALTONEN	11H	CDF $p\bar{p}$ at 1.96 TeV
••• We do not use the following data for averages, fits, limits, etc. •••				
305.6 ± 0.3		¹ BLECHMAN	03	Threshold shift
309.7 ± 0.9 ± 0.4	19	ALBRECHT	97	ARG $e^+e^- \approx 10$ GeV
309.2 ± 0.7 ± 0.3	14 ± 4.5	FRABETTI	96	E687 γ Be, $\bar{E}_\gamma \approx 220$ GeV
307.5 ± 0.4 ± 1.0	112 ± 17	EDWARDS	95	CLE2 $e^+e^- \approx 10.5$ GeV

¹BLECHMAN 03 finds that a more sophisticated treatment than a simple Breit-Wigner for the proximity of the threshold of the dominant decay, $\Sigma_c(2455)\pi$, lowers the $\Lambda_c(2595)^+ - \Lambda_c^+$ mass difference by 2 or 3 MeV. The analysis of AALTONEN 11H bears this out.

$\Lambda_c(2595)^+$ WIDTH

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
2.59 ± 0.30 ± 0.47	3.5k	² AALTONEN	11H	CDF $p\bar{p}$ at 1.96 TeV
••• We do not use the following data for averages, fits, limits, etc. •••				
2.9 $^{+2.9}_{-2.1}$ $^{+1.8}_{-1.4}$	19	ALBRECHT	97	ARG $e^+e^- \approx 10$ GeV
3.9 $^{+1.4}_{-1.2}$ $^{+2.0}_{-1.0}$	112 ± 17	EDWARDS	95	CLE2 $e^+e^- \approx 10.5$ GeV

²AALTONEN 11H treats the three charged modes $\Lambda_c(2595)^+ \rightarrow \Sigma_c(2455)^+ \pi^-$, $\Sigma_c(2455)^+ \pi^0$, $\Sigma_c(2455)^0 \pi^+$ separately in terms of a common coupling constant h_2 and obtains $h_2^2 = 0.36 \pm 0.08$. From this the width is determined.

$\Lambda_c(2595)^+$ DECAY MODES

$\Lambda_c^+ \pi \pi$ and its submode $\Sigma_c(2455)\pi$ — the latter just barely — are the only strong decays allowed to an excited Λ_c^+ having this mass; and the submode seems to dominate.

Mode	Fraction (Γ_i/Γ)
Γ_1 $\Lambda_c^+ \pi^+ \pi^-$	[a] —
Γ_2 $\Sigma_c(2455)^{++} \pi^-$	24 ± 7 %
Γ_3 $\Sigma_c(2455)^0 \pi^+$	24 ± 7 %
Γ_4 $\Lambda_c^+ \pi^+ \pi^-$ 3-body	18 ± 10 %
Γ_5 $\Lambda_c^+ \pi^0$	[b] not seen
Γ_6 $\Lambda_c^+ \gamma$	not seen

[a] See AALTONEN 11H, Fig. 8, for the calculated ratio of $\Lambda_c^+ \pi^0 \pi^0$ and $\Lambda_c^+ \pi^+ \pi^-$ partial widths as a function of the $\Lambda_c(2595)^+ - \Lambda_c^+$ mass difference. At our value of the mass difference, the ratio is about 4.

[b] A test that the isospin is indeed 0, so that the particle is indeed a Λ_c^+ .

OMITTED FROM SUMMARY TABLE

A broad, statistically significant peak (997^{+141}_{-129} events) seen in $\Lambda_c^+ \pi^+ \pi^-$. However, nothing at all is known about its quantum numbers, including whether it is a Λ_c^+ or a Σ_c , or whether the width might be due to overlapping states.

$\Sigma_c(2800)$

$I(J^P) = 1(?)^?$ Status: ***

Seen in the $\Lambda_c^+ \pi^+$, $\Lambda_c^+ \pi^0$, and $\Lambda_c^+ \pi^-$ mass spectra.

$\Sigma_c(2800)$ MASSES

The charged ++ and + masses are obtained from the mass-difference measurements that follow. The neutral mass is dominated by the mass-difference measurement, but is pulled up somewhat by the less well-determined but considerably higher direct-mass measurement. It is possible, in fact, that AUBERT 08BN is seeing a different Σ_c .

2460 ± 25	82	BIAGI	83	SPEC Σ^- Be 135 GeV

¹AAIJ 14Z systematic error includes in quadrature the 0.14 MeV uncertainty from the $m(\Lambda_c^+)$ mass value.

²The systematic error was (wrongly) given the other way round in LESIAK 05; see the erratum.

³Although COTEUS 87 claims to agree well with BIAGI 83 on the mass and width, there appears to be a discrepancy between the two experiments. BIAGI 83 sees a single peak (stated significance about 6 standard deviations) in the $\Lambda K^- \pi^+ \pi^+$ mass spectrum. COTEUS 87 sees two peaks in the same spectrum, one at the Ξ_c^+ mass, the other 75 MeV lower. The latter is attributed to $\Xi_c^+ \rightarrow \Sigma^0 K^- \pi^+ \pi^+ \rightarrow (\Lambda \gamma) K^- \pi^+ \pi^+$, with the γ unseen. The combined significance of the double peak is stated to be 5.5 standard deviations. But the absence of any trace of a lower peak in BIAGI 83 seems to us to throw into question the interpretation of the lower peak of COTEUS 87.

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 6 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 1.4$ for 3 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

VALUE (units 10 ⁻³)	EVTS	DOCUMENT ID	TECN	COMMENT
5.5 ± 0.2 ± 1.8	6.3k	¹ AAJ	20AH LHCB	pp at 13 TeV
¹ AAJ 20AH extracts $B(\Xi_c^0 \rightarrow \Lambda_c^+ \pi^-)$ using two different normalization modes: $\Lambda_c^+ \rightarrow p K^- \pi^+$ and $\Xi_c^+ \rightarrow p K^- \pi^+$. The mean value of both results, taking their correlations into account, is presented as the final result. The measurement assumes production fraction ratios $f_{\Xi_c^0} / f_{\Lambda_c^+} = (9.7 \pm 0.9 \pm 3.1) \times 10^{-2}$ (from AAJ 19AB plus heavy quark symmetry arguments) as well as $f_{\Xi_c^0} / f_{\Xi_c^+} = 1.00 \pm 0.01$. It further uses the inputs $B(\Lambda_c^+ \rightarrow p K^- \pi^+) = (6.23 \pm 0.33) \times 10^{-2}$ and $B(\Xi_c^+ \rightarrow p K^- \pi^+) = (4.5 \pm 2.1 \pm 0.7) \times 10^{-3}$ (from LI 19c). Its correlation with $B(\Xi_c^+ \rightarrow p K^- \pi^+)$, as measured in AAJ 20AH, is 0.414.

$1.67 \pm 0.29 \pm 0.15 \pm 0.09 \pm 0.25$	1 MOON	21	BELL e^+e^- at $\Upsilon(nS)$

¹ Measurement of the ratio of $\Xi_c(2970)^+ \rightarrow \Xi_c(2645)^0 \pi^+$ versus $\Xi_c(2970)^+ \rightarrow \Xi_c^0 \pi^+$. The last uncertainty is from possible isospin-symmetry-breaking effects. MOON 21 determines from an angular analysis of the $\Xi_c^+ \pi^+ \pi^-$ final state that the spin of the $\Xi_c(2970)^+$ is strongly compatible with $J = 1/2$, assuming domination by the lowest partial wave in $\Xi_c(2970)^+ \rightarrow \Xi_c(2645)^0 \pi^+$. When further combined with the size of this ratio, MOON 21 determines from heavy quark symmetry that the spin-parity of the $\Xi_c(2970)^+$ is favored to be $J^P = 1/2^+$, with light degrees of freedom in the 0^+ state.

$\Omega_c(2770)^0$

$I(J^P) = 0(\frac{3}{2}^+)$ Status: ***

The natural assignment is that this goes with the $\Sigma_c(2520)$ and $\Xi_c(2645)$ to complete the lowest mass $J^P = \frac{3}{2}^+$ SU(3) sextet, part of the SU(4) 20-plet that includes the $\Delta(1232)$. But J and P have not been measured.

$\Omega_c(2770)^0$ MASS

The mass is obtained from the mass-difference measurement that follows.

VALUE (MeV)	DOCUMENT ID

DOUBLY CHARMED BARYONS (C = +2)

$\Xi_{cc}^{++} = ucc, \Xi_{cc}^+ = dcc, \Omega_{cc}^+ = scc$

$$I(J^P) = ?(?^?) \text{ Status: } *$$

OMITTED FROM SUMMARY TABLE

Nominally the isospin partner of the Ξ_{cc}^{++} (ccu). While the SELEX experiment (MATTSON 02, OCHERASHVILI 05) claimed an observation of this state, subsequent searches by BABAR (AUBERT,B 06D), Belle (CHISTOV 06, KATO 14), and LHCb (AAIJ 13CD, AAIJ 20AX) did not find any significant signal or evidence for the Ξ_{cc}^+ . However, AAIJ 21AE reports that its search for $\Xi_{cc}^+ \rightarrow \Xi_c^+ \pi^+ \pi^-$, when combined with a prior search for $\Xi_{cc}^+ \rightarrow \Lambda_c^+ K^- \pi^+$ decays in AAIJ 20AX, yields a signal at 2.9 σ global significance (4.0 σ local).

Ξ_{cc}^+ MASS

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
3518.9 ± 0.9 OUR AVERAGE				
3518 ± 3	6	¹ OCHERASHVILI.05	SELX	Σ^- nucleus \approx 600 GeV
3519 ± 1	16	² MATTSON 02	SELX	Σ^- nucleus \approx 600 GeV

- • • We do not use the following data for averages, fits, limits, etc. • • •
- 3623.0 ± 1.4 368 ± 193 ³ AAIJ 21AE LHCb pp at 7, 8, 13 TeV
- ¹ OCHERASHVILI 05 claims "an excess of 5.62 events over ... 1.38 ± 0.13 events" for a significance of 4.8 σ in $pD^+ K^-$ events.
- ² MATTSON 02 claims "an excess of 15.9 events over an expected background of 6.1 ± 0.5 events, a statistical significance of 6.3 σ " in the $\Lambda_c^+ K^- \pi^+$ invariant-mass spectrum. The probability that the peak is a fluctuation increases from 1.0 × 10⁻⁶ to 1.1 × 10⁻⁴ when the number of bins searched is considered.
- ³ Uncertainties are statistical only. Because of undetermined systematic uncertainties in the extraction of this result it cannot be considered a mass measurement. AAIJ 21AE performs a combined fit to its $\Xi_{cc}^+ \rightarrow \Xi_c^+ \pi^+ \pi^-$ data and the $\Xi_{cc}^+ \rightarrow \Lambda_c^+ K^- \pi^+$ data from AAIJ 20AX, finding a global significance of 2.9 σ (4.0 σ local).

Baryon Particle Listings

Λ_b^0

BOTTOM BARYONS
($B = -1$)

$\Lambda_b^0 = udb, \Xi_b^0 = usb, \Xi_b^- = dsb, \Omega_b^- = sss$

Λ_b^0

$I(J^P) = 0(\frac{1}{2}^+)$ Status: ***

In the quark model, a Λ_b^0 is an isospin-0 udb state. The lowest Λ_b^0 ought to have $J^P = 1/2^+$. None of $I, J,$ or P have actually been measured.

Λ_b^0 MEAN LIFE

See b -baryon Admixture section for data on b -baryon mean life average over species of b -baryon particles.

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

Λ_b^0

- ¹ Measured using $\Lambda_b^0 \rightarrow J/\psi \Lambda$ and $B^0 \rightarrow J/\psi K^*(892)^0$ decays.
- ² Used $\Lambda_b^0 \rightarrow J/\psi p K^-$ and $B^0 \rightarrow J/\psi K^*(892)^0$ decays.
- ³ Measured with $\Lambda_b^0 \rightarrow J/\psi(\mu^+ \mu^-) \Lambda^0(p\pi^-)$ decays.
- ⁴ Uses fully reconstructed $\Lambda_b \rightarrow J/\psi \Lambda$ decays.
- ⁵ Uses $B^0 \rightarrow J/\psi K_S^0$ decays for denominator.
- ⁶ Measures $1/\tau_{\Lambda_b^0} - 1/\tau_{B^0}$ and uses $\tau_{B^0} = 1.519 \pm 0.007$ ps to extract lifetime ratio.
- ⁷ Measured mean life ratio using fully reconstructed decays.

Λ_b^0 DECAY MODES

The branching fractions $B(b\text{-baryon} \rightarrow \Lambda \ell^- \bar{\nu}_\ell \text{anything})$ and $B(\Lambda_b^0 \rightarrow \Lambda_c^+ \ell^- \bar{\nu}_\ell \text{anything})$ are not pure measurements because the underlying measured products of these with $B(b \rightarrow b\text{-baryon})$ were used to determine $B(b \rightarrow b\text{-baryon})$, as described in the note "Production and Decay of b -Flavored Hadrons."

For inclusive branching fractions, e.g., $\Lambda_b \rightarrow \bar{\Lambda}_c \text{anything}$, the values usually are multiplicities, not branching fractions. They can be greater than one.

Mode	Fraction (Γ_i/Γ)	Scale factor/ Confidence level

[a] P_c^+ is a pentaquark-charmonium state.

[b] Not a pure measurement. See note at head of Λ_b^0 Decay Modes.

[c] Here h^- means π^- or K^- .

CONSTRAINED FIT INFORMATION

An overall fit to 10 branching ratios uses 12 measurements and one constraint to determine 7 parameters. The overall fit has a $\chi^2 = 10.8$ for 6 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

VALUE (units 10^{-5})	
5.8 ± 0.8 OUR AVERAGE	
6.01 ± 0.60 ± 0.58 ± 0.28	1 ABAZOV 11o D0 $p\bar{p}$ at 1.96 TeV
4.7 ± 2.3 ± 0.2	2 ABE 97b CDF $p\bar{p}$ at 1.8 TeV
••• We do not use the following data for averages, fits, limits, etc. •••	
180 ± 60 ± 90	16 ALBAJAR 91e UA1 $p\bar{p}$ at 630 GeV
¹ ABAZOV 11o uses $B(B^0 \rightarrow J/\psi K_S^0) \times B(b \rightarrow B^0) = (1.74 \pm 0.08) \times 10^{-4}$ to obtain the result. The $(\pm 0.08) \times 10^{-4}$ uncertainty of this product is listed as the last uncertainty of the measurement, $(\pm 0.28) \times 10^{-5}$.	
² ABE 97b reports $[B(\Lambda_b^0 \rightarrow J/\psi \Lambda) \times B(b \rightarrow \Lambda_b^0)] / [B(B^0 \rightarrow J/\psi K_S^0) \times B(b \rightarrow B^0)] = 0.27 \pm 0.12 \pm 0.05$. We multiply by our best value $B(B^0 \rightarrow J/\psi K_S^0) \times B(b \rightarrow B^0) = (1.74 \pm 0.08) \times 10^{-4}$. Our first error is their experiment error and our second error is the systematic error from using our best value.

CP AND T VIOLATION PARAMETERS

Measured values of the triple-product asymmetry parameters, odd under time-reversal, are defined as $A_{c(s)}(\Lambda/\phi) = (N_{c(s)}^+ - N_{c(s)}^-) / (\text{sum})$

where $N_{c(s)}^+$, $N_{c(s)}^-$ are the number of Λ or ϕ candidates for which the $\cos(\Phi)$ and $\sin(\Phi)$ observables are positive and negative, respectively. Angles $\cos(\Phi)$ and $\sin(\Phi)$ are defined as in LEITNER 07.

$0.05 \pm 0.17 \pm 0.07$ ⁴ AAIJ 13AG LHCb Repl. by AAIJ 20O

¹ Extracted using a Bayesian analysis. The most probable value is given as -0.022 , with a 68% credibility interval $[-0.048, 0.005]$. Transverse polarizations of Λ_b^0 of -0.004 (68% credibility interval $[-0.064, 0.051]$), 0.001 (68% credibility interval $[-0.035, 0.045]$), and 0.032 (68% credibility interval $[-0.011, 0.065]$) are also reported at 7 TeV, 8 TeV and 13 TeV, respectively. Note that both statistical and systematic uncertainties are included.

² An angular analysis of $\Lambda_b \rightarrow J/\psi \Lambda$ decay is performed. Note that the sign of α in CMS definition is the opposite to that used by AAIJ 13AG and AAD 14L. Λ_b transverse production polarization of $0.00 \pm 0.06 \pm 0.06$ is also reported, as well as squares of the helicity amplitudes.

³ An angular analysis of $\Lambda_b \rightarrow J/\psi \Lambda$ decay is performed and magnitudes of all helicity amplitudes are also reported.

⁴ An angular analysis of $\Lambda_b \rightarrow J/\psi \Lambda$ decay is performed and a Λ_b transverse production polarization of $0.06 \pm 0.07 \pm 0.02$ is also reported.

 $f_L(\mu\mu)$ longitudinal polarization fraction in $\Lambda_b \rightarrow \Lambda \mu^+ \mu^-$

FORWARD-BACKWARD ASYMMETRIES

The forward-backward asymmetry is defined as $A_{FB}(\Lambda_b^0) = [N(F) - N(B)] / [N(F) + N(B)]$, where the forward (F) direction corresponds to a particle (Λ_b^0 or $\bar{\Lambda}_b^0$) sharing valence quark flavors with a beam particle with the same sign of rapidity.

$$\Xi_b^0$$

$I(J^P) = \frac{1}{2}(\frac{1}{2}^+)$ Status: ***
I, J, P need confirmation.

In the quark model, Ξ_b^0 and Ξ_b^- are an isodoublet (usb , dsb) state; the lowest Ξ_b^0 and Ξ_b^- ought to have $J^P = 1/2^+$. None of I, J, or P have actually been measured.

¹ Uses $\Omega_b^- \rightarrow \Xi_C^+ K^- \pi^-$ and $\Xi_C^+ \rightarrow p K^- \pi^+$ decays. Reports the value of $6044.3 \pm 1.2 \pm 1.1^{+0.19}_{-0.22}$ MeV where the last uncertainty is due to the mass of Ξ_C^+ . We have combined the two systematic uncertainties in quadrature.
² Reconstructed in $\Omega_b^- \rightarrow \Omega_C^0 \pi^-$, $\Omega_C^0 \rightarrow p K^- K^- \pi^+$ decays. Reference Ξ_b^- mass 5797.72 ± 0.6 MeV from AAIJ 14B.
³ Uses $\Omega_b^- \rightarrow J/\psi \Omega^-$ and $\Omega_C^0 \pi^-$ decays, with the first evidence for $\Omega_b^- \rightarrow \Omega_C^0 \pi^-$ at 3.3 σ significance.
⁴ Measured in $\Omega_b^- \rightarrow J/\psi \Omega^-$ with 19 ± 5 events.
⁵ Observed in $\Omega_b^- \rightarrow J/\psi \Omega^-$ decays with $16⁺⁶₋₄$ candidates, a significance of 5.5 sigma from a combined mass-lifetime fit.
⁶ Observed in $\Omega_b^- \rightarrow J/\psi \Omega^-$ decays with 17.8 ± 4.9 ± 0.8 candidates, a significance of 5.4 sigma.

b -baryon ADMIXTURE (Λ_b , Ξ_b , Ω_b)

b -baryon ADMIXTURE MEAN LIFE

Each measurement of the b -baryon mean life is an average over an admixture of various b baryons which decay weakly. Different techniques emphasize different admixtures of produced particles, which could result in a different b -baryon mean life. More b -baryon flavor specific channels are not included in the measurement.

($\Lambda_b, \Xi_b, \Omega_b$)

These branching fractions are actually an average over weakly decaying b -baryons weighted by their production rates at the LHC, LEP, and Tevatron, branching ratios, and detection efficiencies. They scale with the b -baryon production fraction $B(b \rightarrow b\text{-baryon})$.

The branching fractions $B(b\text{-baryon} \rightarrow \Lambda \ell^- \bar{\nu}_\ell \text{ anything})$ and $B(\Lambda_b^0 \rightarrow \Lambda_c^+ \ell^- \bar{\nu}_\ell \text{ anything})$ are not pure measurements because the underlying measured products of these with $B(b \rightarrow b\text{-baryon})$ were used to determine $B(b \rightarrow b\text{-baryon})$, as described in the note "Production and Decay of b -Flavored Hadrons."

For inclusive branching fractions, e.g., $B \rightarrow D^\pm \text{ anything}$, the values usually are multiplicities, not branching fractions. They can be greater than one.

Mode	Fraction (Γ_i/Γ)	Scale factor
Γ_1 $p\mu^- \bar{\nu}$ anything	$(5.8 \pm \frac{2.3}{2.0})\%$	
Γ_2 $p\ell \bar{\nu}_\ell$ anything	$(5.6 \pm 1.2)\%$

$3.8 \pm 0.6 \pm 0.6$	125

The values and averages in this section serve only to show what values result if one assumes our $B(b \rightarrow b\text{-baryon})$. They cannot be thought of as measurements since the underlying product branching fractions were also used to determine $B(b \rightarrow b\text{-baryon})$ as described in the note on "Production and Decay of b -Flavored Hadrons."

¹ BARATE 98D reports $[\Gamma(b\text{-baryon} \rightarrow \Lambda \ell^- \bar{\nu}_\ell \text{ anything})/\Gamma_{\text{total}}] \times [B(\bar{b} \rightarrow b\text{-baryon})] = 0.00326 \pm 0.00016 \pm 0.00039$ which we divide by our best value $B(\bar{b} \rightarrow b\text{-baryon}) = (8.4 \pm 1.1) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Measured using the excess of $\Lambda \ell^-$, lepton impact parameter.

² AKERS 96 reports $[\Gamma(b\text{-baryon} \rightarrow \Lambda \ell^- \bar{\nu}_\ell \text{ anything})/\Gamma_{\text{total}}] \times [B(\bar{b} \rightarrow b\text{-baryon})] = 0.00291 \pm 0.00023 \pm 0.00025$ which we divide by our best value $B(\bar{b} \rightarrow b\text{-baryon}) = (8.4 \pm 1.1) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

³ ABREU 95s reports $[\Gamma(b\text{-baryon} \rightarrow \Lambda \ell^- \bar{\nu}_\ell \text{ anything})/\Gamma_{\text{total}}] \times [B(\bar{b} \rightarrow b\text{-baryon})] = 0.0030 \pm 0.0006 \pm 0.0004$ which we divide by our best value $B(\bar{b} \rightarrow b\text{-baryon}) = (8.4 \pm 1.1) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁴ BUSKULIC 95L reports $[\Gamma(b\text{-baryon} \rightarrow \Lambda \ell^- \bar{\nu}_\ell \text{ anything})/\Gamma_{\text{total}}] \times [B(\bar{b} \rightarrow b\text{-baryon})] = 0.0061 \pm 0.0006 \pm 0.0010$ which we divide by our best value $B(\bar{b} \rightarrow b\text{-baryon}) = (8.4 \pm 1.1) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁵ AKERS 93 superseded by AKERS 96.

⁶ BUSKULIC 92i reports $[\Gamma(b\text{-baryon} \rightarrow \Lambda \ell^- \bar{\nu}_\ell \text{ anything})/\Gamma_{\text{total}}] \times [B(\bar{b} \rightarrow b\text{-baryon})] = 0.0070 \pm 0.0010 \pm 0.0018$ which we divide by our best value $B(\bar{b} \rightarrow b\text{-baryon}) = (8.4 \pm 1.1) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Superseded by BUSKULIC 95L.

AAIJ	19W	PRL 122 222001	R. Aaij et al.	(LHCb Collab.)
------	-----	----------------	----------------	----------------

$P_c(4380)^+$ Status: *

A resonance seen in $\Lambda_b^0 \rightarrow P_c^+ K^-$, then $P_c \rightarrow J/\psi p$, with a significance of 9 standard deviations. The $J/\psi p$ quark content is $uudc\bar{c}$, a pentaquark. See also the $P_c(4450)^+$. In the best amplitude fit, the two states have opposite parity, one having $J = 3/2$, the other $J = 5/2$.

Extraction of the pentaquark signals requires some understanding of the dominant $K^- p$ background. AAIJ 15P used a model-dependent approach. AAIJ 16AG reanalyzed the data making minimal assumptions about the $K^- p$ background, and thus confirmed the strong significance of the pentaquark signals.

- ACHARYA 21 search for dyons at LHC. Using a production model limits (we report the lowest) are set for dyons with magnetic charge up to 5 gD, electric charges up to 200 e and spins 0, 1/2, 1. The corresponding mass limits for magnetic monopoles are in the range 870-2040 GeV for magnetic charges in the same range.
- AAD 20G give limits for Drell-Yan production with spin-0 and spin-1/2 monopoles. The above limit is for spin = 0 at mass = 3 TeV.
- ACHARYA 19B limits both β-dependent and β-independent on monopoles with spins 0, 1/2, and 1 and with magnetic charges ranging from one to five times the Dirac charge in mass ranges between 200 GeV and 5000 GeV.
- ACHARYA 18A provide limits on monopoles with spins 0, 1/2, and 1 and with magnetic charges ranging from two to five times the Dirac charge.
- The search was sensitive to monopoles which had stopped in aluminium trapping volumes. Monopoles with spins 0 and 1/2 were considered; mass-dependent spin 1/2 monopole limits are quoted here.
- AAD 16AB model-independent 95% CL limits estimated using a fiducial region of approximately constant acceptance. Limits are mass-dependent.
- ACHARYA 16 limits at 95% CL estimated using a Drell-Yan-like production mechanism for scalar monopoles.
- AAD 12CS searched for monopoles as highly ionising objects. The cross section limits are based on an assumed Drell-Yan-like production process for spin 1/2 monopoles. The limits are mass- and scenario-dependent.
- ABBIENDI 08 assume production of spin 1/2 monopoles with effective charge gβ (n=1), via e⁺e⁻ → γ* → M \bar{M} , so that the cross section is proportional to (1 + cos²θ). There is no z information for such highly saturated tracks, so a parabolic track in the jet chamber is projected onto the xy plane. Charge per hit in the chamber produces a clean separation of signal and background.
- ABULENCIA 06K searches for high-ionizing signals in CDF central outer tracker and time-of-flight detector. For Drell-Yan M \bar{M} production, the cross section limit implies M > 360 GeV at 95% CL.
- AKTAS 05A model-dependent limits as a function of monopole mass shown for arbitrary mass of 60 GeV. Based on search for stopped monopoles in the H1 Al beam pipe.
- AKTAS 05A limits with assumed elastic spin 0 monopole pair production.
- AKTAS 05A limits with assumed inelastic spin 1/2 monopole pair production.
- KALBFLEISCH 04 reports searches for stopped magnetic monopoles in Be, Al, and Pb samples obtained from discarded material from the upgrading of DØ and CDF. A large-aperture warm-bore cryogenic detector was used. The approach was an extension of the methods of KALBFLEISCH 00. Cross section results moderately model dependent; interpretation as a mass lower limit depends on possibly invalid perturbation expansion.
- KALBFLEISCH 00 used an induction method to search for stopped monopoles in pieces of the DØ (FNAL) beryllium beam pipe and in extensions to the drift chamber aluminum support cylinder. Results are model dependent.
- KALBFLEISCH 00 result is for aluminum.
- KALBFLEISCH 00 result is for beryllium.
- HE 97 used a lead target and barium phosphate glass detectors. Cross-section limits are well below those predicted via the Drell-Yan mechanism.
- This work has also been reinterpreted in the framework of monopole production via the thermal Schwinger process (GOULD 17); this gives rise to lower mass limits.
- Multiphoton events.
- Cherenkov radiation polarization.
- Re-examines CERN neutrino experiments.

Monopole Production — Other Accelerator Searches

- ABBOTT 98K search for heavy pointlike Dirac monopoles via central production of a pair of photons with high transverse energies.
- ACCIARRI 95C finds a limit B(Z → γγ) < 0.8 × 10⁻⁵ (which is possible via a monopole loop) at 95% CL and sets the mass limit via a cross section model.

Monopole Flux — Cosmic Ray Searches

"Caty" in the charge column indicates a search for monopole-catalyzed nucleon decay.

- ¹ABBASI 22 search was based on Cherenkov light detection in an array of optical modules in the Antarctic ice cap. Limits are speed-dependent.
- ²ACERO 21 employ NOVA experiment to set reported 90% CL upper limit on the cosmic monopoles flux for velocity $6 \times 10^{-4} < \beta < 5 \times 10^{-3}$ and mass $> 5 \times 10^8$ GeV.
- ³GAPONENKO 21 use data of NT200 two-year operation at Baikal to give speed-dependent limits for different assumed catalysis cross sections. Reported limit is for $\sigma = 10$ mb.
- ⁴ALBERT 17 limits were estimated using a Cherenkov light in an array of optical modules under the Mediterranean Sea. The limits are for MM masses between 10^{10} and 10^{14} GeV. The limits are speed-dependent.
- ⁵AAB 16 search was made with a set of telescopes sampling the longitudinal profile of fluorescence light emitted by extensive air showers. Limits are speed dependent.
- ⁶AARTSEN 16b was based on a Cherenkov signature in an array of optical modules which were sunk in the Antarctic ice cap. Limits are speed-dependent.
- ⁷Beyond the monopole speed, the limits of AARTSEN 14 depend on the catalysis cross section (σ) which corresponds to the monopole radiating \bar{l} times the light per track length compared to the Cherenkov light from a single electrically charged, relativistic particle. The values quoted here correspond to $\sigma = 1$ barn or $\bar{l} = 30$.
- ⁸ABBASI 13 and ABBASI 10a were based on a Cherenkov signature in an array of optical modules which were sunk in the Antarctic ice cap. Limits are speed-dependent.
- ⁹ADRIAN-MARTINEZ 12a measurements were based on a Cherenkov signature in an underwater telescope in the Western Mediterranean Sea. Limits are speed-dependent.
- ¹⁰The limits from UENO 12 depend on the monopole speed and are also sensitive to assumed values of monopole mass and the catalysis cross section.
- ¹¹HOGAN 08 and DETRIXHE 11 limits on relativistic monopoles are based on nonobservation of radio Cherenkov signals at the South Pole. Limits are speed-dependent.
- ¹²BALESTRA 08 exposed of nuclear track detector modules totaling 400 m² for 4 years at the Chacaltaya Laboratory (5230 m) in search for intermediate-mass monopoles with $\beta > 0.05$. The analysis is mainly based on three CR39 modules. For $M > 5 \times 10^{13}$ GeV there

- can be upward-going monopoles as well, hence the flux limit is half that obtained for less massive monopoles. Previous experiments (e.g. MACRO and OHYA (ORITO 91)) had set limits only for $M > 1 \times 10^9$ GeV.
- ¹³AMBROSIO 02b direct search final result for $m \geq 10^{17}$ GeV, based upon 4.2 to 9.5 years of running, depending upon the subsystem. Limit with CR39 track-etch detector extends the limit from $\beta=4 \times 10^{-5}$ (3.1×10^{-16} cm⁻²sr⁻¹s⁻¹) to $\beta=1 \times 10^{-4}$ (2.1×10^{-16} cm⁻²sr⁻¹s⁻¹). Limit curve in paper is piecewise continuous due to different detection techniques for different β ranges.
- ¹⁴AMBROSIO 02c limit for catalysis of nucleon decay with catalysis cross section of ≈ 1 mb. The flux limit increases by ~ 3 at the higher β limit, and increases to 1×10^{-14} cm⁻²sr⁻¹s⁻¹ if the catalysis cross section is 0.01 mb. Based upon 71193 hr of data with the streamer detector, with an acceptance of 4250 m²sr.
- ¹⁵AMBROSIO 02d result for "more than two years of data." Ionization search using several subsystems. Limit curve as a function of β not given. Included in AMBROSIO 02b.
- ¹⁶AMBROSIO 97 global MACRO 90%CL is 0.78×10^{-15} at $\beta=1.1 \times 10^{-4}$, goes through a minimum at 0.61×10^{-15} near $\beta=(1.1-2.7) \times 10^{-3}$, then rises to 0.84×10^{-15} at $\beta=0.1$. The global limit in this region is below the Parker bound at 10^{-15} . Less stringent limits are established for $4 \times 10^{-5} < \beta < 1 \times 10^{-4}$. Limits set by various triggers and different subdetectors are given in the paper. All limits assume a catalysis cross section smaller than a few mb.
- ¹⁷AHLEN 94 limit for dyons extends down to $\beta=0.9E-4$ and a limit of $1.3E-14$ extends to $\beta=0.8E-4$. Also see comment by PRICE 94 and reply of BARISH 94. One loophole in the AHLEN 94 result is that in the case of monopoles catalyzing nucleon decay, relativistic particles could veto the events. See AMBROSIO 97 for additional results.
- ¹⁸Catalysis of nucleon decay; sensitive to assumed catalysis cross section.
- ¹⁹ORITO 91 limits are functions of velocity. Lowest limits are given here.
- ²⁰Used DKMPR mechanism and Penning effect.
- ²¹Assumes monopole attaches fermion nucleus.
- ²²Limit from combining data of CAPLIN 86, BERMON 85, INCANDELA 84, and CABRERA 83. For a discussion of controversy about CAPLIN 86 observed event, see GUY 87. Also see SCHOUTEN 87.
- ²³Based on lack of high-energy solar neutrinos from catalysis in the sun.
- ²⁴Anomalous long-range α (⁴He) tracks.
- ²⁵CABRERA 82 candidate event has single Dirac charge within $\pm 5\%$.
- ²⁶ALVEREZ 75, FLEISCHER 75, and FRIEDLANDER 75 explain as fragmenting nucleus. EBERHARD 75 and ROSS 76 discuss conflict with other experiments. HAGSTROM 77 reinterprets as antinucleus. PRICE 78 reassesses.

- ¹Catalysis of nucleon decay.
- ²ADAMS 93 limit based on "survival and growth of a small galactic seed field" is 10^{-16} ($m/10^{17}$ GeV) cm⁻²sr⁻¹s⁻¹. Above 10^{17} GeV, limit 10^{-16} (10^{17} GeV/m) cm⁻²sr⁻¹s⁻¹ (from requirement that monopole density does not overclose the universe) is more stringent.
- ³Re-evaluates PARKER 70 limit for GUT monopoles.

 Long-lived \tilde{q} (Squark) mass limit
 \tilde{b} (Sbottom) mass limit
 – R-parity conserving \tilde{b} (Sbottom) mass limit
 – R-parity violating \tilde{b} (Sbottom) mass limit
 \tilde{t} (Stop) mass limit
 – R-parity conserving \tilde{t} (Stop) mass limit
 – R-parity violating \tilde{t} (Stop) mass limit
 Heavy \tilde{g} (Glauino) mass limit
 – R-parity conserving heavy \tilde{g} (Glauino) mass limit
 – R-parity violating heavy \tilde{g} (Glauino) mass limit
 Long-lived \tilde{g} (Glauino) mass limit
 Light \tilde{G} (Gravitino) mass limits from collider experiments
 Supersymmetry miscellaneous results

The results shown below, unless stated otherwise, are based on the Minimal Supersymmetric Standard Model (MSSM), as described in the Note on Supersymmetry. Unless otherwise indicated, this includes the assumption of common gaugino and scalar masses at the scale of Grand Unification (GUT), and use of the resulting relations in the spectrum and decay branching ratios. Unless otherwise indicated, it is also assumed that R -parity (R) is conserved and that:

- 1) The $\tilde{\chi}_1^0$ is the lightest supersymmetric particle (LSP),
- 2) $m_{\tilde{f}_L} = m_{\tilde{f}_R}$, where $\tilde{f}_{L,R}$ refer to the scalar partners of left- and right-handed fermions.

Limits involving different assumptions are identified in the Comments or in the Footnotes, in particular also the many simplified models, see definitions below. We summarize here the notations used in this Chapter to characterize some of the most common deviations from the MSSM (for further details, see the Note on Supersymmetry).

Theories with R -parity violation (RPV) are characterized by a superpotential of the form: $\lambda_{ijk} L_i L_j e_k^c + \lambda'_{ijk} L_i L_j d_k^c + \lambda''_{ijk} u_i^c d_j^c d_k^c$, where i, j, k are generation indices. The presence of any of these couplings is often identified in the following by the symbols $LL\tilde{E}$, $LQ\tilde{D}$, and $U\tilde{D}\tilde{D}$. Mass limits in the presence of RPV will often refer to “direct” and “indirect” decays. Direct refers to RPV decays of the particle in consideration. Indirect refers to cases where RPV appears in the decays of the LSP. The LSP need not be the $\tilde{\chi}_1^0$.

In several models, most notably in theories with so-called Gauge Mediated Supersymmetry Breaking (GMSB), the gravitino (\tilde{G}) is the LSP. It is usually much lighter than any other massive particle in the spectrum, and $m_{\tilde{G}}$ is then neglected in all decay processes involving gravitinos. In these scenarios, particles other than the neutralino are sometimes considered as the next-to-lightest supersymmetric particle (NLSP), and are assumed to decay to their even- R partner plus \tilde{G} . If the lifetime is short enough for the decay to take place within the detector, \tilde{G} is assumed to be undetected and to give rise to missing energy (\cancel{E}) or missing transverse energy (\cancel{E}_T) signatures.

When needed, specific assumptions on the eigenstate content of $\tilde{\chi}^0$ and $\tilde{\chi}^\pm$ states are indicated, using the notation $\tilde{\gamma}$ (photino), \tilde{H} (higgsino), \tilde{W} (wino), and \tilde{Z} (zino) to signal that the limit of pure states was used. The term gaugino is also used, to generically indicate wino-like charginos and zino-like neutralinos.

In the listings we have made use of the following abbreviations for simplified models employed by the experimental collaborations in supersymmetry searches published in the past year.

WARNING: Experimental lower mass limits determined within simplified models are to be treated with extreme care as they might not be directly applicable to realistic models. This is outlined in detail in the publications and we recommend consulting them before using bounds. For example, branching ratios, typically fixed to specific values in simplified models, can vary substantially in more elaborate models.

Simplified Models Table

- Tglu1A:** gluino pair production with $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_1^0$.
Tglu1B: gluino pair production with $\tilde{g} \rightarrow q\tilde{q}'\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$.
Tglu1C: gluino pair production with a 2/3 probability of having a $\tilde{g} \rightarrow q\tilde{q}'\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ decay and a 1/3 probability of having a $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_2^0$, $\tilde{\chi}_2^0 \rightarrow Z^\pm\tilde{\chi}_1^0$ decay.
Tglu1D: gluino pair production with one gluino decaying to $q\tilde{q}'\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{G}$, and the other gluino decaying to $q\tilde{q}\tilde{\chi}_1^0$ with $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.
Tglu1E: gluino pair production with $\tilde{g} \rightarrow q\tilde{q}'\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_2^0$ and $\tilde{\chi}_2^0 \rightarrow Z^\pm\tilde{\chi}_1^0$ where $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$, $m_{\tilde{\chi}_2^0} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$.
Tglu1F: gluino pair production with $\tilde{g} \rightarrow q\tilde{q}'\tilde{\chi}_1^\pm$ or $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_2^0$ with equal branching ratios, where $\tilde{\chi}_1^\pm$ decays through an intermediate scalar tau lepton or sneutrino to $\tau\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate scalar tau lepton or sneutrino to $\tau^+\tau^-\tilde{\chi}_1^0$ or $\nu\bar{\nu}\tilde{\chi}_1^0$; the mass hierarchy is such that $m_{\tilde{\chi}_1^\pm} \sim m_{\tilde{\chi}_2^0} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$ and $m_{\tilde{\tau},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$.
Tglu1G: gluino pair production with $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_2^0$, and $\tilde{\chi}_2^0$ decaying through an intermediate slepton or sneutrino to $l^+l^-\tilde{\chi}_1^0$ or $\nu\bar{\nu}\tilde{\chi}_1^0$ where $m_{\tilde{\chi}_2^0} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$ and $m_{\tilde{l},\tilde{\nu}} = (m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0})/2$.
Tglu1H: gluino pair production with $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_2^0$, and $\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 Z^{0(*)}$.
Tglu1I: gluino pair production with $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_2^0$, and $\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 H$.
Tglu1J: gluino pair production with $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_2^0$, and $\text{BR}(\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 Z^{0(*)}) = \text{BR}(\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 H) = 0.5$.
Tglu1LL gluino pair production where $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_1^0$ happens with 1/3 probability and $\tilde{g} \rightarrow q\tilde{q}'\tilde{\chi}_1^\pm$ happens with 2/3 probability. The $\tilde{\chi}_1^\pm$ is assumed to be few hundreds of MeV heavier than the $\tilde{\chi}_1^0$, and decays to $\tilde{\chi}_1^0$ via a pion.
Tglu2A: gluino pair production with $\tilde{g} \rightarrow b\tilde{b}\tilde{\chi}_1^0$.
Tglu3A: gluino pair production with $\tilde{g} \rightarrow t\tilde{t}\tilde{\chi}_1^0$.
Tglu3B: gluino pair production with $\tilde{g} \rightarrow t\tilde{t}$ where \tilde{t} decays exclusively to $t\tilde{\chi}_1^0$.
Tglu3C: gluino pair production with $\tilde{g} \rightarrow t\tilde{t}$ where \tilde{t} decays exclusively to $c\tilde{\chi}_1^0$.
Tglu3D: gluino pair production with $\tilde{g} \rightarrow t\tilde{b}\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$.
Tglu3E: gluino pair production where the gluino decays 25% of the time through $\tilde{g} \rightarrow t\tilde{t}\tilde{\chi}_1^0$, 25% of the time through $\tilde{g} \rightarrow b\tilde{b}\tilde{\chi}_1^0$ and 50% of the time through $\tilde{g} \rightarrow t\tilde{b}\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$.
Tglu3F: gluino pair production with wino-like couplings to electroweakinos, that is: $\tilde{g} \rightarrow t\tilde{t}\tilde{\chi}_{1,2}^0$ with BR 17%, $\tilde{g} \rightarrow b\tilde{b}\tilde{\chi}_{1,2}^0$ with BR 17%, $\tilde{g} \rightarrow t\tilde{t}\tilde{\chi}_1^\pm$ with BR 66%.
Tglu3G: gluino pair production with higgsino-like couplings to electroweakinos, that is: $\tilde{g} \rightarrow t\tilde{t}\tilde{\chi}_{1,2}^0$ with BR 50%, $\tilde{g} \rightarrow t\tilde{t}\tilde{\chi}_1^\pm$ with BR 50%.
Tglu4A: gluino pair production with one gluino decaying to $q\tilde{q}'\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{G}$, and the other gluino decaying to $q\tilde{q}\tilde{\chi}_1^0$ with $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.

- Tglu4B:** gluino pair production with gluinos decaying to $q\bar{q}\tilde{\chi}_1^0$ and $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.
- Tglu4C:** gluino pair production with gluinos decaying to $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$ and $\tilde{\chi}_1^0 \rightarrow Z + \tilde{G}$.
- Tglu4D:** gluino pair production with $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$ where the $\tilde{\chi}_1^0$ decays with equal probability to $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ or to $\tilde{\chi}_1^0 \rightarrow H + \tilde{G}$.
- Tglu4E:** gluino pair production with $\tilde{g} \rightarrow b\bar{b}\tilde{\chi}_1^0$ where the $\tilde{\chi}_1^0$ decays with equal probability to $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ or to $\tilde{\chi}_1^0 \rightarrow Z + \tilde{G}$.
- Tglu4F:** gluino pair production with $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ where the $\tilde{\chi}_1^0$ decays with equal probability to $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ or to $\tilde{\chi}_1^0 \rightarrow Z + \tilde{G}$.
- Tglu1RPV:** gluino pair production with $\tilde{g} \rightarrow uds$ via RPV coupling λ''_{112} .
- Tglu2RPV:** gluino pair production with $\tilde{g} \rightarrow (tbd, tbs)$ via RPV coupling λ''_{313} or λ''_{323} .
-
- Tsqk1:** squark pair production with $\tilde{q} \rightarrow q\tilde{\chi}_1^0$.
- Tsqk1LL:** squark pair production where $\tilde{q} \rightarrow q\tilde{\chi}_1^0$ and $\tilde{q} \rightarrow q'\tilde{\chi}_1^\pm$ each happen with 50% probability. The $\tilde{\chi}_1^\pm$ is assumed to be few hundreds of MeV heavier than the $\tilde{\chi}_1^0$, and decays to $\tilde{\chi}_1^0$ via a pion.
- Tsqk2:** squark pair production with $\tilde{q} \rightarrow q\tilde{\chi}_2^0$ and $\tilde{\chi}_2^0 \rightarrow Z + \tilde{\chi}_1^0$.
- Tsqk2A:** squark pair production with $\tilde{q} \rightarrow q\tilde{\chi}_2^0$, where one of the $\tilde{\chi}_2^0 \rightarrow Z^*(\tilde{\chi}_1^0 \rightarrow f\bar{f}\tilde{\chi}_1^0)$ and the other $\tilde{\chi}_2^0 \rightarrow \tilde{\ell}\ell^+ \rightarrow \ell^+\ell^-\tilde{\chi}_1^0$.
- Tsqk3:** squark pair production with $\tilde{q} \rightarrow q'\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ (like Tglu1B but for squarks)
- Tsqk4:** squark pair production with squarks decaying to $q\tilde{\chi}_1^0$ and $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.
- Tsqk4A:** squark pair production with one squark decaying to $q\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{G}$, and the other squark decaying to $q\tilde{\chi}_1^0$ with $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.
- Tsqk4B:** squark pair production with squarks decaying to $q\tilde{\chi}_1^0$ and $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.
-
- Tstop1:** stop pair production with $\tilde{t} \rightarrow t\tilde{\chi}_1^0$.
- Tstop1LL:** stop pair production where $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ and $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ each happen with 50% probability. The $\tilde{\chi}_1^\pm$ is assumed to be few hundreds of MeV heavier than the $\tilde{\chi}_1^0$, and decays to $\tilde{\chi}_1^0$ via a pion.
- Tstop2:** stop pair production with $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$.
- Tstop3:** stop pair production with the subsequent four-body decay $\tilde{t} \rightarrow bff'\tilde{\chi}_1^0$ where f represents a lepton or a quark.
- Tstop4:** stop pair production with $\tilde{t} \rightarrow c\tilde{\chi}_1^0$.
- Tstop5:** stop pair production with $\tilde{t} \rightarrow b\tilde{\tau}$ with $\tilde{\tau} \rightarrow \tau\tilde{G}$.
- Tstop6:** stop pair production with $\tilde{t} \rightarrow t + \tilde{\chi}_2^0$, where $\tilde{\chi}_2^0 \rightarrow Z + \tilde{\chi}_1^0$ or $H + \tilde{\chi}_1^0$ each with BR 50%.
- Tstop7:** stop pair production with $\tilde{t}_2 \rightarrow \tilde{t}_1 + H/Z$, where $\tilde{t}_1 \rightarrow t + \tilde{\chi}_1^0$.
- Tstop8:** stop pair production with equal probability of the stop decaying via $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ or via $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$.
- Tstop9:** stop pair production with equal probability of the stop decaying via $\tilde{t} \rightarrow c\tilde{\chi}_1^0$ or via the four-body decay $\tilde{t} \rightarrow bff'\tilde{\chi}_1^0$ where f represents a lepton or a quark.
- Tstop10:** stop pair production with $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ and $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0 \rightarrow (f\bar{f}') + \tilde{\chi}_1^0$ with a virtual W -boson.
- Tstop11:** stop pair production with $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm$ decaying through an intermediate slepton to $\nu\tilde{\chi}_1^0$.
- Tstop12:** stop pair production with $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ and $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.
- Tstop13:** stop pair production with $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ where the $\tilde{\chi}_1^0$ can decay with equal probability to $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ or to $\tilde{\chi}_1^0 \rightarrow Z + \tilde{G}$.
- Tstop14:** stop pair production with wino-like couplings to electroweakinos, that is: $\tilde{t} \rightarrow t\tilde{\chi}_{1,2}^0$ with BR 33%, $\tilde{g} \rightarrow b\tilde{\chi}_1^\pm$ with BR 67%.
- Tstop15:** stop pair production with higgsino-like couplings to electroweakinos, that is: $\tilde{t} \rightarrow t\tilde{\chi}_{1,2}^0$ with BR 50%, $\tilde{g} \rightarrow b\tilde{\chi}_1^\pm$ with BR 50%.
- Tstop1RPV:** stop pair production with $\tilde{t} \rightarrow b\bar{s}$ via RPV coupling λ''_{323} .
- Tstop2RPV:** stop pair production with $\tilde{t} \rightarrow b\bar{\ell}$, via RPV coupling λ''_{333} .
- Tstop3RPV:** stop pair production with $\tilde{t} \rightarrow q\mu$, via RPV coupling λ''_{23k} .
- Tstop4RPV:** stop pair production with $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow bbs$ via RPV coupling λ''_{323} .
- Tstop5RPV:** stop pair production with $\tilde{t} \rightarrow t\tilde{\chi}_{1,2}^0$, $\tilde{\chi}_{1,2}^0 \rightarrow tbs$ via RPV coupling λ''_{323} .
-
- Tsbot1:** sbottom pair production with $\tilde{b} \rightarrow b\tilde{\chi}_1^0$.
- Tsbot2:** sbottom pair production with $\tilde{b} \rightarrow t\tilde{\chi}_1^-, \tilde{\chi}_1^- \rightarrow W^-\tilde{\chi}_1^0$.
- Tsbot3:** sbottom pair production with $\tilde{b} \rightarrow b\tilde{\chi}_2^0$, where one of the $\tilde{\chi}_2^0 \rightarrow Z^*(\tilde{\chi}_1^0 \rightarrow f\bar{f}\tilde{\chi}_1^0)$ and the other $\tilde{\chi}_2^0 \rightarrow \tilde{\ell}\ell^+ \rightarrow \ell^+\ell^-\tilde{\chi}_1^0$.
- Tsbot4:** sbottom pair production with $\tilde{b} \rightarrow b\tilde{\chi}_2^0$, with $\tilde{\chi}_2^0 \rightarrow H\tilde{\chi}_1^0$.
-
- Tchi1chi1A:** electroweak pair and associated production of nearly mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0$, where $\tilde{\chi}_1^\pm$ decays to $\tilde{\chi}_1^0$ plus soft radiation, and where one of the $\tilde{\chi}_1^0$ decays to $\gamma + \tilde{G}$ while the other one decays to $Z/H + \tilde{G}$ (with equal probability).
- Tchi1chi1B:** electroweak pair production of charginos $\tilde{\chi}_1^\pm$, where $\tilde{\chi}_1^\pm$ decays through an intermediate slepton or sneutrino to $\nu\tilde{\chi}_1^0$ and where the slepton or sneutrino mass is 5%, 25%, 50%, 75% and 95% of the $\tilde{\chi}_1^\pm$ mass.
- Tchi1chi1C:** electroweak pair production of charginos $\tilde{\chi}_1^\pm$, where $\tilde{\chi}_1^\pm$ decays through an intermediate slepton or sneutrino to $\nu\tilde{\chi}_1^0$ and where $m_{\tilde{\ell},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$.
- Tchi1chi1D:** electroweak associated pair production of charginos $\tilde{\chi}_1^\pm$, where $\tilde{\chi}_1^\pm$ decays through an intermediate scalar tau lepton or sneutrino to $\tau\nu\tilde{\chi}_1^0$ and where $m_{\tilde{\tau},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$.
- Tchi1chi1F:** electroweak pair and associated production of nearly mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0$ (i.e. $\tilde{\chi}_1^\pm\tilde{\chi}_1^\pm$ and $\tilde{\chi}_1^\pm\tilde{\chi}_1^0$ production) where the $\tilde{\chi}_1^\pm$ decays exclusively to $\tilde{\chi}_1^0$ plus soft radiation and the $\tilde{\chi}_1^0$ decays to $\gamma/Z + \tilde{G}$.
- Tchi1chi1G:** electroweak pair production of charginos $\tilde{\chi}_1^\pm$, which are nearly mass-degenerate with neutralinos $\tilde{\chi}_1^0$. The $\tilde{\chi}_1^\pm$ decays either to $W^\pm + \tilde{G}$, or to $\tilde{\chi}_1^0$ plus soft radiation. The $\tilde{\chi}_1^0$ decays exclusively to $\gamma + \tilde{G}$.
- Tchi1chi1H:** electroweak pair production of charginos $\tilde{\chi}_1^\pm$, with $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{\chi}_1^0$ and $W^\pm \rightarrow \ell^\pm + \nu$.
- Tchi1chi1I:** electroweak pair production of charginos $\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ and $W^\pm \rightarrow q\bar{q}'$.
-
- Tchi1n1A:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0$, where $\tilde{\chi}_1^\pm$ decays exclusively to $W^\pm + \tilde{G}$ and $\tilde{\chi}_1^0$ decays exclusively to $\gamma + \tilde{G}$.
- Tchi1n2A:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate slepton or sneutrino to $\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate slepton or sneutrino to $l^+\tilde{\chi}_1^0$ or $\nu\tilde{\nu}\tilde{\chi}_1^0$.
- Tchi1n2B:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate slepton or sneutrino to $\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate slepton or sneutrino to $l^+\tilde{\chi}_1^0$ or $\nu\tilde{\nu}\tilde{\chi}_1^0$ and where the slepton or sneutrino mass is 5%, 25%, 50%, 75% and 95% of the $\tilde{\chi}_1^\pm$ mass.
- Tchi1n2C:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate slepton or sneutrino to $\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate slepton or sneutrino to $l^+\tilde{\chi}_1^0$ or $\nu\tilde{\nu}\tilde{\chi}_1^0$ and where $m_{\tilde{\ell},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$.
- Tchi1n2D:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate scalar tau lepton or sneutrino to $\tau\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate scalar tau lepton or sneutrino to $\tau^+\tau^-\tilde{\chi}_1^0$ or $\nu\tilde{\nu}\tilde{\chi}_1^0$ and where $m_{\tilde{\tau},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$.
- Tchi1n2E:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{\chi}_1^0$ and $\tilde{\chi}_2^0 \rightarrow H + \tilde{\chi}_1^0$.
- Tchi1n2F:** electroweak associated production of mass-degenerate wino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate W^{**} to $\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate Z^* to $l^+\tilde{\chi}_1^0$ or $\nu\tilde{\nu}\tilde{\chi}_1^0$.
- Tchi1n2Fa:** electroweak associated production of mass-degenerate wino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate W^{**} to $q\bar{q}\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate Z^* to $l^+\tilde{\chi}_1^0$ or $\nu\tilde{\nu}\tilde{\chi}_1^0$.
- Tchi1n2Fb:** electroweak associated production of mass-degenerate wino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate $W^{(*)}$ to $q\bar{q}\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate $Z^{(*)}$ to $q\bar{q}\tilde{\chi}_1^0$.
- Tchi1n2G:** electroweak associated production of Higgsino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, and electroweak associated production of $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^0$, where $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0})/2$ and where $\tilde{\chi}_1^\pm$

Supersymmetric Particle Searches

- decays through an intermediate $W^{\pm*}$ to $q\bar{q}\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate Z^* to $l^+l^-\tilde{\chi}_1^0$.
- Tchi1n2Ga:** electroweak associated production of Higgsino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, and electroweak associated production of $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^0$, where $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0})/2$ and where $\tilde{\chi}_1^\pm$ decays through an intermediate $W^{\pm*}$ to $l\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate Z^* to $l^+l^-\tilde{\chi}_1^0$.
- Tchi1n2H:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate slepton or sneutrino to $l\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate scalar tau lepton or sneutrino to $\tau^+\tau^-\tilde{\chi}_1^0$ or $\nu\bar{\nu}\tilde{\chi}_1^0$.
- Tchi1n2I:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays to $W^\pm + \tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays 50% of the time to $Z + \tilde{\chi}_1^0$ and 50% of the time to $H + \tilde{\chi}_1^0$.
- Tchi1n12_GGM:** in the framework of General Gauge Mediation (GGM): electroweak pair and associated production of nearly mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0, \tilde{\chi}_2^0$ (i.e. $\tilde{\chi}_1^\pm\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm\tilde{\chi}_1^0$ and $\tilde{\chi}_1^\pm\tilde{\chi}_2^0$ production) where the $\tilde{\chi}_1^\pm$ decays exclusively to $W^\pm + \tilde{G}$, the $\tilde{\chi}_2^0$ decays to $Z/H + \tilde{G}$ and the $\tilde{\chi}_1^0$ decays to $\gamma/Z + \tilde{G}$. The branching ratios depend on the composition of the gauge eigenstates of the neutralinos in the GGM scenario.
- TwinoLSPBL:** Electroweak pair production of wino-like $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_1^0$ (i.e. $\tilde{\chi}_1^\pm\tilde{\chi}_1^\pm$ and $\tilde{\chi}_1^0\tilde{\chi}_1^0$). The $\tilde{\chi}_1^\pm$ can decay via bi-linear RPV into Zl, Hl or $W\nu$; the $\tilde{\chi}_1^0$ can decay into $Z\nu, H\nu$ or Wl .
- Tn1n1A:** electroweak pair and associated production of nearly mass-degenerate Higgsino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0$ and $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ decay to $\tilde{\chi}_1^0$ plus soft radiation and where both of the $\tilde{\chi}_1^0$ decay to $H + \tilde{G}$.
- Tn1n1B:** electroweak pair and associated production of nearly mass-degenerate Higgsino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0$ and $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ decay to $\tilde{\chi}_1^0$ plus soft radiation and where the $\tilde{\chi}_1^0$ decays 50% of the time to $H + \tilde{G}$ and 50 % of the time to $Z + \tilde{G}$.
- Tn1n1C:** electroweak pair and associated production of nearly mass-degenerate Higgsino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0$ and $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ decay to $\tilde{\chi}_1^0$ plus soft radiation and where both of the $\tilde{\chi}_1^0$ decay to $Z + \tilde{G}$.
- Tn1n1D:** electroweak pair and associated production of nearly mass-degenerate Higgsino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0, \tilde{\chi}_2^0$.
- Tn1n1E:** electroweak pair and associated production of nearly mass-degenerate wino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0$.
- Tn2n3A:** electroweak associated production of mass-degenerate neutralinos $\tilde{\chi}_2^0$ and $\tilde{\chi}_3^0$, where $\tilde{\chi}_2^0$ and $\tilde{\chi}_3^0$ decay through intermediate sleptons to $l^+l^-\tilde{\chi}_1^0$ and where the slepton mass is 5%, 25%, 50%, 75% and 95% of the $\tilde{\chi}_2^0$ mass.
- Tn2n3B:** electroweak associated production of mass-degenerate neutralinos $\tilde{\chi}_2^0$ and $\tilde{\chi}_3^0$, where $\tilde{\chi}_2^0$ and $\tilde{\chi}_3^0$ decay through intermediate sleptons to $l^+l^-\tilde{\chi}_1^0$ and where $m_{\tilde{l}} = (m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0})/2$.
- TWinoBinoA:** electroweak pair production of mass-degenerate wino-like doublet ($\tilde{\chi}_2^0, \tilde{\chi}_1^\pm$) (including all pair-production mechanisms) decaying into a bino singlet ($\tilde{\chi}_1^0$). Decays happen via Standard Model bosons, assumed to decay via hadrons.
- TWinoHinoA:** electroweak pair production of mass-degenerate wino-like doublet ($\tilde{\chi}_2^0, \tilde{\chi}_2^\pm$) (including all possible pair-production mechanisms) decaying into a quasi-mass-degenerate Higgsino triplet ($\tilde{\chi}_1^0, \tilde{\chi}_2^0, \tilde{\chi}_1^\pm$). Decays happen via Standard Model bosons, assumed to decay via hadrons.
- THinoBinoA:** electroweak pair production of quasi-mass-degenerate higgsino-like triplet ($\tilde{\chi}_2^0, \tilde{\chi}_2^\pm, \tilde{\chi}_1^\pm$) (including all possible pair-production mechanisms) decaying into a bino singlet ($\tilde{\chi}_1^0$). Decays happen via Standard Model bosons, assumed to decay via hadrons.
- HinoWinoA:** electroweak pair production of quasi-mass-degenerate higgsino-like triplet ($\tilde{\chi}_2^0, \tilde{\chi}_2^\pm, \tilde{\chi}_2^\pm$) (including all possible pair-production mechanisms) decaying into a mass-degenerate wino doublet ($\tilde{\chi}_1^0, \tilde{\chi}_1^\pm$). Decays happen via Standard Model bosons, assumed to decay via hadrons.

$\tilde{\chi}_1^0$ is often assumed to be the lightest supersymmetric particle (LSP). See also the $\tilde{\chi}_2^0, \tilde{\chi}_3^0, \tilde{\chi}_4^0$ section below.

We have divided the $\tilde{\chi}_1^0$ listings below into five sections:

- 1) Accelerator limits for stable $\tilde{\chi}_1^0$,
- 2) Bounds on $\tilde{\chi}_1^0$ from dark matter searches,
- 3) $\tilde{\chi}_1^0 - p$ elastic cross section (spin-dependent, spin-independent interactions),
- 4) Other bounds on $\tilde{\chi}_1^0$ from astrophysics and cosmology, and
- 5) Unstable $\tilde{\chi}_1^0$ (Lightest Neutralino) mass limit.

Accelerator limits for stable $\tilde{\chi}_1^0$

Unless otherwise stated, results in this section assume spectra, production rates, decay modes, and branching ratios as evaluated in the MSSM, with gaugino and sfermion mass unification at the GUT scale. These papers generally study production of $\tilde{\chi}_i^0\tilde{\chi}_j^0$ ($i \geq 1, j \geq 2$), $\tilde{\chi}_1^+\tilde{\chi}_1^-$, and (in the case of hadronic collisions) $\tilde{\chi}_1^+\tilde{\chi}_2^0$ pairs. The mass limits on $\tilde{\chi}_1^0$ are either direct, or follow indirectly from the constraints set by the non-observation of $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ states on the gaugino and higgsino MSSM parameters M_2 and μ . In some cases, information is used from the nonobservation of slepton decays.

Obsolete limits obtained from e^+e^- collisions up to $\sqrt{s}=184$ GeV have been removed from this compilation and can be found in the 2000 Edition (The European Physical Journal **C15** 1 (2000)) of this Review. $\Delta m = m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}$.

1 AAD 21AX searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for pair production of electroweakinos decaying to the LSP via the emission of Standard Model bosons (Higgs, W, Z) decaying into hadrons. The final state in all cases characterised by the presence of \cancel{E}_T , jets, and large-R jets tagged according to the boson of interest. Different assumptions (Higgsino, Wino, Bino) are made for the pair produced electroweakinos and for the LSP multiplet. No significant excess above the Standard Model predictions is observed. Limits are set on the electroweakino masses as a function of the model parameters (in particular $m_{\tilde{\chi}_1^0}$). See Fig. 16.

2 AAD 21BF searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for pair production of gluinos, stops, electroweakinos decaying RPV either directly or indirectly via the LSP. The final state in all cases is one or two leptons, many jets (up to fifteen) and b -jets. Different models with different branching fractions of the gluino or stop follow from the assumptions on the nature of the electroweakinos. No significant excess above the Standard Model predictions is observed. Limits are set on the $gluino, \tilde{t}_1$, electroweakino masses as a function of the $\tilde{\chi}_1^0$ mass in several scenarios of gluino, stop and electroweakino pair production.

3 DREINER 09 show that in the general MSSM with non-universal gaugino masses there exists no model-independent laboratory bound on the mass of the lightest neutralino. An essentially massless $\tilde{\chi}_1^0$ is allowed by the experimental and observational data, imposing some constraints on other MSSM parameters, including M_2, μ and the slepton and squark masses.

4 ABBIENDI 04H search for charginos and neutralinos in events with acoplanar leptons+jets and multi-jet final states in the 192–209 GeV data, combined with the results on leptonic final states from ABBIENDI 04. The results hold for a scan over the parameter space covering the region $0 < M_2 < 5000$ GeV, $-1000 < \mu < 1000$ GeV and $\tan\beta$ from 1 to 40. This limit supersedes ABBIENDI 00h.

5 HEISTER 04 data collected up to 209 GeV. Updates earlier analysis of selections from HEISTER 02e, includes a new analysis of charginos and neutralinos decaying into stau and uses results on charginos with initial state radiation from HEISTER 02j. The limit is based on the direct search for charginos and neutralinos, the constraints from the slepton search and the Higgs mass limits from HEISTER 02 using a top mass of 175 GeV, interpreted in a framework with universal gaugino and sfermion masses. Assuming the mixing in the stau sector to be negligible, the limit improves to 43.1 GeV. Under the assumption of MSUGRA with unification of the Higgs and sfermion masses, the limit improves to 50 GeV, and reaches 53 GeV for $A_0 = 0$. These limits include and update the results of BARATE 01.

6 ABDALLAH 03M uses data from $\sqrt{s} = 192\text{--}208$ GeV. A limit on the mass of $\tilde{\chi}_1^0$ is derived from direct searches for neutralinos combined with the chargino search. Neutralinos are searched in the production of $\tilde{\chi}_1^0\tilde{\chi}_2^0, \tilde{\chi}_1^0\tilde{\chi}_3^0$, as well as $\tilde{\chi}_2^0\tilde{\chi}_3^0$ and $\tilde{\chi}_2^0\tilde{\chi}_4^0$ giving rise to

$\tilde{\chi}_1^0$ (Lightest Neutralino) mass limit

See key on page 1127

Searches Particle Listings Supersymmetric Particle Searches

cascade decays, and $\tilde{\chi}_1^0 \tilde{\chi}_2^0$ and $\tilde{\chi}_1^0 \tilde{\chi}_2^0$, followed by the decay $\tilde{\chi}_2^0 \rightarrow \tilde{\tau} \tau$. The results hold for the parameter space defined by values of $M_2 < 1$ TeV, $|\mu| \leq 2$ TeV with the $\tilde{\chi}_1^0$ as LSP. The limit is obtained for $\tan\beta = 1$ and large m_0 , where $\tilde{\chi}_2^0 \tilde{\chi}_4^0$ and chargino pair production are important. If the constraint from Higgs searches is also imposed, the limit improves to 49.0 GeV in the m_h^{\max} scenario with $m_t=174.3$ GeV. These limits update the results of ABREU 00.

⁷ ABDALLAH 03M uses data from $\sqrt{s} = 192\text{--}208$ GeV. An indirect limit on the mass of $\tilde{\chi}_1^0$ is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays and $\tilde{\tau}\tau$ final states), for charginos (for all Δm_{\pm}) and for sleptons, stop and sbottom. The results hold for the full parameter space defined by values of $M_2 < 1$ TeV, $|\mu| \leq 2$ TeV with the $\tilde{\chi}_1^0$ as LSP. Constraints from the Higgs search in the m_h^{\max} scenario assuming $m_t=174.3$ GeV are included. The limit is obtained for $\tan\beta \geq 5$ when stau mixing leads to mass degeneracy between $\tilde{\tau}_1$ and $\tilde{\chi}_1^0$ and the limit is based on $\tilde{\chi}_2^0$ production followed by its decay to $\tilde{\tau}_1 \tau$. In the pathological scenario where m_0 and $|\mu|$ are large, so that the $\tilde{\chi}_2^0$ production cross section is negligible, and where there is mixing in the stau sector but not in stop nor sbottom, the limit is based on charginos with soft decay products and an ISR photon. The limit then degrades to 39 GeV. See Figs. 40–42 for the dependence of the limit on $\tan\beta$ and $m_{\tilde{\tau}}$. These limits update the results of ABREU 00w.

⁸ ACCIARRI 00d data collected at $\sqrt{s}=189$ GeV. The results hold over the full parameter space defined by $0.7 \leq \tan\beta \leq 60$, $0 \leq M_2 \leq 2$ TeV, $m_0 \leq 500$ GeV, $|\mu| \leq 2$ TeV. The minimum mass limit is reached for $\tan\beta=1$ and large m_0 . The results of slepton searches from ACCIARRI 99w are used to help set constraints in the region of small m_0 . The limit improves to 48 GeV for $m_0 \geq 200$ GeV and $\tan\beta \geq 10$. See their Figs. 6–8 for the $\tan\beta$ and m_0 dependence of the limits. Updates ACCIARRI 98f.

⁹ AAD 14k sets limits on the χ -nucleon spin-dependent and spin-independent cross sections out to $m_\chi = 10$ TeV.

¹⁰ CALIBBI 13 use the fact that if the relic abundance of $\tilde{\chi}_1^0$ does not overclose the universe, scalar lepton and Higgsino masses must be relatively small. Using 8 TeV ATLAS constraints on the scalar tau mass and on invisible Higgs decays, they estimate a lower bound for the $\tilde{\chi}_1^0$ mass.

Bounds on $\tilde{\chi}_1^0$ from dark matter searches

These papers generally exclude regions in the $M_2 - \mu$ parameter plane assuming that $\tilde{\chi}_1^0$ is the dominant form of dark matter in the galactic halo. These limits are based on the lack of detection in laboratory experiments, telescopes, or by the absence of a signal in underground neutrino detectors. The latter signal is expected if $\tilde{\chi}_1^0$ accumulates in the Sun or the Earth and annihilates into high-energy ν 's.

¹ ABDALLAH 21 places constraints on the dark matter annihilation cross section for annihilations into gamma-rays from the dwarf irregular galaxy WLM for masses between 0.15 to 10 TeV.

² ABAZAJIAN 20 sets constraints on the dark matter annihilation from gamma-ray searches from Fermi LAT observations of the Galactic center.

³ ABDALLAH 20 places constraints on the dark matter annihilation cross section for annihilations into gamma-rays from Milky Way dwarf galaxy satellites for masses between 0.2 to 40 TeV.

⁴ ABE 20G is based on SuperKamiokande data taken from 1996 to 2016 searching for neutrinos produced from dark matter annihilations in the galactic center or halo. They place constraints on the dark matter-nucleon scattering cross section for dark matter masses between 1 GeV and 10 TeV.

⁵ ALBERT 20 sets limits on the annihilation cross section of dark matter with mass between 1 and 100 TeV from gamma-ray observations of the local dwarf spheroidal galaxies.

⁶ ALBERT 20A set limits on the dark matter annihilation cross section from neutrinos observations in the Galactic center using 11 years of ANTARES data.

⁷ ALBERT 20C set limits on the dark matter annihilation cross section from neutrinos observations in the Galactic center combining Antares and IceCube data.

⁸ ALVAREZ 20 set limits on the dark matter annihilation from gamma-ray searches from Fermi LAT observations in the directions of dwarf spheroidal galaxies.

⁹ HOOF 20 set limits on the dark matter annihilation from gamma-ray searches from Fermi LAT observations in the directions of dwarf spheroidal galaxies.

¹⁰ DI-MAURO 19 sets limits on the dark matter annihilation from gamma-ray searches in M31 and M33 galaxies using Fermi LAT data.

¹¹ JOHNSON 19 sets limits on p-wave dark matter annihilations in the galactic center using Fermi data.

¹² LI 19D sets limits on dark matter annihilation cross sections searching for line-like signals in the all-sky Fermi data.

¹³ ABDALLAH 18 places constraints on the dark matter annihilation cross section for annihilations into gamma-rays in the Galactic center for masses between 300 GeV to 70 TeV. This updates ABDALLAH 16.

¹⁴ AHNEN 18 uses observations of the dwarf satellite galaxy Ursa Major II to obtain upper limits on annihilation cross sections for dark matter in various channels for masses between 0.1–100 TeV.

¹⁵ ALBERT 18B sets limits on the annihilation cross section of dark matter with mass between 1 and 100 TeV from gamma-ray observations of the Andromeda galaxy.

¹⁶ ALBERT 18C sets limits on the spin-dependent coupling of dark matter to protons from dark matter annihilation in the Sun.

¹⁷ AARTSEN 17 is based on data collected during 327 days of detector livetime with IceCube. They looked for interactions of ν 's resulting from neutralino annihilations in the Earth over a background of atmospheric neutrinos and set 90% CL limits on the spin independent neutralino-proton cross section for neutralino masses in the range 10–10000 GeV.

¹⁸ AARTSEN 17A is based on data collected during 532 days of livetime with the IceCube 86-string detector including the DeepCore sub-array. They looked for interactions of ν 's from neutralino annihilations in the Sun over a background of atmospheric neutrinos and set 90% CL limits on the spin dependent neutralino-proton cross section for neutralino masses in the range 10–10000 GeV. This updates AARTSEN 16c.

¹⁹ AARTSEN 17C is based on 1005 days of running with the IceCube detector. They set a limit on the annihilation cross section for dark matter with masses between 10–1000 GeV annihilating in the Galactic center assuming an NFW profile. The limit is of $1.2 \times 10^{23} \text{ cm}^3 \text{ s}^{-1}$ in the $\tau^+ \tau^-$ channel. Supersedes AARTSEN 15E.

²⁰ ARCHAMBAULT 17 performs a joint statistical analysis of four dwarf galaxies with VERITAS looking for gamma-ray emission from neutralino annihilation. They set limits on the neutralino annihilation cross section.

²¹ ADRIAN-MARTINEZ 16 is based on data from the ANTARES neutrino telescope. They looked for interactions of ν 's from neutralino annihilations in the Sun over a background of atmospheric neutrinos and set 90% CL limits on the muon neutrino flux. They also obtain limits on the spin dependent and spin independent neutralino-proton cross section for neutralino masses in the range 50 to 5,000 GeV. This updates ADRIAN-MARTINEZ 13.

²² AHNEN 16 combines 158 hours of Segue 1 observations with MAGIC with 6 year observations of 15 dwarf satellite galaxies by Fermi-LAT to set limits on annihilation cross sections for dark matter masses between 10 GeV and 100 TeV.

²³ AVRORIN 16 is based on 2.76 years with Lake Baikal neutrino telescope. They derive 90% upper limits on the annihilation cross section from dark matter annihilations in the Galactic center.

²⁴ CIRELLI 16 and LEITE 16 derive bounds on the annihilation cross section from radio observations.

²⁵ ACKERMANN 15 is based on 5.8 years of data with Fermi-LAT and search for monochromatic gamma-rays in the energy range of 0.2–500 GeV from dark matter annihilations. This updates ACKERMANN 13A.

²⁶ ACKERMANN 15A is based on 50 months of data with Fermi-LAT and search for dark matter annihilation signals in the isotropic gamma-ray background as well as galactic subhalos in the energy range of a few GeV to a few tens of TeV.

²⁷ ACKERMANN 15B is based on 6 years of data with Fermi-LAT observations of Milky Way dwarf spheroidal galaxies. Set limits on the annihilation cross section from $m_\chi = 2$ GeV to 10 TeV. This updates ACKERMANN 14.

²⁸ BUCKLEY 15 is based on 5 years of Fermi-LAT data searching for dark matter annihilation signals from Large Magellanic Cloud.

²⁹ CHOI 15 is based on 3903 days of SuperKamiokande data searching for neutrinos produced from dark matter annihilations in the sun. They place constraints on the dark matter-nucleon scattering cross section for dark matter masses between 4–200 GeV.

³⁰ ALEKSIC 14 is based on almost 160 hours of observations of Segue 1 satellite dwarf galaxy using the MAGIC telescopes between 2011 and 2013. Sets limits on the annihilation cross section out to $m_\chi = 10$ TeV.

³¹ AVRORIN 14 is based on almost 2.76 years with Lake Baikal neutrino telescope. They derive 90% upper limits on the fluxes of muons and muon neutrinos from dark matter annihilations in the Sun.

Searches Particle Listings

Supersymmetric Particle Searches

- ³² AARTSEN 13c is based on data collected during 339.8 effective days with the IceCube 59-string detector. They looked for interactions of ν_μ 's from neutralino annihilations in nearby galaxies and galaxy clusters. They obtain limits on the neutralino annihilation cross section for neutralino masses in the range 30–100,000 GeV.
- ³³ BERGSTROM 13, JIN 13, and KOPP 13 derive limits on the mass and annihilation cross section using AMS-02 data. JIN 13 also sets a limit on the lifetime of the dark matter particle.
- ³⁴ BOLIEV 13 is based on data collected during 24.12 years of live time with the Bakson Underground Scintillator Telescope. They looked for interactions of ν_μ 's from neutralino annihilations in the Sun over a background of atmospheric neutrinos and set 90% CL limits on the muon flux. They also obtain limits on the spin dependent and spin independent neutralino-proton cross section for neutralino masses in the range 10–1000 GeV.
- ³⁵ ACKERMANN 10 place upper limits on the annihilation cross section with $b\bar{b}$ or $\mu^+\mu^-$ final states.
- ³⁶ ACHTERBERG 06 is based on data collected during 421.9 effective days with the AMANDA detector. They looked for interactions of ν_μ 's from the centre of the Earth over a background of atmospheric neutrinos and set 90% CL limits on the muon flux. Their limit is compared with the muon flux expected from neutralino annihilations into W^+W^- and $b\bar{b}$ at the centre of the Earth for MSSM parameters compatible with the relic dark matter density, see their Fig. 7.
- ³⁷ ACKERMANN 06 is based on data collected during 143.7 days with the AMANDA-II detector. They looked for interactions of ν_μ 's from the Sun over a background of atmospheric neutrinos and set 90% CL limits on the muon flux. Their limit is compared with the muon flux expected from neutralino annihilations into W^+W^- in the Sun for SUSY model parameters compatible with the relic dark matter density, see their Fig. 3.
- ³⁸ DEBOER 06 interpret an excess of diffuse Galactic gamma rays observed with the EGRET satellite as originating from π^0 decays from the annihilation of neutralinos into quark jets. They analyze the corresponding parameter space in a supergravity inspired MSSM model with radiative electroweak symmetry breaking, see their Fig. 3 for the preferred region in the $(m_0, m_{1/2})$ plane of a scenario with large $\tan\beta$.
- ³⁹ AMBROSIO 99 and DESAI 04 set new neutrino flux limits which can be used to limit the parameter space in supersymmetric models based on neutralino annihilation in the Sun and the Earth.
- ⁴⁰ LOSECCO 95 reanalyzed the IMB data and places lower limit on $m_{\tilde{\chi}_1^0}$ of 18 GeV if the LSP is a photino and 10 GeV if the LSP is a higgsino based on LSP annihilation in the sun producing high-energy neutrinos and the limits on neutrino fluxes from the IMB detector.
- ⁴¹ MORI 93 excludes some region in $M_2-\mu$ parameter space depending on $\tan\beta$ and lightest scalar Higgs mass for neutralino dark matter $m_{\tilde{\chi}_1^0} > m_W$, using limits on upgoing muons produced by energetic neutrinos from neutralino annihilation in the Sun and the Earth.
- ⁴² BOTTINO 92 excludes some region $M_2-\mu$ parameter space assuming that the lightest neutralino is the dark matter, using upgoing muons at Kamiokande, direct searches by Ge detectors, and by LEP experiments. The analysis includes top radiative corrections on Higgs parameters and employs two different hypotheses for nucleon-Higgs coupling. Effects of rescaling in the local neutralino density according to the neutralino relic abundance are taken into account.
- ⁴³ BOTTINO 91 excluded a region in $M_2-\mu$ plane using upgoing muon data from Kamioka experiment, assuming that the dark matter surrounding us is composed of neutralinos and that the Higgs boson is not too heavy.
- ⁴⁴ GELMINI 91 exclude a region in $M_2-\mu$ plane using dark matter searches.
- ⁴⁵ KAMIONKOWSKI 91 excludes a region in the $M_2-\mu$ plane using IMB limit on upgoing muons originated by energetic neutrinos from neutralino annihilation in the sun, assuming that the dark matter is composed of neutralinos and that $m_{H_1^0} \lesssim 50$ GeV. See Fig. 8 in the paper.
- ⁴⁶ MORI 91b exclude a part of the region in the $M_2-\mu$ plane with $m_{\tilde{\chi}_1^0} \lesssim 80$ GeV using a limit on upgoing muons originated by energetic neutrinos from neutralino annihilation in the earth, assuming that the dark matter surrounding us is composed of neutralinos and that $m_{H_1^0} \lesssim 80$ GeV.
- ⁴⁷ OLIVE 88 result assumes that photinos make up the dark matter in the galactic halo. Limit is based on annihilations in the sun and is due to an absence of high energy neutrinos detected in underground experiments. The limit is model dependent.

$\tilde{\chi}_1^0-p$ elastic cross section

Experimental results on the $\tilde{\chi}_1^0-p$ elastic cross section are evaluated at $m_{\tilde{\chi}_1^0}=100$ GeV. The experimental results on the cross section are often mass dependent. Therefore, the mass and cross section results are also given where the limit is strongest, when appropriate. Results are quoted separately for spin-dependent interactions (based on an effective 4-Fermi Lagrangian of the form $\tilde{\chi}_1^0 \gamma^\mu \tilde{\chi}_1^0 \chi \bar{\chi} \gamma_\mu \mu^5 q$) and spin-independent interactions ($\tilde{\chi}_1^0 \chi \bar{\chi} q$). For calculational details see GRIEST 88b, ELLIS 88b, BARBIERI 89c, DREES 93b, ARNOWITT 96, BERGSTROM 96, and BAER 97 in addition to the theory papers listed in the Tables. For a description of the theoretical assumptions and experimental techniques underlying most of the listed papers, see the review on "Dark matter" in this "Review of Particle Physics," and references therein. Most of the following papers use galactic halo and nuclear interaction assumptions from (LEWIN 96).

- The strongest limit is $< 2.5 \times 10^{-5}$ pb at $m_\chi = 25$ GeV. This updates AMOLE 17.
- The strongest limit is $< 2 \times 10^{-4}$ pb at $m_\chi = 30$ GeV. For scatterings on neutrons, the strongest limit is $< 6.3 \times 10^{-6}$ pb at $m_\chi = 30$ GeV.
- The strongest limit is $< 4.4 \times 10^{-4}$ pb at $m_\chi = 40$ GeV. This updates FU 17.
- The strongest limit is 5×10^{-4} pb at $m_\chi = 35$ GeV. The limit for scattering on neutrons is 3×10^{-5} pb at 100 GeV and is 1.6×10^{-5} pb at 35 GeV. This updates AKERIB 16A.
- Directional recoil detector. This updates DAW 12.
- This result updates ARCHAMBAULT 12. The strongest limit is 0.013 pb at $m_\chi = 20$ GeV.
- The strongest limit is 5×10^{-4} pb at $m_\chi = 80$ GeV.
- The strongest limit is 5.2×10^{-3} pb at 50 GeV. The limit for scattering on neutrons is 2.8×10^{-4} pb at 100 GeV and the strongest limit is 2.0×10^{-4} pb at 50 GeV. This updates APRILE 13.
- The strongest limit is 0.0043 pb and occurs at $m_\chi = 35$ GeV. FELIZARDO 14 also presents limits for the scattering on neutrons. At $m_\chi = 100$ GeV, the upper limit is 0.13 pb and the strongest limit is 0.066 pb at $m_\chi = 35$ GeV.
- This result updates LEBEDENKO 09A. The strongest limit is 8×10^{-3} pb at $m_\chi = 50$ GeV. Limit applies to the neutralino neutron elastic cross section.
- The strongest limit is 6×10^{-3} pb at $m_\chi = 60$ GeV.
- The strongest limit is 5.7×10^{-3} pb at $m_\chi = 35$ GeV.
- This result updates LEE 07A. The strongest limit is at $m_\chi = 80$ GeV.
- Predictions for the spin-dependent elastic cross section based on a frequentist approach to electroweak observables in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry.
- The strongest limit is 0.6 pb and occurs at $m_\chi = 30$ GeV. The limit for scattering on neutrons is 0.01 pb at $m_\chi = 100$ GeV, and the strongest limit is 0.0045 pb at $m_\chi = 30$ GeV.
- Limit applies to neutron elastic cross section.
- The strongest upper limit is 0.25 pb and occurs at $m_\chi \simeq 40$ GeV.
- The strongest upper limit is 4 pb and occurs at $m_\chi \simeq 60$ GeV. The limit on the neutron spin-dependent elastic cross section is 0.07 pb. This latter limit is improved in AHMED 09, where a limit of 0.02 pb is obtained at $m_\chi = 100$ GeV. The strongest limit in AHMED 09 is 0.018 pb and occurs at $m_\chi = 60$ GeV.
- The strongest upper limit is 1.2 pb and occurs at $m_\chi \simeq 40$ GeV. The limit on the neutron spin-dependent cross section is 35 pb.
- The strongest upper limit is 0.35 pb and occurs at $m_\chi \simeq 60$ GeV.
- The strongest upper limit is 1.2 pb and occurs $m_\chi \simeq 30$ GeV.
- ELLIS 04 calculates the $\chi-p$ elastic scattering cross section in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry, but without universal scalar masses. In the case of universal squark and slepton masses, but non-universal Higgs masses, the limit becomes 2×10^{-4} , see ELLIS 03e.
- The strongest upper limit is 0.75 pb and occurs at $m_\chi \simeq 70$ GeV.
- The strongest upper limit is 30 pb and occurs at $m_\chi \simeq 20$ GeV.
- The strongest upper limit is 8 pb and occurs at $m_\chi \simeq 30$ GeV.
- ELLIS 01c calculates the $\chi-p$ elastic scattering cross section in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry. In models with nonuniversal Higgs masses, the upper limit to the cross section is 6×10^{-4} .
- The strongest upper limit is 3 pb and occurs at $m_\chi \simeq 60$ GeV. The limits are for inelastic scattering $\chi^0 + {}^{129}\text{Xe} \rightarrow \chi^0 + {}^{129}\text{Xe}^* (39.58 \text{ keV})$.
- The strongest upper limit is 4.4 pb and occurs at $m_\chi \simeq 60$ GeV.
- The strongest upper limit is about 35 pb and occurs at $m_\chi \simeq 15$ GeV.

- 1 Commissioning Run for PandaX-4T. The strongest limit is 3.8×10^{-11} pb at $m_\chi = 40$ GeV.
- 2 WANG 20G strongest limit is 2.2×10^{-10} pb at 30 GeV using 132 ton-day full exposure of PandaX-II. This updates CUI 17A, though the results here provide weaker constraints.
- 3 The strongest upper limit is 2.2×10^{-8} pb at 60 GeV.
- 4 This updates AMAUDRUZ 18.
- 5 This updates AMOLE 16.
- 6 The strongest limit is 2.05×10^{-6} at $m = 60$ GeV.
- 7 The strongest limit is 1.09×10^{-8} pb at $m_\chi = 126$ GeV. This updates AGNES 15.
- 8 The strongest limit is 1.0×10^{-8} pb at $m_\chi = 46$ GeV. This updates AGNESE 15B.
- 9 Based on 278.8 days of data collection. The strongest limit is 4.1×10^{-11} pb at $m_\chi = 30$ GeV. This updates APRILE 17C.
- 10 AKERIB 17. The strongest limit is 1.1×10^{-10} pb at 50 GeV. This updates AKERIB 16.
- 11 The strongest limit is 1.1×10^{-9} pb at 50 GeV. This updates APRILE 12.
- 12 The strongest upper limit is 7.6×10^{-10} at $m_\chi = 33$ GeV.
- 13 Predictions for the spin-independent elastic cross section based on a frequentist approach to electroweak observables in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using the 20 fb⁻¹ 8 TeV and the 5 fb⁻¹ 7 TeV LHC data and the LUX data.
- 14 The strongest limit is 3.6×10^{-6} pb and occurs at $m_\chi = 35$ GeV. Felizardo 2014 updates Felizardo 2012.
- 15 Predictions for the spin-independent elastic cross section based on a Bayesian approach to electroweak observables in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using the 20 fb⁻¹ LHC data and LUX.

- 16 AGNESE 13 presents 90% CL limits on the elastic cross section for masses in the range 7–100 GeV using the Si based detector. The strongest upper limit is 1.8×10^{-6} pb at $m_\chi = 50$ GeV. This limit is improved to 7×10^{-7} pb in AGNESE 13A.
- 17 This result updates LEBEDENKO 09. The strongest limit is 3.9×10^{-8} pb at $m_\chi = 52$ GeV.
- 18 ANGLÖHER 12 presents results of 730 kg days from the CRESST-II dark matter detector. They find two maxima in the likelihood function corresponding to best fit WIMP masses of 25.3 and 11.6 GeV with elastic cross sections of 1.6×10^{-6} and 3.7×10^{-5} pb respectively, see their Table 4. The statistical significance is more than 4σ . ANGLÖHER 12 updates ANGLÖHER 09.
- 19 Predictions for the spin-independent elastic cross section based on a frequentist approach to electroweak observables in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using the 5 fb⁻¹ LHC data and XENON100.
- 20 The strongest limit is 1.4×10^{-7} at $m_\chi = 60$ GeV.
- 21 This result updates LEE 07A. The strongest limit is 2.1×10^{-7} at $m_\chi = 70$ GeV.
- 22 AHMED 11A gives combined results from CDMS and EDELWEISS. The strongest limit is at $m_\chi = 90$ GeV.
- 23 ARMENGAUD 11 updates result of ARMENGAUD 10. Strongest limit at $m_\chi = 85$ GeV.
- 24 The strongest upper limit is 5.1×10^{-8} pb and occurs at $m_\chi \approx 30$ GeV. The values quoted here are based on the analysis performed in ANGLE 08 with the update from SORESENSEN 09.
- 25 The strongest upper limit is 6.6×10^{-7} pb and occurs at $m_\chi \approx 65$ GeV.
- 26 AKERIB 06A updates the results of AKERIB 05. The strongest upper limit is 1.6×10^{-7} pb and occurs at $m_\chi \approx 60$ GeV.
- 27 The strongest upper limit is also close to 1.0×10^{-6} pb and occurs at $m_\chi \approx 70$ GeV. BENOIT 06 claim that the discrimination power of ZEPLIN-I measurement (ALNER 05A) is not reliable enough to obtain a limit better than 1×10^{-3} pb. However, SMITH 06 do not agree with the criticisms of BENOIT 06.
- 28 AKERIB 04 is incompatible with BERNABEI 00 most likely value, under the assumption of standard WIMP-halo interactions. The strongest upper limit is 4×10^{-7} pb and occurs at $m_\chi \approx 60$ GeV.
- 29 Predictions for the spin-independent elastic cross section in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry.
- 30 KIM 02 and ELLIS 04 calculate the χp elastic scattering cross section in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry, but without universal scalar masses.
- 31 In the case of universal squark and slepton masses, but non-universal Higgs masses, the limit becomes 2×10^{-6} (2×10^{-11} when constraint from the BNL $g-2$ experiment are included), see ELLIS 03E. ELLIS 05 display the sensitivity of the elastic scattering cross section to the π -Nucleon Σ term.
- 32 PIERCE 04A calculates the χp elastic scattering cross section in the framework of models with very heavy scalar masses. See Fig. 2 of the paper.
- 33 The strongest upper limit is 1.8×10^{-5} pb and occurs at $m_\chi \approx 80$ GeV.
- 34 Under the assumption of standard WIMP-halo interactions, Akerib 03 is incompatible with BERNABEI 00 most likely value at the 99.98% CL. See Fig. 4.
- 35 BAER 03A calculates the χp elastic scattering cross section in several models including the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry.
- 36 The strongest upper limit is 7×10^{-6} pb and occurs at $m_\chi \approx 30$ GeV.
- 37 ABRAMS 02 is incompatible with the DAMA most likely value at the 99.9% CL. The strongest upper limit is 3×10^{-6} pb and occurs at $m_\chi \approx 30$ GeV.
- 38 The strongest upper limit is 2×10^{-5} pb and occurs at $m_\chi \approx 40$ GeV.
- 39 The strongest upper limit is 7×10^{-6} pb and occurs at $m_\chi \approx 46$ GeV.
- 40 The strongest upper limit is 1.8×10^{-5} pb and occurs at $m_\chi \approx 32$ GeV.
- 41 BOTTINO 01 calculates the $\chi-p$ elastic scattering cross section in the framework of the following supersymmetric models: $N=1$ supergravity with the radiative breaking of the electroweak gauge symmetry, $N=1$ supergravity with nonuniversal scalar masses and an effective MSSM model at the electroweak scale.
- 42 Calculates the $\chi-p$ elastic scattering cross section in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry.
- 43 ELLIS 01C calculates the $\chi-p$ elastic scattering cross section in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry. ELLIS 02B find a range 2×10^{-8} – 1.5×10^{-7} at $\tan\beta=50$. In models with nonuniversal Higgs masses, the upper limit to the cross section is 4×10^{-7} .
- 44 ACCOMANDO 00 calculate the $\chi-p$ elastic scattering cross section in the framework of minimal $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry. The limit is relaxed by at least an order of magnitude when models with nonuniversal scalar masses are considered. A subset of the authors in ARNOWITT 02 updated the limit to $< 9 \times 10^{-8}$ ($\tan\beta < 55$).
- 45 BERNABEI 00 search for annual modulation of the WIMP signal. The data favor the hypothesis of annual modulation at 4σ and are consistent, for a particular model framework quoted there, with $m_{\chi 0} = 44 \pm 19$ GeV and a spin-independent X^0 -proton cross section of $(5.4 \pm 1.0) \times 10^{-6}$ pb. See also BERNABEI 01 and BERNABEI 00c.
- 46 FENG 00 calculate the $\chi-p$ elastic scattering cross section in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry with a particular emphasis on focus point models. At $\tan\beta=50$, the range is 8×10^{-8} – 4×10^{-7} .

Other bounds on $\tilde{\chi}_1^0$ from astrophysics and cosmology

Most of these papers generally exclude regions in the $M_2 - \mu$ parameter plane by requiring that the $\tilde{\chi}_1^0$ contribution to the overall cosmological density is less than some maximal value to avoid overclosure of the Universe. Those not based on the cosmological density are indicated. Many of these papers also include LEP and/or other bounds.

	49	KRAUSS	83	COSM $\tilde{\tau}$
		VYSOTSKI	83	COSM $\tilde{\tau}$

¹ ELLIS 00 updates ELLIS 98. Uses LEP e^+e^- data at $\sqrt{s}=202$ and 204 GeV to improve bound on neutralino mass to 51 GeV when scalar mass universality is assumed and 46 GeV when Higgs mass universality is relaxed. Limits on $\tan\beta$ improve to > 2.7 ($\mu > 0$), > 2.2 ($\mu < 0$) when scalar mass universality is assumed and > 1.9 (both signs of μ) when Higgs mass universality is relaxed.

² ATHRON 17b places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using all Run I and the 13 fb^{-1} 13 TeV Run II LHC searches and other experimental data.

³ BECHTLE 16 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using all Run I LHC searches.

⁴ BAGNASCHI 15 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using all Run I LHC searches.

⁵ Implications of the LHC result on the Higgs mass and on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry.

⁶ BUCHMUELLER 14A places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches using the 20 fb^{-1} 8 TeV and the 5 fb^{-1} 7 TeV LHC and the LUX data.

⁷ ROSZKOWSKI 14 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using Bayesian statistics and indirect experimental searches using the 20 fb^{-1} LHC and the LUX data.

⁸ CABRERA 13 and STREGE 13 place constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry with and without non-universal Higgs masses using the 5.8 fb^{-1} , $\sqrt{s}=7$ TeV ATLAS supersymmetry searches and XENON100 results.

⁹ ELLIS 13B place constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry with and without Higgs mass universality. Models with universality below the GUT scale are also considered.

¹⁰ BALAZS 12 and STREGE 12 place constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using the 1 fb^{-1} LHC supersymmetry searches, the 5 fb^{-1} Higgs mass constraints, both with $\sqrt{s}=7$ TeV, and XENON100 results.

¹¹ BECHTLE 12 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches, using the 5 fb^{-1} LHC and XENON100 data.

¹² BESKIDT 12 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches, the 5 fb^{-1} LHC and the XENON100 data.

¹³ BELANGER 04 and BOTTINO 12 (see also BOTTINO 03, BOTTINO 03A and BOTTINO 04) do not assume gaugino or scalar mass unification.

¹⁴ FENG 12b places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry and large sfermion masses using the 1 fb^{-1} LHC supersymmetry searches, the 5 fb^{-1} LHC Higgs mass constraints both with $\sqrt{s}=7$ TeV, and XENON100 results.

¹⁵ BUCHMUELLER 11 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches and including supersymmetry breaking relations between A and B parameters.

¹⁶ Places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry but non-Universal Higgs masses.

¹⁷ ELLIS 10 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry with universality above the GUT scale.

¹⁸ BUCHMUELLER 09 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches.

¹⁹ DREINER 09 show that in the general MSSM with non-universal gaugino masses there exists no model-independent laboratory bound on the mass of the lightest neutralino. An essentially massless χ_1^0 is allowed by the experimental and observational data, imposing some constraints on other MSSM parameters, including M_2 , μ and the slepton and squark masses.

²⁰ BUCHMUELLER 08 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches.

²¹ CALIBBI 07 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry with universality above the GUT scale including the effects of right-handed neutrinos.

²² ELLIS 07 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry with universality below the GUT scale.

²³ ALLANACH 06 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry.

²⁴ DE-AUSTRI 06 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry.

²⁵ BALTZ 04 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry.

²⁶ Limit assumes a pseudo scalar mass < 200 GeV. For larger pseudo scalar masses, $m_{\chi} > 18(29)$ GeV for $\tan\beta = 50(10)$. Bounds from WMAP, $(g-2)_\mu$, $b \rightarrow s\gamma$, LEP.

²⁷ ELLIS 04b places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry including supersymmetry breaking relations between A and B parameters. See also ELLIS 03d.

²⁸ PIERCE 04A places constraints on the SUSY parameter space in the framework of models with very heavy scalar masses.

²⁹ BAER 03, CHATTOPADHYAY 03, ELLIS 03c and LAHANAS 03 place constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry based on WMAP results for the cold dark matter density.

³⁰ BOEHM 00b and ELLIS 03 place constraints on the SUSY parameter space in the framework of minimal $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry. Includes the effect of χ - t co-annihilations.

³¹ LAHANAS 02 places constraints on the SUSY parameter space in the framework of minimal $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry. Focuses on the role of pseudo-scalar Higgs exchange.

³² BARGER 01c use the cosmic relic density inferred from recent CMB measurements to constrain the parameter space in the framework of minimal $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry.

³³ ELLIS 01b places constraints on the SUSY parameter space in the framework of minimal $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry. Focuses on models with large $\tan\beta$.

³⁴ FENG 00 explores cosmologically allowed regions of MSSM parameter space with multi-TeV masses.

³⁵ ELLIS 98b assumes a universal scalar mass and radiative supersymmetry breaking with universal gaugino masses. The upper limit to the LSP mass is increased due to the inclusion of $\chi - \tilde{\tau}_R$ coannihilations.

- 36 EDSJO 97 included all coannihilation processes between neutralinos and charginos for any neutralino mass and composition.
- 37 Notes the location of the neutralino Z resonance and h resonance annihilation corridors in minimal supergravity models with radiative electroweak breaking.
- 38 Mass of the bino (=LSP) is limited to $m_{\tilde{B}} \lesssim 350$ GeV for $m_t = 174$ GeV.
- 39 DREES 93, KELLEY 93 compute the cosmic relic density of the LSP in the framework of minimal $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry.
- 40 FALK 93 relax the upper limit to the LSP mass by considering sfermion mixing in the MSSM.
- 41 MIZUTA 93 include coannihilations to compute the relic density of Higgsino dark matter.
- 42 LOPEZ 92 calculate the relic LSP density in a minimal SUSY GUT model.
- 43 MCDONALD 92 calculate the relic LSP density in the MSSM including exact tree-level annihilation cross sections for all two-body final states.
- 44 GRIEST 91 improve relic density calculations to account for coannihilations, pole effects, and threshold effects.
- 45 NOJIRI 91 uses minimal supergravity mass relations between squarks and sleptons to narrow cosmologically allowed parameter space.
- 46 Mass of the bino (=LSP) is limited to $m_{\tilde{B}} \lesssim 350$ GeV for $m_t \leq 200$ GeV. Mass of the higgsino (=LSP) is limited to $m_{\tilde{H}} \lesssim 1$ TeV for $m_t \leq 200$ GeV.
- 47 ROSZKOWSKI 91 calculates LSP relic density in mixed gaugino/higgsino region.
- 48 Mass of the bino (=LSP) is limited to $m_{\tilde{B}} \lesssim 550$ GeV. Mass of the higgsino (=LSP) is limited to $m_{\tilde{H}} \lesssim 3.2$ TeV.
- 49 KRAUSS 83 finds $m_{\tilde{\gamma}}$ not 30 eV to 2.5 GeV. KRAUSS 83 takes into account the gravitino decay. Find that limits depend strongly on reheated temperature. For example a new allowed region $m_{\tilde{\gamma}} = 4-20$ MeV exists if $m_{\text{gravitino}} < 40$ TeV. See figure 2.

Unstable $\tilde{\chi}_1^0$ (Lightest Neutralino) mass limit

Unless otherwise stated, results in this section assume spectra and production rates as evaluated in the MSSM. Unless otherwise stated, the goldstino or gravitino mass $m_{\tilde{G}}$ is assumed to be negligible relative to all other masses. In the following, \tilde{G} is assumed to be undetected and to give rise to a missing energy (\cancel{E}) signature.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- 1 AAD 21Y searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on Tchi1n12-GGM, and RPV models similar to Tchi1n2I, Tglu1A (with $q = u, d, s, c, b$, with equal branching fractions), and $\tilde{\ell}_L/\tilde{\nu} \rightarrow \ell/\nu\tilde{\chi}_1^0$ (mass-degenerate $\tilde{\ell}_L$ and $\tilde{\nu}$ of all 3 generations), all with $\tilde{\chi}_1^0 \rightarrow \ell^{\pm}\ell^{\mp}\nu$ via λ_{12k} or λ_{j33} (where $i, k \in 1, 2$), see their Figure 11.
- 2 AAIJ 21V searched in 5.38 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for long-lived particles (LLP) decaying to $e^{\pm}\mu^{\mp}\nu$. The LLP can be a $\tilde{\chi}_1^0$ in RPV SUSY, or a right-handed neutrino, and can be produced in pairs, in the decay of the Higgs boson, or from charged current processes. No significant excess above the Standard Model expectations is observed. Limits are set on the cross section times branching ratio for all three production mechanisms, see their Figures 6-8.
- 3 SIRUNYAN 21AF searched in 140 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with two displaced vertices from long-lived particles decaying into multijet or dijet final states. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu2RPV with χ'_{323} coupling, on the $\tilde{\chi}_1^0$ mass in an RPV model with $\tilde{\chi}_1^0$ pair production and the RPV decay $\tilde{\chi}_1^0 \rightarrow tbs$ with χ'_{323} coupling and on the \tilde{t} mass in an RPV model with top squark pair production and the RPV decay $\tilde{t} \rightarrow \tilde{d}_i\tilde{d}_j$ with χ'_{3ij} coupling, see their Figure 7.
- 4 SIRUNYAN 21M searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with two opposite-sign same-flavor leptons (electrons, muons) and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^{\pm}$ mass in Tchi1n2Fa, see their Figure 11, on the $\tilde{\chi}_1^0$ mass in Tn1n1C and Tn1n1B for $m_{-0}=m_{\tilde{\chi}_1^{\pm}}=m_{-0}$, see their Figure 12. Limits are also set on the light squark mass in the simplified model Tsqk2A, on the sbottom mass in Tsb0t3, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.
- 5 AAD 20AN searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with two photons and missing transverse momentum. Events are further categorised in terms of lepton or jet multiplicity. No significant excess over the expected background is observed. Limits at 95% C.L. are set on the Higgsino mass in the Tn1n1A simplified model, see their Figure 11.
- 6 SIRUNYAN 19CA searched in 77.4 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing delayed photons in both single and diphoton plus \cancel{E}_T final states. No excess is observed above the background expected from Standard Model processes. The results are used to set 95% C.L. exclusion limits in the context of GMSB, using the SPS8 benchmark model. For neutralino proper decay lengths of 0.1, 1, 10, and 100 m, masses up to about 320, 525, 360, and 215 GeV are excluded, respectively. See their Fig. 5. The searches involve the simplified models Tglu1D, Tglu4A,B,C, Tsqk4,4A,4B.
- 7 SIRUNYAN 19ci searched in 77.5 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t4 simplified model, see Figure 3, and on the wino mass in the Tchi1n2E simplified model, see their Figure 4. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 5.
- 8 SIRUNYAN 19K searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with a photon, an electron or muon, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the chargino and neutralino mass in the Tchi1n1A simplified model, see their Figure 6. Limits are also set on the gluino mass in the Tglu4A simplified model, and on the squark mass in the Tsqk4A simplified model, see their Figure 7.
- 9 AABOUD 18ck searched for events with at least 3 b-jets and large missing transverse energy in two datasets of pp collisions at $\sqrt{s} = 13$ TeV of 36.1 fb^{-1} and 24.3 fb^{-1} depending on the trigger requirements. The analyses aimed to reconstruct two Higgs bosons decaying to pairs of b-quarks. No significant excess above the Standard Model expectations is observed. Limits are set on the Higgsino mass in the Tn1n1A simplified model, see their Figure 15(a). Constraints are also presented as a function of the BR of Higgsino decaying into an higgs boson and a gravitino, see their Figure 15(b).
- 10 AABOUD 18z searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via λ_{12k} or λ_{j33} to charged leptons, see their Figures 7, 8.
- 11 SIRUNYAN 18Ao searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos and higgsinos in events with either two or more leptons (electrons or muons) of the same electric charge, or with three or more leptons, which can include up to two hadronically decaying tau leptons. No significant excess above

Supersymmetric Particle Searches

- the Standard Model expectations is observed. Limits are set on the chargino/neutralino mass in the Tchi1n2A, Tchi1n2H, Tchi1n2D, Tchi1n2E and Tchi1n2F simplified models, see their Figures 14, 15, 16, 17 and 18. Limits are also set on the higgsino mass in the Tn1n1A, Tn1n1B and Tn1n1C simplified models, see their Figure 19.
- 12 SIRUNYAN 18AP searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and neutralinos by combining a number of previous and new searches. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino/neutralino mass in the Tchi1n2E, Tchi1n2F and Tchi1n2I simplified models, see their Figures 7, 8, 9 and 10. Limits are also set on the higgsino mass in the Tn1n1A, Tn1n1B and Tn1n1C simplified models, see their Figure 11, 12, 13 and 14.
- 13 SIRUNYAN 18AR searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two opposite-charge, same-flavour leptons (electrons or muons), jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see their Figure 7. Limits are also set on the chargino/neutralino mass in the Tchi1n2F simplified models, see their Figure 8, and on the higgsino mass in the Tn1n1B and Tn1n1C simplified models, see their Figure 9. Finally, limits are set on the sbottom mass in the Tsb0t3 simplified model, see their Figure 10.
- 14 SIRUNYAN 18o searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two Higgs bosons, decaying to pairs of b -quarks, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the Higgsino mass in the T1n1n1A simplified model, see their Figure 9.
- 15 SIRUNYAN 18x searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and \cancel{E}_T . The razor variables (M_R and R^2) are used to categorise the events. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t4 simplified model and on the wino mass in the Tchi1n2E simplified model, see their Figure 5. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 6.
- 16 KHACHATRYAN 14L searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of direct pair production of neutralinos with Higgs or Z -bosons in the decay chain, leading to HH , HZ and ZZ final states with missing transverse energy. The decays of 16–20. a Higgs boson to a b -quark pair, to a photon pair, and to final states with leptons are considered in conjunction with hadronic and leptonic decay modes of the Z and W bosons. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in the context of GMSB simplified models where the decays $\tilde{\chi}_1^0 \rightarrow H\bar{G}$ or $\tilde{\chi}_1^0 \rightarrow Z\bar{G}$ take place either 100% or 50% of the time, see Figs. 16–20.
- 17 AAD 20b searched in 32.8 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing an oppositely charge lepton pair ($e\bar{e}$, $\mu\bar{\mu}$ or $e\mu$) coming from long-lived neutralinos decaying through the R -parity-violating decay $\tilde{\chi}_1^0 \rightarrow \ell\bar{\nu}\nu$ with $\lambda_{121} \neq 0$ or $\lambda_{122} \neq 0$. No excess over the expected background is observed. Limits are derived for decay lengths of the neutralino between 1 mm and 10 m in a scenario where a squark-antisquark pair is produced, with the squark decaying to a quark and a $\tilde{\chi}_1^0$, with either $\tilde{\chi}_1^0 \rightarrow e\bar{\nu}\nu$ or $\tilde{\chi}_1^0 \rightarrow \mu\bar{\nu}\nu$ ($\lambda_{121} \neq 0$) or $\tilde{\chi}_1^0 \rightarrow e\mu\nu/\mu\nu$ ($\lambda_{122} \neq 0$), see their Figures 4 and 5.
- 18 AABOUD 19G searched in 32.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for evidence of neutralinos decaying into a Z -boson and a gravitino, in events characterized by the presence of dimuon vertices with displacements from the pp interaction point in the range of 1400 cm. Neutralinos are assumed to be produced in the decay chain of gluinos as in Tglu1A models. No significant excess is observed in the number of vertices relative to the predicted background. In GGM with a gluino mass of 1100 GeV, neutralino masses in the range 300–1000 GeV are excluded for certain values of $c\tau$, see their Figure 7.
- 19 AAJ 17z searched in 1 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 2 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing a displaced vertex with one associated high transverse momentum μ . No excess is observed above the background expected from Standard Model processes. The results are used to set 95% C.L. upper limits on the cross section times branching fractions of pair-produced neutralinos decaying non-promptly into a muon and two quarks. Long-lived particles in a mass range 23–198 GeV are considered, see their Fig. 5 and Fig. 6.
- 20 KHACHATRYAN 16BX searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing 3 or more leptons coming from the electroweak production of wino- or higgsino-like neutralinos, assuming non-zero R -parity-violating leptonic couplings λ_{122} , λ_{123} , and λ_{233} or semileptonic couplings λ'_{31} , λ'_{233} , λ'_{331} , and λ'_{333} . No excess over the expected background is observed and limits are derived on the neutralino mass, see Figs. 24 and 25.
- 21 AAD 14BH searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing non-pointing photons in a diphoton plus missing transverse energy final state. No excess is observed above the background expected from Standard Model processes. The results are used to set 95% C.L. exclusion limits in the context of gauge-mediated supersymmetric breaking models, with the lightest neutralino being the next-to-lightest supersymmetric particle and decaying with a lifetime in the range from 0.25 ns to about 100 ns into a photon and a gravitino. For limits on the NLSP lifetime versus Λ plane, for the SPS8 model, see their Fig. 7.
- 22 AAD 13AP searched in 4.8 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing non-pointing photons in a diphoton plus missing transverse energy final state. No excess is observed above the background expected from Standard Model processes. The results are used to set 95% C.L. exclusion limits in the context of gauge-mediated supersymmetric breaking models, with the lightest neutralino being the next-to-lightest supersymmetric particle and decaying with a lifetime in excess of 0.25 ns into a photon and a gravitino. For limits in the NLSP lifetime versus Λ plane, for the SPS8 model, see their Fig. 8.
- 23 AAD 13Q searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing a high- p_T isolated photon, at least one jet identified as originating from a bottom quark, and high missing transverse momentum. Such signatures may originate from supersymmetric models with gauge-mediated supersymmetry breaking in events in which one of a pair of higgsino-like neutralinos decays into a photon and a gravitino while the other decays into a Higgs boson and a gravitino. No significant excess above the expected background was found and limits were set on the neutralino mass in a generalized GMSB model (GGM) with a higgsino-like neutralino NLSP, see their Fig. 4. Intermediate neutralino masses between 220 and 380 GeV are excluded at 95% C.L., regardless of the squark and gluino masses, purely on the basis of the expected weak production.
- 24 AAD 13R looked in 4.4 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing new, heavy particles that decay at a significant distance from their production point into a final state containing a high-momentum muon and charged hadrons. No excess over the expected background is observed and limits are placed on the production cross-section of neutralinos via squarks for various $m_{\tilde{q}}$, $m_{\tilde{\chi}_1^0}$ in an R -parity violating scenario with $\lambda'_{211} \neq 0$, as a function of the neutralino lifetime, see their Fig. 6.
- 25 AALTONEN 13i searched in 6.3 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events containing \cancel{E}_T and a delayed photon that arrives late in the detector relative to the time expected from prompt production. No evidence of delayed photon production is observed.
- 26 CHATRCHYAN 13AH searched in 4.9 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing \cancel{E}_T and a delayed photon that arrives late in the detector relative to the time expected from prompt production. No significant excess above the expected background was found and limits were set on the pair production of $\tilde{\chi}_1^0$ depending on the neutralino proper decay length, see Fig. 8. Supersedes CHATRCHYAN 12BK.
- 27 AAD 12CP searched in 4.8 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two photons and large \cancel{E}_T due to $\tilde{\chi}_1^0 \rightarrow \gamma\bar{G}$ decays in a GMSB framework. No significant excess above the expected background was found and limits were set on the neutralino mass in a generalized GMSB model (GGM) with a bino-like neutralino NLSP, see Figs. 6 and 7. The other sparticle masses were decoupled, $\tan\beta = 2$ and $c\tau_{NLSP} < 0.1 \text{ mm}$. Also, in the framework of the SPS8 model, limits are presented in Fig. 8.
- 28 AAD 12CT searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing four or more leptons (electrons or muons) and either moderate values of missing transverse momentum or large effective mass. No significant excess is found in the data. Limits are presented in a simplified model of R -parity violating supersymmetry in which charginos are pair-produced and then decay into a W -boson and a $\tilde{\chi}_1^0$, which in turn decays through an RPV coupling into two charged leptons ($e^\pm e^\mp$ or $\mu^\pm \mu^\mp$) and a neutrino. In this model, limits are set on the neutralino mass as a function of the chargino mass, see Fig. 3a. Limits are also set in an R -parity violating mSUGRA model, see Fig. 3b.
- 29 AAD 12R looked in 33 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing new, heavy particles that decay at a significant distance from their production point into a final state containing a high-momentum muon and charged hadrons. No excess over the expected background is observed and limits are placed on the production cross-section of neutralinos via squarks for various ($m_{\tilde{q}}$, $m_{\tilde{\chi}_1^0}$) in an R -parity violating scenario with $\lambda'_{211} \neq 0$, as a function of the neutralino lifetime, see their Fig. 8. Superseded by AAD 13R.
- 30 ABZOV 12AD looked in 6.2 fb^{-1} of pp collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events with a photon, a Z -boson, and large \cancel{E}_T in the final state. This topology corresponds to a GMSB model where pairs of neutralino NLSPs are either pair produced promptly or from decays of other supersymmetric particles and then decay to either $Z\bar{G}$ or $\gamma\bar{G}$. No significant excess over the SM expectation is observed and a limit at 95% C.L. on the cross section is derived as a function of the effective SUSY breaking scale Λ , see Fig. 3. Assuming $N_{mes} = 2$, $M_{mes} = 3 \Lambda$, $\tan\beta = 3$, $\mu = 0.75 M_1$, and $C_{grav} = 1$, the model is excluded at 95% C.L. for values of $\Lambda < 87 \text{ TeV}$.
- 31 CHATRCHYAN 12BK searched in 2.23 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two photons and large \cancel{E}_T due to $\tilde{\chi}_1^0 \rightarrow \gamma\bar{G}$ decays in a GMSB framework. No significant excess above the expected background was found and limits were set on the pair production of $\tilde{\chi}_1^0$ depending on the neutralino lifetime, see Fig. 6.
- 32 CHATRCHYAN 11B looked in 35 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with an isolated lepton (e or μ), a photon and \cancel{E}_T which may arise in a generalized gauge mediated model from the decay of Wino-like NLSPs. No evidence for an excess over the expected background is observed. Limits are derived in the plane of squark/gluino mass versus Wino mass (see Fig. 4). Mass degeneracy of the produced squarks and gluinos is assumed.
- 33 AALTONEN 10 searched in 2.6 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for diphoton events with large \cancel{E}_T . They may originate from the production of $\tilde{\chi}^\pm$ in pairs or associated to a $\tilde{\chi}_1^0$, decaying into $\tilde{\chi}_1^0$ which itself decays in GMSB to $\tilde{\chi}_1^0 \rightarrow \gamma\bar{G}$. There is no excess of events beyond expectation. An upper limit on the cross section is calculated in the GMSB model as a function of the $\tilde{\chi}_1^0$ mass and lifetime, see their Fig. 2. A limit is derived on the $\tilde{\chi}_1^0$ mass of 149 GeV for $\tau_{\tilde{\chi}_1^0} \ll 1 \text{ ns}$, which improves the results of previous searches.
- 34 ABZOV 10P looked in 6.3 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events with at least two isolated γ s and large \cancel{E}_T . These could be the signature of $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ production, decaying to $\tilde{\chi}_1^0$ and finally $\tilde{\chi}_1^0 \rightarrow \gamma\bar{G}$ in a GMSB framework. No significant excess over the SM expectation is observed, and a limit at 95% C.L. on the cross section is derived for $N_{mes} = 1$, $\tan\beta = 15$ and $\mu > 0$, see their Fig. 2. This allows them to set a limit on the effective SUSY breaking scale $\Lambda > 124 \text{ TeV}$, from which the excluded $\tilde{\chi}_1^0$ mass range is obtained.
- 35 ABZOV 08F looked in 1.1 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for diphoton events with large \cancel{E}_T . They may originate from the production of $\tilde{\chi}^\pm$ in pairs or associated to a $\tilde{\chi}_1^0$, decaying to a $\tilde{\chi}_1^0$ which itself decays promptly in GMSB to $\tilde{\chi}_1^0 \rightarrow \gamma\bar{G}$. No significant excess was found compared to the background expectation. A limit is derived on the masses of SUSY particles in the GMSB framework for $M = 2\Lambda$, $N = 1$, $\tan\beta = 15$ and $\mu > 0$, see Figure 2. It also excludes $\Lambda < 91.5 \text{ TeV}$. Supersedes the results of ABZOV 05A. Superseded by ABZOV 10P.
- 36 ABULENCIA 07H searched in 346 pb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events with at least three leptons (e or μ) from the decay of $\tilde{\chi}_1^0$ via LLE couplings. The results are consistent with the hypothesis of no signal. Upper limits on the cross-section are extracted and a limit is derived in the framework of mSUGRA on the masses of $\tilde{\chi}_1^0$ and $\tilde{\chi}_1^\pm$, see e.g. their Fig. 3 and Tab. II.
- 37 ABBIENDI 06b use 600 pb^{-1} of data from $\sqrt{s} = 189\text{--}209 \text{ GeV}$. They look for events with diphotons + \cancel{E} final states originating from prompt decays of pair-produced neutralinos in a GMSB scenario with $\tilde{\chi}_1^0$ NLSP. Limits on the cross-section are computed as a function of $m(\tilde{\chi}_1^0)$, see their Fig. 14. The limit on the $\tilde{\chi}_1^0$ mass is for a pure Bino state assuming a prompt decay, with lifetimes up to 10^{-9} s . Supersedes the results of ABBIENDI 04N.
- 38 ABDALLAH 05b use data from $\sqrt{s} = 180\text{--}209 \text{ GeV}$. They look for events with single photons + \cancel{E} final states. Limits are computed in the plane ($m(\tilde{G})$, $m(\tilde{\chi}_1^0)$), shown in their Fig. 9b for a pure Bino state in the GMSB framework and in Fig. 9c for a no-scale supergravity model. Supersedes the results of ABREU 00Z.
- 39 ABDALLAH 05b use data from $\sqrt{s} = 130\text{--}209 \text{ GeV}$. They look for events with diphotons + \cancel{E} final states and single photons not pointing to the vertex, expected in GMSB when

Supersymmetric Particle Searches

the $\tilde{\chi}_1^0$ is the NLSP. Limits are computed in the plane $(m(\tilde{G}), m(\tilde{\chi}_1^0))$, see their Fig. 10. The lower limit is derived on the $\tilde{\chi}_1^0$ mass for a pure Bino state assuming a prompt decay and $m_{\tilde{e}_R} = m_{\tilde{e}_L} = 2 m_{\tilde{\chi}_1^0}$. It improves to 100 GeV for $m_{\tilde{e}_R} = m_{\tilde{e}_L} = 1.1 m_{\tilde{\chi}_1^0}$ and the limit in the plane $(m(\tilde{\chi}_1^0), m(\tilde{e}_R))$ is shown in Fig. 10b. For long-lived neutralinos, cross-section limits are displayed in their Fig 11. Supersedes the results of ABREU 00Z.

$\tilde{\chi}_2^0, \tilde{\chi}_3^0, \tilde{\chi}_4^0$ (Neutralinos) mass limits

Neutralinos are unknown mixtures of photinos, z-inos, and neutral higgsinos (the supersymmetric partners of photons and of Z and Higgs bosons). The limits here apply only to $\tilde{\chi}_2^0, \tilde{\chi}_3^0$, and $\tilde{\chi}_4^0$. $\tilde{\chi}_1^0$ is the lightest supersymmetric particle (LSP); see $\tilde{\chi}_1^0$ Mass Limits. It is not possible to quote rigorous mass limits because they are extremely model dependent; i.e. they depend on branching ratios of various $\tilde{\chi}^0$ decay modes, on the masses of decay products ($\tilde{e}, \tilde{\gamma}, \tilde{q}, \tilde{g}$), and on the \tilde{e} mass exchanged in $e^+e^- \rightarrow \tilde{\chi}_i^0 \tilde{\chi}_j^0$. Limits arise either from direct searches, or from the MSSM constraints set on the gaugino and higgsino mass parameters M_2 and μ through searches for lighter charginos and neutralinos. Often limits are given as contour plots in the $m_{\tilde{\chi}_0} - m_{\tilde{e}}$ plane vs other parameters. When specific assumptions are made, e.g. the neutralino is a pure photino ($\tilde{\gamma}$), pure z-ino (\tilde{Z}), or pure neutral higgsino (\tilde{H}^0), the neutralinos will be labelled as such.

Limits obtained from e^+e^- collisions at energies up to 136 GeV, as well as other limits from different techniques, are now superseded and have not been included in this compilation. They can be found in the 1998 Edition (The European Physical Journal **C3** 1 (1998)) of this Review. Some later papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

1 AAD 21BG searched in 139 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for pair production $\tilde{\chi}_2^0 \tilde{\chi}_1^\pm$ in final states with three leptons, with and without assuming the presence of a $Z \rightarrow \ell\ell$ decay. No significant excess above the Standard Model predictions is observed. Limits are set on the $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ mass in Tchi1n2E, Tchi1n2F and Tchi1n2Ga. See their Fig. 16.

2 AAD 21Y searched in 139 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on Tchi1n2-GGM, and RPV models similar to Tchi1n2l, Tglu1A (with $q = u, d, s, c, b$, with equal branching fractions), and $\tilde{\ell}_L/\tilde{\nu} \rightarrow \ell/\nu \tilde{\chi}_1^0$ (mass-degenerate $\tilde{\ell}_L$ and $\tilde{\nu}$ of all 3 generations), all with $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \nu$ via λ_{12k} or λ_{i33} (where $i, k \in 1, 2$), see their Figure 11.

3 SIRUNYAN 21M searched in 137 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with two opposite-sign same-flavor leptons (electrons, muons) and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ mass in Tchi1n2Fa, see their Figure 11, on the $\tilde{\chi}_1^0$ mass in Tn1n1C and Tn1n1B for $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0}$, see their Figure 12. Limits are also set on the light squark mass for the simplified model Tsqk2A, on the sbottom mass in Tsb0t3, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.

4 TUMASYAN 21C searched in 137 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with one lepton, a Higgs boson decaying to a pair of bottom quarks, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Lower limits are set on the masses of $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ in the simplified model Tchi1n2E, see their Figure 6.

5 AAD 20AN searched in 139 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with two photons and missing transverse momentum. Events are further categorised in terms of lepton or jet multiplicity. No significant excess over the expected background is observed. Limits at 95% C.L. are set on the Higgsino mass in the Tn1n1A simplified model, see their Figure 11.

Searches Particle Listings

Supersymmetric Particle Searches

- 6 AAD 20l reported on ATLAS searches for electroweak production in models with compressed mass spectra as Tchi1n2Ga. A dataset of pp collisions at $\sqrt{s} = 13$ TeV corresponding to an integrated luminosity of 139 fb^{-1} was used. Events with $E_{T, \tau}$, two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Constraints at 95% C.L. are placed in Higgsino models on the mass of the $\tilde{\chi}_2^0$ (the $\tilde{\chi}_1^\pm$ mass is halfway between the $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^0$ masses) at 193 GeV for a mass splitting between $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^0$ of 9.3 GeV and extend down to a mass splitting of 2.4 GeV at the LEP chargino mass limit. See their Fig. 14(a).
- 7 AAD 20l reported on ATLAS searches for electroweak production in models with compressed mass spectra as Tchi1n2Fa. A dataset of pp collisions at $\sqrt{s} = 13$ TeV corresponding to an integrated luminosity of 139 fb^{-1} was used. Events with $E_{T, \tau}$, two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Constraints at 95% C.L. are placed in Wino-Bino models on the mass of the $\tilde{\chi}_2^0$ (degenerate with $\tilde{\chi}_1^\pm$) at 240 GeV for a mass splitting between $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^0$ of 7 GeV and extend down to a mass splitting of 1.5 GeV at the LEP chargino mass limit of 92.4 GeV. See their Fig. 14(b,c).
- 8 AAD 20k reported on a search for electroweak production in models with mass splittings near the electroweak scale as Tchi1n2F and exploiting three-lepton final state events with an emulated recursive jigsaw reconstruction method. The analysis uses a dataset of pp collisions at $\sqrt{s} = 13$ TeV corresponding to an integrated luminosity of 139 fb^{-1} . Exclusion limits at 95% C.L. are derived on next-to-lightest neutralinos and charginos with masses up to 345 GeV for a massless lightest neutralino, see their Fig. 7.
- 9 AAD 20r searched for electroweak production in the model Tchi1n2E, selecting events with a pair of b -tagged jets consistent with those from a Higgs boson decay, either an electron or a muon from the W boson decay and $E_{T, \tau}$. The analysis uses a dataset of pp collisions at $\sqrt{s} = 13$ TeV corresponding to an integrated luminosity of 139 fb^{-1} . Exclusion limits at 95% C.L. are derived on next-to-lightest neutralinos and charginos with masses up to 740 GeV for a massless lightest neutralino, assuming pure wino cross-sections. See their Fig. 6.
- 10 SIRUNYAN 20AU searched in 77.2 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing one soft, hadronically decaying tau lepton, one energetic jet from initial-state radiation, and large $E_{T, \tau}$. No excess over the expected background is observed. Limits are derived on the wino mass in the Tchi1n2D simplified model, see their Figure 2.
- 11 AABOUD 19AU searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos and next-to-lightest neutralinos decaying into lightest neutralinos and a W and a Higgs boson, respectively. Fully hadronic, semileptonic, diphoton, and multilepton (electrons, muons) final states with missing transverse momentum are considered in this search. Observations are consistent with the Standard Model expectations, and 95% confidence-level limits of up to 680 GeV on the chargino/next-to-lightest neutralino masses are set (Tchi1n2E model). See their Figure 14 for an overlay of exclusion contours from all searches.
- 12 SIRUNYAN 19BU searched for pair production of gauginos via vector boson fusion assuming the gaugino spectrum is compressed, in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV. The final states explored included zero leptons plus two jets, one lepton plus two jets, and one hadronic tau plus two jets. A similar bound is obtained in the light slepton limit.
- 13 AABOUD 18AY searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos and neutralinos as in Tchi1n2D models, in events characterised by the presence of at least two hadronically decaying tau leptons and large missing transverse energy. No significant deviation from the expected SM background is observed. Assuming decays via intermediate $\tilde{\tau}_L$ and $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0}$, the observed limits rule out $\tilde{\chi}_2^0$ masses up to 760 GeV for a massless $\tilde{\chi}_1^0$. See their Fig.7 (right). Interpretations are also provided in Fig 8 (bottom) for different assumptions on the ratio between $m_{\tilde{\tau}}$ and $m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0}$.
- 14 AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the next-to-lightest neutralino mass up to 1100 GeV for massless $\tilde{\chi}_1^0$ in the Tchi1n2C simplified model exploiting the 3ℓ signature, see their Figure 8(c).
- 15 AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the next-to-lightest neutralino mass up to 580 GeV for massless $\tilde{\chi}_1^0$ in the Tchi1n2F simplified model exploiting the $2\ell+2$ jets and 3ℓ signatures, see their Figure 8(d).
- 16 AABOUD 18CK searched for events with at least 3 b -jets and large missing transverse energy in two datasets of pp collisions at $\sqrt{s} = 13$ TeV of 36.1 fb^{-1} and 24.3 fb^{-1} depending on the trigger requirements. The analyses aimed to reconstruct two Higgs bosons decaying to pairs of b -quarks. No significant excess above the Standard Model expectations is observed. Limits are set on the Higgsino mass in the T1n1A simplified model, see their Figure 15(a). Constraints are also presented as a function of the BR of Higgsino decaying into an higgs boson and a gravitino, see their Figure 15(b).
- 17 AABOUD 18CO searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of mass-degenerate charginos and next-to-lightest neutralinos in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. The search channels are based on recursive jigsaw reconstruction. Limits are set on the next-to-lightest neutralinos mass up to 600 GeV for massless neutralinos in the Tchi1n2F simplified model exploiting the statistical combination of $2\ell+2$ jets and 3ℓ channels. Next-to-lightest neutralinos masses below 220 GeV are not excluded due to an excess of events above the SM prediction in the dedicated regions. See their Figure 13(d).
- 18 AABOUD 18R searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in Tchi1n2G higgsino models, and $\tilde{\chi}_2^0$ masses are excluded up to 145 GeV for $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0} = 5$ GeV. The exclusion limits extend down to mass splittings of 2.5 GeV, see their Fig. 10 (top). Results are also interpreted in terms of exclusion bounds on the production cross-sections for the NUHM2 scenario as a function of the universal gaugino mass $m_{1/2}$ and $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}$, see their Fig. 12.
- 19 AABOUD 18R searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in Tchi1n2F wino models, and $\tilde{\chi}_2^0$ masses are excluded up to 175 GeV for $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0} = 10$ GeV. The exclusion limits extend down to mass splittings of 2 GeV, see their Fig. 10 (bottom). Results are also interpreted in terms of exclusion bounds on the production cross-sections for the NUHM2 scenario as a function of the universal gaugino mass $m_{1/2}$ and $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}$, see their Fig. 12.
- 20 AABOUD 18U searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results of the diphoton channel are interpreted in terms of lower limits on the masses of gauginos Tchi1n1A models, which reach as high as 1.3 TeV. Gaugino masses below 1060 GeV are excluded for any NLSP mass, see their Fig. 10.
- 21 SIRUNYAN 18AU searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing two low-momentum, oppositely charged leptons (electrons or muons) and $E_{T, \tau}$. No excess over the expected background is observed. Limits are derived on the wino mass in the Tchi1n2F simplified model, see their Figure 5. Limits are also set on the stop mass in the Tstop10 simplified model, see their Figure 6. Finally, limits are set on the Higgsino mass in the Tchi1n2G simplified model, see Figure 8 and in the pMSSM, see Figure 7.
- 22 SIRUNYAN 18DP searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos and neutralinos or of chargino pairs in events with a tau lepton pair and significant missing transverse momentum. Both hadronic and leptonic decay modes are considered for the tau lepton. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass in the Tchi1n1D and Tchi1n2 simplified models, see their Figures 14 and 15. Also, excluded stau pair production cross sections are shown in Figures 11, 12, and 13.
- 23 SIRUNYAN 17AW searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with a charged lepton (electron or muon), two jets identified as originating from a b -quark, and large $E_{T, \tau}$. No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the chargino and the next-to-lightest neutralino in the Tchi1n2E simplified model, see their Figure 6.
- 24 AAD 16AA summarized and extended ATLAS searches for electroweak supersymmetry in final states containing several charged leptons, $E_{T, \tau}$, with or without hadronic jets, in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on mass-degenerate $\tilde{\chi}_2^0$ and $\tilde{\chi}_3^0$ masses in the Tn2n3A and Tn2n3B simplified models. See their Fig. 15.
- 25 AAD 15BA searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of charginos and neutralinos decaying to a final state containing a W boson and a 125 GeV Higgs boson, plus missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of direct chargino and next-to-lightest neutralino production, with the decays $\tilde{\chi}_1^\pm \rightarrow W^\pm \tilde{\chi}_1^0$ and $\tilde{\chi}_2^0 \rightarrow H \tilde{\chi}_1^0$ having 100% branching fraction, see Fig. 8. A combination of the multiple final states for the Higgs decay yields the best limits (Fig. 8d).
- 26 AAD 14H searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of charginos and neutralinos decaying to a final state with three leptons and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of direct chargino and next-to-lightest neutralino production, with decays to the lightest neutralino via either all three generations of leptons, staus only, gauge bosons, or Higgs bosons, see Fig. 7. An interpretation in the pMSSM is also given, see Fig. 8.
- 27 AAD 14X searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the neutralino mass in an R-parity conserving simplified model where the decay $\tilde{\chi}_{2,3}^0 \rightarrow \ell^\pm \ell^\mp \tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 10.
- 28 AAD 13 searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7$ TeV for charginos and neutralinos decaying to a final state with three leptons (e and μ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the phenomenological MSSM, see Fig. 2 and 3, and in simplified models, see Fig. 4. For the simplified models with intermediate slepton decays, degenerate $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ masses up to 500 GeV are excluded at 95% C.L. for very large mass differences with the $\tilde{\chi}_1^0$. Supersedes AAD 12AS.
- 29 CHATRCHYAN 12BJ searched in 4.98 fb^{-1} of pp collisions at $\sqrt{s} = 7$ TeV for direct electroweak production of charginos and neutralinos in events with at least two leptons, jets and missing transverse momentum. No significant excesses over the expected SM backgrounds are observed and 95% C.L. limits on the production cross section of $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ pair production were set in a number of simplified models, see Figs. 7 to 12. Most limits are for exactly 3 jets.
- 30 ABREU 00w combines data collected at $\sqrt{s} = 189$ GeV with results from lower energies. The mass limit is obtained by constraining the MSSM parameter space with gaugino and fermion mass universality at the GUT scale, using the results of negative direct searches for neutralinos (including cascade decays and $\tilde{\tau}$ final states) from ABREU 01, for charginos from ABREU 00j and ABREU 00t (for all Δm_\pm), and for charged sleptons from ABREU 01b. The results hold for the full parameter space defined by all values of M_2 and $|\mu| \leq 2$ TeV with the $\tilde{\chi}_1^0$ as LSP.
- 31 AAD 20AN searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with two photons and missing transverse momentum. Events are further categorised in terms of lepton or jet multiplicity. No significant excess over the expected background is observed. Limits at 95% C.L. are derived in Tchi1n2E simplified models. Next-to-lightest neutralinos and charginos with masses up to 310 GeV for a massless lightest neutralino are excluded. See their Fig. 10.
- 32 AAD 14c searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of chargino-neutralino pairs, decaying to a final state with two leptons (e and μ) and missing transverse momentum. No excess beyond the Standard Model expectation is

observed. Exclusion limits are derived in simplified models of chargino and next-to-lightest neutralino production, with decays to the lightest neutralino via gauge bosons, see Fig. 7. An interpretation in the pMSSM is also given, see Fig. 10.

³³ KHACHATRYAN 14i searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for electroweak production of charginos and neutralinos decaying to a final state with three leptons (e or μ) and missing transverse momentum, or with a Z-boson, dijets and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models, see Figs. 12–16.

³⁴ AAD 12As searched in 2.06 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for charginos and neutralinos decaying to a final state with three leptons (e and μ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the phenomenological MSSM, see Fig. 2 (top), and in simplified models, see Fig. 2 (bottom).

³⁵ AAD 12T looked in 1 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for the production of supersymmetric particles decaying into final states with missing transverse momentum and exactly two isolated leptons (e or μ). Same-sign dilepton events were separately studied. Additionally, in opposite-sign events, a search was made for an excess of same-flavor over different-flavor lepton pairs. No excess over the expected background is observed and limits are placed on the effective production cross section of opposite-sign dilepton events with $E_T > 250 \text{ GeV}$ and on same-sign dilepton events with $E_T > 100 \text{ GeV}$. The latter limit is interpreted in a simplified electroweak gaugino production model.

$\tilde{\chi}_1^\pm, \tilde{\chi}_2^\pm$ (Charginos) mass limits

Charginos are unknown mixtures of w-inos and charged higgsinos (the supersymmetric partners of W and Higgs bosons). A lower mass limit for the lightest chargino ($\tilde{\chi}_1^\pm$) of approximately 45 GeV, independent of the field composition and of the decay mode, has been obtained by the LEP experiments from the analysis of the Z width and decays. These results, as well as other now superseded limits from e^+e^- collisions at energies below 136 GeV, and from hadronic collisions, can be found in the 1998 Edition (The European Physical Journal **C3** 1 (1998)) of this Review.

Unless otherwise stated, results in this section assume spectra, production rates, decay modes and branching ratios as evaluated in the MSSM, with gaugino and stfermion mass unification at the GUT scale. These papers generally study production of $\tilde{\chi}_1^0 \tilde{\chi}_2^0, \tilde{\chi}_1^+ \tilde{\chi}_1^-$ and (in the case of hadronic collisions) $\tilde{\chi}_1^+ \tilde{\chi}_2^0$ pairs, including the effects of cascade decays. The mass limits on $\tilde{\chi}_1^\pm$ are either direct, or follow indirectly from the constraints set by the non-observation of $\tilde{\chi}_2^0$ states on the gaugino and higgsino MSSM parameters M_2 and μ . For generic values of the MSSM parameters, limits from high-energy e^+e^- collisions coincide with the highest value of the mass allowed by phase-space, namely $m_{\tilde{\chi}_1^\pm} \lesssim \sqrt{s}/2$. The still unpublished combination of the results of the four LEP collaborations from the 2000 run of LEP2 at \sqrt{s} up to $\approx 209 \text{ GeV}$ yields a lower mass limit of 103.5 GeV valid for general MSSM models. The limits become however weaker in certain regions of the MSSM parameter space where the detection efficiencies or production cross sections are suppressed. For example, this may happen when: (i) the mass differences $\Delta m_{\pm} = m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0}$ or $\Delta m_{\nu} = m_{\tilde{\chi}_1^\pm} - m_{\tilde{\nu}}$ are very small, and the detection efficiency is reduced; (ii) the electron sneutrino mass is small, and the $\tilde{\chi}_1^\pm$ production rate is suppressed due to a destructive interference between s and t channel exchange diagrams. The regions of MSSM parameter space where the following limits are valid are indicated in the comment lines or in the footnotes.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

> 540	95	42 KHACHATRY...16R	CMS	$\geq 1\gamma + 1 e$ or $\mu + \cancel{E}_T$, Tchi1n1A					1 AAD 21AX searched in 139 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for pair production of electroweakinos decaying to the LSP via the emission of Standard Model bosons (Higgs, W, Z) decaying into hadrons. The final state in all cases characterised by the presence of \cancel{E}_T , jets, and large-R jets tagged according to the boson of interest. Different assumptions (Higgsino, Wino, Bino) are made for the pair produced electroweakinos and for the LSP multiplet. No significant excess above the Standard Model predictions is observed. Limits are set on the electroweakino masses as a function of the model parameters (in particular $m_{\tilde{\chi}_1^0}$). See Figs. 12, 14, 15.
> 250	95	43 AAD	15BA ATLS	$m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0}$, $m_{\tilde{\chi}_1^0} = 0$ GeV					2 AAD 21BG searched in 139 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for pair production $\tilde{\chi}_2^0 \tilde{\chi}_1^\pm$ in final states with three leptons, with and without assuming the presence of a Z ⁰ to $\ell\ell$ decay. No significant excess above the Standard Model predictions is observed. Limits are set on the $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ mass in Tchi1n2E, Tchi1n2F and Tchi1n2Ga. See their Fig. 16.
> 590	95	44 AAD	15CA ATLS	$\geq 2 \gamma + \cancel{E}_T$, GGM, bino-like NLSP, any NLSP mass					

³ AAD 21E searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for production of wino-like $\tilde{\chi}_1^\pm \tilde{\chi}_1^\pm$ and $\tilde{\chi}_1^\pm \tilde{\chi}_1^0$, followed by the RPV decay of $\tilde{\chi}_1^\pm$ into $Z\ell$, $H\ell$ or $W\nu$ and of $\tilde{\chi}_1^0$ into $Z\nu$, $H\nu$ or $W\ell$, in events with three leptons, looking for $Z\ell$ resonances. No significant excess above the Standard Model predictions is observed. Limits are set on the common $m_{\tilde{\chi}_1^\pm}/m_{\tilde{\chi}_1^0}$ mass in the TwnoLSPRPV simplified model, as a function of

the common $\tilde{\chi}_1^\pm/\tilde{\chi}_1^0$ branching fraction to a Z boson. See Figure 9.

⁴ AAD 21Y searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on Tchi1n2-GGM, and RPV models similar to Tchi1n2I, Tglu1A (with $q = u, d, s, c, b$, with equal branching fractions), and $\tilde{\ell}_L/\tilde{\nu} \rightarrow \ell/\nu \tilde{\chi}_1^0$ (mass-degenerate $\tilde{\ell}_L$ and $\tilde{\nu}$ of all 3 generations), all with $\tilde{\chi}_1^0 \rightarrow \ell^\pm \tilde{\ell}^\mp \nu$ via λ_{12k} or λ_{i33} (where $i, k = 1, 2$), see their Figure 11.

⁵ SIRUNYAN 21M searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for supersymmetry in events with two opposite-sign same-flavor leptons (electrons, muons) and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ mass in Tchi1n2Fa, see their Figure 11, on the $\tilde{\chi}_1^0$ mass in Tn1n1C and Tn1n1B for $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0}$, see their Figure 12. Limits are also set on the light squark mass for the simplified model Tsqk2A, on the sbottom mass in Tsb0t3, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.

⁶ TUMASYAN 21C searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for supersymmetry in events with one lepton, a Higgs boson decaying to a pair of bottom quarks, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Lower limits are set on the masses of $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ in the simplified model Tchi1n2E, see their Figure 6.

⁷ AAD 20AN searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two photons and missing transverse momentum. Events are further categorised in terms of lepton or jet multiplicity. No significant excess over the expected background is observed. Limits at 95% C.L. are set on the Higgsino mass in the T1n1n1A simplified model, see their Figure 11.

⁸ AAD 20I reported on ATLAS searches for electroweak production in models with compressed mass spectra as Tchi1n2Fa. A dataset of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ corresponding to an integrated luminosity of 139 fb^{-1} was used. Events with \cancel{E}_T , two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Constraints at 95% C.L. are placed on the mass of the $\tilde{\chi}_1^\pm$ (degenerate with $\tilde{\chi}_2^0$) at 240 GeV for a mass splitting between $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_1^0$ of 7 GeV and extend down to a mass splitting of 1.5 GeV at the LEP chargino mass limit of 92.4 GeV. See their Fig. 14(b,c).

⁹ AAD 20K reported on a search for electroweak production in models with mass splittings near the electroweak scale as Tchi1n2F and exploiting three-lepton final state events with an emulated recursive jigsaw reconstruction method. The analysis uses a dataset of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ corresponding to an integrated luminosity of 139 fb^{-1} . Exclusion limits at 95% C.L. are derived on next-to-lightest neutralinos and charginos with masses up to 345 GeV for a massless lightest neutralino, see their Fig. 7.

¹⁰ AAD 20O reported on a search for electroweak production in models with charginos and sleptons decaying into final states with exactly two oppositely charged leptons and missing transverse momentum. A dataset of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ corresponding to an integrated luminosity of 139 fb^{-1} was used. Exclusion limits at 95% C.L. are derived on $m_{\tilde{\chi}_1^\pm}$ decaying according to the Tchi1chi1H simplified model. Chargino masses up to 420 GeV are excluded for a massless lightest neutralino, see their Fig. 7(a).

¹¹ AAD 20Q reported on a search for electroweak production in models with charginos and sleptons decaying into final states with exactly two oppositely charged leptons and missing transverse momentum. A dataset of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ corresponding to an integrated luminosity of 139 fb^{-1} was used. Exclusion limits at 95% C.L. are derived on $m_{\tilde{\chi}_1^\pm}$ decaying according to the Tchi1chi1C simplified model. Chargino masses up to 1000 GeV are excluded for a massless lightest neutralino, see their Fig. 7(b).

¹² AAD 20R searched for electroweak production in the model Tchi1n2E, selecting events with a pair of b -tagged jets consistent with those from a Higgs boson decay, either an electron or a muon from the W boson decay and \cancel{E}_T . The analysis uses a dataset of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ corresponding to an integrated luminosity of 139 fb^{-1} . Exclusion limits at 95% C.L. are derived on next-to-lightest neutralinos and charginos with masses up to 740 GeV for a massless lightest neutralino, assuming pure wino cross-sections. See their Fig. 6.

¹³ SIRUNYAN 20AU searched in 77.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing one soft, hadronically decaying tau lepton, one energetic jet from initial-state radiation, and large \cancel{E}_T . No excess over the expected background is observed. Limits are derived on the wino mass in the Tchi1n2D simplified model, see their Figure 2.

¹⁴ SIRUNYAN 20B searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one photon and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on chargino masses in a general gauge-mediated SUSY breaking (GGM) scenario Tchi1n12-GGM, see Figure 4. Limits are also set on the NLSP mass in the Tchi1chi1F and Tchi1chi1G simplified models, see their Figure 5. Finally, limits are set on the gluino mass in the Tglu4A simplified model, see Figure 6.

¹⁵ AABOUD 19AU searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and next-to-lightest neutralinos decaying into lightest neutralinos and a W , and a Higgs boson, respectively. Fully hadronic, semileptonic, diphoton, and multilepton (electrons, muons) final states with missing transverse momentum are considered in this search. Observations are consistent with the Standard Model expectations, and 95% confidence-level limits of up to 680 GeV on the chargino/next-to-lightest neutralino masses are set (Tchi1n2E model). See their Figure 14 for an overlay of exclusion contours from all searches.

¹⁶ SIRUNYAN 19BU searched for pair production of gauginos via vector boson fusion assuming the gaugino spectrum is compressed, in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$. The final states explored included zero leptons plus two jets, one lepton plus two jets, and one hadronic tau plus two jets. A similar bound is obtained in the light slepton limit.

¹⁷ SIRUNYAN 19CI searched in 77.5 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and \cancel{E}_T .

No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t4 simplified model, see Figure 3, and on the wino mass in the Tchi1n2E simplified model, see their Figure 4. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 5.

¹⁸ SIRUNYAN 19K searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with a photon, an electron or muon, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the chargino and neutralino mass in the Tchi1n1A simplified model, see their Figure 6. Limits are also set on the gluino mass in the Tglu4A simplified model, and on the squark mass in the Tsqk4A simplified model, see their Figure 7.

¹⁹ AABOUD 18AY searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos as in Tchi1chi1D models in events characterised by the presence of at least two hadronically decaying tau leptons and large missing transverse energy. No significant deviation from the expected SM background is observed. In the Tchi1chi1D model, assuming decays via intermediate $\tilde{\tau}_1$, the observed limits rule out $\tilde{\chi}_1^\pm$ masses up to 630 GeV for a massless $\tilde{\chi}_1^0$. See their Fig.7 (left). Interpretations are also provided in Fig 8 (top) for different assumptions on the ratio between $m_{\tilde{\tau}_1}$ and $m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0}$.

²⁰ AABOUD 18AY searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and neutralinos as in Tchi1n2D models, in events characterised by the presence of at least two hadronically decaying tau leptons and large missing transverse energy. No significant deviation from the expected SM background is observed. Assuming decays via intermediate $\tilde{\tau}_1$ and $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0}$, the observed limits rule out $\tilde{\chi}_1^\pm$ masses up to 760 GeV for a massless $\tilde{\chi}_1^0$. See their Fig.7 (right). Interpretations are also provided in Fig 8 (bottom) for different assumptions on the ratio between $m_{\tilde{\tau}_1}$ and $m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0}$.

²¹ AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass up to 750 GeV for massless neutralinos in the Tchi1chi1C simplified model exploiting $2\ell + 0$ jets signatures, see their Figure 8(a).

²² AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass up to 1100 GeV for massless neutralinos in the Tchi1n2C simplified model exploiting 3ℓ signature, see their Figure 8(c).

²³ AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass up to 580 GeV for massless neutralinos in the Tchi1n2F simplified model exploiting $2\ell+2$ jets and 3ℓ signatures, see their Figure 8(d).

²⁴ AABOUD 18CK searched for events with at least 3 b -jets and large missing transverse energy in two datasets of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ of 36.1 fb^{-1} and 24.3 fb^{-1} depending on the trigger requirements. The analyses aimed to reconstruct two Higgs bosons decaying to pairs of b -quarks. No significant excess above the Standard Model expectations is observed. Limits are set on the Higgsino mass in the T1n1n1A simplified model, see their Figure 15(a). Constraints are also presented as a function of the BR of Higgsino decaying into a Higgs boson and a gravitino, see their Figure 15(b).

²⁵ AABOUD 18CO searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of mass-degenerate charginos and next-to-lightest neutralinos in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. The search channels are based on recursive jigsaw reconstruction. Limits are set on the chargino mass up to 600 GeV for massless neutralinos in the Tchi1n2F simplified model exploiting the statistical combination of $2\ell+2$ jets and 3ℓ channels. Chargino masses below 220 GeV are not excluded due to an excess of events above the SM prediction in the dedicated regions. See their Figure 13(d).

²⁶ AABOUD 18R searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in Tchi1n2G wino models and $\tilde{\chi}_1^\pm$ masses are excluded up to 175 GeV for $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 10 \text{ GeV}$. The exclusion limits extend down to mass splittings of 2 GeV, see their Fig. 10 (bottom).

²⁷ AABOUD 18R searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in Tchi1n2G higgsino models and $\tilde{\chi}_1^\pm$ masses are excluded up to 145 GeV for $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$. The exclusion limits extend down to mass splittings of 2.5 GeV, see their Fig. 10 (top).

²⁸ AABOUD 18U searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results of the diphoton channel are interpreted in terms of lower limits on the masses of gauginos Tchi1chi1A models, which reach as high as 1.3 TeV. Gaugino masses below 1060 GeV are excluded for any NLSP mass, see their Fig. 10.

²⁹ AABOUD 18Z searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via λ_{12k} or λ_{j33} to charged leptons, see their Figures 7, 8.

³⁰ SIRUNYAN 18AA searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one photon and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in a general gauge-mediated SUSY breaking (GGM) scenario with bino-like $\tilde{\chi}_1^0$ and wino-like $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$, see Figure

Searches Particle Listings

Supersymmetric Particle Searches

7. Limits are also set on the NLSP mass in the Tchi1n1A and Tchi1ch1A simplified models, see their Figure 8. Finally, limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, see their Figure 9, and on the squark mass in the Tskq4A and Tskq4B simplified models, see their Figure 10.
- 31 SIRUNYAN 18AJ searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two low-momentum, oppositely charged leptons (electrons or muons) and \cancel{E}_T . No excess over the expected background is observed. Limits are derived on the wino mass in the Tchi1n2F simplified model, see their Figure 5. Limits are also set on the stop mass in the Tstop10 simplified model, see their Figure 6. Finally, limits are set on the Higgsino mass in the Tchi1n2G simplified model, see Figure 8 and in the pMSSM, see Figure 7.
- 32 SIRUNYAN 18AO searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and neutralinos in events with either two or more leptons (electrons or muons) of the same electric charge, or with three or more leptons, which can include up to two hadronically decaying tau leptons. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino/neutralino mass in the Tchi1n2A, Tchi1n2H, Tchi1n2D, Tchi1n2E and Tchi1n2F simplified models, see their Figures 14, 15, 16, 17 and 18. Limits are also set on the higgsino mass in the Tn1n1A, Tn1n1B and Tn1n1C simplified models, see their Figure 19.
- 33 SIRUNYAN 18AP searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and neutralinos by combining a number of previous and new searches. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino/neutralino mass in the Tchi1n2E, Tchi1n2F and Tchi1n2I simplified models, see their Figures 7, 8, 9 and 10. Limits are also set on the higgsino mass in the Tn1n1A, Tn1n1B and Tn1n1C simplified models, see their Figure 11, 12, 13 and 14.
- 34 SIRUNYAN 18AR searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two opposite-charge, same-flavour leptons (electrons or muons), jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see their Figure 7. Limits are also set on the chargino/neutralino mass in the Tchi1n2F simplified models, see their Figure 8, and on the higgsino mass in the Tn1n1B and Tn1n1C simplified models, see their Figure 9. Finally, limits are set on the sbottom mass in the Tsb0t3 simplified model, see their Figure 10.
- 35 SIRUNYAN 18DN searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and for pair production of top squarks in events with two leptons (electrons or muons) of the opposite electric charge. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass in the Tchi1ch1C and Tchi1ch1E simplified models, see their Figure 8. Limits are also set on the stop mass in the Tstop1 and Tstop2 simplified models, see their Figure 9.
- 36 SIRUNYAN 18DP searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and neutralinos or of chargino pairs in events with a tau lepton pair and significant missing transverse momentum. Both hadronic and leptonic decay modes are considered for the tau lepton. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass in the Tchi1ch1D and Tchi1n2 simplified models, see their Figures 14 and 15. Also, excluded stau pair production cross sections are shown in Figures 11, 12, and 13.
- 37 SIRUNYAN 18X searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and \cancel{E}_T . The razor variables (M_R and R^2) are used to categorise the events. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t4 simplified model and on the wino mass in the Tchi1n2E simplified model, see their Figure 5. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 6.
- 38 KHACHATRYAN 17L searched in about 19 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two τ (at least one decaying hadronically) and \cancel{E}_T . In the Tchi1ch1C model, assuming decays via intermediate $\tilde{\tau}$ or $\tilde{\nu}_\tau$ with equivalent mass, the observed limits rule out $\tilde{\chi}_1^\pm$ masses up to 420 GeV for a massless $\tilde{\chi}_1^0$. See their Fig. 5.
- 39 SIRUNYAN 17AV searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with a charged lepton (electron or muon), two jets identified as originating from a b -quark, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the chargino and the next-to-lightest neutralino in the Tchi1n2E simplified model, see their Figure 6.
- 40 AAD 16AA summarized and extended ATLAS searches for electroweak supersymmetry in final states containing several charged leptons, \cancel{E}_T , with or without hadronic jets, in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on the $\tilde{\chi}_1^\pm$ mass in the Tchi1ch1B and Tchi1ch1C simplified models. See their Fig. 13.
- 41 AAD 16AA summarized and extended ATLAS searches for electroweak supersymmetry in final states containing several charged leptons, \cancel{E}_T , with or without hadronic jets, in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on mass-degenerate $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ masses in the Tchi1n2B, Tchi1n2C, and Tchi1n2D simplified models. See their Figs. 16, 17, and 18. Interpretations in phenomenological-MSSM, two-parameter Non Universal Higgs Masses (NUHM2), and gauge-mediated symmetry breaking (GMSB) models are also given in their Figs. 20, 21 and 22.
- 42 KHACHATRYAN 16R searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with one or more photons, one electron or muon, and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in a general gauge-mediated SUSY breaking model (GGM), for a wino-like neutralino NLSP scenario, see Fig. 5. Limits are also set in the Tglu1D and Tchi1n1A simplified models, see Fig. 6. The Tchi1n1A limit is reduced to 340 GeV for a branching ratio reduced by the weak mixing angle.
- 43 AAD 15BA searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for electroweak production of charginos and neutralinos decaying to a final state containing a W boson and a 125 GeV Higgs boson, plus missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of direct chargino and next-to-lightest neutralino production, with the decays $\tilde{\chi}_1^\pm \rightarrow W^\pm \tilde{\chi}_1^0$ and $\tilde{\chi}_2^0 \rightarrow H_{\pm}^0 \tilde{\chi}_1^0$ having 100% branching fraction, see Fig. 8. A combination of the multiple final states for the Higgs decay yields the best limits (Fig. 8d).
- 44 AAD 15CA searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with one or more photons and \cancel{E}_T , with or without leptons (e, μ). No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in the general gauge-mediated SUSY breaking model (GGM), for wino-like NLSP, see Fig. 9, 12.
- 45 AAD 14H searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for electroweak production of charginos and neutralinos decaying to a final state with three leptons and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of direct chargino and next-to-lightest neutralino production, with decays to the lightest neutralino via either all three generations of leptons, staus only, gauge bosons, or Higgs bosons, see Fig. 7. An interpretation in the pMSSM is also given, see Fig. 8.
- 46 AAD 14X searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the wino-like chargino mass in an R-parity violating simplified model where the decay $\tilde{\chi}_1^\pm \rightarrow W^{(*)\pm} \tilde{\chi}_1^0$, with $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \nu$, takes place with a branching ratio of 100%, see Fig. 8.
- 47 KHACHATRYAN 14L searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of chargino-neutralino $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ pair production with Higgs or W -bosons in the decay chain, leading to HW final states with missing transverse energy. The decays of a Higgs boson to a photon pair are considered in conjunction with hadronic and leptonic decay modes of the W bosons. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in the context of simplified models where the decays $\tilde{\chi}_2^0 \rightarrow H_{\pm}^0 \tilde{\chi}_1^0$ and $\tilde{\chi}_1^\pm \rightarrow W^\pm \tilde{\chi}_1^0$ take place 100% of the time, see Figs. 22–23.
- 48 AAD 13C searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for charginos and neutralinos decaying to a final state with three leptons (e and μ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the phenomenological MSSM, see Fig. 2 and 3, and in simplified models, see Fig. 4. For the simplified models with intermediate slepton decays, degenerate $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ masses up to 500 GeV are excluded at 95% C.L. for very large mass differences with the $\tilde{\chi}_1^0$. Supersedes AAD 12As.
- 49 AAD 13B searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for gauginos decaying to a final state with two leptons (e and μ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Limits are derived in a simplified model of wino-like chargino pair production, where the chargino always decays to the lightest neutralino via an intermediate on-shell charged slepton, see Fig. 2(b). Chargino masses between 110 and 340 GeV are excluded at 95% C.L. for $m_{\tilde{\chi}_1^0} = 10 \text{ GeV}$. Exclusion limits are also derived in the phenomenological MSSM, see Fig. 3.
- 50 AAD 12CT searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing four or more leptons (electrons or muons) and either moderate values of missing transverse momentum or large effective mass. No significant excess is found in the data. Limits are presented in a simplified model of R-parity violating supersymmetry in which charginos are pair-produced and then decay into a W -boson and a $\tilde{\chi}_1^0$, which in turn decays through an RPV coupling into two charged leptons ($e^\pm e^\mp$ or $e^\pm \mu^\mp$) and a neutrino. In this model, chargino masses up to 540 GeV are excluded at 95% C.L. for $m_{\tilde{\chi}_1^0}$ above 300 GeV, see Fig. 3a. The limit deteriorates for lighter $\tilde{\chi}_1^0$. Limits are also set in an R-parity violating MSUGRA model, see Fig. 3b.
- 51 KHACHATRYAN 12BJ searched in 4.98 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for direct electroweak production of charginos and neutralinos in events with at least two leptons, jets and missing transverse momentum. No significant excesses over the expected SM backgrounds are observed and 95% C.L. limits on the production cross section of $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ pair production were set in a number of simplified models, see Figs. 7 to 12.
- 52 ABDALLAH 03M uses data from $\sqrt{s} = 192\text{--}208 \text{ GeV}$ to obtain limits in the framework of the MSSM with gaugino and sfermion mass universality at the GUT scale. An indirect limit on the mass of charginos is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays), for charginos and for sleptons. These limits are valid for values of $M_2 < 1 \text{ TeV}$, $|\mu| \leq 2 \text{ TeV}$ with the $\tilde{\chi}_1^0$ as LSP. Constraints from the Higgs search in the m_h^{max} scenario assuming $m_h = 174.3 \text{ GeV}$ are included. The quoted limit applies if there is no mixing in the third family or when $m_{\tilde{1}} - m_{\tilde{\chi}_1^0} > 6 \text{ GeV}$. If mixing is included the limit degrades to 90 GeV. See Fig. 43 for the mass limits as a function of $\tan\beta$. These limits update the results of ABREU 00W.
- 53 AAD 20AN searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two photons and missing transverse momentum. Events are further categorised in terms of lepton or jet multiplicity. No significant excess over the expected background is observed. Limits at 95% C.L. are derived in Tchi1n2E simplified models. Next-to-lightest neutralinos and charginos with masses up to 310 GeV for a massless lightest neutralino are excluded. See their Fig. 10.
- 54 KHACHATRYAN 16AA searched in 7.4 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with one or more photons, hadronic jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in the general gauge-mediated SUSY breaking model (GGM), for a wino-like neutralino NLSP scenario and with the wino mass fixed at 10 GeV above the bino mass, see Fig. 4. Limits are also set in the Tchi1ch1A and Tchi1n1A simplified models, see Fig. 3.
- 55 KHACHATRYAN 16R searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with one or more photons, one electron or muon, and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are also set in the Tglu1F simplified model, see Fig. 6.
- 56 KHACHATRYAN 16Y searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with one or two soft isolated leptons, hadronic jets, and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the $\tilde{\chi}_1^\pm$ mass (which is degenerate with the $\tilde{\chi}_2^0$) in the Tchi1n2A simplified model, see Fig. 4.
- 57 AAD 14AV searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for the direct production of charginos, neutralinos and staus in events containing at least two hadronically decaying τ -leptons, large missing transverse momentum and low jet activity. The quoted limit was derived for direct $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$ production with $\tilde{\chi}_2^0 \rightarrow \tilde{\tau} \tau \rightarrow \tau \tau \tilde{\chi}_1^0$ and $\tilde{\chi}_1^\pm \rightarrow \tilde{\tau} \nu(\tilde{\nu} \tau) \rightarrow \tau \nu \tilde{\chi}_1^0$, $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm}$, $m_{\tilde{\tau}} = 0.5 (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})$, $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$. No excess over the expected SM background is observed. Exclusion limits are set in simplified models of $\tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$ and $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ pair production, see their Figure 7. Upper limits on the cross section and signal strength for direct di-stau production are derived, see Figures 8 and 9. Also, limits are derived in a pMSSM model where the only light slepton is the $\tilde{\tau}_R$, see Figure 10.

⁵⁸ AAD 14AV searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for the direct production of charginos, neutralinos and staus in events containing at least two hadronically decaying τ -leptons, large missing transverse momentum and low jet activity. The quoted limit was derived for direct $\tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$ production with $\tilde{\chi}_1^\pm \rightarrow \tilde{\tau} \nu(\tilde{\nu}_\tau \tau) \rightarrow \tau \nu \tilde{\chi}_1^0$, $m_{\tilde{\tau}} = 0.5 (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})$, $m_{\tilde{\chi}_1^0} = 0$ GeV. No excess over the expected SM background is observed.

Exclusion limits are set in simplified models of $\tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$ and $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ pair production, see their Figure 7. Upper limits on the cross section and signal strength for direct di-stau production are derived, see Figures 8 and 9. Also, limits are derived in a pMSSM model where the only light slepton is the $\tilde{\tau}_R$, see Figure 10.

⁵⁹ AAD 14G searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of chargino pairs, or chargino-neutralino pairs, decaying to a final state with two leptons (e and μ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of chargino pair production, with chargino decays to the lightest neutralino via either sleptons or gauge bosons, see Fig 5.; or in simplified models of chargino and next-to-lightest neutralino production, with decays to the lightest neutralino via gauge bosons, see Fig. 7. An interpretation in the pMSSM is also given, see Fig. 10.

⁶⁰ AALTONEN 14 searched in 5.8 fb⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV for evidence of chargino and next-to-lightest neutralino associated production in final states consisting of three leptons (electrons, muons or taus) and large missing transverse momentum. The results are consistent with the Standard Model predictions within 1.85 σ . Limits on the chargino mass are derived in an mSUGRA model with $m_0 = 60$ GeV, $\tan\beta = 3$, $A_0 = 0$ and $\mu > 0$, see their Fig. 2.

⁶¹ KHACHATRYAN 14I searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of chargino pairs decaying to a final state with opposite-sign lepton pairs (e or μ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models, see Fig. 18.

⁶² AALTONEN 13Q searched in 6.0 fb⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV for evidence of chargino-neutralino associated production in like-sign dilepton final states. One lepton is identified as the hadronic decay of a tau lepton, while the other is an electron or muon. Good agreement with the Standard Model predictions is observed and limits are set on the chargino-neutralino cross section for simplified gravity- and gauge-mediated models, see their Figs. 2 and 3.

⁶³ AAD 12AS searched in 2.06 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for charginos and neutralinos decaying to a final state with three leptons (e and μ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the phenomenological MSSM, see Fig. 2 (top), and in simplified models, see Fig. 2 (bottom).

⁶⁴ AAD 12T looked in 1 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for the production of supersymmetric particles decaying into final states with missing transverse momentum and exactly two isolated leptons (e or μ). Opposite-sign and same-sign dilepton events were separately studied. Additionally, in opposite-sign events, a search was made for an excess of same-flavor over different-flavor lepton pairs. No excess over the expected background is observed and limits are placed on the effective production cross section of opposite-sign dilepton events with $E_{Tl} > 250$ GeV and on same-sign dilepton events with $E_{Tl} > 100$ GeV. The latter limit is interpreted in a simplified electroweak gaugino production model as a lower chargino mass limit.

⁶⁵ CHATRCHYAN 11B looked in 35 pb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with an isolated lepton (e or μ), a photon and E_{Tl} which may arise in a generalized gauge mediated model from the decay of Wino-like NLSPs. No evidence for an excess over the expected background is observed. Limits are derived in the plane of squark/gluino mass versus Wino mass (see Fig. 4). Mass degeneracy of the produced squarks and gluinos is assumed.

⁶⁶ CHATRCHYAN 11V looked in 35 pb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with > 3 isolated leptons (e , μ or τ), with or without jets and E_{Tl} . No evidence for an excess over the expected background is observed. Limits are derived in the CMSSM ($m_0, m_{1/2}$) plane for $\tan\beta = 3$ (see Fig. 5).

• • • We do not use the following data for averages, fits, limits, etc. • • •

> 260	95	12	KHACHATRYAN...15AB CMS	$\tilde{\chi}_1^\pm \rightarrow \tilde{\chi}_1^0 \pi^\pm, \tau_{\tilde{\chi}_1^\pm} = 0.2ns$, AMSB

¹ SIRUNYAN 20N searched in 101 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of long-lived charginos in events containing isolated tracks with missing hits in the outer layer of the silicon tracker and little or no associated calorimetric energy deposits (disappearing tracks). No significant excess above the Standard Model expectations is observed. In an AMSB context and assuming a wino LSP, limits are set on the cross section of direct chargino production through $pp \rightarrow \tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$ and $pp \rightarrow \tilde{\chi}_1^\pm \tilde{\chi}_1^0$, assuming $B(\tilde{\chi}_1^\pm \rightarrow \tilde{\chi}_1^0 \pi^\pm) = 100\%$, as a function of the chargino mass and mean proper lifetime, see Figure 2. In the case of a Higgsino LSP, limits are set on the cross section of direct chargino production through $pp \rightarrow \tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$ and $pp \rightarrow \tilde{\chi}_1^\pm \tilde{\chi}_{1,2}^0$, assuming $B(\tilde{\chi}_1^\pm \rightarrow \tilde{\chi}_1^0 \pi^\pm) = 95.5\%$, $B(\tilde{\chi}_1^\pm \rightarrow \tilde{\chi}_1^0 e^\pm) = 3\%$, $B(\tilde{\chi}_1^\pm \rightarrow \tilde{\chi}_1^0 \mu^\pm) = 1.5\%$, as a function of the chargino mass and mean proper lifetime, see Figure 3.

² AABOUD 19AT searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for metastable R-hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Results are interpreted in terms of direct electroweak production of long-lived charginos in the context of mAMSB scenarios. Chargino masses are excluded at 95% C.L. below 1090 GeV. See their Figure 10 (right).

³ AABOUD 18As searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of long-lived charginos in the context of AMSB or phenomenological MSSM scenarios with wino-like LSP. Events with a disappearing track due to a low-momentum pion accompanied by at least one jet with high transverse momentum from initial-state radiation are considered. No significant excess above the Standard Model expectations is observed. Exclusion limits are set at 95% confidence level on the mass of charginos for different chargino lifetimes. For a pure wino with a lifetime of about 0.2 ns, corresponding to a mass-splitting between the charged and neutral wino of around 160 MeV, chargino masses up to 460 GeV are excluded, see their Fig. 8.

⁴ SIRUNYAN 18BR searched in 38.4 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of long-lived charginos in events containing isolated tracks with missing hits in the outer layer of the silicon tracker and little or no associated calorimetric energy deposits (disappearing tracks). No significant excess above the Standard Model expectations is observed. In an AMSB context, limits are set on the cross section of direct chargino production through $pp \rightarrow \tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$ and $pp \rightarrow \tilde{\chi}_1^\pm \tilde{\chi}_1^0$, assuming $BR(\tilde{\chi}_1^\pm \rightarrow \tilde{\chi}_1^0 \pi^\pm) = 100\%$, as a function of the chargino mass and mean proper lifetime, see Figures 3, 4 and 5.

⁵ AAD 15AE searched in 19.1 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for heavy long-lived charged particles, measured through their specific ionization energy loss in the ATLAS pixel detector or their time-of-flight in the ALTAS muon system. In the absence of an excess of events above the expected backgrounds, limits are set on stable charginos, see Fig. 10.

⁶ AAD 15BM searched in 18.4 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for stable and metastable non-relativistic charged particles through their anomalous specific ionization energy loss in the ATLAS pixel detector. In absence of an excess of events above the expected backgrounds, limits are set on stable charginos (see Table 5) and on metastable charginos decaying to $\tilde{\chi}_1^0 \pi^\pm$, see Fig. 11.

⁷ AAD 13H searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for direct electroweak production of long-lived charginos in the context of AMSB scenarios. The search is based on the signature of a high-momentum isolated track with few associated hits in the outer part of the tracking system, arising from a chargino decay into a neutralino and a low-momentum pion. The p_T spectrum of the tracks was found to be consistent with the SM expectations. Constraints on the lifetime and the production cross section were obtained, see Fig. 6. In the minimal AMSB framework with $\tan\beta = 5$, and $\mu > 0$, a chargino having a mass below 103 (85) GeV for a chargino-neutralino mass splitting $\Delta m_{\tilde{\chi}_1^0}$ of 160 (170) MeV is excluded at the 95% C.L. See Fig. 7 for more precise bounds.

⁸ AAD 12BJ looked in 1.02 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for signatures of decaying charginos resulting in isolated tracks with few associated hits in the outer region of the tracking system. The p_T spectrum of the tracks was found to be consistent with the SM expectations. Constraints on the lifetime and the production cross section were obtained. In the minimal AMSB framework with $m_{3/2} < 32$ TeV, $m_0 < 1.5$ TeV, $\tan\beta = 5$, and $\mu > 0$, a chargino having a mass below 92 GeV and a lifetime between 0.5 ns and 2 ns is excluded at the 95% C.L. See their Fig. 8 for more precise bounds.

⁹ ABAZOV 09M searched in 1.1 fb⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV for events with direct production of a pair of charged massive stable particles identified by their TOF. The number of the observed events is consistent with the predicted background. The data are used to constrain the production cross section as a function of the $\tilde{\chi}_1^\pm$ mass, see their Fig. 2. The quoted limit improves to 206 GeV for gaugino-like charginos.

¹⁰ ABBIENDI 03L used $e^+ e^-$ data at $\sqrt{s} = 130$ –209 GeV to select events with two high momentum tracks with anomalous dE/dx . The excluded cross section is compared to the theoretical expectation as a function of the heavy particle mass in their Fig. 3. The bounds are valid for colorless fermions with lifetime longer than 10^{-6} s. Supersedes the results from ACKERSTAFF 98P.

¹¹ ABREU 00T searches for the production of heavy stable charged particles, identified by their ionization or Cherenkov radiation, using data from $\sqrt{s} = 130$ to 189 GeV. These limits include and update the results of ABREU 98P.

¹² KHACHATRYAN 15AB searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing tracks with little or no associated calorimetric energy deposits and with missing hits in the outer layers of the tracking system (disappearing-track signature). Such disappearing tracks can result from the decay of charginos that are nearly mass degenerate with the lightest neutralino. The number of observed events is in agreement with the background expectation. Limits are set on the cross section of electroweak chargino production in terms of the chargino mass and mean proper lifetime, see Fig. 4. In the minimal AMSB model, a chargino mass below 260 GeV is excluded at 95% C.L., see their Fig. 5.

Searches Particle Listings

Supersymmetric Particle Searches

- 13** KHACHATRYAN 15o searched in 18.8 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of long-lived charginos in the context of AMSB and pMSSM scenarios. The results are based on a previously published search for heavy stable charged particles at 7 and 8 TeV. In the minimal AMSB framework with $\tan\beta = 5$ and $\mu \geq 0$, constraints on the chargino mass and lifetime were placed, see Fig. 5. Charginos with a mass below 800 (100) GeV are excluded at the 95% C.L. for lifetimes above 100 ns (3 ns). Constraints are also placed on the pMSSM parameter space, see Fig. 3.
- 14** KHACHATRYAN 15w searched in up to 20.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of long-lived neutralinos produced through \tilde{q} -pair production, with $\tilde{q} \rightarrow q\tilde{\chi}^0$ and $\tilde{\chi}^0 \rightarrow \ell^+\ell^-\nu$ (RPV: $\lambda_{121}, \lambda_{122} \neq 0$). 95% C.L. exclusion limits on cross section times branching ratio are set as a function of mean proper decay length of the neutralino, see Figs. 6 and 9.
- 15** AAD 13BD searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing tracks with no associated hits in the outer region of the tracking system resulting from the decay of charginos that are nearly mass degenerate with the lightest neutralino, as is often the case in AMSB scenarios. No significant excess above the background expectation is observed for candidate tracks with large transverse momentum. Constraints on chargino properties are obtained and in the minimal AMSB model, a chargino mass below 270 GeV is excluded at 95% C.L., see their Fig. 7.
- 16** ABAZOV 13B looked in 6.3 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for charged massive long-lived particles in events with muon-like particles that have both speed and ionization energy loss inconsistent with muons produced in beam collisions. In the absence of an excess, limits are set at 95% C.L. on gaugino- and higgsino-like charginos, see their Table 20 and Fig. 23.

$\tilde{\nu}$ (Sneutrino) mass limit

The limits may depend on the number, $N(\tilde{\nu})$, of sneutrinos assumed to be degenerate in mass. Only $\tilde{\nu}_L$ (not $\tilde{\nu}_R$) is assumed to exist. It is possible that $\tilde{\nu}$ could be the lightest supersymmetric particle (LSP).

We report here, but do not include in the Listings, the limits obtained from the fit of the final results obtained by the LEP Collaborations on the invisible width of the Z boson ($\Delta\Gamma_{\text{inv.}} < 2.0 \text{ MeV}$, LEP-SLC 06): $m_{\tilde{\nu}} > 43.7 \text{ GeV}$ ($N(\tilde{\nu})=1$) and $m_{\tilde{\nu}} > 44.7 \text{ GeV}$ ($N(\tilde{\nu})=3$).

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- 1** AABOUD 18CM searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for heavy particles decaying into an $e\mu$, $e\tau$, $\mu\tau$ final state. No significant deviation from the expected SM background is observed. Limits are set on the mass of a stau neutrino with R-parity-violating couplings. For $\tilde{\nu}_\tau \rightarrow e\mu$, masses below 3.4 TeV are excluded at 95% CL, see their Figure 4(b). Upper limits on the RPV couplings $|\lambda_{312}|$ versus $|\lambda'_{311}|$ are also performed, see their Figure 8(a-b).
- 2** AABOUD 18CM searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for heavy particles decaying into an $e\mu$, $e\tau$, $\mu\tau$ final state. No significant deviation from the expected SM background is observed. Limits are set on the mass of a stau neutrino with R-parity-violating couplings. For $\tilde{\nu}_\tau \rightarrow e\tau$, masses below 2.9 TeV are excluded at 95% CL, see their Figure 5(b). Upper limits on the RPV couplings $|\lambda_{313}|$ versus $|\lambda'_{311}|$ are also performed, see their Figure 8(c).
- 3** AABOUD 18CM searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for heavy particles decaying into an $e\mu$, $e\tau$, $\mu\tau$ final state. No significant deviation from the expected SM background is observed. Limits are set on the mass of a stau neutrino with R-parity-violating couplings. For $\tilde{\nu}_\tau \rightarrow \mu\tau$, masses below 2.6 TeV are excluded at 95% CL, see their Figure 6(b). Upper limits on the RPV couplings $|\lambda_{323}|$ versus $|\lambda'_{311}|$ are also performed, see their Figure 8(d).
- 4** AABOUD 18Z searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSB pair production with R-parity violating decays of the LSP via λ_{12k} or λ_{133} to charged leptons, see their Figures 7, 8.
- 5** SIRUNYAN 18AT searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for heavy resonances decaying into $e\mu$ final states. No significant excess above the Standard Model expectation is observed and 95% C.L. exclusions are placed on the cross section times branching ratio for the R-parity-violating production and decay of a supersymmetric tau sneutrino, see their Fig. 3.
- 6** AABOUD 16P searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with different flavour dilepton pairs ($e\mu$, $e\tau$, $\mu\tau$) from the production of $\tilde{\nu}_\tau$ via an RPV λ'_{311} coupling and followed by a decay via $\lambda_{312} = \lambda_{321} = 0.07$ for $e + \mu$, via $\lambda_{313} = \lambda_{331} = 0.07$ for $e + \tau$ and via $\lambda_{323} = \lambda_{332} = 0.07$ for $\mu + \tau$. No evidence for a dilepton resonance over the SM expectation is observed, and limits are derived on $m_{\tilde{\nu}}$ at 95% CL, see their Figs. 2(b), 3(b), 4(b), and Table 3.
- 7** AAD 14X searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the sneutrino mass in an R-parity violating simplified model where the decay $\tilde{\nu} \rightarrow \nu\tilde{\chi}^0_1$, with $\tilde{\chi}^0_1 \rightarrow \ell^\pm\ell^\mp\nu$, takes place with a branching ratio of 100%, see Fig. 9.
- 8** AAD 11Z looked in 1.07 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with one electron and one muon of opposite charge from the production of $\tilde{\nu}_\tau$ via an RPV λ'_{311} coupling and followed by a decay via λ_{312} into $e + \mu$. No evidence for an (e, μ) resonance over the SM expectation is observed, and a limit is derived in the plane of λ'_{311} versus $m_{\tilde{\nu}}$ for three values of λ_{312} , see their Fig. 2. Masses $m_{\tilde{\nu}} < 1.32$ (1.45) TeV are excluded for $\lambda'_{311} = 0.10$ and $\lambda_{312} = 0.05$ ($\lambda'_{311} = 0.11$ and $\lambda_{312} = 0.07$).
- 9** ABDALLAH 03M uses data from $\sqrt{s} = 192$ -208 GeV to obtain limits in the framework of the MSSM with gaugino and sfermion mass universality at the GUT scale. An indirect limit on the mass is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays) and for sleptons. These limits are valid for values of $M_2 < 1 \text{ TeV}$, $|\mu| \leq 1 \text{ TeV}$ with the $\tilde{\chi}^0_1$ as LSP. The quoted limit is obtained when there is no mixing in the third family. See Fig. 43 for the mass limits as a function of $\tan\beta$. These limits update the results of ABREU 00w.
- 10** HEISTER 02N derives a bound on $m_{\tilde{\nu}_e}$ by exploiting the mass relation between the $\tilde{\nu}_e$ and \tilde{e} , based on the assumption of universal GUT scale gaugino and scalar masses $m_{1/2}$ and m_0 and the search described in the \tilde{e} section. In the MSUGRA framework with radiative electroweak symmetry breaking, the limit improves to $m_{\tilde{\nu}_e} > 130 \text{ GeV}$, assuming a trilinear coupling $A_0=0$ at the GUT scale. See Figs. 5 and 7 for the dependence of the limits on $\tan\beta$.
- 11** DECAMP 92 limit is from $\Gamma(\text{invisible})/\Gamma(\ell\ell) = 5.91 \pm 0.15$ ($N_{\nu_i} = 2.97 \pm 0.07$).
- 12** SIRUNYAN 19AO searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two same-sign muons and at last two jets, originating from resonant production of second-generation sleptons ($\tilde{\mu}_L, \tilde{\nu}_\mu$) via the R-parity violating coupling λ'_{211} to quarks. No significant excess above the Standard Model expectations is observed. Upper limits on cross sections are derived in the context of two simplified models, see their Figure 4. The cross section limits are translated into limits on λ'_{211} for a modified CMSSM, see their Figure 5.
- 13** KHACHATRYAN 16BE searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of narrow resonances decaying into $e\mu$ final states. No significant excess above the Standard Model expectation is observed and 95% C.L. exclusions are placed on the cross section times branching ratio for the production of an R-parity-violating supersymmetric tau sneutrino, see their Fig. 3.
- 14** AAD 15o searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of heavy particles decaying into $e\mu$, $e\tau$ or $\mu\tau$ final states. No significant excess above the Standard Model expectation is observed, and 95% C.L. exclusions are placed on the cross section times branching ratio for the production of an R-parity-violating supersymmetric tau sneutrino, applicable to any sneutrino flavour, see their Fig. 2.
- 15** AAD 13Al searched in 4.6 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for evidence of heavy particles decaying into $e\mu$, $e\tau$ or $\mu\tau$ final states. No significant excess above the Standard Model expectation is observed, and 95% C.L. exclusions are placed on the cross section times branching ratio for the production of an R-parity-violating supersymmetric tau sneutrino, see their Fig. 2. For couplings $\lambda'_{311} = 0.10$ and $\lambda_{i3k} = 0.05$, the lower limits on the $\tilde{\nu}_\tau$ mass are 1610, 1110, 1100 GeV in the $e\mu$, $e\tau$, and $\mu\tau$ channels, respectively.

- ¹⁶ AAD 11H looked in 35 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with one electron and one muon of opposite charge from the production of $\tilde{\nu}_\tau$ via an RPV λ'_{311} coupling and followed by a decay via λ_{312} into $e + \mu$. No evidence for an excess over the SM expectation is observed, and a limit is derived in the plane of λ'_{311} versus $m_{\tilde{\nu}_\tau}$ for several values of λ_{312} , see their Fig. 2. Superseded by AAD 11Z.
- ¹⁷ AALTONEN 10Z searched in 1 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events from the production $d\bar{d} \rightarrow \tilde{\nu}_\tau$ with the subsequent decays $\tilde{\nu}_\tau \rightarrow e\mu, \mu\tau, e\tau$ in the MSSM framework with RPV. Two isolated leptons of different flavor and opposite charges are required, with τ s identified by their hadronic decay. No statistically significant excesses are observed over the SM background. Upper limits on λ_{311}^2 times the branching ratio are listed in their Table III for various $\tilde{\nu}_\tau$ masses. Limits on the cross section times branching ratio for $\lambda'_{311} = 0.10$ and $\lambda_{312} = 0.05$, displayed in Fig. 2, are used to set limits on the $\tilde{\nu}_\tau$ mass of 558 GeV for the $e\mu$, 441 GeV for the $\mu\tau$ and 442 GeV for the $e\tau$ channels.
- ¹⁸ ABAZOV 10M looked in 5.3 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events with exactly one pair of high p_T isolated $e\mu$ and a veto against hard jets. No evidence for an excess over the SM expectation is observed, and a limit at 95% C.L. on the cross section times branching ratio is derived, see their Fig. 3. These limits are translated into limits on couplings as a function of $m_{\tilde{\nu}_\tau}$ as shown on their Fig. 4. As an example, for $m_{\tilde{\nu}_\tau} = 100 \text{ GeV}$ and $\lambda_{312} \leq 0.07$, couplings $\lambda'_{311} > 7.7 \times 10^{-4}$ are excluded.
- ¹⁹ ABDALLAH 04H use data from LEP 1 and $\sqrt{s} = 192\text{--}208 \text{ GeV}$. They re-use results or re-analyze the data from ABDALLAH 03M to put limits on the parameter space of anomaly-mediated supersymmetry breaking (AMSB), which is scanned in the region $1 < m_{3/2} < 50 \text{ TeV}$, $0 < m_0 < 1000 \text{ GeV}$, $1.5 < \tan\beta < 35$, both signs of μ . The constraints are obtained from the searches for mass degenerate chargino and neutralino, for SM-like and invisible Higgs, for leptonically decaying charginos and from the limit on non-SM Z width of 3.2 MeV. The limit is for $m_t = 174.3 \text{ GeV}$ (see Table 2 for other m_t values). The limit improves to 114 GeV for $\mu < 0$.
- ²⁰ ADRIANI 93M limit from $\Delta\Gamma(Z)(\text{invisible}) < 16.2 \text{ MeV}$.
- ²¹ ALEXANDER 91F limit is for one species of $\tilde{\nu}$ and is derived from $\Gamma(\text{invisible, new})/\Gamma(\ell\ell) < 0.38$.

Charged sleptons

This section contains limits on charged scalar leptons ($\tilde{\ell}$, with $\ell=e,\mu,\tau$). Studies of width and decays of the Z boson (use is made here of $\Delta\Gamma_{\text{inv}} < 2.0 \text{ MeV}$, LEP 00) conclusively rule out $m_{\tilde{\ell}_R} < 40 \text{ GeV}$ (41 GeV for $\tilde{\ell}_L$), independently of decay modes, for each individual slepton. The limits improve to 43 GeV (43.5 GeV for $\tilde{\ell}_L$) assuming all 3 flavors to be degenerate. Limits on higher mass sleptons depend on model assumptions and on the mass splitting $\Delta m = m_{\tilde{\ell}} - m_{\tilde{\chi}_1^0}$. The mass and composition of $\tilde{\chi}_1^0$ may affect the electron production rate in e^+e^- collisions through t-channel exchange diagrams. Production rates are also affected by the potentially large mixing angle of the lightest mass eigenstate $\tilde{\ell}_1 = \tilde{\ell}_R \sin\theta_\ell + \tilde{\ell}_L \cos\theta_\ell$. It is generally assumed that only $\tilde{\tau}$ may have significant mixing. The coupling to the Z vanishes for $\theta_\ell=0.82$. In the high-energy limit of e^+e^- collisions the interference between γ and Z exchange leads to a minimal cross section for $\theta_\ell=0.91$, a value which is sometimes used in the following entries relative to data taken at LEP2. When limits on $m_{\tilde{\ell}_R}$ are quoted, it is understood that limits on $m_{\tilde{\ell}_L}$ are usually at least as strong.

Possibly open decays involving gauginos other than $\tilde{\chi}_1^0$ will affect the detection efficiencies. Unless otherwise stated, the limits presented here result from the study of $\tilde{\ell}^+\tilde{\ell}^-$ production, with production rates and decay properties derived from the MSSM. Limits made obsolete by the recent analyses of e^+e^- collisions at high energies can be found in previous Editions of this Review.

For decays with final state gravitinos (\tilde{G}), $m_{\tilde{G}}$ is assumed to be negligible relative to all other masses.

R-parity conserving \tilde{e} (Selectron) mass limit

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- ¹ SIRUNYAN 21M searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for supersymmetry in events with two opposite-sign same-flavor leptons (electrons, muons) and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the $\tilde{\chi}_1^0$ and $\tilde{\chi}_1^\pm$ mass in Tchi1n2Fa, see their Figure 11, on the $\tilde{\chi}_1^0$ mass in Tn1n1C and Tn1n1B for $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0}$, see their Figure 12. Limits are also set on the light squark mass for the simplified model Tsqk2A, on the sbottom mass in Tsb0t3, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.
- ² AAD 20o reported on a search for electroweak production in models with charginos and sleptons decaying into final states with exactly two oppositely charged leptons and missing transverse momentum. A dataset of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ corresponding to an integrated luminosity of 139 fb^{-1} was used. Light-flavour sleptons \tilde{e} and $\tilde{\mu}$ are constrained at 95% C.L. to have masses above 700 GeV for massless lightest neutralino, see their Fig. 7(c). Exclusion limits are also set for selectrons and smuons separately, considering either right- or left-handed components, by including only the di-electron and di-muon same-flavour signal regions defined in the search, see their Fig. 8.
- ³ SIRUNYAN 19AW searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak pair production of selectrons or smuons in events with two leptons (electrons or muons) of the opposite electric charge and same flavour, no jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass assuming left-handed, right-handed or both left- and right-handed (mass degenerate) production, see their Figure 6. Similarly, limits are set on the smuon mass, see their Figure 7. Limits are also set on slepton masses under the assumption that the selectron and smuon are mass degenerate, see their Figure 5.
- ⁴ AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass up to 500 GeV for massless $\tilde{\chi}_1^0$, assuming degeneracy of $\tilde{e}, \tilde{\mu}$, and $\tilde{\tau}$ and exploiting the 2ℓ signature, see their Figure 8(b).
- ⁵ AABOUD 18R searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in slepton pair production models with a fourfold degeneracy assumed in selectron and smuon masses. The \tilde{e} masses are excluded up to 190 GeV for $m_{\tilde{e}} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$. The exclusion limits extend down to mass splittings of 1 GeV, see their Fig. 11.
- ⁶ CHATRCHYAN 14R searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass in a stau (N)NLSF simplified model (GMSB) where the decay $\tilde{\ell} \rightarrow \ell^\pm \tau^\pm \tilde{\tau} \tilde{G}$ takes place with a branching ratio of 100%, see Fig. 8.
- ⁷ AAD 13B searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for sleptons decaying to a final state with two leptons (e and μ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Limits are derived in a simplified model of direct left-handed slepton pair production, where left-handed slepton masses between 85 and 195 GeV are excluded at 95% C.L. for $m_{\tilde{\chi}_1^0} = 20 \text{ GeV}$. See also Fig. 2(a). Exclusion limits are also derived in the phenomenological MSSM, see Fig. 3.
- ⁸ ABBIENDI 04 search for $\tilde{e}_R \tilde{e}_R$ production in acoplanar di-electron final states in the 183–208 GeV data. See Fig. 13 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$ and for the limit at $\tan\beta=35$. This limit supersedes ABBIENDI 00g.
- ⁹ ACHARD 04 search for $\tilde{e}_R \tilde{e}_L$ and $\tilde{e}_R \tilde{e}_R$ production in single- and acoplanar di-electron final states in the 192–209 GeV data. Absolute limits on $m_{\tilde{e}_R}$ are derived from a scan over the MSSM parameter space with universal GUT scale gaugino and scalar masses $m_{1/2}$ and m_0 , $1 \leq \tan\beta \leq 60$ and $-2 \leq \mu \leq 2 \text{ TeV}$. See Fig. 4 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$. This limit supersedes ACCIARRI 99w.
- ¹⁰ ABDALLAH 03M looked for acoplanar dielectron + \cancel{E} final states at $\sqrt{s} = 189\text{--}208 \text{ GeV}$. The limit assumes $\mu = -200 \text{ GeV}$ and $\tan\beta=1.5$ in the calculation of the production cross

section and $B(\bar{e} \rightarrow e\tilde{\chi}_1^0)$. See Fig. 15 for limits in the $(m_{\tilde{e}_R}, m_{\tilde{\chi}_1^0})$ plane. These limits

- include and update the results of ABREU 01
- 11** ABDALLAH 03M uses data from $\sqrt{s} = 192\text{--}208$ GeV to obtain limits in the framework of the MSSM with gaugino and sfermion mass universality at the GUT scale. An indirect limit on the mass is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays) and for sleptons. These limits are valid for values of $M_2 < 1$ TeV, $|\mu| \leq 1$ TeV with the $\tilde{\chi}_1^0$ as LSP. The quoted limit is obtained when there is no mixing in the third family. See Fig. 43 for the mass limits as a function of $\tan\beta$. These limits update the results of ABREU 00w.
- 12** HEISTER 02E looked for acoplanar dielectron + \cancel{E}_T final states from e^+e^- interactions between 183 and 209 GeV. The mass limit assumes $\mu < -200$ GeV and $\tan\beta=2$ for the production cross section and $B(\bar{e} \rightarrow e\tilde{\chi}_1^0)=1$. See their Fig. 4 for the dependence of the limit on Δm . These limits include and update the results of BARATE 01.
- 13** HEISTER 02N search for $\tilde{e}_R\tilde{e}_L$ and $\tilde{e}_R\tilde{e}_R$ production in single- and acoplanar di-electron final states in the 183–208 GeV data. Absolute limits on $m_{\tilde{e}_R}$ are derived from a scan over the MSSM parameter space with universal GUT scale gaugino and scalar masses $m_{1/2}$ and m_0 , $1 \leq \tan\beta \leq 50$ and $-10 \leq \mu \leq 10$ TeV. The region of small $|\mu|$, where cascade decays are important, is covered by a search for $\tilde{\chi}_1^0\tilde{\chi}_3^0$ in final states with leptons and possibly photons. Limits on $m_{\tilde{e}_L}$ are derived by exploiting the mass relation between the \tilde{e}_L and \tilde{e}_R , based on universal m_0 and $m_{1/2}$. When the constraint from the mass limit of the lightest Higgs from HEISTER 02 is included, the bounds improve to $m_{\tilde{e}_R} > 77(75)$ GeV and $m_{\tilde{e}_L} > 115(115)$ GeV for a top mass of 175(180) GeV. In the MSUGRA framework with radiatively electroweak symmetry breaking, the limits improve further to $m_{\tilde{e}_R} > 95$ GeV and $m_{\tilde{e}_L} > 152$ GeV, assuming a trilinear coupling $A_0=0$ at the GUT scale. See Figs. 4, 5, 7 for the dependence of the limits on $\tan\beta$.
- 14** AAD 20i reported on ATLAS searches for slepton pair production in models with compressed mass spectra. A dataset of pp collisions at $\sqrt{s} = 13$ TeV corresponding to an integrated luminosity of 139 fb^{-1} was used. Events with \cancel{E}_T , two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Light-flavour sleptons \tilde{e} and $\tilde{\mu}$ are constrained at 95% C.L. to have masses above 251 GeV for a mass splitting slepton- $\tilde{\chi}_1^0$ of 10 GeV, with constraints extending down to mass splittings of 550 MeV at the LEP slepton limits (73 GeV), see their Fig. 16(a). If only selectrons are considered, and $\tilde{e} = \tilde{e}_R$, masses below 101 GeV are excluded for mass splitting $\tilde{e}_R, \tilde{\chi}_1^0$ of 7.5 GeV. See their Fig. 16(b).
- 15** AAD 20j reported on ATLAS searches for slepton pair production in models with compressed mass spectra. A dataset of pp collisions at $\sqrt{s} = 13$ TeV corresponding to an integrated luminosity of 139 fb^{-1} was used. Events with \cancel{E}_T , two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Light-flavour sleptons \tilde{e} and $\tilde{\mu}$ are constrained at 95% C.L. to have masses above 251 GeV for a mass splitting slepton- $\tilde{\chi}_1^0$ of 10 GeV, with constraints extending down to mass splittings of 550 MeV at the LEP slepton limits (73 GeV). See their Fig. 16(a). If only selectron are considered, and $\tilde{e} = \tilde{e}_L$, masses below 169 GeV are excluded for mass splitting $\tilde{e}_L, \tilde{\chi}_1^0$ of 7.1 GeV. See their Fig. 16(b).
- 16** AAD 14g searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of slepton pairs, decaying to a final state with two leptons (e and μ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of slepton pair production, see Fig. 8. An interpretation in the pMSSM is also given, see Fig. 10.
- 17** KHACHATRYAN 14i searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of slepton pairs decaying to a final state with opposite-sign lepton pairs (e or μ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models, see Fig. 18.

R-parity violating \tilde{e} (Selectron) mass limit

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- 1** AAD 21Y searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on Tch1n12-GGM, and RPV models similar to Tch1n2l, Tglu1A (with $q = u, d, s, c, b$, with equal branching fractions), and $\tilde{e}_L/\tilde{\nu} \rightarrow \ell/\nu\tilde{\chi}_1^0$ (mass-degenerate \tilde{e}_L and $\tilde{\nu}$ of all 3 generations), all with $\tilde{\chi}_1^0 \rightarrow \ell^\pm\tilde{e}\tilde{\nu}$ via λ_{12k} or λ_{i33} (where $i, k = 1, 2$), see their Figure 11.
- 2** AABOUD 18Z searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying

taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via λ_{12k} or λ_{i33} to charged leptons, see their Figures 7, 8.

- 3** AAD 14x searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass in an R-parity violating simplified model where the decay $\tilde{e} \rightarrow \ell\tilde{\chi}_1^0$, with $\tilde{\chi}_1^0 \rightarrow \ell^\pm\tilde{e}\tilde{\nu}$, takes place with a branching ratio of 100%, see Fig. 9.
- 4** ABBIENDI 04F use data from $\sqrt{s} = 189\text{--}209$ GeV. They derive limits on sparticle masses under the assumption of RPV with $LL\tilde{E}$ or $LQ\tilde{D}$ couplings. The results are valid for $\tan\beta = 1.5$, $\mu = -200$ GeV, with, in addition, $\Delta m > 5$ GeV for indirect decays via $LQ\tilde{D}$. The limit quoted applies to direct decays via $LL\tilde{E}$ or $LQ\tilde{D}$ couplings. For indirect decays, the limits on the \tilde{e}_R mass are respectively 99 and 92 GeV for $LL\tilde{E}$ and $LQ\tilde{D}$ couplings and $m_{\tilde{\chi}_1^0} = 10$ GeV and degrade slightly for larger $\tilde{\chi}_1^0$ mass. Supersedes the results of ABBIENDI 00.
- 5** ABDALLAH 04M use data from $\sqrt{s} = 192\text{--}208$ GeV to derive limits on sparticle masses under the assumption of RPV with $LL\tilde{E}$ or $U\tilde{D}\tilde{D}$ couplings. The results are valid for $\mu = -200$ GeV, $\tan\beta = 1.5$, $\Delta m > 5$ GeV and assuming a BR of 1 for the given decay. The limit quoted is for indirect $U\tilde{D}\tilde{D}$ decays using the neutralino constraint of 39.5 GeV for $LL\tilde{E}$ and of 38.0 GeV for $U\tilde{D}\tilde{D}$ couplings, also derived in ABDALLAH 04M. For indirect decays via $LL\tilde{E}$ the limit improves to 95 GeV if the constraint from the neutralino is used and to 94 GeV if it is not used. For indirect decays via $U\tilde{D}\tilde{D}$ couplings it remains unchanged when the neutralino constraint is not used. Supersedes the result of ABREU 00u.

- 1** SIRUNYAN 21M searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with two opposite-sign same-flavor leptons (electrons, muons) and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ mass in Tch1n2Fa, see their Figure 11, on the $\tilde{\chi}_1^0$ mass in Tn1n1C and Tn1n1B for $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0}$, see their Figure 12. Limits are also set on the light squark mass for the simplified model Tsqk2A, on the sbottom mass in Tsbot3, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.

- ² AAD 20i reported on ATLAS searches for slepton pair production in models with compressed mass spectra. A dataset of pp collisions at $\sqrt{s} = 13$ TeV corresponding to an integrated luminosity of 139 fb^{-1} was used. Events with \cancel{E}_T , two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Light-flavour sleptons \tilde{e} and $\tilde{\mu}$ are constrained at 95% C.L. to have masses above 251 GeV for a mass splitting slepton- $\tilde{\chi}_1^0$ of 10 GeV, with constraints extending down to mass splittings of 550 MeV at the LEP slepton limits (73 GeV). See their Fig. 16(a). If only smuon are considered, and $\tilde{\mu} = \tilde{\mu}_R$, masses below 150 GeV are excluded for mass splitting $\tilde{\mu}_R, \tilde{\chi}_1^0$ of 8.2 GeV. See their Fig. 16(b).
- ³ AAD 20i reported on ATLAS searches for slepton pair production in models with compressed mass spectra. A dataset of pp collisions at $\sqrt{s} = 13$ TeV corresponding to an integrated luminosity of 139 fb^{-1} was used. Events with \cancel{E}_T , two same-flavour, opposite-charge, low-transverse-momentum leptons, and jets from initial-state radiation or characteristic of vector-boson fusion production are selected. Light-flavour sleptons \tilde{e} and $\tilde{\mu}$ are constrained at 95% C.L. to have masses above 251 GeV for a mass splitting slepton- $\tilde{\chi}_1^0$ of 10 GeV, with constraints extending down to mass splittings of 550 MeV at the LEP slepton limits (73 GeV). See their Fig. 16(a). If only smuon are considered, and $\tilde{\mu} = \tilde{\mu}_L$, masses below 216 GeV are excluded for mass splitting $\tilde{\mu}_L, \tilde{\chi}_1^0$ of 10 GeV. See their Fig. 16(b).
- ⁴ AAD 20o reported on a search for electroweak production in models with charginos and sleptons decaying into final states with exactly two oppositely charged leptons and missing transverse momentum. A dataset of pp collisions at $\sqrt{s} = 13$ TeV corresponding to an integrated luminosity of 139 fb^{-1} was used. Light-flavour sleptons \tilde{e} and $\tilde{\mu}$ are constrained at 95% C.L. to have masses above 700 GeV for massless lightest neutralino, see their Fig. 7(c). Exclusion limits are also set for selectrons and smuons separately, considering either right- or left-handed components, by including only the di-electron and di-muon same-flavour signal regions defined in the search, see their Fig. 8.
- ⁵ SIRUNYAN 19AW searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak pair production of selectrons or smuons in events with two leptons (electrons or muons) of the opposite electric charge and same flavour, no jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the selectron mass assuming left-handed, right-handed or both left- and right-handed (mass degenerate) production, see their Figure 6. Similarly, limits are set on the smuon mass, see their Figure 7. Limits are also set on slepton masses under the assumption that the selectron and smuon are mass degenerate, see their Figure 5.
- ⁶ AABOUD 18R searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in slepton pair production models with a fourfold degeneracy assumed in selectron and smuon masses. The $\tilde{\mu}$ masses are excluded up to 190 GeV for $m_{\tilde{\mu}} - m_{\tilde{\chi}_1^0} = 5$ GeV. The exclusion limits extend down to mass splittings of 1 GeV, see their Fig. 11.
- ⁷ CHATRCHYAN 14R searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass in a stau (N)NLSF simplified model (GMSB) where the decay $\tilde{l} \rightarrow \ell^\pm \tau^\pm \tau^\pm \bar{G}$ takes place with a branching ratio of 100%, see Fig. 8.
- ⁸ AAD 13s searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7$ TeV for sleptons decaying to a final state with two leptons (e and μ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Limits are derived in a simplified model of direct left-handed slepton pair production, where left-handed slepton masses between 85 and 195 GeV are excluded at 95% C.L. for $m_{\tilde{\chi}_1^0} = 20$ GeV. See also Fig. 2(a). Exclusion limits are also derived in the phenomenological MSSM, see Fig. 3.
- ⁹ ABBIENDI 04 search for $\tilde{\mu}_R \tilde{\mu}_R$ production in acoplanar di-muon final states in the 183–208 GeV data. See Fig. 14 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$ and for the limit at $\tan\beta=35$. Under the assumption of 100% branching ratio for $\tilde{\mu}_R \rightarrow \mu \tilde{\chi}_1^0$, the limit improves to 94.0 GeV for $\Delta m > 4$ GeV. See Fig. 11 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$ at several values of the branching ratio. This limit supersedes ABBIENDI 00c.
- ¹⁰ ACHARD 04 search for $\tilde{\mu}_R \tilde{\mu}_R$ production in acoplanar di-muon final states in the 192–209 GeV data. Limits on $m_{\tilde{\mu}_R}$ are derived from a scan over the MSSM parameter space with universal GUT scale gaugino and scalar masses $m_{1/2}$ and m_0 , $1 \leq \tan\beta \leq 60$ and $-2 \leq \mu \leq 2$ TeV. See Fig. 4 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$. This limit supersedes ACCIARRI 99w.
- ¹¹ ABDALLAH 03M looked for acoplanar dimuon + \cancel{E} final states at $\sqrt{s} = 189$ –208 GeV. The limit assumes $B(\tilde{\mu} \rightarrow \mu \tilde{\chi}_1^0) = 100\%$. See Fig. 16 for limits on the $(m_{\tilde{\mu}_R}, m_{\tilde{\chi}_1^0})$ plane. These limits include and update the results of ABREU 01.
- ¹² ABDALLAH 03M uses data from $\sqrt{s} = 192$ –208 GeV to obtain limits in the framework of the MSSM with gaugino and sfermion mass universality at the GUT scale. An indirect limit on the mass is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays) and for sleptons. These limits are valid for values of $M_2 < 1$ TeV, $|\mu| \leq 1$ TeV with the $\tilde{\chi}_1^0$ as LSP. The quoted limit is obtained when there is no mixing in the third family. See Fig. 43 for the mass limits as a function of $\tan\beta$. These limits update the results of ABREU 00w.
- ¹³ HEISTER 02E looked for acoplanar dimuon + \cancel{E}_T final states from e^+e^- interactions between 183 and 209 GeV. The mass limit assumes $B(\tilde{\mu} \rightarrow \mu \tilde{\chi}_1^0) = 1$. See their Fig. 4 for the dependence of the limit on Δm . These limits include and update the results of BARATE 01.
- ¹⁴ AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass up to 500 GeV for massless $\tilde{\chi}_1^0$, assuming degeneracy of $\tilde{e}, \tilde{\mu}$, and $\tilde{\tau}$ and exploiting the 2ℓ signature, see their Figure 8(b).
- ¹⁵ AAD 14G searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of slepton pairs, decaying to a final state with two leptons (e and μ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of slepton pair production, see Fig. 8. An interpretation in the pMSSM is also given, see Fig. 10.

- ¹⁶ KHACHATRYAN 14i searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of slepton pairs decaying to a final state with opposite-sign lepton pairs (e or μ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models, see Fig. 18.
- ¹⁷ ABREU 00v use data from $\sqrt{s} = 130$ –189 GeV to search for tracks with large impact parameter or visible decay vertices. Limits are obtained as function of $m_{\tilde{e}}$, after combining these results with the search for slepton pair production in the SUGRA framework from ABREU 01 to cover prompt decays and on stable particle searches from ABREU 00q. For limits at different $m_{\tilde{e}}$, see their Fig. 12.

- ¹ AAD 21Y searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on Tch1n12-GGM, and RPV models similar to Tch1n2l, Tglu1A (with $q = u, d, s, c, b$, with equal branching fractions), and $\tilde{e}_L/\tilde{\nu} \rightarrow \ell/\nu \tilde{\chi}_1^0$ (mass-degenerate \tilde{e}_L and $\tilde{\nu}$ of all 3 generations), all with $\tilde{\chi}_1^0 \rightarrow \ell^\pm \tilde{e} \nu$ via λ_{12k} or λ_{133} (where $i, k \in 1, 2$), see their Figure 11.
- ² AABOUD 18Z searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSF pair production with R-parity violating decays of the LSP via λ_{12k} or λ_{133} to charged leptons, see their Figures 7, 8.
- ³ AAD 14x searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass in an R-parity violating simplified model where the decay $\tilde{e} \rightarrow \ell \tilde{\chi}_1^0$, with $\tilde{\chi}_1^0 \rightarrow \ell^\pm \tilde{e} \nu$, takes place with a branching ratio of 100%, see Fig. 9.
- ⁴ SIRUNYAN 19Ao searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing two same-sign muons and at last two jets, originating from resonant production of second-generation sleptons ($\tilde{\mu}_L, \tilde{\nu}_\mu$) via the R-parity violating coupling λ'_{211} to quarks. No significant excess above the Standard Model expectations is observed. Upper limits on cross sections are derived in the context of two simplified models, see their Figure 4. The cross section limits are translated into limits on λ'_{211} for a modified CMSSM, see their Figure 5.
- ⁵ ABDALLAH 04M use data from $\sqrt{s} = 192$ –208 GeV to derive limits on sparticle masses under the assumption of RPV with $L\tilde{E}$ or $\tilde{U}\tilde{D}\tilde{D}$ couplings. The results are valid for $\mu = -200$ GeV, $\tan\beta = 1.5$, $\Delta m \geq 5$ GeV and assuming a BR of 1 for the given decay. The limit quoted is for indirect $\tilde{U}\tilde{D}\tilde{D}$ decays using the neutralino constraint of 39.5 GeV for $L\tilde{E}$ and of 38.0 GeV for $\tilde{U}\tilde{D}\tilde{D}$ couplings, also derived in ABDALLAH 04M. For indirect decays via $L\tilde{E}$ the limit improves to 90 GeV if the constraint from the neutralino is used and remains at 87 GeV if it is not used. For indirect decays via $\tilde{U}\tilde{D}\tilde{D}$ couplings it degrades to 85 GeV when the neutralino constraint is not used. Supersedes the result of ABREU 00u.
- ⁶ HEISTER 03G searches for the production of smuons in the case of RPV prompt decays with $L\tilde{E}, L\tilde{Q}\tilde{D}$ or $\tilde{U}\tilde{D}\tilde{D}$ couplings at $\sqrt{s} = 189$ –209 GeV. The search is performed for direct and indirect decays, assuming one coupling at a time to be non-zero. The limit holds for direct decays mediated by RPV $L\tilde{Q}\tilde{D}$ couplings and improves to 90 GeV for indirect decays (for $\Delta m > 10$ GeV). Limits are also given for $L\tilde{E}$ direct ($m_{\tilde{\mu}_R} > 87$ GeV) and indirect decays ($m_{\tilde{\mu}_R} > 96$ GeV for $m(\tilde{\chi}_1^0) > 23$ GeV from BARATE 98s) and for $\tilde{U}\tilde{D}\tilde{D}$ indirect decays ($m_{\tilde{\mu}_R} > 85$ GeV for $\Delta m > 10$ GeV). Supersedes the results from BARATE 01s.

R-parity conserving $\tilde{\tau}$ (Stau) mass limit

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

¹ AAD 20H presented ATLAS searches for direct production of $\tilde{\tau}$ in final states with two hadronically decaying leptons and \cancel{E}_T . The analysis uses a dataset of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ corresponding to an integrated luminosity of 139 fb^{-1} . Exclusion limits at 95% C.L. are derived in scenarios of direct production of $\tilde{\tau}$ pairs with each $\tilde{\tau}$ decaying into a τ and the lightest neutralino $\tilde{\chi}_1^0$ in simplified models where the $\tilde{\tau}_R$ and $\tilde{\tau}_L$ mass eigenstates are degenerate. Stau masses from 120 GeV to 390 GeV are excluded for a massless lightest neutralino, see their Fig. 7(a). If $\tilde{\tau}_L$ -only pair production is considered, the exclusion region extends between 155 GeV to 310 GeV, see their Fig. 7(b).

² SIRUNYAN 20P searched in 77.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct pair production of tau sleptons in events with a tau lepton pair and significant missing transverse momentum. Final states with two double hadronic decay of the tau leptons are considered, as well as where one of the tau leptons decays into an electron or a muon. No significant excess above the Standard Model expectations is observed. Limits are set on the stau mass in a simplified models where two tau sleptons are pair produced and decay to a tau lepton and the lightest neutralino, assuming either only left-handed stau production, see Figure 8, or assuming degenerate left- and right-handed stau production, see Figure 9.

³ ABBIENDI 04 search for $\tilde{\tau}\tilde{\tau}$ production in acoplanar di-tau final states in the 183–208 GeV data. See Fig. 15 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$ and for the limit at $\tan\beta = 35$. Under the assumption of 100% branching ratio for $\tilde{\tau}_R \rightarrow \tau \tilde{\chi}_1^0$, the limit improves to 89.8 GeV for $\Delta m > 8 \text{ GeV}$. See Fig. 12 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$ at several values of the branching ratio and for their dependence on θ_τ . This limit supersedes ABBIENDI 00c.

⁴ ACHARD 04 search for $\tilde{\tau}\tilde{\tau}$ production in acoplanar di-tau final states in the 192–209 GeV data. Limits on $m_{\tilde{\tau}_R}$ are derived from a scan over the MSSM parameter space with universal GUT scale gaugino and scalar masses $m_{1/2}$ and m_0 , $1 \leq \tan\beta \leq 60$ and $-2 \leq \mu \leq 2 \text{ TeV}$. See Fig. 4 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$.

⁵ ABDALLAH 03M looked for acoplanar $\tilde{\tau}\tilde{\tau}$ final states at $\sqrt{s} = 130\text{--}208 \text{ GeV}$. A dedicated search was made for low mass $\tilde{\tau}\tilde{\tau}$ decoupling from the Z^0 . The limit assumes $B(\tilde{\tau} \rightarrow \tau \tilde{\chi}_1^0) = 100\%$. See Fig. 20 for limits on the $(m_{\tilde{\tau}}, m_{\tilde{\chi}_1^0})$ plane and as function of the $\tilde{\chi}_1^0$ mass and of the branching ratio. The limit in the low-mass region improves to 29.6 and 31.1 GeV for $\tilde{\tau}_R$ and $\tilde{\tau}_L$, respectively, at $\Delta m > m_{\tilde{\tau}}$. The limit in the high-mass region improves to 84.7 GeV for $\tilde{\tau}_R$ and $\Delta m > 15 \text{ GeV}$. These limits include and update the results of ABREU 01.

⁶ HEISTER 02E looked for acoplanar ditau + \cancel{E}_T final states from e^+e^- interactions between 183 and 209 GeV. The mass limit assumes $B(\tilde{\tau} \rightarrow \tau \tilde{\chi}_1^0) = 1$. See their Fig. 4 for the dependence of the limit on Δm . These limits include and update the results of BARATE 01.

⁷ AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass up to 500 GeV for massless $\tilde{\chi}_1^0$ assuming degeneracy of $\tilde{e}, \tilde{\mu}$, and $\tilde{\tau}$ and exploiting the 2ℓ signature, see their Figure 8(b).

⁸ KHACHATRYAN 17L searched in about 19 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two τ (at least one decaying hadronically) and \cancel{E}_T . Results were interpreted to set constraints on the cross section for production of $\tilde{\tau}_L$ pairs for $m_{\tilde{\chi}_1^0} = 1 \text{ GeV}$. No mass constraints are set, see their Fig. 7.

⁹ AAD 16AA summarized and extended ATLAS searches for electroweak supersymmetry in final states containing several charged leptons, \cancel{E}_T , with or without hadronic jets, in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The paper reports 95% C.L. exclusion limits on the cross-section for production of $\tilde{\tau}_R$ and $\tilde{\tau}_L$ pairs for various $m_{\tilde{\chi}_1^0}$, using the 2 hadronic $\tau + \cancel{E}_T$ analysis. The $m_{\tilde{\tau}_R/L} = 109 \text{ GeV}$ is excluded for $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$, with the constraints being stronger for $\tilde{\tau}_R$. See their Fig. 12.

¹⁰ AAD 12AF searched in 2 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two tau leptons, jets and large \cancel{E}_T in a GMSB framework. No significant excess above the expected background was found and an upper limit on the visible cross section for new phenomena is set. A 95% C.L. lower limit of 32 TeV on the mGMSB breaking scale Λ is set for $M_{mess} = 250 \text{ TeV}, N_S = 3, \mu > 0$ and $C_{grav} = 1$, independent of $\tan\beta$.

¹¹ AAD 12AG searched in 2.05 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with at least one hadronically decaying tau lepton, jets, and large \cancel{E}_T in a GMSB framework.

No significant excess above the expected background was found and an upper limit on the visible cross section for new phenomena is set. A 95% C.L. lower limit of 30 TeV on the mGMSB breaking scale Λ is set for $M_{mess} = 250 \text{ TeV}, N_S = 3, \mu > 0$ and $C_{grav} = 1$, independent of $\tan\beta$. For large values of $\tan\beta$, the limit on Λ increases to 43 TeV.

¹² AAD 12CM searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with at least one tau lepton, zero or one additional light lepton (e/μ) jets, and large \cancel{E}_T in a GMSB framework. No significant excess above the expected background was found and an upper limit on the visible cross section for new phenomena is set. A 95% C.L. lower limit of 54 TeV on the mGMSB breaking scale Λ is set for $M_{mess} = 250 \text{ TeV}, N_S = 3, \mu > 0$ and $C_{grav} = 1$, for $\tan\beta > 20$. Here the $\tilde{\tau}_1$ is the NLSP.

¹³ ABBIENDI 06B use 600 pb^{-1} of data from $\sqrt{s} = 189\text{--}209 \text{ GeV}$. They look for events from pair-produced staus in a GMSB scenario with $\tilde{\tau}$ NLSP including prompt $\tilde{\tau}$ decays to ditau + \cancel{E} final states, large impact parameters, kinked tracks and heavy stable charged particles. Limits on the cross-section are computed as a function of $m(\tilde{\tau})$ and the lifetime, see their Fig. 7. The limit is compared to the $\sigma \cdot BR^2$ from a scan over the GMSB parameter space.

¹⁴ ABDALLAH 04H use data from LEP 1 and $\sqrt{s} = 192\text{--}208 \text{ GeV}$. They re-use results or re-analyze the data from ABDALLAH 03M to put limits on the parameter space of anomaly-mediated supersymmetry breaking (AMSB), which is scanned in the region $1 < m_{3/2} < 50 \text{ TeV}, 0 < m_0 < 1000 \text{ GeV}, 1.5 < \tan\beta < 35$, both signs of μ . The constraints are obtained from the searches for mass degenerate chargino and neutralino, for SM-like and invisible Higgs, for leptonically decaying charginos and from the limit on non-SM Z width of 3.2 MeV. The limit is for $m_t = 174.3 \text{ GeV}$ (see Table 2 for other m_t values). The limit improves to 75 GeV for $\mu < 0$.

R-parity violating $\tilde{\tau}$ (Stau) mass limit

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

¹ AAD 21Y searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on Tchi1n2-GGM, and RPV models similar to Tchi1n2L, Tglu1A (with $q = u, d, s, c, b$, with equal branching fractions), and $\tilde{\ell}_L/\tilde{\nu} \rightarrow \ell/\nu \tilde{\chi}_1^0$ (mass-degenerate $\tilde{\ell}_L$ and $\tilde{\nu}$ of all 3 generations), all with $\tilde{\chi}_1^0 \rightarrow \ell^\pm e^\mp \nu$ via λ_{12k} or λ_{i33} (where $i, k \in 1, 2$), see their Figure 11.

² AABOUD 18Z searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via λ_{12k} or λ_{i33} to charged leptons, see their Figures 7, 8.

³ ABDALLAH 04M use data from $\sqrt{s} = 192\text{--}208 \text{ GeV}$ to derive limits on sparticle masses under the assumption of RPV with $LL\tilde{E}$ couplings. The results are valid for $\mu = -200 \text{ GeV}, \tan\beta = 1.5, \Delta m > 5 \text{ GeV}$ and assuming a BR of 1 for the given decay. The limit quoted is for indirect decays using the neutralino constraint of 39.5 GeV, also derived in ABDALLAH 04M. For indirect decays via $LL\tilde{E}$ the limit decreases to 86 GeV if the constraint from the neutralino is not used. Supersedes the result of ABREU 00u.

⁴ ABBIENDI 04F use data from $\sqrt{s} = 189\text{--}209 \text{ GeV}$. They derive limits on sparticle masses under the assumption of RPV with $LL\tilde{E}$ or $LQ\tilde{D}$ couplings. The results are valid for $\tan\beta = 1.5, \mu = -200 \text{ GeV}$, with, in addition, $\Delta m > 5 \text{ GeV}$ for indirect decays via $LQ\tilde{D}$. The limit quoted applies to direct decays with $LL\tilde{E}$ couplings and improves to 75 GeV for $LQ\tilde{D}$ couplings. The limit on the $\tilde{\tau}_R$ mass for indirect decays is 92 GeV for $LL\tilde{E}$ couplings at $m_{\tilde{\chi}_1^0} = 10 \text{ GeV}$ and no exclusion is obtained for $LQ\tilde{D}$ couplings. Supersedes the results of ABBIENDI 00.

Long-lived $\tilde{\ell}$ (Slepton) mass limit

Limits on scalar leptons which leave detector before decaying. Limits from Z decays are independent of lepton flavor. Limits from continuum e^+e^- annihilation are also independent of flavor for smuons and staus. Selection limits from e^+e^- collisions in the continuum depend on MSSM parameters because of the additional neutralino exchange contribution.

1 AAD 21AL searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for pair production of long-lived sleptons in events with highly displaced leptons. No significant excess above the Standard Model predictions is observed. Limits are set on $m_{\tilde{e}}, m_{\tilde{\mu}}, m_{\tilde{\tau}}$ as a function of the slepton lifetime, assuming the $\tilde{\ell} \rightarrow \ell \tilde{G}$ decay and mass-degenerate $\tilde{\ell}_L$ and $\tilde{\ell}_R$. See Figures 2.

2 AABOUD 19AT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for metastable and stable R -hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Results are interpreted in terms of exclusion limits on long-lived stau in the context of GMSB models. Lower limits on the mass for direct production of staus are set at 430 GeV, see their Fig. 10 (left).

3 KHACHATRYAN 16BW searched in 2.5 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with heavy stable charged particles, identified by their anomalously high energy deposits in the silicon tracker and/or long time-of-flight measurements by the muon system. No evidence for an excess over the expected background is observed. Limits are derived for pair production of tau sleptons as a function of mass, depending on their direct or inclusive production in a minimal GMSB scenario along the Snowmass Points and Slopes (SPS) line 7, see Fig. 4 and Table 7.

4 AAD 15AE searched in 19.1 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for heavy long-lived charged particles, measured through their specific ionization energy loss in the ATLAS pixel detector or their time-of-flight in the ALTA5 muon system. In the absence of an excess of events above the expected backgrounds, limits are set on stable $\tilde{\tau}$ sleptons in various scenarios, see Figs. 5–7.

5 AAIJ 15BD searched in 3.0 fb^{-1} of pp collisions at $\sqrt{s} = 7$ and 8 TeV for evidence of Drell-Yan pair production of long-lived $\tilde{\tau}$ particles. No evidence for such particles is observed and 95% C.L. upper limits on the cross section of $\tilde{\tau}$ pair production are derived, see Fig. 7. In the mGMSB, assuming the SP57 benchmark scenario $\tilde{\tau}$ masses between 124 and 309 GeV are excluded at 95% C.L.

6 ABBIENDI 03L used e^+e^- data at $\sqrt{s} = 130-209$ GeV to select events with two high momentum tracks with anomalous dE/dx . The excluded cross section is compared to the theoretical expectation as a function of the heavy particle mass in their Fig. 3. The limit improves to 98.5 GeV for $\tilde{\mu}_L$ and $\tilde{\tau}_L$. The bounds are valid for colorless spin 0 particles with lifetimes longer than 10^{-6} s. Supersedes the results from ACKERSTAFF 98P.

7 ABREU 00Q searches for the production of pairs of heavy, charged stable particles in e^+e^- annihilation at $\sqrt{s} = 130-189$ GeV. The upper bound improves to 88 GeV for $\tilde{\mu}_L, \tilde{\tau}_L$. These limits include and update the results of ABREU 98P.

8 ACCIARRI 99H searched for production of pairs of back-to-back heavy charged particles at $\sqrt{s} = 130-183$ GeV. The upper bound improves to 82.2 GeV for $\tilde{\mu}_L, \tilde{\tau}_L$.

9 The BARATE 98K mass limit improves to 82 GeV for $\tilde{\mu}_L, \tilde{\tau}_L$. Data collected at $\sqrt{s} = 161-184$ GeV.

10 AAD 13AA searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7$ TeV for events containing long-lived massive particles in a GMSB framework. No significant excess above the expected background was found. A 95% C.L. lower limit of 300 GeV is placed on long-lived $\tilde{\tau}$'s in the GMSB model with $M_{mess} = 250$ TeV, $N_5 = 3, \mu > 0$, for $\tan\beta = 5-20$. The lower limit on the GMSB breaking scale Λ was found to be 99–110 TeV, for $\tan\beta$ values between 5 and 40, see Fig. 4 (top). Also, directly produced long-lived sleptons, or sleptons decaying to long-lived ones, are excluded at 95% C.L. up to a $\tilde{\tau}$ mass of 278 GeV for models with slepton splittings smaller than 50 GeV.

11 ABAZOV 13B looked in 6.3 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV for charged massive long-lived particles in events with muon-like particles that have both speed and ionization energy loss inconsistent with muons produced in beam collisions. In the absence of an excess, limits are set at 95% C.L. on the production cross section of stau leptons in the mass range 100–300 GeV, see their Table 20 and Fig. 23.

12 CHATRCHYAN 13AB looked in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7$ TeV and in 18.8 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for events with heavy stable particles, identified by their anomalous dE/dx in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of $\tilde{\tau}_1$'s. No evidence for an excess over the expected background is observed. Supersedes CHATRCHYAN 12L.

- 13 CHATRCHYAN 13AB limits are derived for pair production of $\tilde{\tau}_1$ as a function of mass in minimal GMSB scenarios along the Snowmass Points and Slopes (SPS) line 7 (see Fig. 8 and Table 7). The limit given here is valid for direct pair $\tilde{\tau}_1$ production.
- 14 CHATRCHYAN 13AB limits are derived for the production of $\tilde{\tau}_1$ as a function of mass in minimal GMSB scenarios along the Snowmass Points and Slopes (SPS) line 7 (see Fig. 8 and Table 7). The limit given here is valid for the production of $\tilde{\tau}_1$ from both direct pair production and from the decay of heavier supersymmetric particles.
- 15 CHATRCHYAN 12L looked in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7$ TeV for events with heavy stable particles, identified by their anomalous dE/dx in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of $\tilde{\tau}_1$'s. No evidence for an excess over the expected background is observed. Limits are derived for the production of $\tilde{\tau}_1$ as a function of mass in minimal GMSB scenarios along the Snowmass Points and Slopes (SPS) line 7 (see Fig. 3). The limit given here is valid for the production of $\tilde{\tau}_1$ in the decay of heavier supersymmetric particles.
- 16 AAD 11P looked in 37 pb^{-1} of pp collisions at $\sqrt{s} = 7$ TeV for events with two heavy stable particles, reconstructed in the Inner tracker and the Muon System and identified by their time of flight in the Muon System. No evidence for an excess over the SM expectation is observed. Limits on the mass are derived, see Fig. 3, for $\tilde{\tau}$ in a GMSB scenario and for sleptons produced by electroweak processes only, in which case the limit degrades to 110 GeV.

\tilde{q} (Squark) mass limit

For $m_{\tilde{q}} > 60-70$ GeV, it is expected that squarks would undergo a cascade decay via a number of neutralinos and/or charginos rather than undergo a direct decay to photinos as assumed by some papers. Limits obtained when direct decay is assumed are usually higher than limits when cascade decays are included.

Limits from e^+e^- collisions depend on the mixing angle of the lightest mass eigenstate $\tilde{q}_1 = \tilde{q}_R \sin\theta_{\tilde{q}} + \tilde{q}_L \cos\theta_{\tilde{q}}$. It is usually assumed that only the sbottom and stop squarks have non-trivial mixing angles (see the stop and sbottom sections). Here, unless otherwise noted, squarks are always taken to be either left/right degenerate, or purely of left or right type. Data from Z decays have set squark mass limits above 40 GeV, in the case of $\tilde{q} \rightarrow q \tilde{\chi}_1^0$ decays if $\Delta m = m_{\tilde{q}} - m_{\tilde{\chi}_1^0} \gtrsim 5$ GeV. For smaller values of Δm , current constraints on the invisible width of the Z ($\Delta\Gamma_{\text{inv}} < 2.0$ MeV, LEP 00) exclude $m_{\tilde{u}_{L,R}} < 44$ GeV, $m_{\tilde{d}_R} < 33$ GeV, $m_{\tilde{d}_L} < 44$ GeV and, assuming all squarks degenerate, $m_{\tilde{q}} < 45$ GeV.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

¹ AAD 21AK searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for pair production of gluinos and squarks in events with a single isolated electron or muon, originating from the decay of a W boson, multiple jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1B simplified model and on the squark mass in the Tsqk3 simplified model, see their Figure 8.

² AAD 21F searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for pair production of squarks in events with a high- p_T jet and \cancel{E}_T . No significant excess above the Standard Model predictions is observed. Limits are set on the \tilde{t} mass in the Tstop3 and Tstop4, on the \tilde{b} mass in the Tstop1, and on the \tilde{q} mass in the Tsqk1 simplified model (four-flavour, two chirality states degeneracy).

- ³ AAD 21L searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for pair production of gluinos or squarks in events with jets, large missing transverse momentum but no electrons or muons. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A and Tglu1B simplified models, on the squark mass in the Tsqk1 and Tsqk3 simplified models and in a simplified model for gluino-squark production, see their Figures 13-17.
- ⁴ SIRUNYAN 21M searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for supersymmetry in events with two opposite-sign same-flavor leptons (electrons, muons) and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ mass in Tch1n2Fa, see their Figure 11, on the $\tilde{\chi}_1^0$ mass in Tn1n1C and Tn1n1B for $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0}$, see their Figure 12. Limits are also set on the light squark mass for the simplified model Tsqk2A, on the sbottom mass in Tsb0t3, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.
- ⁵ SIRUNYAN 19AG searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two photons and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4B simplified model and on the squark mass in the Tsqk4B simplified model, see their Figure 3.
- ⁶ SIRUNYAN 19CH searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing multiple jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A and Tglu3A simplified models, see their Figure 13. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb0t1, Tstop1 simplified models, see their Figure 14.
- ⁷ SIRUNYAN 19K searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with a photon, an electron or muon, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the chargino and neutralino mass in the Tch1n1A simplified model, see their Figure 6. Limits are also set on the gluino mass in the Tglu4A simplified model, and on the squark mass in the Tsqk4A simplified model, see their Figure 7.
- ⁸ AABOUD 18BJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with two opposite-sign charged leptons (electrons and muons), jets and missing transverse momentum, with various requirements to be sensitive to signals with different kinematic endpoint values in the dilepton invariant mass distribution. The data are found to be consistent with the SM expectation. Results are interpreted in the Tsqk2 model in case of $m_{\tilde{\chi}_1^0} = 1 \text{ GeV}$: for any $m_{\tilde{\chi}_2^0}$, squark masses below 1200 GeV are excluded, see their Fig. 14(b).
- ⁹ AABOUD 18BV searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one jet identified as c-jet, large missing transverse energy and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tsqk1 models considering only \tilde{c}_1 . In scenarios with massless neutralinos, scharm masses below 850 GeV are excluded. If the differences of the \tilde{c}_1 and $\tilde{\chi}_1^0$ masses is below 100 GeV , scharm masses below 500 GeV are excluded. See their Fig.6 and Fig.7.
- ¹⁰ AABOUD 18I searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one jet with a transverse momentum above 250 GeV and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tsqk1 models. In the compressed scenario with similar squark and neutralino masses, squark masses below 710 GeV are excluded. See their Fig.10(b).
- ¹¹ AABOUD 18U searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results are interpreted in terms of lower limits on the masses of squark in Tsqk4B models. Masses below 1820 GeV are excluded for any NLSP mass, see their Fig. 9.
- ¹² AABOUD 18V searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tsqk1 model: squark masses below 1550 GeV are excluded for massless LSP, see their Fig. 13(a).
- ¹³ AABOUD 18V searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tsqk3 model. Assuming that $m_{\tilde{\chi}_1^\pm} = 0.5 (m_{\tilde{q}} + m_{\tilde{\chi}_1^0})$, squark masses below 1150 GeV are excluded for massless LSP, see their Fig. 14(a). Exclusions are also shown assuming $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$, see their Fig. 14(b).
- ¹⁴ SIRUNYAN 18AA searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one photon and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in a general gauge-mediated SUSY breaking (GGM) scenario with bino-like $\tilde{\chi}_1^0$ and wino-like $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$, see Figure 7. Limits are also set on the NLSP mass in the Tch1n1A and Tch1ch1A simplified models, see their Figure 8. Finally, limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, see their Figure 9, and on the squark mass in the Tsqk4A and Tsqk4B simplified models, see their Figure 10.
- ¹⁵ SIRUNYAN 18AY searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing one or more jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb0t1, Tstop1 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range $10^{-3} \text{ mm} < c\tau < 10^5 \text{ mm}$, see their Figure 4.
- ¹⁶ AABOUD 17AR searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one isolated lepton, at least two jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.25 TeV are set on the 1st and 2nd generation squark masses in Tsqk3 simplified models, with $x = (m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0}) / (m_{\tilde{q}} - m_{\tilde{\chi}_1^0}) = 1/2$. Similar limits are obtained for variable x and fixed neutralino mass, $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$. See their Figure 13.
- ¹⁷ AABOUD 17N searched in 14.7 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with 2 same-flavour, opposite-sign leptons (electrons or muons), jets and large missing transverse momentum. The results are interpreted as 95% C.L. limits in Tsqk2 models, assuming $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$ and $m_{\tilde{\chi}_2^0} = 600 \text{ GeV}$. See their Fig. 12 for exclusion limits as a function of $m_{\tilde{\chi}_2^0}$.
- ¹⁸ KHACHATRYAN 17P searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figures 7 and 8. Limits are also set on the squark mass in the Tsqk1 simplified model, see their Fig. 7, and on the sbottom mass in the Tsb0t1 simplified model, see Fig. 8. Finally, limits are set on the stop mass in the Tstop1, Tstop3, Tstop4, Tstop6 and Tstop7 simplified models, see Fig. 8.
- ¹⁹ KHACHATRYAN 17V searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two photons and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino and squark mass in the context of general gauge mediation models Tglu4B and Tsqk4, see their Fig. 4.
- ²⁰ SIRUNYAN 17AY searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one photon, jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, and on the squark mass in the Tsqk4A and Tsqk4B simplified models, see their Figure 6.
- ²¹ SIRUNYAN 17AZ searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A simplified models, see their Figures 6. Limits are also set on the squark mass in the Tsqk1 simplified model (for single light squark and for 8 degenerate light squarks), on the sbottom mass in the Tsb0t1 simplified model and on the stop mass in the Tstop1 simplified model, see their Fig. 7. Finally, limits are set on the stop mass in the Tstop2, Tstop4 and Tstop8 simplified models, see Fig. 8.
- ²² SIRUNYAN 17P searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with multiple jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A, Tglu3A and Tglu3D simplified models, see their Fig. 12. Limits are also set on the squark mass in the Tsqk1 simplified model, on the stop mass in the Tstop1 simplified model, and on the sbottom mass in the Tsb0t1 simplified model, see Fig. 13.
- ²³ AABOUD 16D searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with an energetic jet and large missing transverse momentum. The results are interpreted as 95% C.L. limits on masses of first and second generation squarks decaying into a quark and the lightest neutralino in scenarios with $m_{\tilde{q}} - m_{\tilde{\chi}_1^0} < 25 \text{ GeV}$. See their Fig. 6.
- ²⁴ AABOUD 16N searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing hadronic jets, large \cancel{E}_T , and no electrons or muons. No significant excess above the Standard Model expectations is observed. First- and second-generation squark masses below 1030 GeV are excluded at the 95% C.L. decaying to quarks and a massless lightest neutralino. See their Fig. 7a.
- ²⁵ KHACHATRYAN 16BS searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one energetic jet, no isolated leptons, and significant \cancel{E}_T , using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the squark mass in the Tsqk1 simplified model, both in the assumption of a single light squark and of 8 degenerate squarks, see Fig. 11 and Table 3.
- ²⁶ AAD 15BV summarized and extended ATLAS searches for gluinos and first- and second-generation squarks in final states containing jets and missing transverse momentum, with or without leptons or b -jets in the $\sqrt{s} = 8 \text{ TeV}$ data set collected in 2012. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on the squark mass in several R-parity conserving models. See their Figs. 9, 11, 18, 22, 24, 27, 28.
- ²⁷ AAD 15CS searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of pair production of squarks, decaying into a quark and a neutralino, where a photon was radiated either from an initial-state quark, from an intermediate squark, or from a final-state quark. No evidence was found for an excess above the expected level of Standard Model background and a 95% C.L. exclusion limit was set on the squark mass as a function of the squark-neutralino mass difference, see Fig. 19.
- ²⁸ AAD 15K searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing at least two jets, where the two leading jets are each identified as originating from c -quarks, and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the mass of superpartners of charm quarks (\tilde{c}). Assuming that the decay $\tilde{c} \rightarrow c\tilde{\chi}_1^0$ takes place 100% of the time, a scalar charm mass below 490 GeV is excluded for $m_{\tilde{\chi}_1^0} < 200 \text{ GeV}$. For more details, see their Fig. 2.
- ²⁹ KHACHATRYAN 15AF searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the squark mass in simplified models where the decay $\tilde{q} \rightarrow q\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, both for the case of a single light squark or 8 degenerate squarks, see Fig. 12. See also Table 5. Exclusions in the CMSSM, assuming $\tan\beta = 30$, $A_0 = -2 \max(m_0, m_{1/2})$ and $\mu > 0$, are also presented, see Fig. 15.
- ³⁰ AAD 14AE searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for strongly produced supersymmetric particles in events containing jets and large missing transverse momentum, and no electrons or muons. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing squarks that decay via $\tilde{q} \rightarrow q\tilde{\chi}_1^0$, where either a single light state or two degenerate generations of squarks are assumed, see Fig. 10.
- ³¹ CHATRCHYAN 14AH searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the razor variables (M_R and R^2) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on squark masses in simplified models where the decay $\tilde{q} \rightarrow q\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 28. Exclusions in the CMSSM, assuming $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, are also presented, see Fig. 26.
- ³² CHATRCHYAN 14I searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing multijets and large \cancel{E}_T . No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing squarks that decay via $\tilde{q} \rightarrow q\tilde{\chi}_1^0$, where either a single light state or two degenerate generations of squarks are assumed, see Fig. 7a.

Supersymmetric Particle Searches

- 33 AAD 13L searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for the production of squarks and gluinos in events containing jets, missing transverse momentum and no high- p_T electrons or muons. No excess over the expected SM background is observed. In mSUGRA/CMSSM models with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, squarks and gluinos of equal mass are excluded for masses below 1360 GeV at 95% C.L. In a simplified model containing only squarks of the first two generations, a gluino octet and a massless neutralino, squark masses below 1320 GeV are excluded at 95% C.L. for gluino masses below 2 TeV. See Figures 10–15 for more precise bounds.
- 34 AAD 13Q searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing a high- p_T isolated photon, at least one jet identified as originating from a bottom quark, and high missing transverse momentum. Such signatures may originate from supersymmetric models with gauge-mediated supersymmetry breaking in events in which one of a pair of higgsino-like neutralinos decays into a photon and a gravitino while the other decays into a Higgs boson and a gravitino. No significant excess above the expected background was found and limits were set on the squark mass as a function of the neutralino mass in a generalized GMSB model (GGM) with a higgsino-like neutralino NLSP, see their Fig. 4. For neutralino masses greater than 220 GeV, squark masses below 1020 GeV are excluded at 95% C.L.
- 35 CHATRCHYAN 13 looked in 4.98 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two opposite-sign leptons (e, μ, τ), jets and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the mSUGRA/CMSSM model with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, see Fig. 6.
- 36 CHATRCHYAN 13G searched in 4.98 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for the production of squarks and gluinos in events containing 0,1,2, ≥ 3 b -jets, missing transverse momentum and no electrons or muons. No excess over the expected SM background is observed. In mSUGRA/CMSSM models with $\tan\beta = 10$, $A_0 = 0$, and $\mu > 0$, squarks and gluinos of equal mass are excluded for masses below 1250 GeV at 95% C.L. Exclusions are also derived in various simplified models, see Fig. 7.
- 37 CHATRCHYAN 13H searched in 4.96 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two photons, ≥ 4 jets and low $E_{\cancel{T}}$ due to $\tilde{q} \rightarrow \gamma \tilde{\chi}_1^0$ decays in a stealth SUSY framework, where the $\tilde{\chi}_1^0$ decays through a singlino (\tilde{S}) intermediate state to $\gamma S \tilde{G}$, with the singlet state S decaying to two jets. No significant excess above the expected background was found and limits were set in a particular R-parity conserving stealth SUSY model. The model assumes $m_{\tilde{\chi}_1^0} = 0.5 m_{\tilde{q}}$, $m_S = 100 \text{ GeV}$ and $m_{\tilde{S}} = 90 \text{ GeV}$. Under these assumptions, squark masses less than 1430 GeV were excluded at the 95% C.L.
- 38 CHATRCHYAN 13T searched in 11.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets and significant $E_{\cancel{T}}$, using the α_T variable to discriminate between processes with genuine and misreconstructed $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on squark masses in simplified models where the decay $\tilde{q} \rightarrow q \tilde{\chi}_1^0$ takes place with a branching ratio of 100%, assuming an eightfold degeneracy of the masses of the first two generation squarks, see Fig. 8 and Table 9. Also limits in the case of a single light squark are given.
- 39 AAD 12AX searched in 1.04 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for supersymmetry in events containing jets, missing transverse momentum and one isolated electron or muon. No excess over the expected SM background is observed and model-independent limits are set on the cross section of new physics contributions to the signal regions. In mSUGRA/CMSSM models with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, squarks and gluinos of equal mass are excluded for masses below 820 GeV at 95% C.L. Limits are also set on simplified models for squark production and decay via an intermediate chargino and on supersymmetric models with bilinear R-parity violation. Supersedes AAD 11G.
- 40 AAD 12CJ searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing one or more isolated leptons (electrons or muons), jets and $E_{\cancel{T}}$. The observations are in good agreement with the SM expectations and exclusion limits have been set in number of SUSY models. In the mSUGRA/CMSSM model with $\tan\beta = 10$, $A_0 = 0$, and $\mu > 0$, 95% C.L. exclusion limits have been derived for $m_{\tilde{q}} < 1200 \text{ GeV}$, assuming equal squark and gluino masses. In minimal GMSB, values of the effective SUSY breaking scale $\Lambda < 50 \text{ TeV}$ are excluded at 95% C.L. for $\tan\beta < 45$. Also exclusion limits in a number of simplified models have been presented, see Figs. 10 and 12.
- 41 AAD 12CP searched in 4.8 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two photons and large $E_{\cancel{T}}$ due to $\tilde{\chi}_1^0 \rightarrow \gamma \tilde{G}$ decays in a GMSB framework. No significant excess above the expected background was found and limits were set on the squark mass as a function of the neutralino mass in a generalized GMSB model (GGM) with a bino-like neutralino NLSP. The other sparticle masses were decoupled, $\tan\beta = 2$ and $c\tau_{NLSP} < 0.1 \text{ mm}$. Also, in the framework of the SP58 model, a 95% C.L. lower limit was set on the breaking scale Λ of 196 TeV.
- 42 AAD 12W searched in 1.04 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for the production of squarks and gluinos in events containing jets, missing transverse momentum and no electrons or muons. No excess over the expected SM background is observed. In mSUGRA/CMSSM models with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, squarks and gluinos of equal mass are excluded for masses below 950 GeV at 95% C.L. In a simplified model containing only squarks of the first two generations, a gluino octet and a massless neutralino, squark masses below 875 GeV are excluded at 95% C.L.
- 43 CHATRCHYAN 12 looked in 35 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with e and/or μ and/or jets, a large total transverse energy, and $E_{\cancel{T}}$. The event selection is based on the dimensionless razor variable R , related to the $E_{\cancel{T}}$ and M_{R2} , an indicator of the heavy particle mass scale. No evidence for an excess over the expected background is observed. Limits are derived in the CMSSM ($m_0, m_{1/2}$) plane for $\tan\beta = 3, 10$ and 50 (see Fig. 7 and 8). Limits are also obtained for Simplified Model Spectra.
- 44 CHATRCHYAN 12AE searched in 4.98 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with at least three jets and large missing transverse momentum. No significant excesses over the expected SM backgrounds are observed and 95% C.L. limits on the production cross section of squarks in a scenario where $\tilde{q} \rightarrow q \tilde{\chi}_1^0$ with a 100% branching ratio, see Fig. 3. For $m_{\tilde{\chi}_1^0} < 200 \text{ GeV}$, values of $m_{\tilde{q}}$ below 760 GeV are excluded at 95% C.L. Also limits in the CMSSM are presented, see Fig. 2.
- 45 CHATRCHYAN 12AT searched in 4.73 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for the production of squarks and gluinos in events containing jets, missing transverse momentum and no electrons or muons. No excess over the expected SM background is observed. In mSUGRA/CMSSM models with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, squarks with masses below 1110 GeV are excluded at 95% C.L. Squarks and gluinos of equal mass are excluded for masses below 1180 GeV at 95% C.L. Exclusions are also derived in various simplified models, see Fig. 6.
- 46 AABOUD 18v searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tsqk5 model. Squark masses below 1100 GeV are excluded if $(m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0})/(m_{\tilde{q}} - m_{\tilde{\chi}_1^0}) < 0.95$ and $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$, see their Fig. 16(a).
- 47 KHACHATRYAN 16BT performed a global Bayesian analysis of a wide range of CMS results obtained with data samples corresponding to 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The set of searches considered, both individually and in combination, includes those with all-hadronic final states, same-sign and opposite-sign dileptons, and multi-lepton final states. An interpretation was given in a scan of the 19-parameter pMSSM. No scan points with a gluino mass less than 500 GeV survived and 98% of models with a squark mass less than 300 GeV were excluded.
- 48 AAD 15AI searched in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing at least one isolated lepton (electron or muon), jets, and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the squark masses in the CMSSM/mSUGRA, see Fig. 15, in the NUHMG, see Fig. 16, and in various simplified models, see Figs. 19–21.
- 49 KHACHATRYAN 15AR searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing jets, either a charged lepton or a photon, and low missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the squark mass in a stealth SUSY model where the decays $\tilde{q} \rightarrow q \tilde{\chi}_1^{\pm}$, $\tilde{\chi}_1^{\pm} \rightarrow \tilde{S} W^{\pm}$, $\tilde{S} \rightarrow S \tilde{G}$ and $S \rightarrow g g$, with $m_{\tilde{S}} = 100 \text{ GeV}$ and $m_S = 90 \text{ GeV}$, take place with a branching ratio of 100%. See Fig. 6 for γ or Fig. 7 for e^{\pm} analyses.
- 50 KHACHATRYAN 15AZ searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with either at least one photon, hadronic jets and $E_{\cancel{T}}$ (single photon channel) or with at least two photons and at least one jet and using the razor variables. No significant excess above the Standard Model expectations is observed. Limits are set on gluino masses in the general gauge-mediated SUSY breaking model (GGM), for both a bino-like and wino-like neutralino NLSP scenario, see Fig. 8 and 9.
- 51 AAD 14E searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilises jets originating from b -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos and squarks, see Figures 5 and 6. In the $\tilde{q} \rightarrow q' \tilde{\chi}_1^{\pm}$, $\tilde{\chi}_1^{\pm} \rightarrow W^{(*)\pm} \tilde{\chi}_2^0, \tilde{\chi}_2^0 \rightarrow Z^{(*)} \tilde{\chi}_1^0$ simplified model, the following assumptions have been made: $m_{\tilde{\chi}_1^{\pm}} = 0.5 m_{\tilde{\chi}_1^0} + m_{\tilde{g}}$, $m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{q}})$. In the $\tilde{q} \rightarrow q' \tilde{\chi}_1^{\pm}$ or $\tilde{q} \rightarrow q' \tilde{\chi}_2^0, \tilde{\chi}_1^{\pm} \rightarrow e^{\pm} \nu \tilde{\chi}_1^0$ or $\tilde{\chi}_2^0 \rightarrow e^{\pm} \ell^{\mp} (\nu \nu) \tilde{\chi}_1^0$ simplified model, the following assumptions have been made: $m_{\tilde{\chi}_1^{\pm}} = m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{q}})$, $m_{\tilde{\chi}_1^0} < 460 \text{ GeV}$. Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.
- 52 CHATRCHYAN 13AO searched in 4.98 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two opposite-sign isolated leptons accompanied by hadronic jets and $E_{\cancel{T}}$. No significant excesses over the expected SM backgrounds are observed and 95% C.L. exclusion limits are derived in the mSUGRA/CMSSM model with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, see Fig. 8.
- 53 CHATRCHYAN 13AV searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for new heavy particle pairs decaying into jets (possibly b -tagged), leptons and $E_{\cancel{T}}$ using the Razor variables. No significant excesses over the expected SM backgrounds are observed and 95% C.L. exclusion limits are derived in the mSUGRA/CMSSM model with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, see Fig. 3. The results are also interpreted in various simplified models, see Fig. 4.
- 54 CHATRCHYAN 13W searched in 4.93 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with one or more photons, hadronic jets and $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on squark masses in the general gauge-mediated SUSY breaking model (GGM), for both a wino-like and bino-like neutralino NLSP scenario, see Fig. 5.
- 55 DREINER 12A reassesses constraints from CMS (at 7 TeV, $\sim 4.4 \text{ fb}^{-1}$) under the assumption that the first and second generation squarks and the lightest SUSY particle are quasi-degenerate in mass (compressed spectrum).
- 56 DREINER 12A reassesses constraints from CMS (at 7 TeV, $\sim 4.4 \text{ fb}^{-1}$) under the assumption that the first and second generation squarks, the gluino, and the lightest SUSY particle are quasi-degenerate in mass (compressed spectrum).

R-parity violating \tilde{q} (Squark) mass limit

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
none 100–720	95	1 SIRUNYAN	18EA CMS	2 large jets with four-parton substructure, $\tilde{q} \rightarrow 4q$
>1600	95	2 KHACHATRYAN..16BX	CMS	$\tilde{q} \rightarrow q \tilde{\chi}_1^0, \tilde{\chi}_1^0 \rightarrow \ell \ell \nu, \lambda_{121} \neq 0$ or $\lambda_{122} \neq 0, m_{\tilde{g}} = 2400 \text{ GeV}$
>1000	95	3 AAD	15CB ATLS	jets, $\tilde{q} \rightarrow q \tilde{\chi}_1^0, \tilde{\chi}_1^0 \rightarrow \ell q q, m_{\tilde{\chi}_1^0} = 108 \text{ GeV}$ and $2.5 < c\tau_{\tilde{\chi}_1^0} < 200 \text{ nm}$
		4 AAD	12AX ATLS	ℓ +jets + $E_{\cancel{T}}$, CMSSM, $m_{\tilde{q}} = m_{\tilde{g}}$
		5 CHATRCHYAN12AL	CMS	$\geq 3\ell^{\pm}$

- 1 SIRUNYAN 18EA searched in 38.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for the pair production of resonances, each decaying to at least four quarks. Reconstructed particles are clustered into two large jets of similar mass, each consistent with four-parton substructure. No statistically significant excess over the Standard Model expectation is observed. Limits are set on the squark and gluino mass in RPV supersymmetry models where squarks (gluinos) decay, through intermediate higgsinos, to four (five) quarks, see their Figure 4.
- 2 KHACHATRYAN 16BX searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing 4 leptons coming from R-parity-violating decays of $\tilde{\chi}_1^0 \rightarrow \ell \ell \nu$ with $\lambda_{121} \neq 0$ or $\lambda_{122} \neq 0$. No excess over the expected background is observed. Limits are derived on the gluino, squark and stop masses, see Fig. 23.
- 3 AAD 15CB searched for events containing at least one long-lived particle that decays at a significant distance from its production point (displaced vertex, DV) into two leptons or into five or more charged particles in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The dilepton signature is characterised by DV formed from at least two leptons candidates.

Four different final states were considered for the multitrack signature, in which the DV must be accompanied by a high-transverse momentum muon or electron candidate that originates from the DV, jets or missing transverse momentum. No events were observed in any of the signal regions. Results were interpreted in SUSY scenarios involving R -parity violation, split supersymmetry, and gauge mediation. See their Fig. 14–20.

⁴ AAD 12Ax searched in 1.04 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for supersymmetry in events containing jets, missing transverse momentum and one isolated electron or muon. No excess over the expected SM background is observed and model-independent limits are set on the cross section of new physics contributions to the signal regions. In mSUGRA/CMSSM models with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, squarks and gluinos of equal mass are excluded for masses below 820 GeV at 95% C.L. Limits are also set on simplified models for squark production and decay via an intermediate chargino and on supersymmetric models with bilinear R -parity violation. Supersedes AAD 11g.

⁵ CHATRCHYAN 12AL looked in 4.98 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for anomalous production of events with three or more isolated leptons. Limits on squark and gluino masses are set in RPV SUSY models with leptonic $LL\bar{E}$ couplings, $\lambda_{123} > 0.05$, and hadronic UDD couplings, $\lambda_{112} > 0.05$, see their Fig. 5. In the UDD case the leptons arise from supersymmetric cascade decays. A very specific supersymmetric spectrum is assumed. All decays are prompt.

Long-lived \tilde{q} (Squark) mass limit

The following are bounds on long-lived scalar squarks, assumed to hadronize into hadrons with lifetime long enough to escape the detector prior to a possible decay. Limits may depend on the mixing angle of mass eigenstates: $\tilde{q}_1 = \tilde{q}_L \cos\theta_q + \tilde{q}_R \sin\theta_q$.

The coupling to the Z^0 boson vanishes for up-type squarks when $\theta_u = 0.98$, and for down type squarks when $\theta_d = 1.17$.

¹ AABOUD 19AT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for metastable and stable R -hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Sbottom R -hadrons are excluded at 95% C.L. for masses below 1250 GeV. Less stringent constraints are achieved with the muon-spectrometer agnostic analysis. See their Figure 9 (bottom-left).

² AABOUD 19AT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for metastable and stable R -hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Stop R -hadrons are excluded at 95% C.L. for masses below 1340 GeV. Similar constraints are achieved with the muon-spectrometer agnostic analysis. See their Figure 9 (bottom-right).

³ SIRUNYAN 19BH searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived particles decaying into jets, with each long-lived particle having a decay vertex well displaced from the production vertex. The selected events are found to be consistent with standard model predictions. Limits are set on the gluino mass in a GMSB model where the gluino is decaying via $\tilde{g} \rightarrow \tilde{g}G$, see their Figure 4 and in an RPV model of supersymmetry where the gluino is decaying via $\tilde{g} \rightarrow T\tilde{D}\tilde{S}$, see their Figures 5. Limits are also set on the stop mass in two RPV models, see their Figure 6 (for $\tilde{t} \rightarrow b\ell$ decays) and Figure 7 (for $\tilde{t} \rightarrow \tilde{d}\tilde{d}$ decays).

⁴ AABOUD 16B searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived R -hadrons using observables related to large ionization losses and slow propagation velocities, which are signatures of heavy charged particles traveling significantly slower than the speed of light. Exclusion limits at 95% C.L. are set on the long-lived sbottom masses exceeding 805 GeV. See their Fig. 5.

⁵ AABOUD 16B searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived R -hadrons using observables related to large ionization losses and slow propagation velocities, which are signatures of heavy charged particles traveling significantly slower than the speed of light. Exclusion limits at 95% C.L. are set on the long-lived stop masses exceeding 890 GeV. See their Fig. 5.

⁶ KHACHATRYAN 16BW searched in 2.5 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with heavy stable charged particles, identified by their anomalously high energy deposits

in the silicon tracker and/or long time-of-flight measurements by the muon system. No evidence for an excess over the expected background is observed. Limits are derived for pair production of top squarks as a function of mass, depending on the interaction model, see Fig. 4 and Table 7.

⁷ AAD 15AE searched in 19.1 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for heavy long-lived charged particles, measured through their specific ionization energy loss in the ATLAS pixel detector or their time-of-flight in the ATLAS muon system. In the absence of an excess of events above the expected backgrounds, limits are set on R -hadrons in various scenarios, see Fig. 11. Limits are also set in LeptoSUSY models where the gluino decays to stable 300 GeV leptons, see Fig. 9.

⁸ AAD 15BM searched in 18.4 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for stable and metastable non-relativistic charged particles through their anomalous specific ionization energy loss in the ATLAS pixel detector. In absence of an excess of events above the expected backgrounds, limits are set on stable bottom and top squark R -hadrons, see Table 5.

⁹ KHACHATRYAN 15AK looked in a data set corresponding to fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$, and a search interval corresponding to 281 h of trigger lifetime, for long-lived particles that have stopped in the CMS detector. No evidence for an excess over the expected background in a cloud interaction model is observed. Assuming the decay $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ and lifetimes between $1 \mu\text{s}$ and 1000 s , limits are derived on \tilde{t} production as a function of $m_{\tilde{\chi}_1^0}$, see Figs. 4 and 7. The exclusions require that $m_{\tilde{\chi}_1^0}$ is kinematically consistent with the minimum values of the jet energy thresholds used.

¹⁰ AAD 13AA searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing colored long-lived particles that hadronize forming R -hadrons. No significant excess above the expected background was found. Long-lived R -hadrons containing a \tilde{t} are excluded for masses up to 683 GeV at 95% C.L. in a general interaction model. Also, limits independent of the fraction of R -hadrons that arrive charged in the muon system were derived, see Fig. 6.

¹¹ AAD 13AA searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing colored long-lived particles that hadronize forming R -hadrons. No significant excess above the expected background was found. Long-lived R -hadrons containing a \tilde{b} are excluded for masses up to 612 GeV at 95% C.L. in a general interaction model. Also, limits independent of the fraction of R -hadrons that arrive charged in the muon system were derived, see Fig. 6.

¹² AAD 13BC searched in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 22.9 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for bottom squark R -hadrons that have come to rest within the ATLAS calorimeter and decay at some later time to hadronic jets and a neutralino. In absence of an excess of events above the expected backgrounds, limits are set on sbottom masses for the decay $\tilde{b} \rightarrow b\tilde{\chi}_1^0$ for different lifetimes, and for a neutralino mass of 100 GeV, see their Table 6 and Fig. 10.

¹³ AAD 13BC searched in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 22.9 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for bottom squark R -hadrons that have come to rest within the ATLAS calorimeter and decay at some later time to hadronic jets and a neutralino. In absence of an excess of events above the expected backgrounds, limits are set on stop masses for the decay $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ for different lifetimes, and for a neutralino mass of 100 GeV, see their Table 6 and Fig. 10.

¹⁴ CHATRCHYAN 13AB looked in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 18.8 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with heavy stable particles, identified by their anomalous dE/dx in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of \tilde{t}_1 's. No evidence for an excess over the expected background is observed. Limits are derived for pair production of stops as a function of mass in the cloud interaction model (see Fig. 8 and Table 6). In the charge-suppressed model, the limit decreases to 818 GeV.

\tilde{b} (Sbottom) mass limit

Limits in e^+e^- depend on the mixing angle of the mass eigenstate $\tilde{b}_1 = \tilde{b}_L \cos\theta_b + \tilde{b}_R \sin\theta_b$. Coupling to the Z vanishes for $\theta_b \sim 1.17$. As a consequence, no absolute constraint in the mass region $\lesssim 40 \text{ GeV}$ is available in the literature at this time from e^+e^- collisions. In the Listings below, we use $\Delta m = m_{\tilde{b}_1} - m_{\tilde{\chi}_1^0}$.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

• • • We do not use the following data for averages, fits, limits, etc. • • •

- sbottom and stop masses in the Tsqk1, Tsb0t1, Tstop1 simplified models, see their Figure 14.
- ⁹ SIRUNYAN 19cl searched in 77.5 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t4 simplified model, see Figure 3, and on the wino mass in the Tch1n2E simplified model, see their Figure 4. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 5.
- ¹⁰ AABOUD 18j searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one jet with a transverse momentum above 250 GeV and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tsb0t1 models. In the compressed scenario with sbottom and neutralino masses differing by m_b , sbottom masses below 430 GeV are excluded. For $m_{\tilde{\chi}_1^0} = 0$ they exclude sbottom masses up to 610 GeV. See their Fig.10(a).
- ¹¹ SIRUNYAN 18Al searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least three charged leptons, in any combination of electrons and muons, jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, see their Figure 5. Limits are also set on the sbottom mass in the Tsb0t2 simplified model, see their Figure 6, and on the stop mass in the Tstop7 simplified model, see their Figure 7.
- ¹² SIRUNYAN 18AR searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two opposite-charge, same-flavour leptons (electrons or muons), jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see their Figure 7. Limits are also set on the chargino/neutralino mass in the Tch1n2F simplified model, see their Figure 8, and on the neutralino mass in the Tn1n1B and Tn1n1C simplified models, see their Figure 9. Finally, limits are set on the sbottom mass in the Tsb0t3 simplified model, see their Figure 10.
- ¹³ SIRUNYAN 18AY searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing one or more jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb0t1, Tstop1 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range $10^{-3} \text{ mm} < c\tau < 10^5 \text{ mm}$, see their Figure 4.
- ¹⁴ SIRUNYAN 18B searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for the pair production of third-generation squarks in events with jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t1 simplified model, see their Figure 5, and on the stop mass in the Tstop4 simplified model, see their Figure 6.
- ¹⁵ SIRUNYAN 18x searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and \cancel{E}_T . The razor variables (M_R and R^2) are used to categorise the events. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t4 simplified model and on the wino mass in the Tch1n2E simplified model, see their Figure 5. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 6.
- ¹⁶ AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 700 GeV are set on the bottom squark mass in Tsb0t2 simplified models assuming $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$. See their Figure 4(d).
- ¹⁷ AABOUD 17AX searched in 36 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two jets identified as originating from b -quarks and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of bottom squarks. In the Tsb0t1 simplified model, a b_1 mass below 950 GeV is excluded for $m_{\tilde{\chi}_1^0} = 0$ (<420) GeV. See their Fig. 7(a).
- ¹⁸ AABOUD 17AX searched in 36 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two jets identified as originating from b -quarks and large missing transverse momentum, with or without leptons. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of bottom squarks. Assuming 50% BR for Tsb0t1 and Tsb0t2 simplified models, a b_1 mass below 880 (860) GeV is excluded for $m_{\tilde{\chi}_1^0} = 0$ (<250) GeV. See their Fig. 7(b).
- ¹⁹ KHACHATRYAN 17A searched in 18.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two forward jets, produced through vector boson fusion, and missing transverse momentum. No significant excess above the Standard Model expectations is observed. A limit is set on sbottom masses in the Tsb0t1 simplified model, see Fig. 3.
- ²⁰ KHACHATRYAN 17AW searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least three charged leptons, in any combination of electrons and muons, and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, and on the sbottom mass in the Tsb0t2 simplified model, see their Figure 4.
- ²¹ KHACHATRYAN 17P searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figures 7 and 8. Limits are also set on the squark mass in the Tsqk1 simplified model, see their Fig. 7, and on the sbottom mass in the Tsb0t1 simplified model, see Fig. 8. Finally, limits are set on the stop mass in the Tstop1, Tstop3, Tstop4, Tstop6 and Tstop7 simplified models, see Fig. 8.
- ²² SIRUNYAN 17AZ searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A simplified models, see their Figures 6. Limits are also set on the squark mass in the Tsqk1 simplified model (for single light squark and for 8 degenerate light squarks), on the sbottom mass in the Tsb0t1 simplified model and on the stop mass in the Tstop1 simplified model, see their Fig. 7. Finally, limits are set on the stop mass in the Tstop2, Tstop4 and Tstop8 simplified models, see Fig. 8.
- ²³ SIRUNYAN 17k searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct production of stop or sbottom pairs in events with multiple jets and significant \cancel{E}_T . A second search also requires an isolated lepton and is combined with the all-hadronic search. No significant excess above the Standard Model expectations is observed. Limits are set on
- the stop mass in the Tstop1, Tstop8 and Tstop4 simplified models, see their Figures 7, 8 and 9 (for the Tstop4 limits, only the results of the all-hadronic search are used). Limits are also set on the sbottom mass in the Tsb0t1 simplified model, see Fig. 10 (also here, only the results of the all-hadronic search are used).
- ²⁴ SIRUNYAN 17s searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two isolated same-sign leptons, jets, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the gluino mass in the Tglu3A, Tglu3B, Tglu3C, Tglu3D and Tglu1B simplified models, see their Figures 5 and 6, and on the sbottom mass in the Tsb0t2 simplified model, see their Figure 6.
- ²⁵ AABOUD 16D searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with an energetic jet and large missing transverse momentum. The results are interpreted as 95% C.L. limits on mass of sbottom decaying into a b -quark and the lightest neutralino in scenarios with $m_{\tilde{b}_1} - m_{\tilde{\chi}_1^0}$ between 5 and 20 GeV. See their Fig. 6.
- ²⁶ AABOUD 16Q searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two jets identified as originating from b -quarks and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks. Assuming that the decay $\tilde{b}_1 \rightarrow b\tilde{\chi}_1^0$ (Tsb0t1) takes place 100% of the time, a b_1 mass below 840 (800) GeV is excluded for $m_{\tilde{\chi}_1^0} < 100$ (360) GeV. Differences in mass above 100 GeV between the \tilde{b}_1 and the $\tilde{\chi}_1^0$ are excluded up to a \tilde{b}_1 mass of 500 GeV. For more details, see their Fig. 4.
- ²⁷ AAD 16BB searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with exactly two same-sign leptons or at least three leptons, multiple hadronic jets, b -jets, and \cancel{E}_T . No significant excess over the Standard Model expectation is found. Exclusion limits at 95% C.L. are set on the sbottom mass for the Tsb0t2 model, assuming $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0} + 100 \text{ GeV}$. See their Fig. 4c.
- ²⁸ KHACHATRYAN 16BJ searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t2 simplified model, see Fig. 6.
- ²⁹ KHACHATRYAN 16BS searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one energetic jet, no isolated leptons, and significant \cancel{E}_T , using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t1 simplified model, see Fig. 11 and Table 3.
- ³⁰ KHACHATRYAN 16BY searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two opposite-sign, same-flavour leptons, jets, and missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see Fig. 4, and on sbottom masses in the Tsb0t3 simplified model, see Fig. 5.
- ³¹ AAD 15CJ searched in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of third generation squarks by combining a large number of searches covering various final states. Limits on the sbottom mass are shown, either assuming the $\tilde{b} \rightarrow b\tilde{\chi}_1^0$ decay, see Fig. 11, or assuming the $\tilde{b} \rightarrow t\tilde{\chi}_1^\pm$ decay, with $\tilde{\chi}_1^\pm \rightarrow W^{(*)}\tilde{\chi}_1^0$, see Fig. 12a, or assuming the $\tilde{b} \rightarrow b\tilde{\chi}_2^0$ decay, with $\tilde{\chi}_2^0 \rightarrow h\tilde{\chi}_1^0$, see Fig. 12b. Interpretations in the pMSSM are also discussed, see Figures 13–15.
- ³² KHACHATRYAN 15AF searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in simplified models where the decay $\tilde{b} \rightarrow b\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 12. See also Table 5. Exclusions in the CMSSM, assuming $\tan\beta = 30$, $A_0 = -2 \max(m_0, m_{1/2})$ and $\mu > 0$, are also presented, see Fig. 15.
- ³³ KHACHATRYAN 15AH searched in 19.4 or 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing either a fully reconstructed top quark, or events containing dijets requiring one or both jets to originate from b -quarks, or events containing a mono-jet. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in simplified models where the decay $\tilde{b} \rightarrow b\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 12. Limits are also set in a simplified model where the decay $\tilde{b} \rightarrow c\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 12.
- ³⁴ KHACHATRYAN 15I searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events in which b -jets and four W -bosons are produced. Five individual search channels are combined (fully hadronic, single lepton, same-sign dilepton, opposite-sign dilepton, multi-lepton). No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in a simplified model where the decay $\tilde{b} \rightarrow t\tilde{\chi}_1^\pm$, with $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$, takes place with a branching ratio of 100%, see Fig. 7.
- ³⁵ AAD 14T searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for monojet-like events. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which assume that the decay $\tilde{b}_1 \rightarrow b\tilde{\chi}_1^0$ takes place 100% of the time, see Fig. 12.
- ³⁶ CHATRCHYAN 14AH searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the razor variables (M_R and R^2) to discriminate between signal and background processes. A second analysis requires at least one of the jets to be originating from a b -quark. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay $\tilde{b} \rightarrow b\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Figs. 28 and 29. Exclusions in the CMSSM, assuming $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, are also presented, see Fig. 26.
- ³⁷ CHATRCHYAN 14R searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a simplified model where the decay $\tilde{b} \rightarrow t\tilde{\chi}_1^\pm$, with $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$, takes place with a branching ratio of 100%, see Fig. 11.
- ³⁸ KHACHATRYAN 15AD searched in 19.4 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two opposite-sign same flavor isolated leptons featuring either a kinematic edge, or a peak at the Z -boson mass, in the invariant mass spectrum. No evidence for a statistically significant excess over the expected SM backgrounds is observed and 95% C.L. exclusion limits are derived in a simplified model of sbottom pair production where the sbottom decays into a b -quark, two opposite-sign dileptons and a neutralino LSP,

Searches Particle Listings

Supersymmetric Particle Searches

- through an intermediate state containing either an off-shell Z-boson or a slepton, see Fig. 8.
- ³⁹ AAD 14Ax searched in 20.1 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for the strong production of supersymmetric particles in events containing either zero or at last one high p_T lepton, large missing transverse momentum, high jet multiplicity and at least three jets identified as originating from b -quarks. No excess over the expected SM background is observed. Limits are derived in mSUGRA/CMSSM models with $\tan\beta = 30$, $A_0 = -2 m_0$ and $\mu > 0$, see their Fig. 14. Also, exclusion limits are set in simplified models containing scalar bottom quarks, where the decay $\bar{b} \rightarrow b\bar{\chi}_2^0$ and $\bar{\chi}_2^0 \rightarrow h\bar{\chi}_1^0$ takes place with a branching ratio of 100%, see their Figures 11.
- ⁴⁰ AAD 14E searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilises jets originating from b -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing bottom, see Fig. 7. Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.
- ⁴¹ CHATRCHYAN 14H searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in a simplified models where the decay $\bar{b} \rightarrow t\bar{\chi}_1^\pm, \bar{\chi}_1^\pm \rightarrow W^\pm\bar{\chi}_1^0$ takes place with a branching ratio of 100%, with varying mass of the $\bar{\chi}_1^\pm$, for $m_{\bar{\chi}_1^0} = 50 \text{ GeV}$, see Fig. 6.
- ⁴² AAD 13AU searched in 20.1 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing two jets identified as originating from b -quarks and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks. Assuming that the decay $\bar{b}_1 \rightarrow b\bar{\chi}_1^0$ takes place 100% of the time, a b_1 mass below 620 GeV is excluded for $m_{\bar{\chi}_1^0} < 120 \text{ GeV}$. For more details, see their Fig. 5.
- ⁴³ CHATRCHYAN 13AT provides interpretations of various searches for supersymmetry by the CMS experiment based on $4.73\text{--}4.98 \text{ fb}^{-1}$ of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ in the framework of simplified models. Limits are set on the sbottom mass in a simplified models where sbottom quarks are pair-produced and the decay $\bar{b} \rightarrow b\bar{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 4.
- ⁴⁴ CHATRCHYAN 13T searched in 11.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets and significant E_T , using the α_T variable to discriminate between processes with genuine and misreconstructed E_T . No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay $\bar{b} \rightarrow b\bar{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 8 and Table 9.
- ⁴⁵ CHATRCHYAN 13v searched in 10.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two isolated same-sign dileptons and at least two b -jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the bottom mass in a simplified models where the decay $\bar{b} \rightarrow t\bar{\chi}_1^\pm, \bar{\chi}_1^\pm \rightarrow W^\pm\bar{\chi}_1^0$ takes place with a branching ratio of 100%, with varying mass of the $\bar{\chi}_1^\pm$, for $m_{\bar{\chi}_1^0} = 50 \text{ GeV}$, see Fig. 4.
- ⁴⁶ AAD 12AN searched in 2.05 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for scalar bottom quarks in events with large missing transverse momentum and two b -jets in the final state. The data are found to be consistent with the Standard Model expectations. Limits are set in an R-parity conserving minimal supersymmetric scenario, assuming $B(\bar{b}_1 \rightarrow b\bar{\chi}_1^0) = 100\%$, see their Fig. 2.
- ⁴⁷ CHATRCHYAN 12AI looked in 4.98 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two same-sign leptons (e, μ), but not necessarily same flavor, at least 2 b -jets and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in a simplified model for sbottom pair production, where the sbottom decays through $\bar{b}_1 \rightarrow t\bar{\chi}_1 W$, see Fig. 8.
- ⁴⁸ CHATRCHYAN 12BO searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for scalar bottom quarks in events with large missing transverse momentum and two b -jets in the final state. The data are found to be consistent with the Standard Model expectations. Limits are set in an R-parity conserving minimal supersymmetric scenario, assuming $B(\bar{b}_1 \rightarrow b\bar{\chi}_1^0) = 100\%$, see their Fig. 2.
- ⁴⁹ AAD 11K looked in 34 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with heavy stable particles, identified by their anomalous dE/dx in the tracker or time of flight in the tile calorimeter, from pair production of \bar{b} . No evidence for an excess over the SM expectation is observed and limits on the mass are derived for pair production of sbottom, see Fig. 4.
- ⁵⁰ AAD 11o looked in 35 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with jets, of which at least one is a b -jet, and E_T . No excess above the Standard Model was found. Limits are derived in the $(m_{\bar{g}}, m_{\bar{b}_1})$ plane (see Fig. 2) under the assumption of 100% branching ratios and \bar{b}_1 being the lightest squark. The quoted limit is valid for $m_{\bar{b}_1} < 500 \text{ GeV}$. A similar approach for \bar{t}_1 as the lightest squark with $\bar{g} \rightarrow \bar{t}_1 t$ and $\bar{t}_1 \rightarrow b\bar{\chi}_1^\pm$ with 100% branching ratios leads to a gluino mass limit of 520 GeV for $130 < m_{\bar{t}_1} < 300 \text{ GeV}$. Limits are also derived in the CMSSM $(m_0, m_{1/2})$ plane for $\tan\beta = 40$, see Fig. 4, and in scenarios based on the gauge group $SO(10)$.
- ⁵¹ CHATRCHYAN 11D looked in 35 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with ≥ 2 jets, at least one of which is b -tagged, and E_T , where the b -jets are decay products of \bar{t} or \bar{b} . No evidence for an excess over the expected background is observed. Limits are derived in the CMSSM $(m_0, m_{1/2})$ plane for $\tan\beta = 50$ (see Fig. 2).
- ⁵² AALTONEN 10R searched in 2.65 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events with E_T and exactly two jets, at least one of which is b -tagged. The results are in agreement with the SM prediction, and a limit on the cross section of 0.1 pb is obtained for the range of masses $80 < m_{\bar{b}_1} < 280 \text{ GeV}$ assuming that the sbottom decays exclusively to $b\bar{\chi}_1^0$. The excluded mass region in the framework of conserved R_p is shown in a plane of $(m_{\bar{b}_1}, m_{\bar{\chi}_1^0})$, see their Fig. 2.
- ⁵³ ABAZOV 10L looked in 5.2 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events with at least 2 b -jets and E_T from the production of $\bar{b}_1\bar{b}_1$. No evidence for an excess over the SM expectation is observed, and a limit on the cross section is derived under the assumption of 100% branching ratio. The excluded mass region in the framework of

conserved R_p is shown in a plane of $(m_{\bar{b}_1}, m_{\bar{\chi}_1^0})$, see their Fig. 3b. The exclusion also extends to $m_{\bar{\chi}_1^0} = 110 \text{ GeV}$ for $160 < m_{\bar{b}_1} < 200 \text{ GeV}$.

² AAD	14E	ATLS	$\ell^\pm \ell^\pm (\ell\bar{\tau}) + \text{jets}, \bar{b}_1 \rightarrow t\bar{\chi}_1^\pm$ with $\bar{\chi}_1^\pm \rightarrow W^{(*)\pm}\bar{\chi}_1^0$ simplified model, $m_{\bar{\chi}_1^\pm} = 2 m_{\bar{\chi}_1^0}$
------------------	-----	------	---

¹ KHACHATRYAN 16BX searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing 2 leptons coming from R-parity-violating decays of supersymmetric particles. No excess over the expected background is observed. Limits are derived on the sbottom mass, assuming the RPV $\bar{b} \rightarrow td$ or $\bar{b} \rightarrow ts$ decay, see Fig. 15.

² AAD 14E searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilises jets originating from b -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing bottom, see Fig. 7. Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.

\tilde{t} (Stop) mass limit

Limits depend on the decay mode. In e^+e^- collisions they also depend on the mixing angle of the mass eigenstate $\tilde{t}_1 = \tilde{t}_L \cos\theta_t + \tilde{t}_R \sin\theta_t$. The coupling to the Z vanishes when $\theta_t = 0.98$. In the Listings below, we use $\Delta m \equiv m_{\tilde{t}_1} - m_{\bar{\chi}_1^0}$ or $\Delta m \equiv m_{\tilde{t}_1} - m_{\tilde{c}}$, depending on relevant decay mode. See also bounds in “ \tilde{q} (Squark) MASS LIMIT.”

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

No significant excess above the Standard Model expectations is observed. Limits are set on the top squark mass in the Tstop1, Tstop2, and Tstop3 simplified models, see their Figures 14.	
none, 172.5–191	95	67	AAD	15J ATLS	$\tilde{t} \rightarrow t\tilde{\chi}_1^0, m_{\tilde{\chi}_1^0} = 1$ GeV						4 SIRUNYAN 21AD searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with multiple jets, no leptons, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the top squark mass in the simplified models Tstop1, Tstop2 with $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{t}} + m_{\tilde{\chi}_1^0})/2$, and a 50:50 mixture of these with $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5$ GeV, see their Figure 8. Limits are also set on the top squark mass for $10 \text{ GeV} < m_{\tilde{t}} - m_{\tilde{\chi}_1^\pm} < 80$ GeV in the simplified models Tstop2, Tstop 3, and Tstop4, see their Figure 9. For indirect top squark production, limits are set on the gluino mass in the simplified models Tglu3A, Tglu3C with $m_{\tilde{t}} - m_{\tilde{\chi}_1^0} = 20$ GeV, and Tglu3D with $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5$ GeV, see their Figure 10.	
> 450	95	68	KHACHATRY...15AF	CMS	$\tilde{t} \rightarrow t\tilde{\chi}_1^0, m_{\tilde{\chi}_1^0} = 0, m_{\tilde{t}} > m_t + m_{\tilde{\chi}_1^0}$						5 SIRUNYAN 21B searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for the pair production of top squarks in events with two oppositely charged leptons (electrons or muons), jets identified as originating from a b -quark and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the top stop mass in the Tstop1, Tstop2 and Tstop11 simplified models, see their Figures 6 and 7.	
> 560	95	69	KHACHATRY...15AH	CMS	$\tilde{t} \rightarrow t\tilde{\chi}_1^0, m_{\tilde{\chi}_1^0} = 0, m_{\tilde{t}} > m_t + m_{\tilde{\chi}_1^0}$						6 TUMASYAN 21i searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for evidence of top squarks in events with at least two jets and large \cancel{E}_T , categorized into events with 0, 1, or 2 leptons. No significant excess above the Standard Model expectations is observed. Limits are set on the top squark mass in the simplified model Tstop1 in the top corridor $ m_{\tilde{t}} - m_{\tilde{\chi}_1^0} - 175 \text{ GeV} < 30 \text{ GeV}$ using dilepton events, see their Figure 7. Limits are also set for a combination of earlier searches with 0, 1, and 2 leptons in the models Tstop1, Tstop2 and a 50:50 mixture of these models, see their Figure 9. The results are interpreted in an alternative signal model of dark matter production via a spin-0 mediator in association with a top quark pair as well.	
> 250	95	70	KHACHATRY...15AH	CMS	$\tilde{t} \rightarrow c\tilde{\chi}_1^0, m_{\tilde{t}} - m_{\tilde{\chi}_1^0} < 10$ GeV						7 AABOU 20 searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing one electron-muon pair with opposite charge. The search targets a region of parameter space where the kinematics of top squark pair production and top quark pair production is very similar and makes use of the double-differential angular distributions of the leptons. No excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 model, see Figures 16 and 17.	
> 730	95	71	KHACHATRY...15X	CMS	$\tilde{t} \rightarrow t\tilde{\chi}_1^0, m_{\tilde{\chi}_1^0} = 100$ GeV, $m_{\tilde{t}} > m_t + m_{\tilde{\chi}_1^0}$						8 AAD 20As searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for evidence of top squarks in events containing either a pair of jets consistent with SM Higgs boson decay into b -quarks or a same-flavour opposite-sign dilepton pair with an invariant mass consistent with a Z boson. No significant excess over the expected background is observed. Limits at 95% C.L. are set in Tstop6 simplified model. Assuming $m_{\tilde{\chi}_1^0} = 0$ GeV, \tilde{t}_1 masses up to 1220 GeV are excluded for $m_{\tilde{\chi}_2^0}$ around 900 GeV. Limits reduce down to \tilde{t}_1 masses up to 900 GeV for $m_{\tilde{\chi}_2^0} = 130$ GeV. See their Fig. 10. Limits are presented also in case of $B(\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 h) = 0$ and 1, see their Fig. 11.	
none 400–645	95	71	KHACHATRY...15X	CMS	$\tilde{t} \rightarrow t\tilde{\chi}_1^0$ or $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm, m_{\tilde{\chi}_1^0} = 100$ GeV, $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5$ GeV						9 AAD 20As searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for evidence of top squarks in events containing either a pair of jets consistent with SM Higgs boson decay into b -quarks or a same-flavour opposite-sign dilepton pair with an invariant mass consistent with a Z boson. No significant excess over the expected background is observed. Limits at 95% C.L. are set in simplified model featuring \tilde{t}_2 pair production, $\tilde{t}_2 \rightarrow \tilde{t}_1 Z$ and $\tilde{t}_1 \rightarrow b f f' \tilde{\chi}_1^0$. Assuming $m_{\tilde{\chi}_1^0} = 300$ GeV, and a mass difference between \tilde{t}_1 and $\tilde{\chi}_1^0$ of 40 GeV, \tilde{t}_2 masses up to 860 GeV are excluded. See their Fig. 12.	
none 270–645	95	72	AAD	14AJ ATLS	$\geq 4 \text{ jets} + \cancel{E}_T, \tilde{t}_1 \rightarrow t\tilde{\chi}_1^0, m_{\tilde{\chi}_1^0} < 30$ GeV						10 AAD 20s searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing multiple jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Exclusion limits at 95% C.L. are set on top squark masses in the Tstop1 model up to 1250 GeV for lightest neutralino masses below 200 GeV. Additional constraints are set in the case where $m_{\tilde{t}} - m_{\tilde{\chi}_1^0} \sim m_t$ for which top squark masses in the range 300–630 GeV are excluded. See their Fig. 13.	
none 250–550	95	72	AAD	14AJ ATLS	$\geq 4 \text{ jets} + \cancel{E}_T, B(\tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm) = 50\%, m_{\tilde{\chi}_1^\pm} = 2m_{\tilde{\chi}_1^0}, m_{\tilde{\chi}_1^0} < 60$ GeV						11 AAD 20s searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing multiple jets and large \cancel{E}_T . Searches Particle Listings

Supersymmetric Particle Searches

- 13 SIRUNYAN 20AH searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for pair production of top squarks in events with a single isolated electron or muon, multiple jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop2 and Tstop8 simplified models, see Figures 6, 7 and 8, respectively.
- 14 SIRUNYAN 20T searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least two jets, and two isolated same-sign or three or more charged leptons (electrons or muons). No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figure 7, and in the Tglu1C and Tglu1B simplified models, see their Figures 8 and 9. Limits are also set on the sbottom mass in the Tsb02 simplified model, see their Figure 10, and on the stop mass in the Tstop7 simplified model, see their Figure 11. Finally, limits are set on the gluino mass in RPV simplified models where the gluino decays either via $\tilde{g} \rightarrow qq\bar{q}\bar{q} + e/\mu/\tau$ or via $\tilde{g} \rightarrow tbs$, see Figure 12.
- 15 SIRUNYAN 20U searched in 77.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for the pair production of top squarks in events with two hadronically decaying taus, jets identified as originating from a b -quark and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop11 simplified model assuming the final state leptons are taus. Different values of the scalar tau mass are considered; the impact on the lower bound is negligible.
- 16 SIRUNYAN 19AU searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one photon, jets, some of which are identified as originating from b -quarks, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the gluino mass in the Tglu4C, Tglu4D and Tglu4E simplified models, and on the top squark mass in the Tstop13 simplified model, see their Figure 5.
- 17 SIRUNYAN 19CH searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing multiple jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A and Tglu3A simplified models, see their Figure 13. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb01, Tstop1 simplified models, see their Figure 14.
- 18 SIRUNYAN 19S searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with zero or one charged leptons, jets and \cancel{E}_T . The razor variables (M_R and R^2) are used to categorize the events. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu3C simplified models, see Figures 22 and 23, and on the stop mass in the Tstop1 simplified model, see their Figure 24.
- 19 SIRUNYAN 19U searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing one electron-muon pair with opposite charge. The search targets a region of parameter space where the kinematics of top squark pair production and top quark pair production is very similar, due to the mass difference between the top squark and the neutralino being close to the top quark mass. No excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 model, with $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0}$ close to m_t , see Figure 5.
- 20 AABOUD 18AQ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for top squark pair production in final states with one isolated electron or muon, several energetic jets, and missing transverse momentum. No significant excess over the Standard Model prediction is observed. In case of Tstop1 models, top squark masses up to 940 GeV are excluded assuming $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$, see their Fig. 20. If the top quark is not on-shell (3-body) decay, exclusions up to 500 GeV are obtained for $m_{\tilde{\chi}_1^0} = 300 \text{ GeV}$. Exclusions as a function of $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0}$ are given in their Fig. 21.
- 21 AABOUD 18AQ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for top squark pair production in final states with one isolated electron or muon, several energetic jets, and missing transverse momentum. No significant excess over the Standard Model prediction is observed. In case of Tstop3 models (4-body), top squark masses up to 370 GeV are excluded for $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0}$ as low as 20 GeV. Top squark masses below 195 GeV are excluded for all $m_{\tilde{\chi}_1^0}$, see their Fig. 20 and Fig. 21.
- 22 AABOUD 18AQ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for top squark pair production in final states with one isolated electron or muon, several energetic jets, and missing transverse momentum. No significant excess over the Standard Model prediction is observed. In case of Tstop2 models, top squark masses up to 840 GeV are excluded for $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 10 \text{ GeV}$. See their Fig. 23. Exclusion limits for this decay mode are presented also in the context of Higgsino-LSP phenomenological MSSM models, where $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$, see their Fig. 26.
- 23 AABOUD 18BV searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one jet identified as c -jet, large missing transverse energy and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tstop4 models. In scenarios with differences of the stop and neutralino masses below 100 GeV, stop masses below 500 GeV are excluded. See their Fig. 6 and Fig. 7.
- 24 AABOUD 18BV searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one jet identified as c -jet, large missing transverse energy and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tstop1 models. In scenarios with massless neutralinos, top squark masses below 850 GeV are excluded. See their Fig. 6.
- 25 AABOUD 18I searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one jet with a transverse momentum above 250 GeV and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tstop3 models. Stop masses below 390 GeV are excluded for $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = m_b$. See their Fig. 9(b).
- 26 AABOUD 18I searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one jet with a transverse momentum above 250 GeV and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tstop4 models. In scenarios with differences of the stop and neutralino masses around 5 GeV, stop masses below 430 GeV are excluded. See their Fig. 9(a).
- 27 AABOUD 18Y searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct pair production of top squarks in final states with two tau leptons, b -jets, and missing transverse momentum. At least one hadronic τ is required. No significant deviation from the SM predictions is observed in the data. The analysis results are interpreted in Tstop5 models with a nearly massless gravitino. Top squark masses up to 1.16 TeV and tau slepton masses up to 1 TeV are excluded, see their Fig. 7.
- 28 SIRUNYAN 18AJ searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two low-momentum, oppositely charged leptons (electrons or muons) and \cancel{E}_T . No excess over the expected background is observed. Limits are derived on the wino mass in the Tch1n2F simplified model, see their Figure 5. Limits are also set on the stop mass in the Tstop10 simplified model, see their Figure 6. Finally, limits are set on the Higgsino mass in the Tch1n2G simplified model, see Figure 8 and in the pMSSM, see Figure 7.
- 29 SIRUNYAN 18AL searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least three charged leptons, in any combination of electrons and muons, jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, see their Figure 5. Limits are also set on the sbottom mass in the Tsb02 simplified model, see their Figure 6, and on the stop mass in the Tstop7 simplified model, see their Figure 7.
- 30 SIRUNYAN 18AN searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing one or two photons and a pair of top quarks from the decay of a pair of top squark in a natural gauge-mediated scenario. The final state consists of a lepton (electron or muon), jets and one or two photons. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop12 simplified model, see their Figure 6.
- 31 SIRUNYAN 18AY searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing one or more jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb01, Tstop1 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range $10^{-3} \text{ mm} < c\tau < 10^5 \text{ mm}$, see their Figure 4.
- 32 SIRUNYAN 18B searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for the pair production of third-generation squarks in events with jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb01 simplified model, see their Figure 5, and on the stop mass in the Tstop4 simplified model, see their Figure 6.
- 33 SIRUNYAN 18C searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for the pair production of top squarks in events with two oppositely charged leptons (electrons or muons), jets identified as originating from a b -quark and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop2 and Tstop11 simplified models, see their Figures 11 and 12. The Tstop1 and Tstop2 results are combined with complementary searches in the all-hadronic and single lepton channels, see their Figures 13 and 14.
- 34 SIRUNYAN 18D searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing identified hadronically decaying top quarks, no leptons, and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 simplified model, see their Figure 8, and on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3E simplified models, see their Figure 9.
- 35 SIRUNYAN 18DI searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for pair production of top squarks in events with a low transverse momentum lepton (electron or muon), a high-momentum jet and significant missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop3 and Tstop10 simplified models, see their Figures 7 and 8. A combination of this search with the all-hadronic search is presented in Figure 9.
- 36 SIRUNYAN 18DN searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and for pair production of top squarks in events with two leptons (electrons or muons) of the opposite electric charge. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass in the Tch1ch1C and Tch1ch1E simplified models, see their Figure 8. Limits are also set on the stop mass in the Tstop1 and Tstop2 simplified models, see their Figure 9.
- 37 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 700 GeV are set on the top squark mass in Tstop11 simplified models, assuming $m_{\tilde{\chi}_1^0} = m_{\tilde{t}_1} - 275 \text{ GeV}$ and $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^0} + 100 \text{ GeV}$. See their Figure 4(e).
- 38 AABOUD 17AX searched in 36 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two jets identified as originating from b -quarks and large missing transverse momentum, with or without leptons. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of top squarks. Assuming 50% BR for Tstop1 and Tstop2 simplified models, a \tilde{t}_1 mass below 880 (860) GeV is excluded for $m_{\tilde{\chi}_1^0} = 0$ (<250) GeV. See their Fig. 7(b).
- 39 AABOUD 17AY searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least four jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits in the range 250–1000 GeV are set on the top squark mass in Tstop1 simplified models. For the first time, additional constraints are set for the region $m_{\tilde{t}_1} \sim m_t + m_{\tilde{\chi}_1^0}$, with exclusion of the \tilde{t}_1 mass range 235–590 GeV. See their Figure 8.
- 40 AABOUD 17AY searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least four jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits in the range 450–850 GeV are set on the top squark mass in a mixture of Tstop1 and Tstop2 simplified models with BR=50% and assuming $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 1 \text{ GeV}$ and $m_{\tilde{\chi}_1^0} < 240 \text{ GeV}$. Constraints are given for various values of the BR. See their Figure 9.
- 41 AABOUD 17BE searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two opposite-charge leptons (electrons and muons) and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 720 GeV are set on the top squark mass in Tstop1 simplified models, assuming massless neutralinos. See their Figure 9 (2-body area).
- 42 AABOUD 17BE searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two opposite-charge leptons (electrons and muons) and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 400 GeV are set on the top squark mass in Tstop3 simplified models, assuming $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 40 \text{ GeV}$. See their Figure 9 (4-body area).
- 43 AABOUD 17BE searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two opposite-charge leptons (electrons and muons) and large missing transverse momentum. No significant excess above the Standard Model expectations is observed.

- Limits up to 430 GeV are set on the top squark mass in Tstop1 simplified models where top quarks are offshell, assuming $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0}$ close to the W mass. See their Figure 9 (3-body area).
- 44 AABOUD 17E searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two opposite-charge leptons (electrons and muons) and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 700 GeV are set on the top squark mass in Tstop2 simplified models, assuming $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 10 \text{ GeV}$ and massless neutralinos. See their Figure 10.
- 45 KHACHATRYAN 17 searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing four or more jets, no more than one lepton, and missing transverse momentum, using the razor variables (M_R and R^2) to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop1 simplified model, see Fig. 17.
- 46 KHACHATRYAN 17AD searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing at least four jets (including b -jets), missing transverse momentum and tagged top quarks. No evidence for an excess over the expected background is observed. Top squark masses in the range 250–740 GeV and neutralino masses up to 240 GeV are excluded at 95% C.L. See Fig. 12.
- 47 KHACHATRYAN 17AD searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing at least four jets (including b -jets), missing transverse momentum and tagged top quarks. No evidence for an excess over the expected background is observed. Limits are derived on the \tilde{t} mass in simplified models that are a mixture of Tstop1 and Tstop2 with branching fractions 50% for each of the two decay modes: top squark masses up to 610 GeV and neutralino masses up to 190 GeV are excluded at 95% C.L. The $\tilde{\chi}_1^{\pm}$ and the $\tilde{\chi}_1^0$ are assumed to be nearly degenerate in mass, with a 5 GeV difference between their masses. See Fig. 12.
- 48 KHACHATRYAN 17P searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figures 7 and 8. Limits are also set on the squark mass in the Tsqk1 simplified model, see their Fig. 7, and on the sbottom mass in the Tsb0t1 simplified model, see Fig. 8. Finally, limits are set on the stop mass in the Tstop1, Tstop3, Tstop4, Tstop6 and Tstop7 simplified models, see Fig. 8.
- 49 KHACHATRYAN 17s searched in 18.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing multiple jets and missing transverse momentum, using the α_T variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop4 model: for $\Delta m = m_{\tilde{t}} - m_{\tilde{\chi}_1^0}$ equal to 10 and 80 GeV, masses of stop below 240 and 260 GeV are excluded, respectively. See their Fig. 3.
- 50 KHACHATRYAN 17s searched in 18.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing multiple jets and missing transverse momentum, using the α_T variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop3 model: for $\Delta m = m_{\tilde{t}} - m_{\tilde{\chi}_1^0}$ equal to 10 and 80 GeV, masses of stop below 225 and 130 GeV are excluded, respectively. See their Fig. 3.
- 51 KHACHATRYAN 17s searched in 18.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing multiple jets and missing transverse momentum, using the α_T variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop2 model: assuming $m_{\tilde{\chi}_1^{\pm}} = 0.25 m_{\tilde{t}} + 0.75 m_{\tilde{\chi}_1^0}$, masses of stop up to 325 GeV and masses of the neutralino up to 225 GeV are excluded. See their Fig. 3.
- 52 KHACHATRYAN 17s searched in 18.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing multiple jets and missing transverse momentum, using the α_T variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop2 model: assuming $m_{\tilde{\chi}_1^{\pm}} = 0.75 m_{\tilde{t}} + 0.25 m_{\tilde{\chi}_1^0}$, masses of stop up to 400 GeV are excluded for low neutralino masses. See their Fig. 3.
- 53 KHACHATRYAN 17s searched in 18.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing multiple jets and missing transverse momentum, using the α_T variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop1 model: assuming masses of stop up to 500 GeV and masses of the neutralino up to 105 GeV are excluded. See their Fig. 3.
- 54 SIRUNYAN 17As searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with a single lepton (electron or muon), jets, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop2 and Tstop8 simplified models, see their Figures 5, 6 and 7.
- 55 SIRUNYAN 17AT searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct production of top squarks in events with jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop2, Tstop4, Tstop8 and Tstop10 simplified models, see their Figures 9 to 14.
- 56 SIRUNYAN 17AZ searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A simplified models, see their Figures 6. Limits are also set on the squark mass in the Tsqk1 simplified model (for single light squark and for 8 degenerate light squarks), on the sbottom mass in the Tsb0t1 simplified model and on the stop mass in the Tstop1 simplified model, see their Fig. 7. Finally, limits are set on the stop mass in the Tstop2, Tstop4 and Tstop8 simplified models, see Fig. 8.
- 57 SIRUNYAN 17k searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct production of stop or sbottom pairs in events with multiple jets and significant \cancel{E}_T . A second search also requires an isolated lepton and is combined with the all-hadronic search. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop8 and Tstop4 simplified models, see their Figures 7, 8 and 9 (for the Tstop4 limits, only the results of the all-hadronic search are used). Limits are also set on the sbottom mass in the Tsb0t1 simplified model, see Fig. 10 (also here, only the results of the all-hadronic search are used).
- 58 SIRUNYAN 17P searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with multiple jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A, Tglu3A and Tglu3D simplified models, see their Fig. 12. Limits are also set on the squark mass in the Tsqk1 simplified model, on the stop mass in the Tstop1 simplified model, and on the sbottom mass in the Tsb0t1 simplified model, see Fig. 13.
- 59 AABOUD 16D searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with an energetic jet and large missing transverse momentum. The results are interpreted as 95% C.L. limits on mass of stop decaying into a charm-quark and the lightest neutralino in scenarios with $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0}$ between 5 and 20 GeV. See their Fig. 5.
- 60 AABOUD 16J searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with one isolated electron or muon, jets, and missing transverse momentum. For the direct stop pair production model where the stop decays via top and lightest neutralino, the results exclude at 95% C.L. stop masses between 745 GeV and 780 GeV for a massless $\tilde{\chi}_1^0$. See their Fig. 8.
- 61 AAD 16AY searched in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with either two hadronically decaying tau leptons, one hadronically decaying tau and one light lepton, or two light leptons. No significant excess over the Standard Model expectation is found. Exclusion limits at 95% C.L. on the mass of top squarks decaying via \tilde{t} to a nearly massless gravitino are placed depending on $m_{\tilde{t}}$ which is ranging from the 87 GeV LEP limit to $m_{\tilde{t}_1}$. See their Figs. 9 and 10.
- 62 KHACHATRYAN 16AV searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with one or two isolated leptons, hadronic jets, b -jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 and Tstop2 simplified models, see Fig. 11.
- 63 KHACHATRYAN 16BK searched in 18.9 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with hadronic jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 and Tstop2 simplified models, see Fig. 16.
- 64 KHACHATRYAN 16BS searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one energetic jet, no isolated leptons, and significant \cancel{E}_T , using the transverse mass variable \tilde{M}_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 simplified model, see Fig. 11 and Table 3.
- 65 KHACHATRYAN 16Y searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with one or two soft isolated leptons, hadronic jets, and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop3 simplified model, see Fig. 3.
- 66 AAD 15CJ searched in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of third generation squarks by combining a large number of searches covering various final states. Stop decays with and without charginos in the decay chain are considered and summaries of all ATLAS Run 1 searches for direct stop production can be found in Fig. 4 (no intermediate charginos) and Fig. 7 (intermediate charginos). Limits are set on stop masses in compressed mass regions, with $B(\tilde{t} \rightarrow c\tilde{\chi}_1^0) + B(\tilde{t} \rightarrow b\tilde{t}'\tilde{\chi}_1^0) = 1$, see Fig. 5. Limits are also set on stop masses assuming that both the decay $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ and $\tilde{t} \rightarrow b\tilde{\chi}_1^{\pm}$ are possible, with both their branching ratios summing up to 1, assuming $\tilde{\chi}_1^{\pm} \rightarrow W^{(*)}\tilde{\chi}_1^0$ and $m_{\tilde{\chi}_1^{\pm}} = 2 m_{\tilde{\chi}_1^0}$, see Fig. 6. Limits on the mass of the next-to-lightest stop \tilde{t}_2 , decaying either to $Z\tilde{t}_1$, $h\tilde{t}_1$ or $t\tilde{\chi}_1^0$, are also presented, see Figs. 9 and 10. Interpretations in the pMSSM are also discussed, see Figs 13–15.
- 67 AAD 15J interpreted the measurement of spin correlations in $\tilde{t}\tilde{t}$ production using 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ in exclusion limits on the pair production of light \tilde{t}_1 squarks with masses similar to the top quark mass. The \tilde{t}_1 is assumed to decay through $\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0$ with predominantly right-handed top and a 100% branching ratio. The data are found to be consistent with the Standard Model expectations and masses between the top quark mass and 191 GeV are excluded, see their Fig. 2.
- 68 KHACHATRYAN 15AF searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the transverse mass variable \tilde{M}_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in simplified models where the decay $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 12. See also Table 5. Exclusions in the CMSSM, assuming $\tan\beta = 30$, $A_0 = -2 \max(m_0, m_{1/2})$ and $\mu > 0$, are also presented, see Fig. 15.
- 69 KHACHATRYAN 15AH searched in 19.4 or 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing either a fully reconstructed top quark, or events containing dijets requiring one or both jets to originate from b -quarks, or events containing a mono-jet. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in simplified models where the decay $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 9. Limits are also set in simplified models where the decays $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ and $\tilde{t} \rightarrow b\tilde{\chi}_1^{\pm}$, with $m_{\tilde{\chi}_1^{\pm}} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$, each take place with a branching ratio of 50%, see Fig. 10, or with other fractions, see Fig. 11. Finally, limits are set in a simplified model where the decay $\tilde{t} \rightarrow c\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Figs. 9, 10 and 11.
- 70 KHACHATRYAN 15AH searched in 19.4 or 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing either a fully reconstructed top quark, or events containing dijets requiring one or both jets to originate from b -quarks, or events containing a mono-jet. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in simplified models where the decay $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 9. Limits are also set in simplified models where the decays $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ and $\tilde{t} \rightarrow b\tilde{\chi}_1^{\pm}$, with $m_{\tilde{\chi}_1^{\pm}} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$, each take place with a branching ratio of 50%, see Fig. 10, or with other fractions, see Fig. 11. Finally, limits are set in a simplified model where the decay $\tilde{t} \rightarrow c\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Figs. 9, 10, and 11.
- 71 KHACHATRYAN 15x searched in 19.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets, at least one of which is required to originate from a b quark, possibly a lepton, and significant \cancel{E}_T , using the razor variables (M_R and R^2) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in simplified models where the decay $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ and the decay $\tilde{t} \rightarrow b\tilde{\chi}_1^{\pm}$, with $m_{\tilde{\chi}_1^{\pm}} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$, take place with branching ratios varying between 0 and 100%, see Figs. 15, 16 and 17.
- 72 AAD 14AJ searched in 20.1 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing four or more jets and large missing transverse momentum. No excess of events above

Searches Particle Listings

Supersymmetric Particle Searches

- the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which either assume that the decay $\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0$ takes place 100% of the time, see Fig. 8, or that this decay takes place 50% of the time, while the decay $\tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm$ takes place the other 50% of the time, see Fig. 9.
- ⁷³ AAD 14BD searched in 20 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing one isolated lepton, jets and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which either assume that the decay $\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0$ takes place 100% of the time, see Fig. 15, or the decay $\tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm$ takes place 100% of the time, see Fig. 16–22. For the mixed decay scenario, see Fig. 23.
- ⁷⁴ AAD 14F searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing two leptons (e or μ), and possibly jets and missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which either assume that the decay $\tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm$ takes place 100% of the time, see Figs. 14–17 and 20, or that the decay $\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0$ takes place 100% of the time, see Figs. 18 and 19.
- ⁷⁵ AAD 14T searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for monojet-like and c -tagged events. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which assume that the decay $\tilde{t}_1 \rightarrow c\tilde{\chi}_1^0$ takes place 100% of the time, see Fig. 9 and 10. The results of the monojet-like analysis are also interpreted in terms of stop pair production in the four-body decay $\tilde{t}_1 \rightarrow bff'\tilde{\chi}_1^0$, see Fig. 11.
- ⁷⁶ CHATRCHYAN 14AH searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with at least two energetic jets and significant \cancel{E}_T , using the razor variables (M_R and R^2) to discriminate between signal and background processes. A second analysis requires at least one of the jets to be originating from a b -quark. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Figs. 28 and 29. Exclusions in the CMSSM, assuming $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, are also presented, see Fig. 26.
- ⁷⁷ CHATRCHYAN 14R searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in a natural higgsino NLSP simplified model (GMSB) where the decay $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$, with $\tilde{\chi}_1^\pm \rightarrow (qq'/\ell\nu)H$, $Z\tilde{G}$, takes place with a branching ratio of 100% (the particles between brackets have a soft p_T spectrum), see Figs. 4–6.
- ⁷⁸ AABOUD 17AF searched in 36 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for evidence of top squarks in events containing 2 leptons, jets, b -jets and \cancel{E}_T . In Tstop6 model, assuming $m_{\tilde{\chi}_1^0} = 0$ GeV, \tilde{t}_1 masses up to 850 GeV are excluded for $m_{\tilde{\chi}_2^0} > 200$ GeV.
- ⁷⁹ AABOUD 17AF searched in 36 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for evidence of \tilde{t}_2 in events containing 2 leptons, jets, b -jets and \cancel{E}_T . In Tstop7 model, assuming $m_{\tilde{\chi}_1^0} = 50$ GeV and 100% decays via Z boson, \tilde{t}_2 masses up to 800 GeV are excluded. Exclusion limits are also shown as a function of the \tilde{t}_2 branching ratios in their Figure 7.
- ⁸⁰ AABOUD 17AF searched in 36 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for evidence of \tilde{t}_2 in events containing 2 leptons, jets, b -jets and \cancel{E}_T . In Tstop7 model, assuming $m_{\tilde{\chi}_1^0} = 50$ GeV and 100% decays via higgs boson, \tilde{t}_2 masses up to 880 GeV are excluded. Exclusion limits are also shown as a function of the \tilde{t}_2 branching ratios in their Figure 7.
- ⁸¹ AABOUD 17AY searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least four jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the top squark mass assuming three pMSSM-inspired models. The first one, referred to as Higgsino LSP model, assumes $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5$ GeV and $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0} = 10$ GeV, with a mixture of decay modes as in Tstop1, Tstop2 and Tstop6. See their Figure 10. The second and third models are referred to as Wino NLSP and well-tempered pMSSM models, respectively. See their Figure 11 and Figure 12, and text for details on assumptions.
- ⁸² AAD 14B searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing a Z boson, with or without additional leptons, plus jets originating from b -quarks and significant missing transverse momentum. No excess over the expected SM background is observed. Limits are derived in simplified models featuring \tilde{t}_2 production, with $\tilde{t}_2 \rightarrow Z\tilde{t}_1$, $\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0$ with a 100% branching ratio, see Fig. 4, and in the framework of natural GMSB, see Fig. 6.
- ⁸³ CHATRCHYAN 14U searched in 19.7 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for evidence of direct pair production of top squarks, with Higgs bosons in the decay chain. The search is performed using a selection of events containing two Higgs bosons, each decaying to a photon pair, missing transverse energy and possibly b -quark jets. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in the context of a “natural SUSY” simplified model where the decays $\tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm$, with $\tilde{\chi}_1^\pm \rightarrow ff'\tilde{\chi}_1^0$, and $\tilde{\chi}_1^0 \rightarrow H\tilde{G}$, all happen with 100% branching ratio, see Fig. 4.
- ⁸⁴ KHACHATRYAN 14C searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for evidence of direct pair production of top squarks, with Higgs or Z -bosons in the decay chain. The search is performed using a selection of events containing leptons and b -quark jets. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in the context of a simplified model with pair production of a heavier top-squark mass eigenstate \tilde{t}_2 decaying to a lighter top-squark eigenstate \tilde{t}_1 via either $\tilde{t}_2 \rightarrow H\tilde{t}_1$ or $\tilde{t}_2 \rightarrow Z\tilde{t}_1$, followed in both cases by $\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0$. The interpretation is performed in the region where the mass difference between the \tilde{t}_1 and $\tilde{\chi}_1^0$ is approximately equal to the top-quark mass, which is not probed by searches for direct \tilde{t}_1 pair production, see Figs. 5 and 6. The analysis excludes top squarks with masses $m_{\tilde{t}_2} < 575$ GeV and $m_{\tilde{t}_1} < 400$ GeV at 95% C.L.

¹ AAD 21BF searched in 139 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for pair production of gluinos, stops, electroweakinos decaying RPV either directly or indirectly via the LSP. The final state in all cases is one or two leptons, many jets (up to fifteen) and b -jets. Different models with different branching fractions of the gluino or stop follow from the assumptions on the nature of the electroweakinos. No significant excess above the Standard Model predictions is observed. Limits are set on the $gluino$, \tilde{t}_1 , electroweakino masses as a function of the $\tilde{\chi}_1^0$ mass in several scenarios of gluino, stop and electroweakino pair production.

- 2 SIRUNYAN 21AF searched in 140 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for supersymmetry in events with two displaced vertices from long-lived particles decaying into multijet or dijet final states. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu2RPV with λ''_{323} coupling, on the $\tilde{\chi}_1^0$ mass in an RPV model with $\tilde{\chi}_1^0$ pair production and the RPV decay $\tilde{\chi}_1^0 \rightarrow tbs$ with λ''_{323} coupling and on the \tilde{t} mass in an RPV model with top squark pair production and the RPV decay $\tilde{t} \rightarrow \bar{d}_i \bar{d}_j$ with λ''_{3ij} coupling, see their Figure 7.
- 3 SIRUNYAN 21u searched in 132 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for supersymmetry in events with displaced tracks and displaced vertices associated with a dijet system. No significant excess above the Standard Model expectations is observed. Limits are set on long-lived gluinos in an RPC GMSB SUSY model of gluino pair production, with $\tilde{g} \rightarrow gG$, see their Figure 9, in Tglu1A in a mini-split model, see their Figure 10, and in an RPV model of gluino pair production, with $\tilde{g} \rightarrow tbs$ with coupling λ''_{323} , see their Figure 11. Limits are also set on long-lived top squarks in Tstop2RPV, see their Figure 12, in an RPV model with $\tilde{t} \rightarrow d\bar{d}$ and λ''_{331} coupling, see their Figure 13, and in a dynamical RPV model with $\tilde{t} \rightarrow \bar{d}\bar{d}$ via a nonholomorphic RPV coupling λ''_{311} , see their Figure 14. The best mass limit is achieved in all cases at $c\tau = 30 \text{ mm}$.
- 4 SIRUNYAN 21v searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for supersymmetry in events with one charged lepton (e^\pm or μ^\pm) and ≥ 7 jets. No significant excess above the Standard Model expectations is observed. Limits are set on an RPV SUSY model like Tstop1 with the additional decay $\tilde{\chi}_1^0 \rightarrow qq\bar{q}$ with coupling λ''_{abc} , with $a, b, c \in 1, 2$, and on a stealth SUSY model called SY, with one scalar particle \tilde{S} with even R-parity and its superpartner \tilde{S} , both singlets under all SM interactions, and with a portal mediated by loop interactions involving a new vectorlike messenger field (Y), where pair produced top squarks decay as $\tilde{t} \rightarrow t\tilde{S}$, and $\tilde{S} \rightarrow G\tilde{S}$, and $\tilde{S} \rightarrow g\tilde{g}$, see their Figure 6 and 7.
- 5 AAD 20M searched for long-lived particles decaying into hadrons and at least one muon in events containing a displaced muon track and a displaced vertex. The analysis uses a dataset of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ corresponding to an integrated luminosity of 136 fb^{-1} . Using the Tstop3RPV simplified model, top squarks with masses up to 1.7 TeV are excluded for a lifetime of 0.1 ns , and masses below 1.3 TeV are excluded for lifetimes between 0.01 ns and 30 ns , see their Fig. 7. The dependence on the RPV coupling λ''_{23k} multiplied by $\cos\theta_{\tilde{t}}$, with $\theta_{\tilde{t}}$ the mixing angle between the left- and right-handed \tilde{t} squarks, is also shown, see their Fig. 7.
- 6 SIRUNYAN 19Bi searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with two muons and two jets, or with one muon, two jets, and missing transverse momentum. Limits are set in a model of pair-produced, prompt or long-lived top squarks with R-parity violating decays to a b -quark and a lepton (Tstop2RPV), branching fraction of $\tilde{t} \rightarrow b\mu$ equal to $1/3$ and $c\tau$ between 0.1 cm and 10 cm in the case of long-lived top squarks. See their Fig. 10.
- 7 SIRUNYAN 19Bj searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with two electrons and two jets, or with one electron, two jets, and missing transverse momentum. Limits are set in a model of pair-produced, prompt top squarks with R-parity violating decays to a b -quark and a lepton (Tstop2RPV), assuming branching fraction of $\tilde{t} \rightarrow be$ equal to $1/3$ and $c\tau = 0 \text{ cm}$. See their Fig. 10.
- 8 AABOUD 18BB searched in 36.7 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for massive coloured resonances which are pair-produced and decay into two jets. No significant deviation from the background prediction is observed. Results are interpreted in a SUSY simplified model as Tstop1RPV with $\tilde{t} \rightarrow d\bar{s}$. Top squarks with masses in the range $100\text{--}410 \text{ GeV}$ are excluded, see their Figure 9(a). The λ''_{312} coupling is assumed to be sufficiently large for the decays to be prompt, but small enough to neglect the single-top-squark resonant production through RPV couplings.
- 9 AABOUD 18BB searched in 36.7 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for massive coloured resonances which are pair-produced and decay into two jets. No significant deviation from the background prediction is observed. Results are interpreted in Tstop1RPV. Top squarks with masses in the range $100\text{--}470 \text{ GeV}$ or $480\text{--}610 \text{ GeV}$ are excluded, see their Figure 9(b). The λ''_{323} coupling is assumed to be sufficiently large for the decays to be prompt, but small enough to neglect the single-top-squark resonant production through RPV couplings.
- 10 AABOUD 18P searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for pair-produced top squarks that decay through RPV λ''_{i33} ($i = 1, 2, 3$) couplings to a final state with two leptons and two jets, at least one of which is identified as a b -jet. No significant excess is observed over the SM background. In the Tstop2RPV model, lower limits on the top squark masses between 600 and 1500 GeV are set depending on the branching fraction to be , $b\mu$, and $b\tau$ final states. See their Figs 6 and 7.
- 11 SIRUNYAN 18AD searched in 2.6 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived particles by exploiting the multiplicity of displaced jets to search for the presence of signal decays occurring at distances between 1 and 1000 mm . Limits are set in a model of pair-produced, long-lived top squarks with R-parity violating decays to a b -quark and a lepton, see their Figure 3.
- 12 SIRUNYAN 18Dv searched in 38.5 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived particles in events with multiple jets and two displaced vertices composed of many tracks. No events with two well-separated high-track-multiplicity vertices were observed. Limits are set on the stop and the gluino mass in RPV models of supersymmetry where the stop (gluino) is decaying solely into dijet (multijet) final states, see their Figures 6 and 7.
- 13 SIRUNYAN 18Dv searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for the pair production of resonances, each decaying to two quarks. The search is conducted separately in a boosted (two-jet) and resolved (four-jet) jet topology. The mass spectra are found to be consistent with the Standard Model expectations. Limits are set on the stop mass in the Tstop3RPV and Tstop1RPV simplified models, see their Figure 11.
- 14 AABOUD 17AI searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more isolated lepton, at least eight jets, either zero or many b -jets, for evidence of R-parity violating decays of the top squark. No significant excess above the Standard Model expectations is observed. Limits up to 1.25 (1.10) TeV are set on the top squark mass in R-parity-violating supersymmetry models where \tilde{t}_1 decays for a bino LSP as: $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ and for a higgsino LSP as $\tilde{t} \rightarrow t\tilde{\chi}_{1,2}^0/b\tilde{\chi}_1^+$. These is followed by the decays through the non-zero λ''_{323} coupling $\tilde{\chi}_{1,2}^0 \rightarrow tbs$, $\tilde{\chi}_1^+ \rightarrow bbs$. See their Figure 10 and text for details on model assumptions.
- 15 AAD 16AM searched in 17.4 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing two large-radius hadronic jets. No deviation from the background prediction is observed. Top squarks with masses between 100 and 315 GeV are excluded at 95% C.L. in the

- hypothesis that they both decay via R-parity violating coupling λ''_{323} to b - and s -quarks. See their Fig. 10.
- 16 KHACHATRYAN 15L searched in 19.4 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for pair production of heavy resonances decaying to pairs of jets in four jet events. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in R-parity-violating supersymmetry models where $\tilde{t} \rightarrow qq$ ($\lambda''_{312} \neq 0$), see Fig. 6 (top) and $\tilde{t} \rightarrow qb$ ($\lambda''_{323} \neq 0$), see Fig. 6 (bottom).
- 17 KHACHATRYAN 14T searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with τ -leptons and b -quark jets, possibly with extra light-flavour jets. No excess above the Standard Model expectations is observed. Limits are set on stop masses in RPV SUSY models with $LQ\bar{D}$ couplings, in two simplified models. In the first model, the decay $\tilde{t} \rightarrow \tau b$ is considered, with $\lambda''_{333} \neq 0$, see Fig. 3. In the second model, the decay $\tilde{t} \rightarrow \tilde{\chi}^\pm b$, with the subsequent decay $\tilde{\chi}^\pm \rightarrow qq\tau^\pm$ is considered, with $\lambda''_{3jk} \neq 0$ and the mass splitting between the top squark and the charging chosen to be 100 GeV , see Fig. 4.
- 18 AAD 21B searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least eight jets and at least 5 b -jets, for evidence of R-parity violating decays of the top squark. No significant excess above the Standard Model expectations is observed. Limits up to 950 GeV are set on the top squark mass in Tstop4RPV simplified model. See their Figure 7 for more detailed mass bounds.
- 19 KHACHATRYAN 16AC searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with low missing transverse momentum, two oppositely charged electrons or muons, and at least five jets, at least one of which is a b -jet, for evidence of R-parity violating, charging-mediated decays of the top squark. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in R-parity-violating supersymmetry models where $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow e^\pm jj$, $\lambda''_{ijk} \neq 0$ ($i, j, k \leq 2$), and with $m_{\tilde{t}} - m_{\tilde{\chi}_1^\pm} = 100 \text{ GeV}$, see Fig. 3.
- 20 KHACHATRYAN 16Bx searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing 4 leptons coming from R-parity-violating decays of $\tilde{\chi}_1^0 \rightarrow \ell\ell\nu$ with $\lambda_{121} \neq 0$ or $\lambda_{122} \neq 0$. No excess over the expected background is observed. Limits are derived on the gluino, squark and stop masses, see Fig. 23.
- 21 KHACHATRYAN 15E searched for long-lived particles decaying to leptons in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. Events were selected with an electron and muon with opposite charges and each with transverse impact parameter values between 0.02 and 2 cm . Limits are set on SUSY benchmark models with pair production of top squarks decaying into an $e\mu$ final state via RPV interactions. See their Fig. 2

Heavy \tilde{g} (Gluino) mass limit

For $m_{\tilde{g}} > 60\text{--}70 \text{ GeV}$, it is expected that gluinos would undergo a cascade decay via a number of neutralinos and/or charginos rather than undergo a direct decay to photons as assumed by some papers. Limits obtained when direct decay is assumed are usually higher than limits when cascade decays are included.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

¹ AAD 21AK searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for pair production of gluinos and squarks in events with a single isolated electron or muon, originating from the decay of a W boson, multiple jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1B simplified model and on the squark mass in the Tsqk3 simplified model, see their Figure 8.

² AAD 21L searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for pair production of gluinos and squarks in events with jets, large missing transverse momentum but no electrons or muons. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A and Tglu1B simplified models, on the squark mass in the Tsqk1 and Tsqk3 simplified models and in a simplified model for gluino-squark production, see their Figures 13-17.

³ AAD 21X searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for the decay of long-lived R-hadrons stopped by the calorimeter, producing high-momentum jets resulting in large out-of-time energy deposits in the calorimeters. These decays are detected using data collected during periods in the LHC bunch structure when collisions are absent. No significant excess above the predicted background is observed. Limits are set on the R-hadron mass in the Tglu1A simplified model as a function of the R-hadron lifetime, for different $m_{\tilde{\chi}_1^0}$. See Figures 9, 10.

⁴ SIRUNYAN 21AD searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with multiple jets, no leptons, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the top squark mass in the simplified models Tstop1, Tstop2 with $m_{\tilde{t}_\pm} = (m_{\tilde{t}} + m_{\tilde{\chi}_1^0})/2$, and a 50:50 mixture of these with $m_{\tilde{t}_\pm} - m_{\tilde{\chi}_1^0} = 5$ GeV, see their Figure 8. Limits are also set on the top squark mass for $10 \text{ GeV} < m_{\tilde{t}} - m_{\tilde{\chi}_1^0} < 80 \text{ GeV}$ in the simplified models Tstop2, Tstop3, and Tstop4, see their Figure 9. For indirect top squark production, limits are set on the gluino mass in the simplified models Tglu3A, Tglu3C with $m_{\tilde{t}} - m_{\tilde{\chi}_1^0} = 20$ GeV, and Tglu3D with $m_{\tilde{t}_\pm} - m_{\tilde{\chi}_1^0} = 5$ GeV, see their Figure 10.

⁵ SIRUNYAN 21M searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with two opposite-sign same-flavor leptons (electrons, muons) and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu4C, see their Figure 10, on the $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ mass in Tchl1n2Fa, see their Figure 11, on the $\tilde{\chi}_1^0$ mass in Tn1n1C and Tn1n1B for $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0}$, see their Figure 12. Limits are also set on the light squark mass for the simplified model Tsqk2A, on the sbottom mass in Tsb0t3, see their Figure 13, and on the slepton mass in direct electroweak pair production of mass-degenerate left- and right-handed sleptons (selectrons and smuons), see their Figure 14.

⁶ AAD 20AL searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with 8 or more jets and moderate missing transverse momentum. The selection makes requirements according to the number of b -tagged jets and the scalar sum of masses of large-radius jets. No significant excess above the Standard Model expectations is observed. Limits up to about 2 TeV are set on the gluino mass in Tglu1E simplified model. Limits up to about 1.8 TeV are set on the gluino mass in Tglu3A simplified model. See their Fig. 10(a).

⁷ AAD 20V searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV in final states with same-sign charged leptons (electrons or muons) and jets. No significant excess over the Standard Model expectation is observed. In the Tglu1E model, considering off-shell intermediate W and Z bosons in the decay chains, gluino masses are excluded at 95% C.L. up to 1600 GeV for neutralino masses of 100 GeV or above (up to 1000 GeV). See their Fig. 7(a).

⁸ SIRUNYAN 20B searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one photon and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on chargino masses in a general gauge-mediated SUSY breaking (GGM) scenario Tchl1n12-GGM, see Figure 4. Limits are also set on the NLSP mass in the Tchl1ch1F and Tchl1ch1G simplified models, see their Figure 5. Finally, limits are set on the gluino mass in the Tglu4A simplified model, see Figure 6.

⁹ SIRUNYAN 20BJ searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing two hadronically decaying, highly energetic Z bosons and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1H simplified model, see their Figure 9.

¹⁰ SIRUNYAN 20E searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with a single electron or muon and multiple jets, including at least one identified as originating from a b -quark, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A simplified model, see their Fig. 10, and the Tglu3C simplified model, see their Fig. 11.

¹¹ SIRUNYAN 20T searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with at least two jets, and two isolated same-sign or three or more charged leptons (electrons or muons). No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figure 7, and in the Tglu1C and Tglu1B simplified models, see their Figures 8 and 9. Limits are also set on the sbottom mass in the Tsb0t2 simplified model, see their Figure 10, and on the stop mass in the Tstop7 simplified model, see their Figure 11. Finally, limits are set on the gluino mass in RPV simplified models where the gluino decays either via $\tilde{g} \rightarrow qq\bar{q}\bar{q} + e/\mu/\tau$ or via $\tilde{g} \rightarrow tbs$, see Figure 12.

¹² AABOUD 19J searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV in final states with hadronic jets, 1 or two hadronically decaying τ and \cancel{E}_T . In Tglu1F, gluino masses are excluded at 95% C.L. up to 2000 GeV for neutralino masses of 100 GeV or below. Neutralino masses up to 1000 GeV are excluded for all gluino masses below 1400 GeV. See their Fig. 9. Limits are also presented in the context of Gauge-Mediated Symmetry Breaking models: in this case, values of A below 110 TeV are excluded at the 95% CL for all values of $\tan\beta$ in the range $2 < \tan\beta < 60$, see their Fig. 10.

¹³ SIRUNYAN 19AG searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with two photons and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4B simplified model and on the squark mass in the Tsqk4B simplified model, see their Figure 3.

¹⁴ SIRUNYAN 19AU searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one photon, jets, some of which are identified as originating from b -quarks, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the gluino mass in the Tglu4C, Tglu4D and Tglu4E simplified models, and on the top squark mass in the Tstop13 simplified model, see their Figure 5.

¹⁵ SIRUNYAN 19CE searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for new particles decaying to a photon and two gluons in events with at least three large-radius jets of which two have substructure and are composed of a photon and two gluons. No statistically significant excess is observed above the SM background expectation. Upper limits at 95% confidence level on the cross section for gluino pair production are set, using a simplified Tglu1A-like stealth SUSY model. Gluino masses up to 1500-1700 GeV are excluded, depending on the neutralino mass, with the highest exclusion set for $m_{\tilde{\chi}_1^0} = 200$ GeV. See their Fig. 4.

¹⁶ SIRUNYAN 19CH searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing multiple jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A and Tglu3A simplified models, see their Figure 13. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb0t1, Tstop1 simplified models, see their Figure 14.

¹⁷ SIRUNYAN 19K searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with a photon, an electron or muon, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the chargino and neutralino mass in the Tchl1n1A simplified model, see their Figure 6. Limits are also set on the gluino mass in the Tglu4A simplified model, and on the squark mass in the Tsqk4A simplified model, see their Figure 7.

¹⁸ SIRUNYAN 19S searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with zero or one charged leptons, jets and \cancel{E}_T . The razor variables (M_R and R^2) are used to categorize the events. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu3C simplified models, see Figures 22 and 23, and on the stop mass in the Tstop1 simplified model, see their Figure 24.

¹⁹ AABOUD 18AR searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for gluino pair production in events containing large missing transverse momentum and several energetic jets, at least three of which must be identified as originating from b -quarks. No excess is found above the predicted background. In Tglu3A models, gluino masses of less than 1.97 TeV are excluded for $m_{\tilde{\chi}_1^0}$ below 300 GeV, see their Fig. 10(a). Interpretations are also provided for scenarios where Tglu3A modes mix with Tglu2A and Tglu3D, see their Fig. 11.

²⁰ AABOUD 18AR searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for gluino pair production in events containing large missing transverse momentum and several energetic jets, at least three of which must be identified as originating from b -quarks. No excess is found above the predicted background. In Tglu2A models, gluino masses of less than 1.92 TeV are excluded for $m_{\tilde{\chi}_1^0}$ below 600 GeV, see their Fig. 10(b). Interpretations are also provided for scenarios where Tglu2A modes mix with Tglu3A and Tglu3D, see their Fig. 11.

²¹ AABOUD 18AS searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for gluino pair production in the context of AMSB or phenomenological MSSM scenarios with wino-like

Searches Particle Listings

Supersymmetric Particle Searches

- LSP and long-lived charginos. Events with a disappearing track due to a low-momentum pion accompanied by at least four jets are considered. No significant excess above the Standard Model expectations is observed. Exclusion limits are set at 95% confidence level on the mass of gluinos for different chargino lifetimes. Gluino masses up to 1.65 TeV are excluded assuming a chargino mass of 460 GeV and lifetime of 0.2 ns, corresponding to a mass-splitting between the charged and neutral wino of around 160 MeV. See their Fig. 9.
- 22 AABOUD 18BJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with two opposite-sign charged leptons (electrons and muons), jets and missing transverse momentum, with various requirements to be sensitive to signals with different kinematic endpoint values in the dilepton invariant mass distribution. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1G model: gluino masses below 1850 GeV are excluded for $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$, see their Fig. 12(a).
- 23 AABOUD 18BJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with two opposite-sign charged leptons (electrons and muons), jets and missing transverse momentum, with various requirements to be sensitive to signals with different kinematic endpoint values in the dilepton invariant mass distribution. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1H model: gluino masses below 1650 GeV are excluded for $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$, see their Fig. 13(a).
- 24 AABOUD 18U searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results for the di-photon channel are interpreted in terms of lower limits on the masses of gluinos in Tglu4B models, which reach as high as 2.3 TeV. Gluinos with masses below 2.15 TeV are excluded for any NLSP mass, see their Fig. 8.
- 25 AABOUD 18U searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results of the $\gamma + \text{jets} + \cancel{E}_T$ channel are interpreted in terms of lower limits on the masses of gluinos in GGM higgsino-bino models (mix of Tglu4B and Tglu4C), which reach as high as 2050 GeV. Gluino masses below 1600 GeV are excluded for any NLSP mass provided that $m_{\tilde{g}} - m_{\tilde{\chi}_1^0} > 50 \text{ GeV}$. See their Fig. 11.
- 26 AABOUD 18V searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1A model: gluino masses below 2030 GeV are excluded for massless LSP, see their Fig. 13(b).
- 27 AABOUD 18V searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1B model. Assuming that $m_{\tilde{\chi}_1^\pm} = 0.5 (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})$, gluino masses below 1980 GeV are excluded for massless LSP, see their Fig. 14(c). Exclusions are also shown assuming $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$, see their Fig. 14(d).
- 28 AABOUD 18V searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1E model: gluino masses below 1750 GeV are excluded for $m_{\tilde{\chi}_1^0} = 1 \text{ GeV}$ and any $m_{\tilde{\chi}_2^0}$ above 100 GeV, see their Fig. 15. Gluino mass exclusion up to 2 TeV is found for $m_{\tilde{\chi}_2^0} = 1 \text{ TeV}$.
- 29 SIRUNYAN 18AA searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one photon and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in a general gauge-mediated SUSY breaking (GGM) scenario with bino-like $\tilde{\chi}_1^0$ and wino-like $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$, see Figure 7. Limits are also set on the NLSP mass in the Tch1n1A and Tch1ch1A simplified models, see their Figure 8. Finally, limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, see their Figure 9, and on the squark mass in the Tskq4A and Tskq4B simplified models, see their Figure 10.
- 30 SIRUNYAN 18AC searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with a single electron or muon and multiple jets. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1B simplified models, see their Figure 5.
- 31 SIRUNYAN 18AL searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least three charged leptons, in any combination of electrons and muons, jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, see their Figure 5. Limits are also set on the sbottom mass in the Tstop2 simplified model, see their Figure 6, and on the stop mass in the Tstop7 simplified model, see their Figure 7.
- 32 SIRUNYAN 18AR searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two opposite-charge, same-flavour leptons (electrons or muons), jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see their Figure 7. Limits are also set on the chargino/neutralino mass in the Tch1n2F simplified models, see their Figure 8, and on the higgsino mass in the Tn1n1B and Tn1n1C simplified models, see their Figure 9. Finally, limits are set on the sbottom mass in the Tstop3 simplified model, see their Figure 10.
- 33 SIRUNYAN 18AV searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing one or more jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tskq1, Tstop1, Tstop1 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range $10^{-3} \text{ mm} < c\tau < 10^5 \text{ mm}$, see their Figure 4.
- 34 SIRUNYAN 18D searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing identified hadronically decaying top quarks, no leptons, and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 simplified model, see their Figure 8, and on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3E simplified models, see their Figure 9.
- 35 SIRUNYAN 18M searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more high-momentum Higgs bosons, decaying to pairs of b -quarks, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1I and Tglu1J simplified models, see their Figure 3.
- 36 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.75 TeV are set on the gluino mass in Tglu3A simplified models in case of off-shell top squarks and for $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$. See their Figure 4(a).
- 37 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.57 TeV are set on the gluino mass in Tglu1E simplified models (2-step models) for $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$. See their Figure 4(b).
- 38 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.86 TeV are set on the gluino mass in Tglu1G simplified models for $m_{\tilde{\chi}_1^0} = 200 \text{ GeV}$. See their Figure 4(c).
- 39 AABOUD 17AR searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one isolated lepton, at least two jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 2.1 TeV are set on the gluino mass in Tglu1B simplified models, with $x = (m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0}) / (m_{\tilde{g}} - m_{\tilde{\chi}_1^0}) = 1/2$. Similar limits are obtained for variable x and fixed neutralino mass, $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$. See their Figure 13.
- 40 AABOUD 17AR searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one isolated lepton, at least two jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.74 TeV are set on the gluino mass in Tglu1E simplified model. Limits up to 1.7 TeV are also set on pMSSM models leading to similar signal event topologies. See their Figure 13.
- 41 AABOUD 17AY searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least four jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.8 TeV are set on the gluino mass in Tglu3A simplified models assuming $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$. See their Figure 13.
- 42 AABOUD 17AZ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least seven jets and large missing transverse momentum. Selected events are further classified based on the presence of large R -jets or b -jets and no leptons. No significant excess above the Standard Model expectations is observed. Limits up to 1.8 TeV are set on the gluino mass in Tglu1E simplified models. See their Figure 6b.
- 43 AABOUD 17AZ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least seven jets and large missing transverse momentum. Selected events are further classified based on the presence of large R -jets or b -jets and no leptons. No significant excess above the Standard Model expectations is observed. Limits up to 1.54 TeV are set on the gluino mass in Tglu3A simplified models. See their Figure 7a.
- 44 AABOUD 17N searched in 14.7 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with 2 same-flavor, opposite-sign leptons (electrons or muons), jets and large missing transverse momentum. In Tglu1J models, gluino masses are excluded at 95% C.L. up to 1300 GeV for $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$ and $m_{\tilde{\chi}_2^0} = 1100 \text{ GeV}$. See their Fig. 12 for exclusion limits as a function of $m_{\tilde{\chi}_2^0}$. Limits are also presented assuming $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^0} + 100 \text{ GeV}$, see their Fig. 13.
- 45 AABOUD 17N searched in 14.7 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with 2 same-flavor, opposite-sign leptons (electrons or muons), jets and large missing transverse momentum. In Tglu1H models, gluino masses are excluded at 95% C.L. up to 1310 GeV for $m_{\tilde{\chi}_1^0} < 400 \text{ GeV}$ and assuming $m_{\tilde{\chi}_2^0} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$. See their Fig. 15.
- 46 AABOUD 17N searched in 14.7 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with 2 same-flavor, opposite-sign leptons (electrons or muons), jets and large missing transverse momentum. In Tglu1J models, gluino masses are excluded at 95% C.L. up to 1700 GeV for small $m_{\tilde{\chi}_1^0}$. The results probe kinematic endpoints as small as $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0} = (m_{\tilde{g}} - m_{\tilde{\chi}_1^0})/2 = 50 \text{ GeV}$. See their Fig. 14.
- 47 KHACHATRYAN 17 searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing four or more jets, no more than one lepton, and missing transverse momentum, using the razor variables (M_R and R^2) to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see Figs. 16 and 17. Also, assuming gluinos decay only via three-body processes involving third-generation quarks plus a neutralino/chargino, and assuming $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0} + 5 \text{ GeV}$, a branching ratio-independent limit on the gluino mass is given, see Fig. 16.
- 48 KHACHATRYAN 17AD searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing at least four jets (including b -jets), missing transverse momentum and tagged top quarks. No evidence for an excess over the expected background is observed. Gluino masses up to 1550 GeV and neutralino masses up to 900 GeV are excluded at 95% C.L. See Fig. 13.
- 49 KHACHATRYAN 17AD searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing at least four jets (including b -jets), missing transverse momentum and tagged top quarks. No evidence for an excess over the expected background is observed. Gluino masses up to 1450 GeV and neutralino masses up to 820 GeV are excluded at 95% C.L. See Fig. 13.
- 50 KHACHATRYAN 17AS searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with a single electron or muon and multiple jets. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1B simplified models, see their Fig. 7.
- 51 KHACHATRYAN 17AW searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least three charged leptons, in any combination of electrons and muons, and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, and on the sbottom mass in the Tstop2 simplified model, see their Figure 4.
- 52 KHACHATRYAN 17P searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figures 7 and 8. Limits are also set on the squark mass in the Tskq1 simplified model, see their Fig. 7, and on the sbottom mass in the Tstop1 simplified model, see Fig. 8. Finally, limits are set on the stop mass in the Tstop1, Tstop3, Tstop4, Tstop6 and Tstop7 simplified models, see Fig. 8.

- ⁵³ KHACHATRYAN 17v searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two photons and large $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino and squark mass in the context of general gauge mediation models Tglu4B and Tsqk4, see their Fig. 4.
- ⁵⁴ SIRUNYAN 17AF searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with a single lepton (electron or muon), jets, including at least one jet originating from a b -quark, and large $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu3B simplified models, see their Figure 2.
- ⁵⁵ SIRUNYAN 17AY searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one photon, jets and large $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, and on the squark mass in the Tskq4A and Tskq4B simplified models, see their Figure 6.
- ⁵⁶ SIRUNYAN 17AZ searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A simplified models, see their Figures 6. Limits are also set on the squark mass in the Tskq1 simplified model (for single light squark and for 8 degenerate light squarks), on the sbottom mass in the Tsb0t1 simplified model and on the stop mass in the Tstop1 simplified model, see their Fig. 7. Finally, limits are set on the stop mass in the Tstop2, Tstop4 and Tstop8 simplified models, see Fig. 8.
- ⁵⁷ SIRUNYAN 17P searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with multiple jets and large $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A, Tglu3A and Tglu3D simplified models, see their Fig. 12. Limits are also set on the squark mass in the Tskq1 simplified model, on the stop mass in the Tstop1 simplified model, and on the sbottom mass in the Tsb0t1 simplified model, see Fig. 13.
- ⁵⁸ SIRUNYAN 17S searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two isolated same-sign leptons, jets, and large $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the gluino mass in the Tglu3A, Tglu3B, Tglu3C, Tglu3D and Tglu1B simplified models, see their Figures 5 and 6, and on the sbottom mass in the Tsb0t2 simplified model, see their Figure 6.
- ⁵⁹ AABOUD 16AC searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with hadronic jets, 1 or two hadronically decaying τ and $E_{\cancel{T}}$. In Tglu1F, gluino masses are excluded at 95% C.L. up to 1570 GeV for neutralino masses of 100 GeV or below. Neutralino masses up to 700 GeV are excluded for all gluino masses between 800 GeV and 1500 GeV, while the strongest neutralino-mass exclusion of 750 GeV is achieved for gluino masses around 1400 GeV. See their Fig. 8. Limits are also presented in the context of Gauge-Mediated Symmetry Breaking models: in this case, values of A below 92 TeV are excluded at the 95% CL, corresponding to gluino masses below 2000 GeV. See their Fig. 9.
- ⁶⁰ AABOUD 16I searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with one isolated electron or muon, hadronic jets, and $E_{\cancel{T}}$. Gluino-mediated pair production of stops with a nearly mass-degenerate stop and neutralino are targeted and gluino masses are excluded at 95% C.L. up to 1460 GeV. A 100% of stops decaying via charm + neutralino is assumed. The results are also valid in case of 4-body decays $\tilde{t}_1 \rightarrow f\bar{f}'b\tilde{\chi}_1^0$. See their Fig. 8.
- ⁶¹ AABOUD 16M searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two photons, hadronic jets and $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Exclusion limits at 95% C.L. are set on gluino masses in the general gauge-mediated SUSY breaking model (GGM), for bino-like NLSP. See their Fig. 3.
- ⁶² AABOUD 16N searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing hadronic jets, large $E_{\cancel{T}}$, and no electrons or muons. No significant excess above the Standard Model expectations is observed. Gluino masses below 1510 GeV are excluded at the 95% C.L. in a simplified model with only gluinos and the lightest neutralino. See their Fig. 7b.
- ⁶³ AABOUD 16N searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing hadronic jets, large $E_{\cancel{T}}$, and no electrons or muons. No significant excess above the Standard Model expectations is observed. Gluino masses below 1500 GeV are excluded at the 95% C.L. in a simplified model with gluinos decaying via an intermediate $\tilde{\chi}_1^\pm$ to two quarks, a W boson and a $\tilde{\chi}_1^0$, for $m_{\tilde{\chi}_1^0} = 200 \text{ GeV}$. See their Fig. 8.
- ⁶⁴ AAD 16AD searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing several energetic jets, of which at least three must be identified as b -jets, large $E_{\cancel{T}}$ and no electrons or muons. No significant excess above the Standard Model expectations is observed. For $\tilde{\chi}_1^0$ below 800 GeV, gluino masses below 1780 GeV are excluded at 95% C.L. for gluinos decaying via bottom squarks. See their Fig. 7a.
- ⁶⁵ AAD 16AD searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing several energetic jets, of which at least three must be identified as b -jets, large $E_{\cancel{T}}$ and one electron or muon. Large-radius jets with a high mass are also used to identify highly boosted top quarks. No significant excess above the Standard Model expectations is observed. For $\tilde{\chi}_1^0$ below 700 GeV, gluino masses below 1760 GeV are excluded at 95% C.L. for gluinos decaying via top squarks. See their Fig. 7b.
- ⁶⁶ AAD 16BB searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with exactly two same-sign leptons or at least three leptons, multiple hadronic jets, b -jets, and $E_{\cancel{T}}$. No significant excess over the Standard Model expectation is found. Exclusion limits at 95% C.L. are set on the gluino mass in various simplified models (Tglu1D, Tglu1E, Tglu3A). See their Figs. 4.a, 4.b, and 4.d.
- ⁶⁷ AAD 16BC searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with one isolated electron or muon, hadronic jets, and $E_{\cancel{T}}$. The data agree with the SM background expectation in the six signal selections defined in the search, and the largest deviation is a 2.1 standard deviation excess. Gluinos are excluded at 95% C.L. up to 1600 GeV assuming they decay via the lightest chargino to the lightest neutralino as in the model Tglu1B for $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$, assuming $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$. See their Fig. 6.
- ⁶⁸ AAD 16V searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with $E_{\cancel{T}}$ various hadronic jet multiplicities from ≥ 7 to ≥ 10 and with various b -jet multiplicity requirements. No significant excess over the Standard Model expectation is found. Exclusion limits at 95% C.L. are set on the gluino mass in one simplified model (Tglu1E) and a pMSSM-inspired model. See their Fig. 5.
- ⁶⁹ KHACHATRYAN 16AM searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with highly boosted W -bosons and b -jets, using the razor variables (M_R and R^2) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3C and Tglu3B simplified models, see Fig. 12.
- ⁷⁰ KHACHATRYAN 16BJ searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the following simplified models: Tglu3A and Tglu3D, see Fig. 4, Tglu3B and Tglu3C, see Fig. 5, and Tglu1B, see Fig. 7.
- ⁷¹ KHACHATRYAN 16BS searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one energetic jet, no isolated leptons, and significant $E_{\cancel{T}}$, using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see Fig. 10 and Table 3.
- ⁷² KHACHATRYAN 16BY searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two opposite-sign, same-flavour leptons, jets, and missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see Fig. 4, and on sbottom masses in the Tsb0t3 simplified model, see Fig. 5.
- ⁷³ KHACHATRYAN 16V searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least four energetic jets and significant $E_{\cancel{T}}$, no identified isolated electron or muon or charged track. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A, and Tglu3A simplified models, see Fig. 8.
- ⁷⁴ AAD 15BG searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with jets, missing $E_{\cancel{T}}$, and two opposite-sign same flavour isolated leptons featuring either a kinematic edge, or a peak at the Z -boson mass, in the invariant mass spectrum. No evidence for a statistically significant excess over the expected SM backgrounds are observed and 95% C.L. exclusion limits are derived in a GGM simplified model of gluino pair production where the gluino decays into quarks, a Z -boson, and a massless gravitino LSP, see Fig. 12. Also, limits are set in simplified models with slepton / sneutrino intermediate states, see Fig. 13.
- ⁷⁵ AAD 15BV summarized and extended ATLAS searches for gluinos and first- and second-generation squarks in final states containing jets and missing transverse momentum, with or without leptons or b -jets in the $\sqrt{s} = 8 \text{ TeV}$ data set collected in 2012. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on the gluino mass in several R -parity conserving models, leading to a generalized constraint on gluino masses exceeding 1150 GeV for lightest supersymmetric particle masses below 100 GeV. See their Figs. 10, 19, 20, 21, 23, 25, 26, 29-37.
- ⁷⁶ AAD 15BX interpreted the results of a wide range of ATLAS direct searches for supersymmetry, during the first run of the LHC using the $\sqrt{s} = 7 \text{ TeV}$ and $\sqrt{s} = 8 \text{ TeV}$ data set collected in 2012, within the wider framework of the phenomenological MSSM (pMSSM). The integrated luminosity was up to 20.3 fb^{-1} . From an initial random sampling of 500 million pMSSM points, generated from the 19-parameter pMSSM, a total of 310,327 model points with $\tilde{\chi}_1^0$ LSP were selected each of which satisfies constraints from previous collider searches, precision measurements, cold dark matter energy density measurements and direct dark matter searches. The impact of the ATLAS Run 1 searches on this space was presented, considering the fraction of model points surviving, after projection into two-dimensional spaces of sparticle masses. Good complementarity is observed between different ATLAS analyses, with almost all showing regions of unique sensitivity. ATLAS searches have good sensitivity at LSP mass below 800 GeV.
- ⁷⁷ AAD 15CA searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with one or more photons, hadronic jets or b -jets and $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on gluino masses in the general gauge-mediated SUSY breaking model (GGM), for bino-like or higgsino-bino admixtures NLSP, see Fig. 8, 10, 11.
- ⁷⁸ KHACHATRYAN 15AF searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets and significant $E_{\cancel{T}}$, using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 13(a), or where the decay $\tilde{g} \rightarrow b\bar{b}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 13(b), or where the decay $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 13(c). See also Table 5. Exclusions in the CMSSM, assuming $\tan\beta = 30$, $A_0 = -2 \max(m_0, m_{1/2})$ and $\mu > 0$, are also presented, see Fig. 15.
- ⁷⁹ KHACHATRYAN 15I searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events in which b -jets and four W -bosons are produced. Five individual search channels are combined (fully hadronic, single lepton, same-sign dilepton, opposite-sign dilepton, multilepton). No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a simplified model where the decay $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 5. Also a simplified model with gluinos decaying into on-shell top squarks is considered, see Fig. 6.
- ⁸⁰ KHACHATRYAN 15X searched in 19.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets, at least one of which is required to originate from a b quark, and significant $E_{\cancel{T}}$, using the razor variables (M_R and R^2) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay $\tilde{g} \rightarrow b\bar{b}\tilde{\chi}_1^0$ and the decay $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ take place with branching ratios varying between 0, 50 and 100%, see Figs. 13 and 14.
- ⁸¹ AAD 14AE searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for strongly produced supersymmetric particles in events containing jets and large missing transverse momentum, and no electrons or muons. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos and squarks, see Figures 5, 6 and 7. Limits are also derived in the mSUGRA/CMSSM with parameters $\tan\beta = 30$, $A_0 = -2 m_0$ and $\mu > 0$, see their Fig. 8.
- ⁸² AAD 14AG searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing one hadronically decaying τ -lepton, zero or one additional light leptons (electrons or muons), jets and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set in several SUSY scenarios. For an interpretation in the minimal GMSB model, see their Fig. 8. For an interpretation in the mSUGRA/CMSSM with parameters $\tan\beta = 30$, $A_0 = -2 m_0$ and $\mu > 0$, see their Fig. 9. For an interpretation in the framework of natural Gauge Mediation, see Fig. 10. For an interpretation in the bRPV scenario, see their Fig. 11.
- ⁸³ AAD 14X searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the

Supersymmetric Particle Searches

- Standard Model expectations is observed. Limits are set on the gluino mass in a general gauge-mediation model (GGM) where the decay $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$, with $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \tilde{G}$, takes place with a branching ratio of 100%, for two choices of $\tan\beta = 1.5$ and 30, see Fig. 11. Also some constraints on the higgsino mass parameter μ are discussed.
- 84 CHATRCHYAN 14AH searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the razor variables (M_R and R^2) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 28. Exclusions in the CMSSM, assuming $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, are also presented, see Fig. 26.
- 85 CHATRCHYAN 14AH searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the razor variables (M_R and R^2) to discriminate between signal and background processes. A second analysis requires at least one of the jets to be originating from a b -quark. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay $\tilde{g} \rightarrow b\bar{b}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Figs. 28 and 29. Exclusions in the CMSSM, assuming $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, are also presented, see Fig. 26.
- 86 CHATRCHYAN 14AH searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the razor variables (M_R and R^2) to discriminate between signal and background processes. A second analysis requires at least one of the jets to be originating from a b -quark. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Figs. 28 and 29. Exclusions in the CMSSM, assuming $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, are also presented, see Fig. 26.
- 87 CHATRCHYAN 14I searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing multijets and large \cancel{E}_T . No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos that decay via $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$ with a 100% branching ratio, see Fig. 7b, or via $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ with a 100% branching ratio, see Fig. 7c, or via $\tilde{g} \rightarrow q\bar{q}W/Z\tilde{\chi}_1^0$, see Fig. 7d.
- 88 CHATRCHYAN 14N searched in 19.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing a single isolated electron or muon and multiple jets, at least two of which are identified as originating from a b -quark. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in three simplified models of gluino pair production with subsequent decay into virtual or on-shell top squarks, where each of the top squarks decays in turn into a top quark and a $\tilde{\chi}_1^0$, see Fig. 4. The models differ in which masses are allowed to vary.
- 89 CHATRCHYAN 14R searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a slepton co-NLSP simplified model (GMSB) where the decay $\tilde{g} \rightarrow q\ell^\pm\ell^\mp\tilde{G}$ takes place with a branching ratio of 100%, see Fig. 8.
- 90 CHATRCHYAN 14R searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a simplified model where the decay $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 11.
- 91 AABOUD 18BJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with two opposite-sign charged leptons (electrons and muons), jets and missing transverse momentum, with various requirements to be sensitive to signals with different kinematic endpoint values in the dilepton invariant mass distribution. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1H model in case of $m_{\tilde{\chi}_1^0} = 1 \text{ GeV}$: for any $m_{\tilde{\chi}_2^0}$, gluino masses below 1500 GeV are excluded, see their Fig. 14(a).
- 92 AABOUD 18v searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in a Tglu1C-like model, assuming 50% BR for each gluino decay mode. Gluino masses below 1770 GeV are excluded for any $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}$ and $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$, see their Fig. 16(b).
- 93 AABOUD 17AZ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least seven jets and large missing transverse momentum. Selected events are further classified based on the presence of large R-jets or b -jets and no leptons. No significant excess above the Standard Model expectations is observed. Limits are set for pMSSM models with $M_1 = 60 \text{ GeV}$, $\tan(\beta) = 10$, $\mu < 0$ varying the soft-breaking parameters M_3 and μ . Gluino masses up to 1600 GeV are excluded for $m_{\tilde{\chi}_1^\pm} = 200 \text{ GeV}$. See their Figure 6a and text for details on the model.
- 94 KHACHATRYAN 16AY searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one isolated high transverse momentum lepton (e or μ), hadronic jets of which at least one is identified as coming from a b -quark, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A simplified model, see Fig. 10, and in the Tglu3B model, see Fig. 11.
- 95 KHACHATRYAN 16BT performed a global Bayesian analysis of a wide range of CMS results obtained with data samples corresponding to 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The set of searches considered, both individually and in combination, includes those with all-hadronic final states, same-sign and opposite-sign dileptons, and multi-lepton final states. An interpretation was given in a scan of the 19-parameter pMSSM. No scan points with a gluino mass less than 500 GeV survived and 98% of models with a squark mass less than 300 GeV were excluded.
- 96 AAD 15AB searched for the decay of neutral, weakly interacting, long-lived particles in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. Signal events require at least two reconstructed vertices possibly originating from long-lived particles decaying to jets in the inner tracking detector and muon spectrometer. No significant excess of events over the expected background was found. Results were interpreted in Stealth SUSY benchmark models where a pair of gluinos decay to long-lived singlinos, S , which in turn each decay to a low-mass gravitino and a pair of jets. The 95% confidence-level limits are set on the cross section \times branching ratio for the decay $\tilde{g} \rightarrow \tilde{S}g$, as a function of the singlino proper lifetime (τ). See their Fig. 10(f)
- 97 AAD 15AI searched in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing at least one isolated lepton (electron or muon), jets, and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the gluino mass in the CMSSM/mSUGRA, see Fig. 15, in the NUHM2, see Fig. 16, and in various simplified models, see Figs. 18–22.
- 98 AAD 15CB searched for events containing at least one long-lived particle that decays at a significant distance from its production point (displaced vertex, DV) into two leptons or into five or more charged particles in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The dilepton signature is characterised by DV formed from at least two lepton candidates. Four different final states were considered for the multitrack signature, in which the DV must be accompanied by a high-transverse momentum muon or electron candidate that originates from the DV, jets or missing transverse momentum. No events were observed in any of the signal regions. Results were interpreted in SUSY scenarios involving R -parity violation, split supersymmetry, and gauge mediation. See their Fig. 12–20.
- 99 KHACHATRYAN 15AD searched in 19.4 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two opposite-sign same flavor isolated leptons featuring either a kinematic edge, or a peak at the Z -boson mass, in the invariant mass spectrum. No evidence for a statistically significant excess over the expected SM backgrounds is observed and 95% C.L. exclusion limits are derived in a simplified model of gluino pair production where the gluino decays into quarks, a Z -boson, and a massless gravitino LSP, see Fig. 9.
- 100 KHACHATRYAN 15AZ searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with either at least one photon, hadronic jets and \cancel{E}_T (single photon channel) or with at least two photons and at least one jet and using the razor variables. No significant excess above the Standard Model expectations is observed. Limits are set on gluino masses in the general gauge-mediated SUSY breaking model (GGM), for both a bino-like and wino-like neutralino NLSP scenario, see Fig. 8 and 9.
- 101 AAD 14Ax searched in 20.1 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for the strong production of supersymmetric particles in events containing either zero or at least one high p_T lepton, large missing transverse momentum, high jet multiplicity and at least three jets identified as originating from b -quarks. No excess over the expected SM background is observed. Limits are derived in mSUGRA/CMSSM models with $\tan\beta = 30$, $A_0 = -2m_0$ and $\mu > 0$, see their Fig. 14. Also, exclusion limits in simplified models containing gluinos and scalar top and bottom quarks are set, see their Figures 12, 13.
- 102 AAD 14E searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilises jets originating from b -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos and squarks, see Figures 5 and 6. In the $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^{(*)}\tilde{\chi}_2^0, \tilde{\chi}_2^0 \rightarrow Z^{(*)}\tilde{\chi}_1^0$ simplified model, the following assumptions have been made: $m_{\tilde{\chi}_1^\pm} = 0.5 m_{\tilde{\chi}_1^0} + m_{\tilde{g}}$, $m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{\chi}_2^\pm})$, $m_{\tilde{\chi}_1^0} < 520 \text{ GeV}$. In the $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow \ell^\pm\nu_{\tilde{\chi}_1^0}$ or $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_2^0, \tilde{\chi}_2^0 \rightarrow \ell^\pm\ell^\mp(\nu\nu)\tilde{\chi}_1^0$ simplified model, the following assumptions have been made: $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{g}})$, $m_{\tilde{\chi}_1^0} < 660 \text{ GeV}$. Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.
- 103 CHATRCHYAN 14H searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, or where the decay $\tilde{g} \rightarrow \tilde{t}t, \tilde{t} \rightarrow t\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, with varying mass of the $\tilde{\chi}_1^0$, or where the decay $\tilde{g} \rightarrow \tilde{b}b, \tilde{b} \rightarrow t\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, with varying mass of the $\tilde{\chi}_1^\pm$, see Fig. 5.
- 104 CHATRCHYAN 14H searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, with varying mass of the $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_1^0$, see Fig. 7.
- 105 CHATRCHYAN 14H searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay $\tilde{g} \rightarrow b\bar{b}\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, for two choices of $m_{\tilde{\chi}_1^\pm}$ and fixed $m_{\tilde{\chi}_1^0}$, see Fig. 6.

• • • We do not use the following data for averages, fits, limits, etc. • • •

1 AAD 21BF searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for pair production of gluinos, stops, electroweakinos decaying RPV either directly or indirectly via the LSP. The final state in all cases is one or two leptons, many jets (up to fifteen) and b-jets. Different models with different branching fractions of the gluino or stop follow from the assumptions on the nature of the electroweakinos. No significant excess above the Standard Model predictions is observed. Limits are set on the gluino, \tilde{t}_1 , electroweakino masses as a function of the $\tilde{\chi}_1^0$ mass in several scenarios of gluino, stop and electroweakino pair production.

2 AAD 21Y searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for supersymmetry in events with four or more leptons (electrons, muons and tau-leptons). No significant excess above the Standard Model expectations is observed. Limits are set on Tch1n12-GGM, and RPV models similar to Tch1n21, Tglu1A (with $q = u, d, s, c, b$, with equal branching fractions), and $\tilde{\ell}_L/\tilde{\nu} \rightarrow \ell/\nu\tilde{\chi}_1^0$ (mass-degenerate $\tilde{\ell}_L$ and $\tilde{\nu}$ of all 3 generations), all with $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \nu$ via λ_{12k} or λ_{j33} (where $i, k \in \{1, 2\}$), see their Figure 11.

3 AAD 20AL searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with 8 or more jets and moderate missing transverse momentum. The selection makes requirements according to the number of b-tagged jets and the scalar sum of masses of large-radius jets. No significant excess above the Standard Model expectations is observed. Exclusion limits at 95% C.L. are set on the gluino mass in RPV simplified models where the gluino decays via $\tilde{g} \rightarrow tbd$ or $\tilde{g} \rightarrow tbs$. They extend up to almost 1.6 TeV for a \tilde{t}_1 mass of 900 GeV. See their Fig. 10(c).

4 AAD 20V searched in 139 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with two same-sign charged leptons (electrons or muons) and jets. No significant excess above the Standard Model expectations is observed. Exclusion limits at 95% C.L. are set on the gluino mass in RPV simplified models where the gluino decays via $\tilde{g} \rightarrow tbd$, see Figure 7(b).

5 SIRUNYAN 20T searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events with at least two jets, and two isolated same-sign or three or more charged leptons (electrons or muons). No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figure 7, and in the Tglu1C and Tglu1B simplified models, see their Figures 8 and 9. Limits are also set on the sbottom mass in the Tstbot2 simplified model, see their Figure 10, and on the stop mass in the Tstop7 simplified model, see their Figure 11. Finally, limits are set on the gluino mass in RPV simplified models where the gluino decays either via $\tilde{g} \rightarrow qq\tilde{q}\tilde{q} + e/\mu/\tau$ or via $\tilde{g} \rightarrow tbs$, see Figure 12.

6 SIRUNYAN 19F searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for three-jet resonances produced in the decay of a gluino in R-parity violating supersymmetric models. The mass range from 200 to 2000 GeV is explored in four separate mass regions. The observations show agreement with standard model expectations. The results are interpreted within the framework of R-parity violating SUSY, where pair-produced gluinos decay to a six quark final state. Gluino masses below 1500 GeV are excluded at 95% C.L. See their Fig.5.

7 AABOUD 18Z searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSB pair production with R-parity violating decays of the LSP via λ_{12k} or λ_{j33} to charged leptons, see their Figures 7, 8.

Supersymmetric Particle Searches

- 8 SIRUNYAN 18AK searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing a single lepton, large jet and b -quark jet multiplicities, coming from R-parity-violating decays of gluinos. No excess over the expected background is observed. Limits are derived on the gluino mass, assuming the RPV $\tilde{g} \rightarrow tbs$ decay, see their Figure 9.
- 9 SIRUNYAN 18D searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing identified hadronically decaying top quarks, no leptons, and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 simplified model, see their Figure 8, and on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3E simplified models, see their Figure 9.
- 10 SIRUNYAN 18EA searched in 38.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for the pair production of resonances, each decaying to at least four quarks. Reconstructed particles are clustered into two large jets of similar mass, each consistent with four-parton substructure. No statistically significant excess over the Standard Model expectation is observed. Limits are set on the squark and gluino mass in RPV supersymmetry models where squarks (gluinos) decay, through intermediate higgsinos, to four (five) quarks, see their Figure 4.
- 11 AABOUD 17AI searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more isolated lepton, at least eight jets, either zero or many b -jets, for evidence of R-parity violating decays of the gluino. No significant excess above the Standard Model expectations is observed. Limits up to 2.1 TeV are set on the gluino mass in R-parity-violating supersymmetry models as Tglu3A with LSP decay through the non-zero λ''_{112} coupling as $\tilde{\chi}_1^0 \rightarrow uds$. See their Figure 9.
- 12 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more isolated lepton, at least eight jets, either zero or many b -jets, for evidence of R-parity violating decays of the gluino. No significant excess above the Standard Model expectations is observed. Limits up to 1.65 TeV are set on the gluino mass in R-parity-violating supersymmetry models with $\tilde{g} \rightarrow t\bar{t}$, $\tilde{t} \rightarrow bs$ through the non-zero λ''_{323} coupling. See their Figure 9.
- 13 AABOUD 17AL searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more isolated lepton, at least eight jets, either zero or many b -jets, for evidence of R-parity violating decays of the gluino. No significant excess above the Standard Model expectations is observed. Limits up to 1.8 TeV are set on the gluino mass in R-parity-violating supersymmetry models as Tglu1A with the LSP decay through the non-zero λ' coupling as $\tilde{\chi}_1^0 \rightarrow qq\ell$. See their Figure 9.
- 14 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.8 TeV are set on the gluino mass in R-parity-violating supersymmetry models as Tglu3A with LSP decaying through the non-zero λ''_{112} coupling as $\tilde{\chi}_1^0 \rightarrow uds$. See their Figure 5(d).
- 15 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.75 TeV are set on the gluino mass in R-parity-violating supersymmetry models as Tglu1A with LSP decaying through the non-zero λ' coupling as $\tilde{\chi}_1^0 \rightarrow qq\ell$. See their Figure 5(c).
- 16 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.45 TeV are set on the gluino mass in R-parity-violating supersymmetry models where $\tilde{g} \rightarrow t\bar{t}_1$ and $\tilde{t}_1 \rightarrow sd$ through the non-zero λ''_{321} coupling. See their Figure 5(b).
- 17 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.45 TeV are set on the gluino mass in R-parity-violating supersymmetry models where $\tilde{g} \rightarrow t\bar{t}_1$ and $\tilde{t}_1 \rightarrow bd$ through the non-zero λ''_{313} coupling. See their Figure 5(a).
- 18 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 400 GeV are set on the down type squark (\tilde{d}_R) mass in R-parity-violating supersymmetry models where $\tilde{d}_R \rightarrow tb$ through the non-zero λ''_{313} coupling or $\tilde{d}_R \rightarrow ts$ through the non-zero λ''_{321} . See their Figure 5(e) and 5(f).
- 19 AABOUD 17AZ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least seven jets and large missing transverse momentum. Selected events are further classified based on the presence of large R-jets or b -jets and no leptons. No significant excess above the Standard Model expectations is observed. Limits are set for R-parity violating decays of the gluino assuming $\tilde{g} \rightarrow t\bar{t}_1$ and $\tilde{t}_1 \rightarrow bs$ through the non-zero λ''_{323} couplings. The range 625–1375 GeV is excluded for $m_{\tilde{t}_1} = 400 \text{ GeV}$. See their Figure 7b.
- 20 KHACHATRYAN 17Y searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing at least 8 or 10 jets, possibly b -tagged, coming from R-parity-violating decays of supersymmetric particles. No excess over the expected background is observed. Limits are derived on the gluino mass, assuming various RPV decay modes, see Fig. 7.
- 21 KHACHATRYAN 16BJ searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the following simplified models: Tglu3A and Tglu3D, see Fig. 4, Tglu3B and Tglu3C, see Fig. 5, and Tglu1B, see Fig. 7.
- 22 KHACHATRYAN 16BX searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing 0 or 1 leptons and b -tagged jets, coming from R-parity-violating decays of supersymmetric particles. No excess over the expected background is observed. Limits are derived on the gluino mass, assuming the RPV $\tilde{g} \rightarrow tbs$ decay, see Fig. 7 and 10.
- 23 AAD 15BV summarized and extended ATLAS searches for gluinos and first- and second-generation squarks in final states containing jets and missing transverse momentum, with or without leptons or b -jets in the $\sqrt{s} = 8 \text{ TeV}$ data set collected in 2012. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on the gluino mass in several R-parity conserving models, leading to a generalized constraint on gluino masses exceeding 1150 GeV for lightest supersymmetric particle masses below 100 GeV. See their Figs. 10, 19, 20, 21, 23, 25, 26, 29–37.
- 24 AAD 14X searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in an R-parity violating simplified model where the decay $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$, with $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \nu$, takes place with a branching ratio of 100%, see Fig. 8.
- 25 CHATRCHYAN 14P searched in 19.4 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for three-jet resonances produced in the decay of a gluino in R-parity violating supersymmetric models. No excess over the expected SM background is observed. Assuming a 100% branching ratio for the gluino decay into three light-flavour jets, limits are set on the cross section of gluino pair production, see Fig. 7, and gluino masses below 650 GeV are excluded at 95% C.L. Assuming a 100% branching ratio for the gluino decaying to one b -quark jet and two light-flavour jets, gluino masses between 200 GeV and 835 GeV are excluded at 95% C.L.
- 26 AABOUD 18CF searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with several jets, possibly b -jets, and large-radius jets for evidence of R-parity violating decays of the gluino. No significant excess above the Standard Model expectations is observed. Limits between 1000 and 1875 GeV are set on the gluino mass in R-parity-violating supersymmetry models as Tglu2RPV with the LSP decay through the non-zero λ'' coupling as $\tilde{\chi}_1^0 \rightarrow qq\ell$. The most stringent limit is obtained for $m_{\tilde{\chi}_1^0} = 1000 \text{ GeV}$, the weakest for $m_{\tilde{\chi}_1^0} = 50 \text{ GeV}$. See their Figure 7(b). Figure 7(a) presents results for gluinos directly decaying into 3 quarks, Tglu1RPV.
- 27 KHACHATRYAN 16BX searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing 4 leptons coming from R-parity-violating decays of $\tilde{\chi}_1^0 \rightarrow \ell\ell\nu$ with $\lambda_{121} \neq 0$ or $\lambda_{122} \neq 0$. No excess over the expected background is observed. Limits are derived on the gluino, squark and stop masses, see Fig. 23.
- 28 AAD 15CB searched for events containing at least one long-lived particle that decays at a significant distance from its production point (displaced vertex, DV) into two leptons or into five or more charged particles in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The dilepton signature is characterised by DV formed from at least two lepton candidates. Four different final states were considered for the multitrack signature, in which the DV must be accompanied by a high-transverse momentum muon or electron candidate that originates from the DV, jets or missing transverse momentum. No events were observed in any of the signal regions. Results were interpreted in SUSY scenarios involving R-parity violation, split supersymmetry, and gauge mediation. See their Fig. 12–20.
- 29 AAD 15X searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing large number of jets, no requirements on missing transverse momentum and no isolated electrons or muons. The sensitivity of the search is enhanced by considering the number of b -tagged jets and the scalar sum of masses of large-radius jets in an event. No evidence was found for excesses above the expected level of Standard Model background. Exclusion limits at 95% C.L. are set on the gluino mass assuming the gluino decays to various quark flavors, and for various neutralino masses. See their Fig. 11–16.
- 30 AAD 14AX searched in 20.1 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for the strong production of supersymmetric particles in events containing either zero or at least one high p_T lepton, large missing transverse momentum, high jet multiplicity and at least three jets identified as originating from b -quarks. No excess over the expected SM background is observed. Limits are derived in mSUGRA/CMSSM models with $\tan\beta = 30$, $A_0 = -2m_0$ and $\mu > 0$, see their Fig. 14. Also, exclusion limits in simplified models containing gluinos and scalar top and bottom quarks are set, see their Figures 12, 13.
- 31 AAD 14E searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilises jets originating from b -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos and squarks, see Figures 5 and 6. In the $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow W^{(*)\pm}\tilde{\chi}_2^0$, $\tilde{\chi}_2^0 \rightarrow Z^{(*)}\tilde{\chi}_1^0$ simplified model, the following assumptions have been made: $m_{\tilde{\chi}_1^\pm} = 0.5 m_{\tilde{\chi}_1^0} + m_{\tilde{g}}$, $m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{g}})$, $m_{\tilde{g}} < 520 \text{ GeV}$. In the $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow \ell^\pm\nu\tilde{\chi}_1^0$ or $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_2^0$, $\tilde{\chi}_2^0 \rightarrow \ell^\pm\ell^\mp(\nu\nu)\tilde{\chi}_1^0$ simplified model, the following assumptions have been made: $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{g}})$, $m_{\tilde{\chi}_1^0} < 660 \text{ GeV}$. Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.
- 32 CHATRCHYAN 14H searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the R-parity violating decay $\tilde{g} \rightarrow tbs$ takes place with a branching ratio of 100%, see Fig. 8.

Long-lived \tilde{g} (Gluino) mass limit

Limits on light gluinos ($m_{\tilde{g}} < 5 \text{ GeV}$) were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics C38 070001 (2014) (<http://pdg.lbl.gov>).

¹ SIRUNYAN 21AF searched in 140 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for supersymmetry in events with two displaced vertices from long-lived particles decaying into multijet or dijet final states. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the simplified model Tglu2RPV with λ_{323}'' coupling, on the $\tilde{\chi}_1^0$ mass in an RPV model with $\tilde{\chi}_1^0$ pair production and the RPV decay $\tilde{\chi}_1^0 \rightarrow tbs$ with λ_{323}'' coupling and on the \tilde{t} mass in an RPV model with top squark pair production and the RPV decay $\tilde{t} \rightarrow \tilde{d}_i\tilde{d}_j$ with λ_{3ij}'' coupling, see their Figure 7.

² SIRUNYAN 21U searched in 132 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for supersymmetry in events with displaced tracks and displaced vertices associated with a dijet system. No significant excess above the Standard Model expectations is observed. Limits are set on long-lived gluinos in an RPC GMSB SUSY model of gluino pair production, with $\tilde{g} \rightarrow g\tilde{G}$, see their Figure 9, in Tglu1A in a mini-split model, see their Figure 10, and in an RPV model of gluino pair production, with $\tilde{g} \rightarrow tbs$ with coupling λ_{323}'' , see their Figure 11. Limits are also set on long-lived top squarks in Tstop2RPV, see their Figure 12, in an RPV model with $\tilde{t} \rightarrow d\tilde{d}$ and λ_{x31}' coupling, see their Figure 13, and in a dynamical RPV model with $\tilde{t} \rightarrow \tilde{d}\tilde{d}$ via a nonholomorphic RPV coupling g_{311}'' , see their Figure 14. The best mass limit is achieved in all cases at $c\tau = 30 \text{ mm}$.

³ AABOUD 19AT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for metastable and stable R-hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Gluino R-hadrons with lifetimes of the order of 50 ns are excluded at 95% C.L. for masses below 1980 GeV using the muon-spectrometer agnostic analysis. Using the full-detector search, the observed lower limits on the mass are 2000 GeV. See their Figure 9 (top).

⁴ AABOUD 19C searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for metastable and stable R-hadrons arising as excesses in the mass distribution of reconstructed tracks with high transverse momentum and large dE/dx . Gluino R-hadrons with lifetimes above 10 ns are excluded at 95% C.L. with lower mass limit range between 1000 GeV and 2060 GeV, see their Figure 5(a). Masses smaller than 1290 GeV are excluded for a lifetime of 1 ns, see their Figure 6. In the case of stable R-hadrons, the lower mass limit is 1890 GeV, see their Figure 5(b).

⁵ SIRUNYAN 19BH searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived particles decaying into jets, with each long-lived particle having a decay vertex well displaced from the production vertex. The selected events are found to be consistent with standard model predictions. Limits are set on the gluino mass in a GMSB model where the gluino is decaying via $\tilde{g} \rightarrow g\tilde{G}$, see their Figure 4 and in an RPV model of supersymmetry where the gluino is decaying via $\tilde{g} \rightarrow \tilde{t}\tilde{d}\tilde{s}$, see their Figures 5. Limits are also set on the stop mass in two RPV models, see their Figure 6 (for $\tilde{t} \rightarrow b\tilde{l}$ decays) and Figure 7 (for $\tilde{t} \rightarrow \tilde{d}\tilde{d}$ decays).

⁶ SIRUNYAN 19BT searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived particles decaying to displaced, nonprompt jets and missing transverse momentum. Candidate signal events are identified using the timing capabilities of the CMS electromagnetic calorimeter. The results of the search are found to be consistent with the background predictions. Limits are set on the gluino mass in a GMSB model where long-lived gluinos are pair produced and decaying via $\tilde{g} \rightarrow g\tilde{G}$, see their Figures 4 and 5.

⁷ AABOUD 18s searched in 32.8 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived gluinos in final states with large missing transverse momentum and at least one high-mass displaced vertex with five or more tracks. The observed yield is consistent with the expected background. Exclusion limits are derived for Tglu1A models predicting the existence of long-lived gluinos reaching roughly $m(\tilde{g}) = 2000 \text{ GeV}$ to 2370 GeV for $m(\tilde{\chi}_1^0) = 100 \text{ GeV}$ and gluino lifetimes between 0.02 and 10 ns, see their Fig. 8. Limits are presented also as a function of the lifetime (for a fixed gluino-neutralino mass difference of 100 GeV) and of the gluino and neutralino masses (for a fixed lifetime of 1 ns). See their Fig. 9 and 10 respectively.

⁸ SIRUNYAN 18AY searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing one or more jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsbol1, Tstop1 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range $10^{-3} \text{ mm} < c\tau < 10^5 \text{ mm}$, see their Figure 4.

⁹ SIRUNYAN 18DV searched in 38.5 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived particles in events with multiple jets and two displaced vertices composed of many tracks. No events with two well-separated high-track-multiplicity vertices were observed. Limits are set on the stop and the gluino mass in RPV models of supersymmetry where the stop (gluino) is decaying solely into dijet (multijet) final states, see their Figures 6 and 7.

¹⁰ KHACHATRYAN 17AR searched in 17.6 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for R-parity-violating SUSY in which long-lived neutralinos or gluinos decay into multijet final states. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass for a range of mean proper decay lengths ($c\tau$), see their Fig. 7. The upper limits on the production cross section times branching ratio squared (Fig. 7) are also applicable to long-lived neutralinos.

¹¹ AABOUD 16B searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived R-hadrons using observables related to large ionization losses and slow propagation velocities, which are signatures of heavy charged particles traveling significantly slower than the speed of light. Exclusion limits at 95% C.L. are set on the long-lived gluino masses exceeding 1580 GeV. See their Fig. 5.

¹² AABOUD 16C searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived and stable R-hadrons identified by anomalous specific ionization energy loss in the ATLAS Pixel detector. Gluino R-hadrons with lifetimes above 0.4 ns are excluded at 95% C.L. with lower mass limit range between 740 GeV and 1590 GeV. In the case of stable R-hadrons, the lower mass limit is 1570 GeV. See their Figs. 5 and 6.

Searches Particle Listings

Supersymmetric Particle Searches

- 13 KHACHATRYAN 16BW searched in 2.5 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with heavy stable charged particles, identified by their anomalously high energy deposits in the silicon tracker and/or long time-of-flight measurements by the muon system. No evidence for an excess over the expected background is observed. Limits are derived for pair production of gluinos as a function of mass, depending on the interaction model and on the fraction f , of produced gluinos hadronizing into a \tilde{g} -gluon state, see Fig. 4 and Table 7.
- 14 AAD 15AE searched in 19.1 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for heavy long-lived charged particles, measured through their specific ionization energy loss in the ATLAS pixel detector or their time-of-flight in the ALTA muon system. In the absence of an excess of events above the expected backgrounds, limits are set for R -hadrons in various scenarios, see Fig. 11. Limits are also set in LeptoSUSY models where the gluino decays to stable 300 GeV leptons, see Fig. 9.
- 15 AAD 15BM searched in 18.4 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for stable and metastable non-relativistic charged particles through their anomalously specific ionization energy loss in the ATLAS pixel detector. In the absence of an excess of events above the expected backgrounds, limits are set within a generic R -hadron model, on stable gluino R -hadrons (see Table 5) and on metastable gluino R -hadrons decaying to $(g/\overline{q\overline{q}})$ plus a light $\tilde{\chi}_1^0$ (see Fig. 7) and decaying to $t\overline{t}$ plus a light $\tilde{\chi}_1^0$ (see Fig. 9).
- 16 KHACHATRYAN 15AK looked in a data set corresponding to 18.6 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$, and a search interval corresponding to 281 h of trigger lifetime, for long-lived particles that have stopped in the CMS detector. No evidence for an excess over the expected background in a cloud interaction model is observed. Assuming the decay $\tilde{g} \rightarrow g\tilde{\chi}_1^0$ and lifetimes between $1 \mu\text{s}$ and 1000 s , limits are derived on \tilde{g} production as a function of $m_{\tilde{\chi}_1^0}$, see Figs. 4 and 6. The exclusions require that $m_{\tilde{\chi}_1^0}$ is kinematically consistent with the minimum values of the jet energy thresholds used.
- 17 AAD 13AA searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing colored long-lived particles that hadronize forming R -hadrons. No significant excess above the expected background was found. Long-lived R -hadrons containing a \tilde{g} are excluded for masses up to 985 GeV at 95% C.L. in a general interaction model. Also, limits independent of the fraction of R -hadrons that arrive charged in the muon system were derived, see Fig. 6.
- 18 AAD 13bc searched in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 22.9 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for bottom squark R -hadrons that have come to rest within the ATLAS calorimeter and decay at some later time to hadronic jets and a neutralino. In the absence of an excess of events above the expected backgrounds, limits are set on gluino masses for different decays, lifetimes, and neutralino masses, see their Table 6 and Fig. 10.
- 19 CHATRCHYAN 13AB looked in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 18.8 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with heavy stable particles, identified by their anomalously dE/dx in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of \tilde{g} 's. No evidence for an excess over the expected background is observed. Limits are derived for pair production of gluinos as a function of mass (see Fig. 8 and Table 5), depending on the fraction, f , of formation of $\tilde{g}-g$ (R -gluonball) states. The quoted limit is for $f = 0.1$, while for $f = 0.5$ it degrades to 1276 GeV. In the conservative scenario where every hadronic interaction causes it to become neutral, the limit decreases to 928 GeV for $f = 0.1$.
- 20 AAD 12P looked in 31 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with pair production of long-lived gluinos. The hadronization of the gluinos leads to R -hadrons which may stop inside the detector and later decay via $\tilde{g} \rightarrow g\tilde{\chi}_1^0$ during gaps between the proton bunches. No significant excess over the expected background is observed. From a counting experiment, a limit at 95% C.L. on the cross section as a function of $m_{\tilde{g}}$ is derived for $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$, see Fig. 4. The limit is valid for lifetimes between 10^{-5} and 10^3 seconds and assumes the *Generic* matter interaction model for the production cross section.
- 21 CHATRCHYAN 12AN looked in 4.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with pair production of long-lived gluinos. The hadronization of the gluinos leads to R -hadrons which may stop inside the detector and later decay via $\tilde{g} \rightarrow g\tilde{\chi}_1^0$ during gaps between the proton bunches. No significant excess over the expected background is observed. From a counting experiment, a limit at 95% C.L. on the cross section as a function of $m_{\tilde{g}}$ is derived, see Fig. 3. The mass limit is valid for lifetimes between 10^{-5} and 10^3 seconds, for what they call "the daughter gluon energy $E_{\tilde{g}} > 100 \text{ GeV}$ and assuming the *cloud* interaction model for R -hadrons. Supersedes KHACHATRYAN 11.
- 22 CHATRCHYAN 12L looked in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with heavy stable particles, identified by their anomalously dE/dx in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of \tilde{g} 's. No evidence for an excess over the expected background is observed. Limits are derived for pair production of gluinos as a function of mass (see Fig. 3), depending on the fraction, f , of formation of $\tilde{g}-g$ (R -glueball) states. The quoted limit is for $f = 0.1$, while for $f = 0.5$ it degrades to 1046 GeV. In the conservative scenario where every hadronic interaction causes it to become neutral, the limit decreases to 928 GeV for $f=0.1$. Supersedes KHACHATRYAN 11c.
- 23 AAD 11K looked in 34 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with heavy stable particles, identified by their anomalously dE/dx in the tracker or time of flight in the tile calorimeter, from pair production of \tilde{g} . No evidence for an excess over the SM expectation is observed. Limits are derived for pair production of gluinos as a function of mass (see Fig. 4), for a fraction, $f = 10\%$, of formation of $\tilde{g}-g$ (R -gluonball). If instead of a phase space driven approach for the hadronic scattering of the R -hadrons, a triple-Regge model or a bag-model is used, the limit degrades to 566 and 562 GeV, respectively.
- 24 AAD 11P looked in 37 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with heavy stable particles, reconstructed and identified by their time of flight in the Muon System. There is no requirement on their observation in the tracker to increase the sensitivity to cases where gluinos have a large fraction, f , of formation of neutral $\tilde{g}-g$ (R -gluonball). No evidence for an excess over the SM expectation is observed. Limits are derived as a function of mass (see Fig. 4), for $f=0.1$. For fractions $f = 0.5$ and 1.0 the limit degrades to 537 and 530 GeV, respectively.
- 25 KHACHATRYAN 11 looked in 10 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with pair production of long-lived gluinos. The hadronization of the gluinos leads to R -hadrons which may stop inside the detector and later decay via $\tilde{g} \rightarrow g\tilde{\chi}_1^0$ during gaps between the proton bunches. No significant excess over the expected background is observed. From a counting experiment, a limit at 95% C.L. on the cross section times branching ratio is derived for $m_{\tilde{g}} - m_{\tilde{\chi}_1^0} > 100 \text{ GeV}$, see their Fig. 2. Assuming 100% branching

ratio, lifetimes between 75 ns and $3 \times 10^5 \text{ s}$ are excluded for $m_{\tilde{g}} = 300 \text{ GeV}$. The \tilde{g} mass exclusion is obtained with the same assumptions for lifetimes between $10 \mu\text{s}$ and 1000 s , but shows some dependence on the model for R -hadron interactions with matter, illustrated in Fig. 3. From a time-profile analysis, the mass exclusion is 382 GeV for a lifetime of $10 \mu\text{s}$ under the same assumptions as above.

- 26 KHACHATRYAN 11c looked in 3.1 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with heavy stable particles, identified by their anomalously dE/dx in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of \tilde{g} . No evidence for an excess over the expected background is observed. Limits are derived for pair production of gluinos as a function of mass (see Fig. 3), depending on the fraction, f , of formation of $\tilde{g}-g$ (R -gluonball). The quoted limit is for $f=0.1$, while for $f=0.5$ it degrades to 357 GeV. In the conservative scenario where every hadronic interaction causes it to become neutral, the limit decreases to 311 GeV for $f=0.1$.

Light \tilde{G} (Gravitino) mass limits from collider experiments

The following are bounds on light ($\ll 1 \text{ eV}$) gravitino indirectly inferred from its coupling to matter suppressed by the gravitino decay constant.

Unless otherwise stated, all limits assume that other supersymmetric particles besides the gravitino are too heavy to be produced. The gravitino is assumed to be undetected and to give rise to a missing energy (\cancel{E}) signature.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- ¹AAD 15BH searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for associated production of a light gravitino and a squark or gluino. The squark (gluino) is assumed to decay exclusively to a quark (gluon) and a gravitino. No evidence was found for an excess above the expected level of Standard Model background and 95% C.L. lower limits were set on the gravitino mass as a function of the squark/gluino mass, both in the case of degenerate and non-degenerate squark/gluino masses, see Figs. 14 and 15.

- ²ABDALLAH 05B use data from $\sqrt{s} = 180\text{--}208 \text{ GeV}$. They look for events with a single photon + \cancel{E} final states from which a cross section limit of $\sigma < 0.18 \text{ pb}$ at 208 GeV is obtained, allowing a limit on the mass to be set. Supersedes the results of ABREU 00Z.

- ³ACHARD 04E use data from $\sqrt{s} = 189\text{--}209 \text{ GeV}$. They look for events with a single photon + \cancel{E} final states from which a limit on the Gravitino mass is set corresponding to $\sqrt{F} > 238 \text{ GeV}$. Supersedes the results of ACCIARRI 99R.

- ⁴HEISTER 03C use the data from $\sqrt{s} = 189\text{--}209 \text{ GeV}$ to search for $\gamma\cancel{E}_T$ final states.

- ⁵ACOSTA 02H looked in 87 pb^{-1} of $p\overline{p}$ collisions at $\sqrt{s}=1.8 \text{ TeV}$ for events with a high- E_T photon and \cancel{E}_T . They compared the data with a GMSB model where the final state could arise from $q\overline{q} \rightarrow \tilde{G}\tilde{G}\gamma$. Since the cross section for this process scales as $1/|F|^4$, a limit at 95% CL is derived on $|F|^{1/2} > 221 \text{ GeV}$. A model independent limit for the above topology is also given in the paper.

- ⁶ABBIENDI,G 00D searches for $\gamma\cancel{E}$ final states from $\sqrt{s}=189 \text{ GeV}$.

Supersymmetry miscellaneous results

Results that do not appear under other headings or that make nonminimal assumptions.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- ¹AAD 20C uses a statistical combination of six final states $b\overline{b}b\overline{b}$, $b\overline{b}W\overline{W}$, $b\overline{b}\tau\tau$, $W\overline{W}W\overline{W}$, $b\overline{b}\gamma\gamma$, and $W\overline{W}\gamma\gamma$ to search for non-resonant and resonant production of Higgs boson pairs. The search uses 36.1 fb^{-1} of pp collisions data at $\sqrt{s} = 13 \text{ TeV}$. Constraints in the habemus Minimal Supersymmetric Standard Model in the $(m_A, \tan\beta)$ parameter space are placed, see their Figure 7(b).

- 2 AAD 20L used 27.8 fb⁻¹ of *pp* collision data at $\sqrt{s} = 13$ TeV to search for heavy neutral Higgs bosons produced in association with at least one *b*-quark and decaying into a pair of *b*-quarks. The data are compatible with SM expectations, yielding no significant excess of events in the mass range 450–1400 GeV, see their Fig. 11. Exclusion limits at 95% C.L. were derived in hMSSM scenarios as a function of m_A and $\tan\beta$, see their Fig. 9 and 10.
- 3 AABOU 16AF uses a selection of searches by ATLAS for the electroweak production of SUSY particles studying resulting constraints on dark matter candidates. They use 20 fb⁻¹ of *pp* collisions at $\sqrt{s} = 8$ TeV. A likelihood-driven scan of an effective model focusing on the gaugino-higgsino and Higgs sector of the pMSSM is performed. The ATLAS searches impact models where $m_0 < 65$ GeV, excluding 86% of them. See their Figs. 2, 4, and 6.
- 4 AAD 16AG searches for prompt lepton-jets using 20 fb⁻¹ of *pp* collisions at $\sqrt{s} = 8$ TeV collected with the ATLAS detector. Lepton-jets are expected from decays of low-mass dark photons in SUSY-portal and Higgs-portal models. No significant excess of events is observed and 95% CL upper limits are computed on the production cross section times branching ratio for two prompt lepton-jets in models predicting 2 or 4 γ_D via SUSY-portal topologies, for γ_D mass values between 0 and 2 GeV. See their Figs 9 and 10. The results are also interpreted in terms of a 90% CL exclusion region in kinetic mixing and dark-photon mass parameter space. See their Fig. 13.
- 5 AAD 13P searched in 5 fb⁻¹ of *pp* collisions at $\sqrt{s} = 7$ TeV for single lepton-jets with at least four muons; pairs of lepton-jets, each with two or more muons; and pairs of lepton-jets with two or more electrons. All of these could be signatures of Hidden Valley supersymmetric models. No statistically significant deviations from the Standard Model expectations are found. 95% C.L. limits are placed on the production cross section times branching ratio of dark photons for several parameter sets of a Hidden Valley model.
- 6 AALTONEN 12AB looked in 5.1 fb⁻¹ of *p* \bar{p} collisions at $\sqrt{s} = 1.96$ TeV for anomalous production of multiple low-energy leptons in association with a *W* or *Z* boson. Such events may occur in hidden valley models in which a supersymmetric Higgs boson is produced in association with a *W* or *Z* boson, with $H \rightarrow \tilde{\chi}_1^0 \tilde{\chi}_1^0$ pair and with the $\tilde{\chi}_1^0$ further decaying into a dark photon (γ_D) and the unobservable lightest SUSY particle of the hidden sector. As the γ_D is expected to be light, it may decay into a lepton pair. No significant excess over the SM expectation is observed and a limit at 95% C.L. is set on the cross section for a benchmark model of supersymmetric hidden-valley Higgs production.
- 7 AAD 11AA looked in 34 pb⁻¹ of *pp* collisions at $\sqrt{s} = 7$ TeV for events with ≥ 4 jets originating from pair production of scalar gluons, each decaying to two gluons. No two-jet resonances are observed over the SM background. Limits are derived on the cross section times branching ratio (see Fig. 3). Assuming 100% branching ratio for the decay to two gluons, the quoted exclusion range is obtained, except for a 5 GeV mass window around 140 GeV.
- 8 CHATRCHYAN 11E looked in 35 pb⁻¹ of *pp* collisions at $\sqrt{s} = 7$ TeV for events with collimated μ pairs (leptonic jets) from the decay of hidden sector states. No evidence for new resonance production is found. Limits are derived and compared to various SUSY models (see Fig. 4) where the LSP, either the $\tilde{\chi}_1^0$ or a \tilde{q} , decays to dark sector particles.
- 9 ABAZOV 10N looked in 5.8 fb⁻¹ of *p* \bar{p} collisions at $\sqrt{s} = 1.96$ TeV for events from hidden valley models in which a $\tilde{\chi}_1^0$ decays into a dark photon, γ_D , and the unobservable lightest SUSY particle of the hidden sector. As the γ_D is expected to be light, it may decay into a tightly collimated lepton pair, called lepton jet. They searched for events with E_T and two isolated lepton jets observable by an opposite charged lepton pair *e* \bar{e} , $\mu\bar{\mu}$ or $\mu\mu$. No significant excess over the SM expectation is observed, and a limit at 95% C.L. on the cross section times branching ratio is derived, see their Table I. They also examined the invariant mass of the lepton jets for a narrow resonance, see their Fig. 4, but found no evidence for a signal.

- AAD 20AM search for a top-color Z' decaying to $t\bar{t}$ in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit is for $\Gamma_{Z'}/M_{Z'} = 0.01$. The limit becomes $M_{Z'} > 4700$ GeV for $\Gamma_{Z'}/M_{Z'} = 0.03$.
- AAD 20W search for techni- ρ decaying to $\pi_T W$ in pp collisions at $\sqrt{s} = 13$ TeV. See their Fig. 5a for limits on σ_B .
- AAD 16W search for color octet vector resonance decaying to $b\bar{b}$ in pp collisions at $\sqrt{s} = 8$ TeV. The vector like quark B is assumed to decay to bH . See their Fig.3 and Fig.4 for limits on σ_B .
- KHACHATRYAN 16E search for top-color Z' decaying to $t\bar{t}$. The quoted limit is for $\Gamma_{Z'}/M_{Z'} = 0.012$. Also exclude $M_{Z'} < 2.9$ TeV for wider topcolor Z' with $\Gamma_{Z'}/M_{Z'} = 0.1$.
- AAD 15AB search for long-lived hidden valley π_V particles which are produced in pairs by the decay of a scalar boson. π_V is assumed to decay into dijets. See their Fig. 10 for the limit on σ_B .
- AAD 15AO search for top-color Z' decaying to $t\bar{t}$. The quoted limit is for $\Gamma_{Z'}/M_{Z'} = 0.012$.
- AAD 15BB search for minimal walking technicolor (MWT) isotriplet vector and axial-vector resonances decaying to Wh or Zh . See their Fig. 3 for the exclusion limit in the MWT parameter space.
- AAD 15Q search for long-lived hidden valley π_V particles which are produced in pairs by the decay of scalar boson. π_V is assumed to decay into dijets. See their Fig. 5 and Fig. 6 for the limit on σ_B .
- AAIJ 15AN search for long-lived hidden valley π_V particles which are produced in pairs by the decay of scalar boson with a mass of 120GeV. π_V is assumed to decay into dijets. See their Fig. 4 for the limit on σ_B .
- KHACHATRYAN 15C search for a vector techni-resonance decaying to WZ . The limit assumes $M_{\pi_T} = (3/4) M_{\rho_T} = 25$ GeV. See their Fig.3 for the limit in $M_{\pi_T} - M_{\rho_T}$ plane of the low scale technicolor model.
- KHACHATRYAN 15W search for long-lived hidden valley π_V particles which are produced in pairs in the decay of heavy higgs boson H . π_V is assumed to decay into $\ell^+ \ell^-$. See their Fig. 7 and Fig. 8 for the limits on σ_B .

- AAD 14AT search for techni- ω and techni- a resonances decaying to $V\gamma$ with $V = W(\rightarrow \ell\nu)$ or $Z(\rightarrow \ell^+ \ell^-)$.
- AAD 14V search for vector techni-resonances decaying into electron or muon pairs in pp collisions at $\sqrt{s} = 8$ TeV. See their table IX for exclusion limits with various assumptions.
- AAD 13AN search for vector techni-resonance a_T decaying into $W\gamma$.
- AAD 13AN search for vector techni-resonance ω_T decaying into $Z\gamma$.
- Search for top-color Z' decaying to $t\bar{t}$. The quoted limit is for $\Gamma_{Z'}/M_{Z'} = 0.012$.
- CHATRCHYAN 13AP search for top-color leptophobic Z' decaying to $t\bar{t}$. The quoted limit is for $\Gamma_{Z'}/M_{Z'} = 0.012$.
- BAAK 12 give electroweak oblique parameter constraints on the QCD-like technicolor models. See their Fig. 28.
- CHATRCHYAN 12AF search for a vector techni-resonance decaying to WZ . The limit assumes $M_{\pi_T} = (3/4) M_{\rho_T} = 25$ GeV. See their Fig. 3 for the limit in $M_{\pi_T} - M_{\rho_T}$ plane of the low scale technicolor model.
- Using the LHC limit on the Higgs boson production cross section, CHIVUKULA 11 obtain a limit on the top-Higgs mass > 300 GeV at 95% CL assuming 150 GeV top-pion mass.
- Using the LHC limit on the Higgs boson production cross section, CHIVUKULA 11A obtain a limit on the technipion mass ruling out the region $110 \text{ GeV} < m_P < 2m_t$. Existence of color techni-fermions, top-color mechanism, and $N_{TC} \geq 3$ are assumed.
- AALTONEN 10I search for the vector techni-resonances (ρ_T, ω_T) decaying into $W\pi_T$ with $W \rightarrow \ell\nu$ and $\pi_T \rightarrow b\bar{b}, b\bar{c},$ or $b\bar{s}$. See their Fig.3 for the exclusion plot in $M_{\pi_T} - M_{\rho_T}$ plane.
- ABZOV 10A search for a vector techni-resonance decaying into WZ . The limit assumes $M_{\rho_T} < M_{\pi_T} + M_W$.
- ABZOV 07I search for the vector techni-resonances (ρ_T, ω_T) decaying into $W\pi_T$ with $W \rightarrow e\nu$ and $\pi_T \rightarrow b\bar{b}$ or $b\bar{c}$. See their Fig. 2 for the exclusion plot in $M_{\pi_T} - M_{\rho_T}$ plane.
- ABULENCIA 05A search for resonances decaying to electron or muon pairs in $p\bar{p}$ collisions. at $\sqrt{s} = 1.96$ TeV. The limit assumes Technicolor-scale mass parameters $M_V = M_A = 500$ GeV.
- CHEKANOV 02B search for color octet techni- π P decaying into dijets in ep collisions. See their Fig. 5 for the limit on $\sigma(ep \rightarrow ePX) \cdot B(P \rightarrow 2j)$.
- ABZOV 01B searches for vector techni-resonances (ρ_T, ω_T) decaying to e^+e^- . The limit assumes $M_{\rho_T} = M_{\omega_T} < M_{\pi_T} + M_W$.
- The limit is independent of the π_T mass. See their Fig. 9 and Fig. 10 for the exclusion plot in the $M_{\rho_T} - M_{\pi_T}$ plane. ABDALLAH 01 limit on the techni-pion mass is $M_{\pi_T} > 79.8$ GeV for $N_D = 2$, assuming its point-like coupling to gauge bosons.
- AFFOLDER 00F search for ρ_T decaying into $W\pi_T$ or $\pi_T\pi_T$ with $W \rightarrow \ell\nu$ and $\pi_T \rightarrow \bar{b}b, \bar{b}c$. See Fig. 1 in the above Note on "Dynamical Electroweak Symmetry Breaking" for the exclusion plot in the $M_{\rho_T} - M_{\pi_T}$ plane.
- AFFOLDER 00K search for the ρ_{T8} decaying into $\pi_{LQ}\pi_{LQ}$ with $\pi_{LQ} \rightarrow b\nu$. For $\pi_{LQ} \rightarrow c\nu$, the limit is $M_{\rho_{T8}} > 510$ GeV. See their Fig. 2 and Fig. 3 for the exclusion plot in the $M_{\rho_{T8}} - M_{\pi_{LQ}}$ plane.
- ABE 99F search for a new particle X decaying into $b\bar{b}$ in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. See Fig. 7 in the above Note on "Dynamical Electroweak Symmetry Breaking" for the upper limit on $\sigma(p\bar{p} \rightarrow X) \times B(X \rightarrow b\bar{b})$. ABE 99F also exclude top gluons of width $\Gamma = 0.3M$ in the mass interval $280 < M < 670$ GeV, of width $\Gamma = 0.5M$ in the mass interval $340 < M < 640$ GeV, and of width $\Gamma = 0.7M$ in the mass interval $375 < M < 560$ GeV.
- ABE 99N search for the techni- ω decaying into $\gamma\pi_T$. The technipion is assumed to decay $\pi_T \rightarrow b\bar{b}$. See Fig. 2 in the above Note on "Dynamical Electroweak Symmetry Breaking" for the exclusion plot in the $M_{\omega_T} - M_{\pi_T}$ plane.
- ABE 97G search for a new particle X decaying into dijets in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. See Fig. 5 in the above Note on "Dynamical Electroweak Symmetry Breaking" for the upper limit on $\sigma(p\bar{p} \rightarrow X) \times B(X \rightarrow 2j)$.

>5.0	>5.4	95	1 MCFARLAND	98	CCFR νN scattering

- MCFARLAND 98 assumed a flavor universal interaction. Neutrinos were mostly of muon type.

MASS LIMITS for Excited e (e^*)

Most e^+e^- experiments assume one-photon or Z exchange. The limits from some e^+e^- experiments which depend on λ have assumed transition couplings which are chirality violating ($\eta_L = \eta_R$). However they can be interpreted as limits for chirality-conserving interactions after multiplying the coupling value λ by $\sqrt{2}$; see Note.

Excited leptons have the same quantum numbers as other ortholeptons. See also the searches for ortholeptons in the "Searches for Heavy Leptons" section.

Limits for Excited e (e^*) from Pair Production

These limits are obtained from $e^+e^- \rightarrow e^+e^*$ and thus rely only on the (electroweak) charge of e^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the e^* coupling is assumed to be of sequential type. Possible t channel contribution from transition magnetic coupling is neglected. All limits assume a dominant $e^* \rightarrow e\gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** 51 (1992)).

				¹ From e^+e^- collisions at $\sqrt{s} = 183$ –209 GeV. $f = f'$ is assumed.
				² From e^+e^- collisions at $\sqrt{s} = 189$ –209 GeV. $f = f'$ is assumed. ACHARD 03B also obtain limit for $f = -f'$: $m_{e^*} > 96.6$ GeV.

Limits for Excited e (e^*) from Single Production

These limits are from $e^+e^- \rightarrow e^*e, W \rightarrow e^*\nu, \text{ or } ep \rightarrow e^*X$ and depend on transition magnetic coupling between e and e^* . All limits assume $e^* \rightarrow e\gamma$ decay except as noted. Limits from LEP, UA2, and H1 are for chiral coupling, whereas all other limits are for nonchiral coupling, $\eta_L = \eta_R = 1$. In most papers, the limit is expressed in the form of an excluded region in the λ – m_{e^*} plane. See the original papers.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** 51 (1992)).

- SIRUNYAN 20AJ search for e^* production in $2e2j$ final states in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit assumes $\Lambda = m_{e^*}$, $f = f' = 1$. The contact interaction is included. See their Fig.11 for exclusion limits in m_{e^*} – Λ plane.
- AABOUD 19AZ search for single e^* production in pp collisions at $\sqrt{s} = 13$ TeV. The limit quoted above is from $e^* \rightarrow e q\bar{q}$ and $e^* \rightarrow \nu W$ decays assuming $f = f' = 1$ and $m_{e^*} = \Lambda$. The contact interaction is included in e^* production and decay amplitudes. See their Fig.6 for exclusion limits in m_{e^*} – Λ plane.
- SIRUNYAN 19Z search for e^* production in $\ell\ell\gamma$ final states in pp collisions at $\sqrt{s} = 13$ TeV. The quoted limit assumes $\Lambda = m_{e^*}$, $f = f' = 1$. The contact interaction is included in the e^* production and decay amplitudes.
- KHACHATRYAN 16AQ search for single e^* production in pp collisions at $\sqrt{s} = 8$ TeV. The limit above is from the $e^* \rightarrow e\gamma$ search channel assuming $f = f' = 1$, $m_{e^*} = \Lambda$. See their Table 7 for limits in other search channels or with different assumptions.
- AAD 15AP search for e^* production in events with three or more charged leptons in pp collisions at $\sqrt{s} = 8$ TeV. The quoted limit assumes $\Lambda = m_{e^*}$, $f = f' = 1$. The contact interaction is included in the e^* production and decay amplitudes.
- AAD 13BB search for single e^* production in pp collisions with $e^* \rightarrow e\gamma$ decay. $f = f' = 1$, and e^* production via contact interaction with $\Lambda = m_{e^*}$ are assumed.
- CHATRCHYAN 13AE search for single e^* production in pp collisions with $e^* \rightarrow e\gamma$ decay. $f = f' = 1$, and e^* production via contact interaction with $\Lambda = m_{e^*}$ are assumed.
- AAD 12AZ search for e^* production via four-fermion contact interaction in pp collisions with $e^* \rightarrow e\gamma$ decay. The quoted limit assumes $\Lambda = m_{e^*}$. See their Fig. 8 for the exclusion plot in the mass-coupling plane.

Limits for Excited e (e^*) from $e^+e^- \rightarrow \gamma\gamma$

These limits are derived from indirect effects due to e^* exchange in the t channel and depend on transition magnetic coupling between e and e^* . All limits are for $\lambda_\gamma = 1$. All limits except ABE 89J and ACHARD 02D are for nonchiral coupling with $\eta_L = \eta_R = 1$. We choose the chiral coupling limit as the best limit and list it in the Summary Table.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

¹ ABDALLAH 04N also obtain a limit on the excited electron mass with $e e^*$ chiral coupling, $m_{e^*} > 295$ GeV at 95% CL.

Indirect Limits for Excited e (e^*)

These limits make use of loop effects involving e^* and are therefore subject to theoretical uncertainty.

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
•••	We do not use the following data for averages, fits, limits, etc. •••		
	¹ DORENBOS... 89	CHRM	$\overline{\mathcal{T}}_{\mu e} \rightarrow \overline{\mathcal{T}}_{\mu e}, \nu_{\mu e} \rightarrow \nu_{\mu e}$
	² GRIFOLS 86	THEO	$\nu_{\mu e} \rightarrow \nu_{\mu e}$
	³ RENARD 82	THEO	$g\text{--}2$ of electron

¹ DORENBOSCH 89 obtain the limit $\lambda_\gamma^2 \Lambda_{\text{cut}}^2 / m_{e^*}^2 < 2.6$ (95% CL), where Λ_{cut} is the cutoff scale, based on the one-loop calculation by GRIFOLS 86. If one assumes that $\Lambda_{\text{cut}} = 1$ TeV and $\lambda_\gamma = 1$, one obtains $m_{e^*} > 620$ GeV. However, one generally expects $\lambda_\gamma \approx m_{e^*} / \Lambda_{\text{cut}}$ in composite models.

² GRIFOLS 86 uses $\nu_{\mu e} \rightarrow \nu_{\mu e}$ and $\overline{\mathcal{T}}_{\mu e} \rightarrow \overline{\mathcal{T}}_{\mu e}$ data from CHARM Collaboration to derive mass limits which depend on the scale of compositeness.

³ RENARD 82 derived from $g\text{--}2$ data limits on mass and couplings of e^* and μ^* . See figures 2 and 3 of the paper.

MASS LIMITS for Excited μ (μ^*)

Limits for Excited μ (μ^*) from Pair Production

These limits are obtained from $e^+e^- \rightarrow \mu^* \mu^*$ and thus rely only on the (electroweak) charge of μ^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the μ^* coupling is assumed to be of sequential type. All limits assume a dominant $\mu^* \rightarrow \mu\gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

- 1 ABE 89D look for pair production of unit-charged particles which leave the detector before decaying. In the above limit the color octet lepton is assumed to fragment into a unit-charged or neutral hadron with equal probability and to have long enough lifetime not to decay within the detector. The limit improves to 99 GeV if it always fragments into a unit-charged hadron.
2 ABT 93 search for e8 production via e-gluon fusion in ep collisions with e8 -> eg. See their Fig. 3 for exclusion plot in the me8-lambda plane for me8 = 35-220 GeV.

MASS LIMITS for Color Octet Neutrinos (nu8)

Table with columns: VALUE (GeV), CL%, DOCUMENT ID, TECN, COMMENT. Includes entries for BARGER 89, KIM 90, and BARTEL 87b with detailed comments on assumptions and cross-sections.

MASS LIMITS for W8 (Color Octet W Boson)

Table with columns: VALUE (GeV), DOCUMENT ID, TECN, COMMENT. Includes entry for ALBAJAR 89 with comment on sigma(W8 -> W+jet)/sigma(W) < 0.019.

REFERENCES FOR Searches for Quark and Lepton Compositeness

Extensive list of references for quark and lepton compositeness searches, including AAD, SIRUNYAN, ABRAMOWICZ, ABOUD, KHACHATRYAN, etc.

Extensive list of references for extra dimensions searches, including ADLOFF, CHEKANOV, AFFOLDER, BOURILKOV, CHEUNG, ACCIARRI, AFFOLDER, BARATE, BARGER, MCFARLAND, DIAZCRUZ, ABT, ADRIANI, BARDADIN..., DECAMP, PDG, ABREU, KIM, ABE, ABE, ABE, ALBAJAR, BARGER, DORENBOS..., BARTEL, GRIFOLS, JODIDIO, RENARD, etc.

Extra Dimensions

For explanation of terms used and discussion of significant model dependence of following limits, see the "Extra Dimensions" review. Footnotes describe originally quoted limit. delta indicates the number of extra dimensions.

Limits not encoded here are summarized in the "Extra Dimensions" review, where the latest unpublished results are also described.

See the related review(s):

Limits on R from Deviations in Gravitational Force Law

This section includes limits on the size of extra dimensions from deviations in the Newtonian (1/r^2) gravitational force law at short distances. Deviations are parameterized by a gravitational potential of the form V = -(G m m')/r [1 + alpha exp(-r/R)]. For delta toroidal extra dimensions of equal size, alpha = 8delta/3. Quoted bounds are for delta = 2 unless otherwise noted.

Table with columns: VALUE (um), CL%, DOCUMENT ID, TECN, COMMENT. Lists various experiments like BLAKEMORE, HEACOCK, LEE, TAN, BERGE, FAYET, KLIMCHITSK., XU, BEZERRA, SUSHKOV, BEZERRA, MASUDA, GERACI, TRENNEL, DECCA, KAPNER, TU, SMULLIN, HOYLE, CHIAVERINI, LONG, HOYLE, HOSKINS with their respective limits and techniques.

- 1 BLAKEMORE 21 obtain constraints on non-Newtonian forces with strengths |alpha| >= 10^8 and length scales R > 10 um. See their Fig. 4 for more details including comparison with previous searches.
2 HEACOCK 21 obtain constraints on non-Newtonian forces with strengths 10^18 <= |alpha| <= 10^25 and length scales R approx 0.02-10 nm. See their Figure 3 for more details. This improves the results of HADDOCK 18. These constraints do not place limits on the size of extra flat dimensions.

Searches Particle Listings

Extra Dimensions

³ LEE 20 search for new forces probing a range of $|\alpha| \simeq 0.1\text{--}10^5$ and length scales $R \simeq 7\text{--}90 \mu\text{m}$. For $\delta = 1$ the bound on R is $30 \mu\text{m}$. See their Fig. 5 for details on the bound.

⁴ TAN 20A search for new forces probing a range of $|\alpha| \simeq 4 \times 10^{-3}\text{--}1 \times 10^2$ and length scales $R \simeq 40\text{--}350 \mu\text{m}$. See their Fig. 6 for details on the bound.

⁵ BERGE 18 uses results from the MICROSCOPE experiment to obtain constraints on non-Newtonian forces with strengths $10^{-11} \lesssim |\alpha| \lesssim 10^{-7}$ and length scales $R \gtrsim 10^5 \text{ m}$. See their Figure 1 for more details. These constraints do not place limits on the size of extra flat dimensions.

⁶ FAYET 18A uses results from the MICROSCOPE experiment to obtain constraints on an EP-violating force possibly arising from a new U(1) gauge boson. For $R \gtrsim 10^7 \text{ m}$ the limits are $|\alpha| \lesssim$ a few 10^{-13} to a few 10^{-11} depending on the coupling, corresponding to $|c| \gtrsim 10^{-24}$ for the coupling of the new spin-1 or spin-0 mediator. These constraints do not place limits on the size of extra flat dimensions. This extends the results of FAYET 18.

⁷ KLIMCHITSKAYA 17A uses an experiment that measures the difference of Casimir forces to obtain bounds on non-Newtonian forces with strengths $|\alpha| \simeq 10^5\text{--}10^{17}$ and length scales $R = 0.03\text{--}10 \mu\text{m}$. See their Fig. 3. These constraints do not place limits on the size of extra flat dimensions.

⁸ XU 13 obtain constraints on non-Newtonian forces with strengths $|\alpha| \simeq 10^{34}\text{--}10^{36}$ and length scales $R \simeq 1\text{--}10 \text{ fm}$. See their Fig. 4 for more details. These constraints do not place limits on the size of extra flat dimensions.

⁹ BEZERRA 11 obtain constraints on non-Newtonian forces with strengths $10^{11} \lesssim |\alpha| \lesssim 10^{18}$ and length scales $R = 30\text{--}1260 \text{ nm}$. See their Fig. 2 for more details. These constraints do not place limits on the size of extra flat dimensions.

¹⁰ SUSHKOV 11 obtain improved limits on non-Newtonian forces with strengths $10^7 \lesssim |\alpha| \lesssim 10^{11}$ and length scales $0.4 \mu\text{m} < R < 4 \mu\text{m}$ (95% CL). See their Fig. 2. These bounds do not place limits on the size of extra flat dimensions. However, a model dependent bound of $M_* > 70 \text{ TeV}$ is obtained assuming gauge bosons that couple to baryon number also propagate in $(4 + \delta)$ dimensions.

¹¹ BEZERRA 10 obtain improved constraints on non-Newtonian forces with strengths $10^{19} \lesssim |\alpha| \lesssim 10^{29}$ and length scales $R = 1.6\text{--}14 \text{ nm}$ (95% CL). See their Fig. 1. This bound does not place limits on the size of extra flat dimensions.

¹² MASUDA 09 obtain improved constraints on non-Newtonian forces with strengths $10^9 \lesssim |\alpha| \lesssim 10^{11}$ and length scales $R = 1.0\text{--}2.9 \mu\text{m}$ (95% CL). See their Fig. 3. This bound does not place limits on the size of extra flat dimensions.

¹³ GERACI 08 obtain improved constraints on non-Newtonian forces with strengths $|\alpha| > 14,000$ and length scales $R = 5\text{--}15 \mu\text{m}$. See their Fig. 9. This bound does not place limits on the size of extra flat dimensions.

¹⁴ TRENKEL 08 uses two independent measurements of Newton's constant G to constrain new forces with strength $|\alpha| \simeq 10^{-4}$ and length scales $R = 0.02\text{--}1 \text{ m}$. See their Fig. 1. This bound does not place limits on the size of extra flat dimensions.

¹⁵ DECCA 07A search for new forces and obtain bounds in the region with strengths $|\alpha| \simeq 10^{13}\text{--}10^{18}$ and length scales $R = 20\text{--}86 \text{ nm}$. See their Fig. 6. This bound does not place limits on the size of extra flat dimensions.

¹⁶ KAPNER 07 search for new forces, probing a range of $|\alpha| \simeq 10^{-3}\text{--}10^5$ and length scales $R \simeq 10\text{--}1000 \mu\text{m}$. For $\delta = 1$ the bound on R is $44 \mu\text{m}$. For $\delta = 2$, the bound is expressed in terms of M_* , here translated to a bound on the radius. See their Fig. 6 for details on the bound.

¹⁷ TU 07 search for new forces probing a range of $|\alpha| \simeq 10^{-1}\text{--}10^5$ and length scales $R \simeq 20\text{--}1000 \mu\text{m}$. For $\delta = 1$ the bound on R is $53 \mu\text{m}$. See their Fig. 3 for details on the bound.

¹⁸ SMULLIN 05 search for new forces, and obtain bounds in the region with strengths $\alpha \simeq 10^3\text{--}10^8$ and length scales $R = 6\text{--}20 \mu\text{m}$. See their Figs. 1 and 16 for details on the bound. This work does not place limits on the size of extra flat dimensions.

¹⁹ HOYLE 04 search for new forces, probing α down to 10^{-2} and distances down to $10 \mu\text{m}$. Quoted bound on R is for $\delta = 2$. For $\delta = 1$, bound goes to $160 \mu\text{m}$. See their Fig. 34 for details on the bound.

²⁰ CHIAVERINI 03 search for new forces, probing α above 10^4 and λ down to $3 \mu\text{m}$, finding no signal. See their Fig. 4 for details on the bound. This bound does not place limits on the size of extra flat dimensions.

²¹ LONG 03 search for new forces, probing α down to 3, and distances down to about $10 \mu\text{m}$. See their Fig. 4 for details on the bound.

²² HOYLE 01 search for new forces, probing α down to 10^{-2} and distances down to $20 \mu\text{m}$. See their Fig. 4 for details on the bound. The quoted bound is for $\alpha \geq 3$.

²³ HOSKINS 85 search for new forces, probing distances down to 4 mm . See their Fig. 13 for details on the bound. This bound does not place limits on the size of extra flat dimensions.

Limits on R from On-Shell Production of Gravitons: $\delta = 2$

This section includes limits on on-shell production of gravitons in collider and astrophysical processes. Bounds quoted are on R , the assumed common radius of the flat extra dimensions, for $\delta = 2$ extra dimensions. Studies often quote bounds in terms of derived parameter; experiments are actually sensitive to the masses of the KK gravitons: $m_{\vec{n}} = |\vec{n}|/R$. See the Review on "Extra Dimensions" for details. Bounds are given in μm for $\delta = 2$.

¹ AAD 21F search for $pp \rightarrow jG$, using 139 fb^{-1} of data at $\sqrt{s} = 13 \text{ TeV}$ to place lower limits on M_D for two to six extra dimensions (see their Table X), from which this bound on R is derived. This limit supersedes that in AABOUD 18l.

² HANNESTAD 03 obtain a limit on R from the heating of old neutron stars by the surrounding cloud of trapped KK gravitons. Limits for all $\delta \leq 7$ are given in their Tables V and VI. These limits supersede those in HANNESTAD 02.

³ SIRUNYAN 21A search for $pp \rightarrow ZG$, using 137 fb^{-1} of data at $\sqrt{s} = 13 \text{ TeV}$ to place lower limits on M_D for two to seven extra dimensions (see their Figure 12), from which this bound on R is derived. These limits supersede those obtained in SIRUNYAN 18bv.

⁴ TUMASYAN 21D search for $pp \rightarrow jG$, using 137 fb^{-1} of data at $\sqrt{s} = 13 \text{ TeV}$ to place lower limits on M_D for two to seven extra dimensions (see their Table 3), from which this bound on R is derived. This limit supersedes that in SIRUNYAN 18s.

⁵ SIRUNYAN 17AQ search for $pp \rightarrow \gamma G$, using 12.9 fb^{-1} of data at $\sqrt{s} = 13 \text{ TeV}$ to place limits on M_D for three to six extra dimensions (see their Table 3).

⁶ AABOUD 16F search for $pp \rightarrow \gamma G$, using 3.2 fb^{-1} of data at $\sqrt{s} = 13 \text{ TeV}$ to place limits on M_D for two to six extra dimensions (see their Figure 9), from which this bound on R is derived.

⁷ KHACHATRYAN 16N search for $pp \rightarrow \gamma G$, using 19.6 fb^{-1} of data at $\sqrt{s} = 8 \text{ TeV}$ to place limits on M_D for three to six extra dimensions (see their Table 5).

⁸ AAD 15CS search for $pp \rightarrow \gamma G$, using 20.3 fb^{-1} of data at $\sqrt{s} = 8 \text{ TeV}$ to place lower limits on M_D for two to six extra dimensions (see their Fig. 18).

⁹ AAD 13C search for $pp \rightarrow \gamma G$, using 4.6 fb^{-1} of data at $\sqrt{s} = 7 \text{ TeV}$ to place bounds on M_D for two to six extra dimensions, from which this bound on R is derived.

¹⁰ AAD 13D search for the dijet decay of quantum black holes in 4.8 fb^{-1} of data produced in pp collisions at $\sqrt{s} = 7 \text{ TeV}$ to place bounds on M_D for two to seven extra dimensions, from which these bounds on R are derived. Limits on M_D for all $\delta \leq 7$ are given in their Table 3.

¹¹ AJELLO 12 obtain a limit on R from the gamma-ray emission of point γ sources that arise from the photon decay of KK gravitons which are gravitationally bound around neutron stars. Limits for all $\delta \leq 7$ are given in their Table 7.

¹² AALTONEN 08AC search for $p\bar{p} \rightarrow \gamma G$ and $p\bar{p} \rightarrow jG$ at $\sqrt{s} = 1.96 \text{ TeV}$ with 2.0 fb^{-1} and 1.1 fb^{-1} respectively, in order to place bounds on the fundamental scale and size of the extra dimensions. See their Table III for limits on all $\delta \leq 6$.

¹³ ABAZOV 08S search for $p\bar{p} \rightarrow \gamma G$, using 1 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$ to place bounds on M_D for two to eight extra dimensions, from which these bounds on R are derived. See their paper for intermediate values of δ .

¹⁴ DAS 08 obtain a limit on R from Kaluza-Klein graviton cooling of SN1987A due to plasmon-plasmon annihilation.

¹⁵ ABULENCIA, A 06 search for $p\bar{p} \rightarrow jG$ using 368 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. See their Table II for bounds for all $\delta \leq 6$.

¹⁶ ABDALLAH 05B search for $e^+e^- \rightarrow \gamma G$ at $\sqrt{s} = 180\text{--}209 \text{ GeV}$ to place bounds on the size of extra dimensions and the fundamental scale. Limits for all $\delta \leq 6$ are given in their Table 6. These limits supersede those in ABREU 00Z.

¹⁷ ACHARD 04E search for $e^+e^- \rightarrow \gamma G$ at $\sqrt{s} = 189\text{--}209 \text{ GeV}$ to place bounds on the size of extra dimensions and the fundamental scale. See their Table 8 for limits with $\delta \leq 8$. These limits supersede those in ACCIARRI 99R.

¹⁸ ACOSTA 04C search for $p\bar{p} \rightarrow jG$ at $\sqrt{s} = 1.8 \text{ TeV}$ to place bounds on the size of extra dimensions and the fundamental scale. See their paper for bounds on $\delta = 4, 6$.

¹⁹ CASSE 04 obtain a limit on R from the gamma-ray emission of point γ sources that arises from the photon decay of gravitons around newly born neutron stars, applying the technique of HANNESTAD 03 to neutron stars in the galactic bulge. Limits for all $\delta \leq 7$ are given in their Table I.

²⁰ ABAZOV 03 search for $p\bar{p} \rightarrow jG$ at $\sqrt{s} = 1.8 \text{ TeV}$ to place bounds on M_D for 2 to 7 extra dimensions, from which these bounds on R are derived. See their paper for bounds on intermediate values of δ . We quote results without the approximate NLO scaling introduced in the paper.

²¹ HANNESTAD 03 obtain a limit on R from graviton cooling of supernova SN1987A. Limits for all $\delta \leq 7$ are given in their Tables V and VI.

²² HANNESTAD 03 obtain a limit on R from gravitons emitted in supernovae and which subsequently decay, contaminating the diffuse cosmic γ background. Limits for all $\delta \leq 7$ are given in their Tables V and VI. These limits supersede those in HANNESTAD 02.

²³ HANNESTAD 03 obtain a limit on R from gravitons emitted in two recent supernovae and which subsequently decay, creating point γ sources. Limits for all $\delta \leq 7$ are given in their Tables V and VI. These limits are corrected in the published erratum.

²⁴ HEISTER 03c use the process $e^+e^- \rightarrow \gamma G$ at $\sqrt{s} = 189\text{--}209 \text{ GeV}$ to place bounds on the size of extra dimensions and the scale of gravity. See their Table 4 for limits with $\delta \leq 6$ for derived limits on M_D .

²⁵ FAIRBAIRN 01 obtains bounds on R from over production of KK gravitons in the early universe. Bounds are quoted in paper in terms of fundamental scale of gravity. Bounds depend strongly on temperature of QCD phase transition and range from $R < 0.13 \mu\text{m}$ to $0.001 \mu\text{m}$ for $\delta=2$; bounds for $\delta=3,4$ can be derived from Table 1 in the paper.

²⁶ HANHART 01 obtain bounds on R from limits on graviton cooling of supernova SN 1987A using numerical simulations of proto-neutron star neutrino emission.

²⁷ CASSISI 00 obtain rough bounds on M_D (and thus R) from red giant cooling for $\delta=2,3$. See their paper for details.

²⁸ ACCIARRI 99S search for $e^+e^- \rightarrow ZG$ at $\sqrt{s} = 189 \text{ GeV}$. Limits on the gravity scale are found in their Table 2, for $\delta \leq 4$.

Mass Limits on M_{TT}

This section includes limits on the cut-off mass scale, M_{TT} , of dimension-8 operators from KK graviton exchange in models of large extra dimensions. Ambiguities in the UV-divergent summation are absorbed into the parameter λ , which is taken to be $\lambda = \pm 1$ in the following analyses. Bounds for $\lambda = -1$ are shown in parenthesis after the bound for $\lambda = +1$, if appropriate. Different papers use slightly different definitions of the mass scale. The definition used here is related to another popular convention by $M_{TT}^4 = (2/\pi) \Lambda_T^4$, as discussed in the above Review on "Extra Dimensions."

1 SIRUNYAN 18DD use dijet angular distributions in 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to place a lower bound on Λ_T , here converted to M_{TT} . This updates the results of SIRUNYAN 17F.

2 GIUDICE 03 place bounds on Λ_G , the coefficient of the gravitationally-induced dimension-6 operator $(2\pi\lambda/\Lambda_G^2)(\sum \bar{F}_i\gamma_\mu^5 F_i)(\sum \bar{F}_j\mu\gamma^5 F_j)$, using data from a variety of experiments. Results are quoted for $\lambda = \pm 1$ and are independent of δ .

3 SIRUNYAN 21N use 137 (140) fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV in the dielectron (dimuon) channels to place a lower limit on Λ_T , here converted to M_{TT} . Bounds on individual channels can be found in their Table 7.

4 SIRUNYAN 19AC use 35.9 (36.3) fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV in the dielectron (dimuon) channels to place a lower limit on Λ_T , here converted to M_{TT} . The dielectron and dimuon channels are combined with previous results in the diphoton channel to set the best limit. Bounds on individual channels and different priors can be found in their Table 2. This updates the results in KHACHATRYAN 15AE.

5 SIRUNYAN 18DU use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to place lower limits on M_{TT} (equivalent to their M_S). This updates the results of CHATRCHYAN 12R.

6 AABOUD 17AP use 36.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to place lower limits on M_{TT} (equivalent to their M_S). This updates the results of AAD 13AS.

7 AAD 14BE use 20 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV in the dielectron channel to place lower limits on M_{TT} (equivalent to their M_S).

8 AAD 13E use 4.9 and 5.0 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV in the dielectron and dimuon channels, respectively, to place lower limits on M_{TT} (equivalent to their M_S). The dielectron and dimuon channels are combined with previous results in the diphoton channel to set the best limit. Bounds on individual channels and different priors can be found in their Table VIII.

9 BAAK 12 use electroweak precision observables to place bounds on the ratio Λ_T/M_D as a function of M_D . See their Fig. 22 for constraints with a Higgs mass of 120 GeV.

10 AARON 11c search for deviations in the differential cross section of $e^\pm p \rightarrow e^\pm X$ in 446 pb⁻¹ of data taken at $\sqrt{s} = 301$ and 319 GeV to place a bound on M_{TT} .

11 ABAZOV 09AE use dijet angular distributions in 0.7 fb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to place lower bounds on Λ_T (equivalent to their M_S), here converted to M_{TT} .

12 ABAZOV 09D use 1.05 fb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to place lower bounds on Λ_T (equivalent to their M_S), here converted to M_{TT} .

13 SCHAEEL 07A use e^+e^- collisions at $\sqrt{s} = 189-209$ GeV to place lower limits on Λ_T , here converted to limits on M_{TT} .

14 ABDALLAH 06C use e^+e^- collisions at $\sqrt{s} \sim 130-207$ GeV to place lower limits on M_{TT} , which is equivalent to their definition of M_S . Bound shown includes all possible

final state leptons, $\ell = e, \mu, \tau$. Bounds on individual leptonic final states can be found in their Table 31.

15 GERDES 06 use 100 to 110 pb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.8$ TeV, as recorded by the CDF Collaboration during Run I of the Tevatron. Bound shown includes a K -factor of 1.3. Bounds on individual e^+e^- and $\gamma\gamma$ final states are found in their Table 1.

16 ABAZOV 05V use 246 pb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to search for deviations in the differential cross section to $\mu^+\mu^-$ from graviton exchange.

17 CHEKANOV 04B search for deviations in the differential cross section of $e^\pm p \rightarrow e^\pm X$ with 130 pb⁻¹ of combined data and Q^2 values up to 40,000 GeV² to place a bound on M_{TT} .

18 ABBIENDI 03D use e^+e^- collisions at $\sqrt{s}=181-209$ GeV to place bounds on the ultraviolet scale M_{TT} , which is equivalent to their definition of M_S .

19 ACHARD 03D look for deviations in the cross section for $e^+e^- \rightarrow ZZ$ from $\sqrt{s} = 200-209$ GeV to place a bound on M_{TT} .

20 ADLOFF 03 search for deviations in the differential cross section of $e^\pm p \rightarrow e^\pm X$ at $\sqrt{s}=301$ and 319 GeV to place bounds on M_{TT} .

21 GIUDICE 03 review existing experimental bounds on M_{TT} and derive a combined limit.

22 HEISTER 03C use e^+e^- collisions at $\sqrt{s}=189-209$ GeV to place bounds on the scale of dim-8 gravitational interactions. Their M_S^2 is equivalent to our M_{TT} with $\lambda = \pm 1$.

23 ACHARD 02 search for s-channel graviton exchange effects in $e^+e^- \rightarrow \gamma\gamma$ at $E_{cm} = 192-209$ GeV.

24 ABBOTT 01 search for variations in differential cross sections to e^+e^- and $\gamma\gamma$ final states at the Tevatron.

25 ABBIENDI 00R uses e^+e^- collisions at $\sqrt{s} = 189$ GeV.

26 ABREU 00A search for s-channel graviton exchange effects in $e^+e^- \rightarrow \gamma\gamma$ at $E_{cm} = 189-202$ GeV.

27 ABREU 00S uses e^+e^- collisions at $\sqrt{s}=183$ and 189 GeV. Bounds on μ and τ individual final states given in paper.

28 CHANG 00B derive 3σ limit on M_{TT} of (28,19,15) TeV for $\delta=(2,4,6)$ respectively assuming the presence of a torsional coupling in the gravitational action. Highly model dependent.

29 CHEUNG 00 obtains limits from anomalous diphoton production at OPAL due to graviton exchange. Original limit for $\delta=4$. However, unknown UV theory renders δ -dependence unreliable. Original paper works in HLZ convention.

30 GRAESSER 00 obtains a bound from graviton contributions to $g-2$ of the muon through loops of 0.29 TeV for $\delta=2$ and 0.38 TeV for $\delta=4,6$. Limits scale as $\lambda^{1/2}$. However calculational scheme not well-defined without specification of high-scale theory. See the "Extra Dimensions Review."

31 HAN 00 calculates corrections to gauge boson self-energies from KK graviton loops and constrain them using S and T . Bounds on M_{TT} range from 0.5 TeV ($\delta=6$) to 1.1 TeV ($\delta=2$); see text. Limits have strong dependence, $\lambda^{\delta+2}$, on unknown λ coefficient.

32 MATHEWS 00 search for evidence of graviton exchange in CDF and DØ dijet production data. See their Table 2 for slightly stronger δ -dependent bounds. Limits expressed in terms of $\bar{M}_S^4 = M_{TT}^4/8$.

33 MELE 00 obtains bound from KK graviton contributions to $e^+e^- \rightarrow VV$ ($V=\gamma, W, Z$) at LEP. Authors use Hewett conventions.

34 ABBIENDI 99P search for s-channel graviton exchange effects in $e^+e^- \rightarrow \gamma\gamma$ at $E_{cm}=189$ GeV. The limits $G_+ > 660$ GeV and $G_- > 634$ GeV are obtained from combined $E_{cm}=183$ and 189 GeV data, where G_\pm is a scale related to the fundamental graviton scale.

35 ACCIARRI 99M search for the reaction $e^+e^- \rightarrow \gamma G$ and s-channel graviton exchange effects in $e^+e^- \rightarrow \gamma\gamma, W^+W^-, ZZ, e^+e^-, \mu^+\mu^-, \tau^+\tau^-, q\bar{q}$ at $E_{cm}=183$ GeV. Limits on the gravity scale are listed in their Tables 1 and 2.

36 ACCIARRI 99S search for the reaction $e^+e^- \rightarrow ZG$ and s-channel graviton exchange effects in $e^+e^- \rightarrow \gamma\gamma, W^+W^-, ZZ, e^+e^-, \mu^+\mu^-, \tau^+\tau^-, q\bar{q}$ at $E_{cm}=189$ GeV. Limits on the gravity scale are listed in their Tables 1 and 2.

37 BOURILKOV 99 performs global analysis of LEP data on e^+e^- collisions at $\sqrt{s}=183$ and 189 GeV. Bound is on Λ_T .

Limits on $1/R = M_c$

This section includes limits on $1/R = M_c$, the compactification scale in models with one TeV-sized extra dimension, due to exchange of Standard Model KK excitations. Bounds assume fermions are not in the bulk, unless stated otherwise. See the "Extra Dimensions" review for discussion of model dependence.

Extra Dimensions

- 1 AAD 12cc use 4.9 and 5.0 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV in the dielectron and dimuon channels, respectively, to place a lower bound on the mass of the lightest KK Z/γ boson (equivalent to $1/R = M_C$). The limit quoted here assumes a flat prior corresponding to when the pure Z/γ KK cross section term dominates. See their Section 15 for more details.
- 2 BARBIERI 04 use electroweak precision observables to place a lower bound on the compactification scale $1/R$. Both the gauge bosons and the Higgs boson are assumed to propagate in the bulk.
- 3 AVNISH 21 perform a study on the ATLAS collaboration search for multiple jets plus missing transverse energy from pp collisions at $\sqrt{s} = 13$ TeV and integrated luminosity of 139 fb⁻¹, to place constraints on the compactification scale and cutoff scale Λ in universal extra dimension models with Standard Model fields propagating in the bulk.
- 4 AABOUD 18av use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV in final states with multiple b-jets, to place a lower bound on the compactification scale in a model with two universal extra dimensions. Assuming the radii of the two extra dimensions are equal, a lower limit of 1.8 TeV for the Kaluza-Klein mass is obtained.
- 5 AABOUD 18cc use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV in final states with same-charge leptons and b-jets, to place a lower bound on the compactification scale in a model with two universal extra dimensions. Assuming the radii of the two extra dimensions are equal, a lower limit of 1.45 TeV for the Kaluza-Klein mass is obtained.
- 6 ACCOMANDO 15 use electroweak precision observables to place a lower bound on the compactification scale $1/R$. See their Fig. 2 for the bound as a function of $\sin\beta$, which parametrizes the VEV contribution from brane and bulk Higgs fields. The quoted value is for the minimum bound which occurs at $\sin\beta = 0.45$.
- 7 KHACHATRYAN 15t use 19.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to place a lower bound on the compactification scale $1/R$.
- 8 CHATRCHYAN 13aq use 5.0 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV and a further 3.7 fb⁻¹ of data at $\sqrt{s} = 8$ TeV to place a lower bound on the compactification scale $1/R$, in models with universal extra dimensions and Standard Model fields propagating in the bulk. See their Fig. 5 for the bound as a function of the universal bulk fermion mass parameter μ .
- 9 CHATRCHYAN 13w use diphoton events with large missing transverse momentum in 4.93 fb⁻¹ of data produced from pp collisions at $\sqrt{s} = 7$ TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$. The model parameters are chosen such that the decay $\gamma^* \rightarrow G\gamma$ occurs with an appreciable branching fraction.
- 10 EDELHAUSER 13 use 19.6 and 20.6 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV analyzed by the CMS Collaboration in the dielectron and dimuon channels, respectively, to place a lower bound on the mass of the second lightest Kaluza-Klein Z/γ boson (converted to a limit on $1/R = M_C$). The bound assumes Standard Model fields propagating in the bulk and that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$.
- 11 AAD 12cp use diphoton events with large missing transverse momentum in 4.8 fb⁻¹ of data produced from pp collisions at $\sqrt{s} = 7$ TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$. The model parameters are chosen such that the decay $\gamma^* \rightarrow G\gamma$ occurs with an appreciable branching fraction.
- 12 AAD 12x use diphoton events with large missing transverse momentum in 1.07 fb⁻¹ of data produced from pp collisions at $\sqrt{s} = 7$ TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$. The model parameters are chosen such that the decay $\gamma^* \rightarrow G\gamma$ occurs with an appreciable branching fraction.
- 13 ABAZOV 12m use same-sign dimuon events in 7.3 fb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to place a lower bound on the compactification scale $1/R$, in models with universal extra dimensions where all Standard Model fields propagate in the bulk.
- 14 BAAK 12 use electroweak precision observables to place a lower bound on the compactification scale $1/R$, in models with universal extra dimensions and Standard Model fields propagating in the bulk. Bound assumes a 125 GeV Higgs mass. See their Fig. 25 for the bound as a function of the Higgs mass.
- 15 FLACKE 12 use electroweak precision observables to place a lower bound on the compactification scale $1/R$, in models with universal extra dimensions and Standard Model fields propagating in the bulk. See their Fig. 1 for the bound as a function of the universal bulk fermion mass parameter μ .
- 16 NISHIWAKI 12 use up to 2 fb⁻¹ of data from the ATLAS and CMS experiments that constrains the production cross section of a Higgs-like particle to place a lower bound on the compactification scale $1/R$ in universal extra dimension models. The quoted bound assumes Standard Model fields propagating in the bulk and a 125 GeV Higgs mass. See their Fig. 1 for the bound as a function of the Higgs mass.
- 17 AAD 11f use diphoton events with large missing transverse energy in 3.1 pb⁻¹ of data produced from pp collisions at $\sqrt{s} = 7$ TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$. The model parameters are chosen such that the decay $\gamma^* \rightarrow G\gamma$ occurs with an appreciable branching fraction.
- 18 AAD 11x use diphoton events with large missing transverse energy in 36 pb⁻¹ of data produced from pp collisions at $\sqrt{s} = 7$ TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$. The model parameters are chosen such that the decay $\gamma^* \rightarrow G\gamma$ occurs with an appreciable branching fraction.
- 19 ABAZOV 10p use diphoton events with large missing transverse energy in 6.3 fb⁻¹ of data produced from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$. The model parameters are chosen such that the decay $\gamma^* \rightarrow G\gamma$ occurs with an appreciable branching fraction.
- 20 ABAZOV 09ae use dijet angular distributions in 0.7 fb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to place a lower bound on the compactification scale.
- 21 HAISCH 07 use inclusive B -meson decays to place a Higgs mass independent bound on the compactification scale $1/R$ in the minimal universal extra dimension model.
- 22 GOGOLADZE 06 use electroweak precision observables to place a lower bound on the compactification scale in models with universal extra dimensions. Bound assumes a 115 GeV Higgs mass. See their Fig. 3 for the bound as a function of the Higgs mass.

- 23 CORNET 00 translates a bound on the coefficient of the 4-fermion operator $(\bar{\ell}\gamma_\mu\tau^\alpha\ell)(\bar{\ell}\gamma^\mu\tau^\alpha\ell)$ derived by Hagiwara and Matsumoto into a limit on the mass scale of KK W bosons.
- 24 RIZZO 00 obtains limits from global electroweak fits in models with a Higgs in the bulk (3.8 TeV) or on the standard brane (3.3 TeV).

Limits on Kaluza-Klein Gravitons in Warped Extra Dimensions

This section places limits on the mass of the first Kaluza-Klein (KK) excitation of the graviton in the warped extra dimension model of Randall and Sundrum. Bounds in parenthesis assume Standard Model fields propagate in the bulk. Experimental bounds depend strongly on the warp parameter, k . See the "Extra Dimensions" review for a full discussion.

Here we list limits for the value of the warp parameter $k/\overline{M}_P = 0.1$.

- 1 SIRUNYAN 21n use 137 (140) fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for dilepton resonances in the dielectron (dimuon) channel. See Table 6 for other limits with warp parameter values $k/\overline{M}_P = 0.01$ and 0.05. This updates the results of SIRUNYAN 18bB.
- 2 AAD 21af use 139 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for ZZ resonances in the $\ell\ell\ell\ell$ and $\ell\nu\ell\nu$ final states ($\ell = e, \mu$). See their Figure 8 for the limit on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\overline{M}_P = 1$. This updates the results of AAD 15AU and AABOUD 18BF.
- 3 AAD 21ay use 139 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV in the diphoton channel to place a lower limit on the mass of the lightest KK graviton. This updates the results of AABOUD 17AP.
- 4 AAD 20at use 139 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for diboson resonances in semileptonic final states ($\ell\nu q q, \ell\ell q q, \nu\nu q q$). See their Figure 15 for the limit on the cross section times branching fraction as a function of the KK graviton mass. Lower limits on the graviton mass are also given for $k/\overline{M}_P = 1$. This updates the results of AABOUD 18AK and AABOUD 18AL.
- 5 AAD 20c use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for Higgs boson pair production in the $b\bar{b}b\bar{b}, b\bar{b}W^+W^-,$ and $b\bar{b}\tau^+\tau^-$ final states. See their Figure 5(b)(c) for limits on the cross section as a function of the KK graviton mass. In the case of $k/\overline{M}_P = 1$ and 2, gravitons are excluded in the mass range 260–3000 GeV and 260–1760 GeV, respectively.

- 6 AAD 20t use 139 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for narrow resonances decaying to bottom quark pairs. See their Figure 7 for the limit on the product of the cross section, branching fraction, acceptance and b -tagging efficiency as a function of the KK graviton mass. In the case of $k/\overline{M}_P = 0.2$, KK gravitons in the mass range 1.25–2.8 TeV are excluded.
- 7 SIRUNYAN 20Ai use 137 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for dijet resonances. See their Figure 6 for the limit on the product of the cross section, branching fraction and acceptance as a function of the KK graviton mass. This updates the results of SIRUNYAN 18Bq.
- 8 SIRUNYAN 20F use 35.9 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for Higgs boson pair production in the $b\bar{b}ZZ$ final state. See their Figure 4 for limits on the cross section times branching fraction as a function of the KK graviton mass, and Figure 5 for limits as a function of k/\overline{M}_P .
- 9 SIRUNYAN 20q use 77.3 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for diboson resonances with dijet final states. See their Figure 12 for the limit on the cross section times branching fraction as a function of the KK graviton mass, including the theoretical prediction for $k/\overline{M}_P = 0.5$. This updates the results of SIRUNYAN 18P.
- 10 AABOUD 19A use 36.1 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for Higgs boson pair production in the $b\bar{b}b\bar{b}$ final state. See their Figure 9 for limits on the cross section times branching fraction as a function of the KK graviton mass. Assuming $k/\overline{M}_P = 1$, gravitons in the mass range 313–1362 GeV are excluded. This updates the results of AABOUD 16i.
- 11 AABOUD 19o use 36.1 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for Higgs boson pair production in the $b\bar{b}WW$ final state. See their Figure 12 for limits on the cross section times branching fraction as a function of the KK graviton mass for $k/\overline{M}_P = 1$ and $k/\overline{M}_P = 2$.
- 12 AAD 19b use 139 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for diboson resonances in the all-hadronic final state. See their Figure 9(b) for the limit on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\overline{M}_P = 1$. This updates the results of AABOUD 18f.
- 13 SIRUNYAN 19 use 35.9 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for Higgs boson pair production in the $b\bar{b}\tau\tau$ final state. See their Figure 9 for limits on the cross section times branching fraction as a function of the KK graviton mass. Assuming $k/\overline{M}_P = 1$, gravitons in the mass range 290–810 GeV are excluded. This updates the result of KHACHATRYAN 16Bq.
- 14 SIRUNYAN 19BE use 35.9 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for Higgs boson pair production by combining the results from four final states: $b\bar{b}\gamma\gamma$, $b\bar{b}\tau\tau$, $b\bar{b}b\bar{b}$, and $b\bar{b}VV$. See their Figure 7 for limits on the cross section times branching fraction as a function of the KK graviton mass.
- 15 SIRUNYAN 19CF use 35.9 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for Higgs boson pair production in the $b\bar{b}q\bar{q}'\ell\nu$ final state. See their Figure 7 for limits on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\overline{M}_P = 0.1$ and 0.3.
- 16 AABOUD 18BI use 36.1 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for top-quark pairs decaying into the lepton-plus jets topology. See their Figure 16 for the limit on the KK graviton mass as a function of the cross section times branching fraction, including theoretical values for $k/\overline{M}_P = 1$.
- 17 AABOUD 18CJ combine the searches for heavy resonances decaying into bosonic and leptonic final states from 36.1 fb^{-1} of pp collision data at $\sqrt{s} = 13 \text{ TeV}$. The lower limit on the KK graviton mass, with $k/\overline{M}_P = 1$, is 2.3 TeV.
- 18 AABOUD 18CQ use 36.1 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for Higgs boson pair production in the $b\bar{b}\tau^+\tau^-$ final state. See their Figure 2 for limits on the cross section times branching fraction as a function of the KK graviton mass. Assuming $k/\overline{M}_P = 1$, gravitons in the mass range 325–885 GeV are excluded.
- 19 AABOUD 18CW use 36.1 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for Higgs boson pair production in the $\gamma\gamma b\bar{b}$ final state. See their Figure 7 for limits on the cross section times branching fraction as a function of the KK graviton mass.
- 20 SIRUNYAN 18AF use 35.9 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for Higgs boson pair production in the $b\bar{b}b\bar{b}$ final state. See their Figure 9 for limits on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\overline{M}_P = 0.5$. This updates the results of KHACHATRYAN 15r.
- 21 SIRUNYAN 18As use 35.9 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for ZZ resonances in the $\ell\nu\bar{\nu}$ final state ($\ell = e, \mu$). See their Figure 5 for the limit on the KK graviton mass as a function of the cross section times branching fraction, including theoretical values for $k/\overline{M}_P = 0.1, 0.5, \text{ and } 1.0$.
- 22 SIRUNYAN 18AX use 35.9 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for WW resonances in $\ell\nu q\bar{q}$ final states ($\ell = e, \mu$). See their Figure 6 for the limit on the KK graviton mass as a function of the cross section times branching fraction, including theoretical values for $k/\overline{M}_P = 0.5$. This updates the results of KHACHATRYAN 14A.
- 23 SIRUNYAN 18BK use 35.9 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for ZZ resonances in the $\nu\bar{\nu}q\bar{q}$ final state. See their Figure 4 for the limit on the KK graviton mass as a function of the cross section times branching fraction, including theoretical values for $k/\overline{M}_P = 0.5$.
- 24 SIRUNYAN 18CW use 35.9 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for Higgs boson pair production in the $b\bar{b}b\bar{b}$ final state. See their Figure 8 for limits on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\overline{M}_P = 0.5$.
- 25 SIRUNYAN 18DJ use 35.9 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for ZZ resonances in $2\ell 2q$ final states ($\ell = e, \mu$). See their Figure 6 for the limit on the KK graviton mass as a function of the cross section times branching fraction. Assuming $k/\overline{M}_P = 0.5$, a graviton mass is excluded below 925 GeV.
- 26 SIRUNYAN 18DU use 35.9 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$, in the diphoton channel to place a lower limit on the mass of the lightest KK graviton. See their paper for limits with other warp parameter values $k/\overline{M}_P = 0.01$ and 0.2. This updates the results of KHACHATRYAN 16i.
- 27 SIRUNYAN 18F use 35.9 fb^{-1} of data from pp collisions at $\sqrt{s} = 13 \text{ TeV}$ to search for Higgs boson pair production in the $b\bar{b}\ell\nu\ell\nu$ final state. See their Figure 7 for limits on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\overline{M}_P = 0.1$.
- 28 SIRUNYAN 18I use 19.7 fb^{-1} of data from pp collisions at $\sqrt{s} = 8 \text{ TeV}$ to search for narrow resonances decaying to bottom quark pairs. See their Figure 3 for the limit on the KK graviton mass as a function of the cross section times branching fraction in the mass range of 325–1200 GeV.
- 29 AAD 16R use 20.3 fb^{-1} of data from pp collisions at $\sqrt{s} = 8 \text{ TeV}$ to place a lower bound on the mass of the lightest KK graviton. See their Figure 4 for the limit on the KK graviton mass as a function of the cross section times branching fraction.
- 30 AAD 15AZ use 20.3 fb^{-1} of data from pp collisions at $\sqrt{s} = 8 \text{ TeV}$ to place a lower bound on the mass of the lightest KK graviton. See their Figure 2 for limits on the KK graviton mass as a function of the cross section times branching ratio.
- 31 AAD 15CT use 20.3 fb^{-1} of data from pp collisions at $\sqrt{s} = 8 \text{ TeV}$ to place a lower bound on the mass of the lightest KK graviton. See their Figures 6b and 6c for the limit on the KK graviton mass as a function of the cross section times branching fraction.
- 32 AAD 14V use $20.3 (20.5) \text{ fb}^{-1}$ of data from pp collisions at $\sqrt{s} = 8 \text{ TeV}$ in the dilepton (dimuon) channels to place a lower bound on the mass of the lightest KK graviton. This updates the results of AAD 12cc.
- 33 AAD 13A use 4.7 fb^{-1} of data from pp collisions at $\sqrt{s} = 7 \text{ TeV}$ in the $\ell\nu\ell\nu$ channel, to place a lower bound on the mass of the lightest KK graviton.
- 34 AAD 13AO use 4.7 fb^{-1} of data from pp collisions at $\sqrt{s} = 7 \text{ TeV}$ in the $\ell\nu jj$ channel, to place a lower bound on the mass of the lightest KK graviton.
- 35 AAD 13AS use 4.9 fb^{-1} of data from pp collisions at $\sqrt{s} = 7 \text{ TeV}$ in the diphoton channel to place lower limits on the mass of the lightest KK graviton. The diphoton channel is combined with previous results in the dilepton and dimuon channels to set the best limit. See their Table 2 for warp parameter values k/\overline{M}_P between 0.01 and 0.1. This updates the results of AAD 12y.
- 36 AAD 12AD use 1.02 fb^{-1} of data from pp collisions at $\sqrt{s} = 7 \text{ TeV}$ to search for KK gravitons in a warped extra dimension decaying to ZZ dibosons in the $lljj$ and $llll$ channels ($\ell = e, \mu$). The limit is quoted for the combined $lljj + llll$ channels. See their Figure 5 for limits on the cross section $\sigma(G \rightarrow ZZ)$ as a function of the graviton mass.
- 37 AALTONEN 12v use 6 fb^{-1} of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ to search for KK gravitons in a warped extra dimension decaying to ZZ dibosons in the $lljj$ and $llll$ channels ($\ell = e, \mu$). It provides improved limits over the previous analysis in AALTONEN 11G. See their Figure 16 for limits from all channels combined on the cross section times branching ratio $\sigma(p\bar{p} \rightarrow G^* \rightarrow ZZ)$ as a function of the graviton mass.
- 38 BAAK 12 use electroweak precision observables to place a lower bound on the compactification scale $k e^{-\pi k R}$, assuming Standard Model fields propagate in the bulk and the Higgs is confined to the IR brane. See their Fig. 27 for more details.
- 39 AALTONEN 11G use $2.5\text{--}2.9 \text{ fb}^{-1}$ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ to search for KK gravitons in a warped extra dimension decaying to ZZ dibosons via the $e\bar{e}e, e\bar{e}\mu\mu, \mu\bar{\mu}\mu\mu, e\bar{e}j, \text{ and } \mu\bar{\mu}jj$ channels. See their Fig. 20 for limits on the cross section $\sigma(G \rightarrow ZZ)$ as a function of the graviton mass.
- 40 AALTONEN 11R uses 5.7 fb^{-1} of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ in the dilepton channel to place a lower bound on the mass of the lightest graviton. It provides combined limits with the diphoton channel analysis of AALTONEN 11U. For warp parameter values k/\overline{M}_P between 0.01 to 0.1 the lower limit on the mass of the lightest graviton is between 612 and 1058 GeV. See their Table 1 for more details.
- 41 ABAZOV 11H use 5.4 fb^{-1} of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ to place a lower bound on the mass of the lightest graviton. Their 95% C.L. exclusion limit does not include masses less than 300 GeV.
- 42 AALTONEN 10N use 2.9 fb^{-1} of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ to place a lower bound on the mass of the lightest graviton.
- 43 ABAZOV 10F use 5.4 fb^{-1} of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ to place a lower bound on the mass of the lightest graviton. For warp parameter values of k/\overline{M}_P between 0.01 and 0.1 the lower limit on the mass of the lightest graviton is between 560 and 1050 GeV. See their Fig. 3 for more details.
- 44 AALTONEN 08s use $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to four electrons via two Z bosons using 1.1 fb^{-1} of data. See their Fig. 8 for limits on $\sigma_B(G \rightarrow ZZ)$ versus the graviton mass.
- 45 ABAZOV 08I use $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to electrons and photons using 1 fb^{-1} of data. For warp parameter values of k/\overline{M}_P between 0.01 and 0.1 the lower limit on the mass of the lightest excitation is between 300 and 900 GeV. See their Fig. 4 for more details.
- 46 AALTONEN 07G use $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to photons using 1.2 fb^{-1} of data. For warp parameter values of $k/\overline{M}_P = 0.1, 0.05, \text{ and } 0.01$ the bounds on the graviton mass are 850, 694, and 230 GeV, respectively. See their Fig. 3 for more details. See also AALTONEN 07H.
- 47 AALTONEN 07H use $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to electrons using 1.3 fb^{-1} of data. For a warp parameter value of $k/\overline{M}_P = 0.1$ the bound on the graviton mass is 807 GeV. See their Fig. 4 for more details. A combined analysis with the diphoton data of AALTONEN 07G yields for $k/\overline{M}_P = 0.1$ a graviton mass lower bound of 889 GeV.
- 48 ABAZOV 05N use $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to muons, electrons or photons, using 260 pb^{-1} of data. For warp parameter values of $k/\overline{M}_P = 0.1, 0.05, \text{ and } 0.01$, the bounds on the graviton mass are 785, 650 and 250 GeV respectively. See their Fig. 3 for more details.
- 49 ABULENCIA 05A use $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to muons or electrons, using 200 pb^{-1} of data. For warp parameter values of $k/\overline{M}_P = 0.1, 0.05, \text{ and } 0.01$, the bounds on the graviton mass are 710, 510 and 170 GeV respectively.

Limits on Kaluza-Klein Gluons in Warped Extra Dimensions

This section places limits on the mass of the first Kaluza-Klein (KK) excitation of the gluon in warped extra dimension models with Standard Model fields propagating in the bulk. Bounds are given for a specific benchmark model with $\Gamma/m = 15.3\%$ where Γ is the width and m the mass of the KK gluon. See the "Extra Dimensions" review for more discussion.

Extra Dimensions

- ¹ AABOUD 18B1 use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV. This result updates AAD 13AQ.
- ² AABOUD 19AS use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV. An upper bound of 3.4 TeV is placed on the KK gluon mass for $\Gamma/m = 30\%$.
- ³ SIRUNYAN 19AL use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to place limits on a KK gluon decaying to a top quark and a heavy vector-like fermion, T . KK gluon masses between 1.5 and 2.3 TeV and between 2.0 and 2.4 TeV are excluded for T masses of 1.2 and 1.5 TeV, respectively.
- ⁴ CHATRCHYAN 13BM use 19.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV. Bound is for a width of approximately 15–20% of the KK gluon mass.
- ⁵ CHEN 13A place limits on the KK mass scale for a specific warped model with custodial symmetry and bulk fermions. See their Figures 4 and 5.
- ⁶ AAD 12BV use 2.05 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV.

Black Hole Production Limits

Semiclassical Black Holes

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
• • •	We do not use the following data for averages, fits, limits, etc. • • •		
¹	SIRUNYAN 18DA CMS	$pp \rightarrow$ multijet	
²	AAD 16N ATLS	$pp \rightarrow$ multijet	
³	AAD 16O ATLS	$pp \rightarrow \ell + (\ell\ell/\ell j/jj)$	
⁴	AAD 13AW ATLS	$pp \rightarrow \mu\mu$	
¹	SIRUNYAN 18DA use 35.9 fb ⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for semiclassical black holes decaying to multijet final states. No excess of events above the expected level of standard model background was observed. Exclusions at 95% C.L. are set on the mass threshold for black hole production as a function of the higher-dimensional Planck scale for rotating and nonrotating black holes under several model assumptions (ADD, 2, 4, 6 extra dimensions model) in the 7.1–10.3 TeV range. These limits supersede those in SIRUNYAN 17CP.		
²	AAD 16N use 3.6 fb ⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for semiclassical black hole decays to multijet final states. No excess of events above the expected level of Standard Model background was observed. Exclusion contours at 95% C.L. are set on the mass threshold for black hole production versus higher-dimensional Planck scale for rotating black holes (ADD, 6 extra dimensions model).		
³	AAD 16O use 3.2 fb ⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for semiclassical black hole decays to high-mass final states with leptons and jets. No excess of events above the expected level of Standard Model background was observed. Exclusion contours at 95% C.L. are set on the mass threshold for black hole production versus higher-dimensional Planck scale for rotating black holes (ADD, 2 to 6 extra dimensions).		
⁴	AAD 13AW use 20.3 fb ⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to search for semiclassical black hole decays to like-sign dimuon final states using large track multiplicity. No excess of events above the expected level of Standard Model background was observed. Exclusion contours at 95% C.L. are set on the mass threshold for black hole production versus higher-dimensional Planck scale in various extra dimensions, rotating and non-rotating models.		

Quantum Black Holes

¹¹	CHATRCHYAN 13A CMS	$pp \rightarrow jj$	
¹	AAD 20T use 139 fb ⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for quantum black hole decays to final states with dijets. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in an ADD (6 extra dimensions) model. Assuming the black hole mass threshold is equal to the higher-dimensional Planck scale, mass thresholds below 9.4 TeV are excluded. This limit supersedes AABOUD 17AK.		
²	AABOUD 18BA use 36.7 fb ⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for quantum black hole decays to final states with a photon and a jet. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in ADD (6 extra dimensions) and RS1 models. Assuming the black hole mass threshold is equal to the Planck scale, mass thresholds below 7.1 TeV and 4.4 TeV are excluded for the ADD and RS1 models, respectively. These limits supersede those in AAD 16A1.		
³	AABOUD 18CM use 36.1 fb ⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for quantum black hole decays with different-flavor high-mass dilepton final states. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in ADD (6 extra dimensions) and RS1 models. Assuming the black hole mass threshold is equal to the Planck scale, mass thresholds below 7.1 TeV and 4.4 TeV are excluded for the ADD and RS1 models, respectively. These limits supersede those in AAD 16A1.		
⁴	SIRUNYAN 18AT use 35.9 fb ⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for quantum black hole decays to $e\mu$ final states. In Figure 4, lower mass limits of 5.3, 5.5 and 5.6 TeV are placed in a model with 4, 5 and 6 extra dimensions, respectively, and a lower mass limit of 3.6 TeV is found for a single warped dimension.		
⁵	SIRUNYAN 18DD use 35.9 fb ⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for quantum black hole decays in dijet angular distributions. A lower mass limit of 5.9 (8.2) TeV is placed in the RS (ADD) model with one (six) extra dimension(s).		
⁶	SIRUNYAN 17CP use 2.3 fb ⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for quantum black holes decaying to dijet final states. No excess of events above the expected level of standard model background was observed. Limits on the quantum black hole mass threshold are set as a function of the higher-dimensional Planck scale, under		

the assumption that the mass threshold must exceed the above Planck scale. Depending on the model, mass thresholds in the range up to 5.1–9.0 TeV are excluded.

- ⁷ KHACHATRYAN 16BE use 19.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to search for quantum black holes undergoing lepton flavor violating decay to the $e\mu$ final state. No excess of events above the expected level of standard model background was observed. Exclusion limits at 95% CL are set on mass thresholds for black hole production in the ADD (2–6 flat extra dimensions), RS1 (1 warped extra dimension), and a model with a Planck scale at the TeV scale from a renormalization of the gravitational constant (no extra dimensions). Limits on the black hole mass threshold are set assuming that it is equal to the higher-dimensional Planck scale. Mass thresholds for quantum black holes in the range up to 3.15–3.63 TeV are excluded in the ADD model. In the RS1 model, mass thresholds below 2.81 TeV are excluded in the PDG convention for the Schwarzschild radius. In the model with no extra dimensions, mass thresholds below 1.99 TeV are excluded.
- ⁸ KHACHATRYAN 15V use 19.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to search for quantum black holes decaying to dijet final states. No excess of events above the expected level of standard model background was observed. Exclusion limits at 95% CL are set on mass thresholds for black hole production in the ADD (2–6 flat extra dimensions) and RS1 (1 warped extra dimension) model. Limits on the black hole mass threshold are set as a function of the higher-dimensional Planck scale, under the assumption that the mass threshold must exceed the above Planck scale. Depending on the model, mass thresholds in the range up to 5.0–6.3 TeV are excluded. This paper supersedes CHATRCHYAN 13AD.
- ⁹ AAD 14AL use 20.3 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to search for quantum black hole decays to final states with high-invariant-mass lepton + jet. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in an ADD (6 extra dimensions) model. Assuming the black hole mass threshold is equal to the higher-dimensional Planck scale, mass thresholds below 5.3 TeV are excluded.
- ¹⁰ AAD 14V use 20.3 (20.5) fb⁻¹ of data in the dielectron (dimuon) channels from pp collisions at $\sqrt{s} = 8$ TeV to search for quantum black hole decays involving high-mass dilepton resonances. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in ADD (6 extra dimensions) and RS1 models. Assuming the black hole mass threshold is equal to the higher-dimensional Planck scale, mass thresholds below 3.65 TeV and 2.24 TeV are excluded for the ADD and RS1 models, respectively.
- ¹¹ CHATRCHYAN 13A use 5 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV to search for quantum black holes decaying to dijet final states. No excess of events above the expected level of standard model background was observed. Exclusion limits at 95% CL are set on mass thresholds for black hole production in the ADD (2–6 flat extra dimensions) and RS (1 warped extra dimension) model. Limits on the black hole mass threshold are set as a function of the higher-dimensional Planck scale, under assumption that the mass threshold must exceed the above Planck scale. Depending on the model, mass thresholds in the range up to 4.0–5.3 TeV are excluded.

Searches Particle Listings

Extra Dimensions, WIMP and Dark Matter Searches

Table listing search results for WIMP and Dark Matter, including columns for author names, publication details, and collaboration names. Entries include Klimchitskaya, V.M. Mostepanenko, Sirunyan, etc.

Table listing search results for WIMP and Dark Matter, including columns for author names, publication details, and collaboration names. Entries include Hoyle, Abbiendi, Abreu, etc.

WIMP and Dark Matter Searches

We omit papers on CHAMP's, millicharged particles, and other exotic particles.

GALACTIC WIMP SEARCHES

These limits are for weakly-interacting stable particles that may constitute the invisible mass in the galaxy. Unless otherwise noted, a local mass density of 0.3 GeV/cm^3 is assumed; see each paper for velocity distribution assumptions.

Spin-Independent Cross Section Limits for Dark Matter Particle (X^0) on Nucleon

For m_X^0 in GeV range

We provide here limits for m_X^0 < 5 GeV

Table with columns: VALUE (pb), CL%, DOCUMENT ID, TECN, COMMENT. Lists various search results for dark matter particles on nucleons, including entries like AKERIB, ALKhatib, etc.

1 AKERIB 21A present new technique for low mass WIMP detection. Require sigma^SI(pX) < 2 x 10^-7 pb for m(WIMP) 10 GeV. 2 ALKHATIB 21 search for light DM using SuperCDMS; require sigma^SI(pX) < 5 x 10^6 for m(DM) = 0.1 GeV.

Searches Particle Listings

WIMP and Dark Matter Searches

4 APRILE 21 search for low recoil energy GeV-scale DM in XENON1T with 1.6 keV threshold. No signal in 0.6 t yr exposure. Limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\text{DM})$ plane for $m(\text{DM})$ between 3–12 GeV. The listed limit is for $m(\text{DM}) = 5$ GeV.	$<2.2 \times 10^{-10}$	90	3 WANG	20G	PNDX	Xe	TPC	
5 AGUILAR-AREVALO 20c search for WIMP SI scatter on Si using DAMIC at SNOLab; some excess; limits placed in σ vs $m(\text{DM})$ for $m(\text{DM})$ in 1.2–10 GeV; quoted limit for $m(\text{WIMP}) = 2$ GeV.	$<7 \times 10^{-5}$	90	4 ANGIOHER	19	CRES	CaWO ₄		
6 AKERIB 20A search for GeV-scale WIMPs via WIMP-nucleon scatter with single photon emission; no signal; limits placed in $m(\text{WIMP})$ vs σ^{SI} plane: for example $\sigma^{SI}(\chi N) < 8 \times 10^{-4}$ pb for $m(\text{WIMP}) = 2.5$ GeV.	$<3 \times 10^{-7}$	90	5 KIM	19A	KIMS	Nal		
7 ABDELHAMEED 19A search for GeV scale dark matter SI scatter on CaWO ₄ ; no signal, limits placed in σ vs. mass plane for $m(\text{DM}) \sim 0.1$ –10 GeV. The listed limit is for $m(\text{DM}) = 1$ GeV.	$<3.5 \times 10^{-5}$	90	6 KOBAYASHI	19	XMAS	Si	WIMP on Xe	
8 AGNESE 19A search for 1.5–10 GeV WIMP scatter on Ge in CDMSlite dataset. Limits set in a likelihood analysis. No signal was observed. Limit reported for $m(\chi) = 5$ GeV.	$<2 \times 10^{-7}$	90	7 SEONG	19	BELL	$\tau \rightarrow \gamma A, A \rightarrow \chi \chi$		
9 AKERIB 19 search for 0.4–5 GeV DM using bremsstrahlung photons and "Migdal" electrons; 1.4×10^4 kg d exposure of liquid Xe; constraint $\sigma^{SI}(\chi N) < 1$ pb for $m(\chi) = 5$ GeV in light scalar mediator model.	$<2 \times 10^{-7}$	90	8 YANG	19	CDEX	annual modulation	Ge	
10 AMOLE 19 search for SI WIMP scatter on C ₃ F ₈ in PICO-60 bubble chamber; no signal; set limit for spin independent coupling $\sigma^{SI}(\chi N) < 1 \times 10^{-6}$ pb for $m(\chi) = 5$ GeV.	$<2 \times 10^{-7}$	90	9 ABE	18c	XMAS	X ⁰ -Xe modulation		
11 APRILE 19c search for light DM scatter on Xe via atomic excitation, ionization (Migdal effect) or bremsstrahlung; no signal, limits placed in σ vs. $m(\text{DM})$ plane for $m(\text{DM}) \sim 0.085$ –2 GeV. The listed limit is for $m(\text{DM}) = 1$ GeV.	$<1.44 \times 10^{-5}$	90	10 ADHIKARI	18	C100	Nal		
12 APRILE 19d search for light DM scatter on Xe via ionization to probe SI, SD, and χ_e cross sections; with 22 t d exposure, limits placed in various σ vs. $m(\text{DM})$ planes. Quoted limit is for $m(\text{DM}) = 5$ GeV.	$<3 \times 10^{-7}$	90	11 AGNES	18	D550	X ⁰ -Ar		
13 ARMENGAUD 19 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 0.045$ –10 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<5 \times 10^{-6}$	95	12 AGNESE	18	SCDM	Ge		
14 KOBAYASHI 19 search for sub-GeV WIMP annual modulation in Xe via brems; no signal; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 0.3$ –1 GeV; quoted limit is for $m(\chi) = 0.5$ GeV.	$<4 \times 10^{-8}$	90	13 AGNESE	18A	SCDM	Ge		
15 LIU 19b search for sub-GeV DM using Migdal effect on Ge at CDEX-IB; no signal, require $\sigma^{SI}(\chi N) < 7 \times 10^2$ pb for $m(\chi) = 0.1$ GeV.	$<6 \times 10^{-11}$	90	14 APRILE	18	XE1T	Xe, Si		
16 AGNES 18 search for 1.8–20 GeV WIMP SI scatter on Ar; quoted limit is for $m(\chi) = 5$ GeV.	$<4.5 \times 10^{-3}$	90	15 ARNAUD	18	NEWS	GeV WIMPs on Ne		
17 AGNESE 18 search for GeV scale WIMPs using CDMSlite; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 1.5$ –20 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<2 \times 10^{-6}$	90	16 AARTSEN	17	ICCB	ν , earth		
18 APRILE 18 search for WIMP scatter on 1 t yr Xe; no signal, limits set in $\sigma(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 6$ –1000 GeV; quoted limit is for $m = 6$ GeV.	$<2 \times 10^{-10}$	90	17 AKERIB	17	LUX	Xe		
19 ARNAUD 18 search for low mass WIMP scatter on Ne via SPC at NEWS-G; limits set in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 0.5$ –20 GeV; quoted limit is for $m = 5$ GeV.	$<1 \times 10^{-3}$	90	18 BARBOSA-D...	17	ICCB	WIMP		
20 JIANG 18 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 3$ –10 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<1.7 \times 10^{-10}$	90	19 CUI	17A	PNDX	WIMPs on Xe		
21 YANG 18 search for WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 2$ –10 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<7.3 \times 10^{-7}$	90			AGNES	16	D550	Ar
22 AKERIB 17 search for WIMP scatter on Xe; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5$ –1 $\times 10^3$ GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<1 \times 10^{-5}$	90	20	AGNESE	16	CDMS	Ge	
23 ANGIOHER 17A search for GeV scale WIMP scatter on Al ₂ O ₃ crystal; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 0.15$ –10 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<2 \times 10^{-4}$	90	21	AGUILAR-AR...	16	DMIC	Si	CCDs
24 ANGIOHER 16 search for GeV scale WIMP scatter on CaWO ₄ ; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 0.5$ –30 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<4.5 \times 10^{-5}$	90	22	ANGLOHER	16	CRES	CaWO ₄	
25 ARMENGAUD 16 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4$ –30 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<2 \times 10^{-6}$	90	23	APRILE	16	X100	Xe	
26 HEHN 16 search for low mass WIMPs via SI scatter on Ge target using profile likelihood analysis; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4$ –30 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<9.4 \times 10^{-8}$	90	24	ARMENGAUD	16	EDE3	Ge	
27 ZHAO 16 search for GeV-scale WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4$ –30 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<1.0 \times 10^{-7}$	90	25	HEHN	16	EDE3	Ge	
28 XIAO 15 search for WIMP scatter on Xe with PandaX-I; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5$ –100 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<5 \times 10^{-6}$	90	26	ZHAO	16	CDEX	Ge	
29 AGNESE 14 search for GeV scale WIMPs SI scatter at SuperCDMS; no signal, limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 3.5$ –30 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<1 \times 10^{-5}$	90			AGNES	15	D550	Ar
30 XIAO 15 search for WIMP scatter on Xe with PandaX-I; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5$ –100 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<1.5 \times 10^{-6}$	90	27	AGNESE	15A	CDM2	Ge	
31 AGNESE 14 search for GeV scale WIMPs SI scatter at SuperCDMS; no signal, limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 3.5$ –30 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<1.5 \times 10^{-7}$	90	28	AGNESE	15B	CDM2	Ge	
32 AKERIB 14 search for WIMP scatter on Xe; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5$ –5000 GeV. Limit given for $m(\chi) = 5$ GeV.	$<2 \times 10^{-6}$	90	29	AMOLE	15	PICO	C ₃ F ₈	
33 LI 13b search for WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4$ –100 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<1.2 \times 10^{-5}$	90			CHOI	15	SKAM	H, solar ν ($b\bar{b}$)
34 ARCHAMBAULT 12 search for low mass WIMP scatter on C ₄ F ₁₀ ; limits set in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 4$ –12 GeV; quoted limit is for $m = 5$ GeV.	$<1.19 \times 10^{-6}$	90			CHOI	15	SKAM	H, solar ν ($\tau^+ \tau^-$)
35 AALSETH 11 search for GeV-scale SI WIMP scatter on Ge; limits placed on $\sigma^{SI}(\chi N)$ for $m(\chi) \sim 3.5$ –100 GeV; quoted limit is for $m(\chi) = 5$ GeV.	$<2 \times 10^{-8}$	90	30	XIAO	15	PNDX	Xe

• • • We do not use the following data for averages, fits, limits, etc. • • •

- MENG 21b search for SI WIMP interaction with 3.7 t Xe and 0.63 t yr exposure. No signal observed. Limits placed in $m(\text{DM})$ vs. σ^{SI} plane.
- FELIZARDO 20 presents 2014 SIMPLE bounds on WIMP DM using C₂ClF₅ target.
- WANG 20g search for SI WIMP scatter on Xe with 132 t d exposure of PANDAX-II.
- ANGLOHER 19 search for low mass WIMP scatter on CaWO₄; no signal; limits placed on Wilson coefficients for $m(\chi) = 0.6$ –60 GeV.
- KIM 19a search for WIMP scatter in Nal KIMS experiment; no signal; require $\sigma^{SI}(\chi N) < 7 \times 10^{-5}$ pb for $m(\chi) = 20$ GeV.
- KOBAYASHI 19 search for WIMP scatter in XMAS single-phase liquid Xe detector; no signal; require $\sigma^{SI}(\chi N) < 3 \times 10^{-7}$ pb for $m(\chi) = 20$ GeV.

See key on page 1127

WIMP and Dark Matter Searches

- 7 SEONG 19 search for $T \rightarrow \gamma A$, $A \rightarrow \chi\chi$ via CP-odd Higgs; no signal; limits on BF set; model dependent conversion to WIMP-nucleon scattering cross section limits $\sigma^{SI} < 10^{-36}$ cm² for $m(\chi) = 0.01\text{--}1$ GeV.
- 8 YANG 19 search for low mass wimps via annual modulation in Ge; no signal; require $\sigma^{SI}(\chi N) < 3.5 \times 10^{-9}$ pb for $m(\chi) = 20$ GeV.
- 9 ABE 18c search for WIMP annual modulation signal for $m(\text{WIMP})$: 6–20 GeV; limits set on SI WIMP-nucleon cross section: see Fig. 6.
- 10 ADHIKARI 18 search for WIMP scatter on NaI; no signal; require $\sigma^{SI} < 1.44 \times 10^{-5}$ pb for $m(\text{WIMP}) = 20$ GeV; inconsistent with DAMA/LIBRA result.
- 11 AGNES 18 search low mass $m(\text{WIMP})$: 1.8–20 GeV scatter on Ar; limits on SI WIMP-nucleon cross section set in Fig. 8.
- 12 AGNESE 18 give limits for $\sigma^{SI}(\chi N)$ for $m(\text{WIMP})$ between 1.5 and 20 GeV using CDMSlite mode data.
- 13 AGNESE 18a search for WIMP scatter on Ge at SuperCDMS; 1 event, consistent with expected background; set limit in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 10\text{--}250$ GeV.
- 14 APRILE 18 search for WIMP scatter on 1 t yr Xe; no signal, limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 6\text{--}1000$ GeV.
- 15 ARNAUD 18 search for low mass WIMP scatter on Ne via SPC at NEWS-G; limits set in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 0.5\text{--}20$ GeV.
- 16 AARTSEN 17 obtain $\sigma(\text{SI}) < 6 \times 10^{-6}$ pb for $m(\text{wimp}) = 20$ GeV from ν from earth.
- 17 AKERIB 17 search for WIMP scatter on Xe; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5\text{--}1 \times 10^5$ GeV.
- 18 BARBOSA-DE-SOUZA 17 search for annual modulation of WIMP scatter on NaI using an exposure of 61 kg yr of DM-Ice17 for recoil energy in the 4–20 keV range (DAMA found modulation for recoil energy < 5 keV). No modulation seen. Sensitivity insufficient to distinguish DAMA signal from null.
- 19 CUI 17a search for SI WIMP scatter; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 10\text{--}1 \times 10^4$ GeV using 54 ton-day exposure of Xe.
- 20 AGNESE 16 CDMSlite excludes low mass WIMPs 1.6–5.5 GeV and SI scattering cross section depending on $m(\text{WIMP})$; see Fig. 4.
- 21 AGUILAR-AREVALO 16 search low mass 1–10 GeV WIMP scatter on Si CCDs; set limits Fig. 11.
- 22 ANGLÖHER 16 search for GeV scale WIMP scatter on CaWO₄; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 0.5\text{--}30$ GeV.
- 23 APRILE 16 search for low mass WIMPs via ionization at XENON100; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 3.5\text{--}20$ GeV.
- 24 ARMENGAUD 16 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}30$ GeV.
- 25 HEHN 16 search for low mass WIMPs via SI scatter on Ge target using profile likelihood analysis; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}30$ GeV.
- 26 ZHAO 16 search for GeV-scale WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}30$ GeV.
- 27 AGNESE 15a reanalyse AHMED 11B low threshold data. See their Fig. 12 (left) for improved limits extending down to 5 GeV.
- 28 AGNESE 15b reanalyse AHMED 10 data.
- 29 See their Fig. 7 for limits extending down to 4 GeV.
- 30 XIAO 15 search for WIMP scatter on Xe with PandaX-I; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5\text{--}100$ GeV.
- 31 This limit value is provided by the authors. See their Fig. 4 for limits extending down to $m_{\chi^0} = 3.5$ GeV.
- 32 This limit value is provided by the authors. AGNESE 14a result is from CDMSlite mode operation with enhanced sensitivity to low mass m_{χ^0} . See their Fig. 3 for limits extending down to $m_{\chi^0} = 3.5$ GeV (see also Fig. 4 in AGNESE 14).
- 33 See their Fig. 5 for limits extending down to $m_{\chi^0} = 5.5$ GeV.
- 34 See their Fig. 5 for limits extending down to $m_{\chi^0} = 1$ GeV.
- 35 See their Fig. 5 for limits extending down to $m_{\chi^0} = 5$ GeV.
- 36 LIU 14a result is based on prototype CDEX-0 detector. See their Fig. 13 for limits extending down to $m_{\chi^0} = 2$ GeV.
- 37 See their Fig. 4 for limits extending down to $m_{\chi^0} = 4.5$ GeV.
- 38 AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between June 2010 and May 2011.
- 39 See their Fig. 8 for limits extending down to $m_{\chi^0} = 7$ GeV.
- 40 This limit value is provided by the authors. AGNESE 13 use data taken between Oct. 2006 and July 2007. See their Fig. 4 for limits extending down to $m_{\chi^0} = 7$ GeV.
- 41 This limit value is provided by the authors. AGNESE 13a use data taken between July 2007 and Sep. 2008. Three candidate events are seen. Assuming these events are real, the best fit parameters are $m_{\chi^0} = 8.6$ GeV and $\sigma = 1.9 \times 10^{-5}$ pb.
- 42 This limit value is provided by the authors. Limit from combined data of AGNESE 13 and AGNESE 13a. See their Fig. 4 for limits extending down to $m_{\chi^0} = 5.5$ GeV.
- 43 BERNABE 13a search for annual modulation of counting rate in the 2–6 keV recoil energy interval, in a 14 yr live time exposure of 1.33 t yr. Find a modulation of 0.0112 ± 0.0012 counts/(day kg keV) with 9.3 sigma C.L. Find period and phase in agreement with expectations from DM particles.
- 44 LI 13b search for WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}100$ GeV.
- 45 See their Fig. 5 for limits for $m_{\chi^0} = 4\text{--}12$ GeV.
- 46 ANGLÖHER 12 observe excess events above the expected background which are consistent with X^0 with mass ~ 25 GeV (or 12 GeV) and spin-independent X^0 -nucleon cross section of 2×10^{-6} pb (or 4×10^{-5} pb).
- 47 Reanalysis of ANGLÖHER 09 data with all three nuclides. See also BROWN 12.
- 48 See also APRILE 14a.
- 49 See their Fig. 4 for limits extending down to $m_{\chi^0} = 7$ GeV.
- 50 See their Fig. 13 for cross section limits for m_{χ^0} between 1.2 and 10 GeV.
- 51 See also DAHL 12 for a criticism.
- 52 See their Fig. 4 for limits extending to $m_{\chi^0} = 3.5$ GeV.
- 53 AALSETH 11a find indications of annual modulation of the data, the energy spectrum being compatible with X^0 mass around 8 GeV. See also AALSETH 13.

- 54 AHMED 11 search for X^0 inelastic scattering. See their Fig. 8–10 for limits. The inelastic cross section reduces to the elastic cross section at the limit of zero mass splitting (Fig. 8, left).
- 55 AHMED 11a combine CDMS II and EDELWEISS data.
- 56 ANGLE 11 show limits down to $m_{\chi^0} = 4$ GeV on Fig. 3.
- 57 APRILE 11 reanalyze APRILE 10 data.
- 58 APRILE 11a search for X^0 inelastic scattering. See their Fig. 2 and 3 for limits. See also APRILE 14a.
- 59 HORN 11 perform detector calibration by neutrons. Earlier results are only marginally affected.
- 60 See their Fig. 10 and 12 for limits extending to X^0 mass of 1 GeV.
- 61 Superseded by AHMED 10.
- 62 See their Fig. 6(a) for cross section limits for m_{χ^0} extending down to 2 GeV.
- 63 See their Fig. 2 for cross section limits for m_{χ^0} between 4 and 10 GeV.

For $m_{\chi^0} = 100$ GeV

For limits from X^0 annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

WIMP and Dark Matter Searches

- 1 MENG 21b search for SI WIMP interaction with 3.7 t Xe and 0.63 t yr exposure. No signal observed. Limits placed in $m(\text{DM})$ vs. σ^{SI} plane.
- 2 ADHIKARI 20 search for SI WIMP scatter from Ar in AJAJ 19 data. No signal observed. Limits placed on σ^P vs. $m(\text{WIMP})$ for various assumed operators and models.
- 3 FELIZARDO 20 presents 2014 SIMPLE bounds on WIMP DM using C_2ClF_5 target .
- 4 WANG 20g search for SI WIMP scatter on Xe with 132 t d exposure of PANDAX-II .
- 5 ABE 19 search for SI DD in single phase Xe; no signal; require $\sigma^{SI}(\chi p) < 4 \times 10^{-8}$ pb for $m(\chi) \sim 100$ GeV.
- 6 AJAJ 19 search for SI WIMP-nucleon scatter with 758 tonne day exposure of single phase liquid Ar; no signal; require $\sigma^{SI}(\chi N) < 3.9 \times 10^{-9}$ pb for $m(\chi) = 100$ GeV.
- 7 ADHIKARI 18 search for WIMP scatter on Na; limit set $\sigma^{SI}(\chi p) < 2.3 \times 10^{-6}$ pb for $m(\chi) = 100$ GeV.
- 8 AGNES 18a search for WIMP scatter on 46.4 kg Ar; no signal; require $\sigma^{SI}(\chi N) < 1.14 \times 10^{-8}$ pb for $m(\chi) = 100$ GeV.
- 9 AGNESE 18a set limit $\sigma^{SI}(\chi N) < 2 \times 10^{-8}$ pb for $m(\text{WIMP}) = 100$ GeV.
- 10 AMAUDRUZ 18 search for WIMP scatter on Ar with DEAP-3600; limits set: $\sigma^{SI}(\chi p) < 1.2 \times 10^{-8}$ pb for $m(\text{WIMP}) = 100$ GeV.
- 11 APRILE 18 search for WIMP scatter on 1.3 t liquid Xe; no signal; require $\sigma^{SI}(\chi p) < 9.12 \times 10^{-11}$ pb for $m(\chi) = 100$ GeV.
- 12 REN 18 search for self-interacting DM at Panda-X-II with a total exposure of 54 ton day; limits set in $m(\text{DM})$ vs. $m(\text{mediator})$ plane.
- 13 AKERIB 17 exclude SI cross section $> 1.7 \times 10^{-10}$ pb for $m(\text{WIMP}) = 100$ GeV. Uses complete LUX data set.
- 14 APRILE 17g set limit $\sigma^{SI}(\chi p) < 1.2 \times 10^{-10}$ pb for $m(\text{WIMP}) = 100$ GeV using 1 ton fiducial mass Xe TPC. Exposure is 34.2 live days.
- 15 CUI 17a search for SI WIMP scatter; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 10^{-1} \times 10^4$ GeV using 54 ton-day exposure of Xe.
- 16 AKERIB 16 re-analysis of 2013 data exclude SI cross section $> 1 \times 10^{-9}$ pb for $m(\text{WIMP}) = 100$ GeV on Xe target.
- 17 APRILE 16b combined 447 live days using Xe target exclude $\sigma(\text{SI}) > 1.1 \times 10^{-9}$ pb for $m(\text{WIMP}) = 50$ GeV.
- 18 TAN 16 search for WIMP scatter off Xe target; see SI exclusion plot Fig. 6.
- 19 TAN 16b search for WIMP-p scatter off Xe target; see Fig. 5 for SI exclusion.
- 20 AGNESE 15b reanalyse AHMED 10 data.
- 21 XIAO 15 search for WIMP scatter on Xe with PandaX-I; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5-100$ GeV.
- 22 AVRORIN 14 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun in data taken between 1998 and 2003. See their Table 1 for limits assuming annihilation into neutrino pairs.
- 23 AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between June 2010 and May 2011.
- 24 ADRIAN-MARTINEZ 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between Jan. 2007 and Dec. 2008.
- 25 AGNESE 13 use data taken between Oct. 2006 and July 2007.
- 26 BOLIEV 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken from 1978 to 2009. See also SUVOROVA 13 for an older analysis of the same data.
- 27 LI 13b search for WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4-100$ GeV.
- 28 ABBASI 12 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun. The amount of X^0 depends on the X^0 -proton cross section.
- 29 Reanalysis of ANGLOHER 09 data with all three nuclides. See also BROWN 12.
- 30 See also APRILE 14a.
- 31 See their Fig. 6 for a limit on inelastically scattering X^0 for $m_{X^0} = 70$ GeV.
- 32 AHMED 11 search for X^0 inelastic scattering. See their Fig. 8-10 for limits.
- 33 AHMED 11a combine CDMS and EDELWEISS data.
- 34 AJELLO 11 search for e^\pm flux from X^0 annihilations in the Sun. Models in which X^0 annihilates into an intermediate long-lived weakly interacting particles or X^0 scatters inelastically are constrained. See their Fig. 6-8 for limits.
- 35 APRILE 11 reanalyse APRILE 10 data.
- 36 APRILE 11a search for X^0 inelastic scattering. See their Fig. 2 and 3 for limits. See also APRILE 14a.
- 37 Supersedes ARMENGAUD 10. A limit on inelastic cross section is also given.
- 38 HORN 11 perform detector calibration by neutrons. Earlier results are only marginally affected.
- 39 AKIMOV 10 give cross section limits for inelastically scattering dark matter. See their Fig. 4.
- 40 Superseded by AHMED 10.
- 41 ANGLE 09 search for X^0 inelastic scattering. See their Fig. 4 for limits.
- 42 GIULIANI 05 analyzes the spin-independent X^0 -nucleon cross section limits with both isoscalar and isovector couplings. See their Fig. 3 and 4 for limits on the couplings.

For $m_{X^0} = 1$ TeV

For limits from X^0 annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

- 1 MENG 21b search for SI WIMP interaction with 3.7 t Xe and 0.63 t yr exposure. No signal observed. Limits placed in $m(\text{DM})$ vs. σ^{SI} plane.
- 2 ADHIKARI 20 search for SI WIMP scatter from Ar in AJAJ 19 data. No signal observed. Limits placed on σ^P vs. $m(\text{WIMP})$ for various assumed operators and models.
- 3 WANG 20g search for SI WIMP scatter on Xe with 132 t d exposure of PANDAX-II .
- 4 YAGUNA 19 recasts DEAP-3600 single-phase liquid argon results in limit for isospin violating DM; for $f_n/f_p = -0.69$, requires $\sigma^{SI}(\chi p) < 3 \times 10^{-6}$ pb for $m(\chi) = 1$ TeV.
- 5 AGNES 18a search for WIMP scatter on 46.4 kg Ar; no signal; require $\sigma^{SI}(\chi N) < 3.8 \times 10^{-8}$ pb for $m(\chi) = 1$ TeV.
- 6 APRILE 18 search for WIMP scatter on 1.3 t Xe; no signal seen; require $\sigma^{SI}(\chi p) < 8.24 \times 10^{-10}$ pb for $m(\chi) = 1$ TeV.
- 7 AKERIB 17 search for WIMP scatter on Xe using complete LUX data set; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5-1 \times 10^5$ GeV.
- 8 CHEN 17E search for inelastic WIMP scatter on Xe; require $\sigma^{SI}(\chi N) < 0.3$ pb for $m(\chi) = 1$ TeV and (mass difference) = 300 keV.
- 9 CUI 17a search for WIMP scatter using 54 ton-day exposure of Xe; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 10^{-1} \times 10^4$ GeV.
- 10 AGNESE 15b reanalyse AHMED 10 data.
- 11 AVRORIN 14 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun in data taken between 1998 and 2003. See their Table 1 for limits assuming annihilation into neutrino pairs.
- 12 AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between June 2010 and May 2011.
- 13 ADRIAN-MARTINEZ 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between Jan. 2007 and Dec. 2008.
- 14 BOLIEV 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken from 1978 to 2009. See also SUVOROVA 13 for an older analysis of the same data.
- 15 ABBASI 12 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun. The amount of X^0 depends on the X^0 -proton cross section.
- 16 Reanalysis of ANGLOHER 09 data with all three nuclides. See also BROWN 12.
- 17 See also APRILE 14a.
- 18 AHMED 11 search for X^0 inelastic scattering. See their Fig. 8-10 for limits.
- 19 AHMED 11a combine CDMS and EDELWEISS data.
- 20 APRILE 11 reanalyse APRILE 10 data.
- 21 Supersedes ARMENGAUD 10. A limit on inelastic cross section is also given.
- 22 HORN 11 perform detector calibration by neutrons. Earlier results are only marginally affected.
- 23 Superseded by AHMED 10.

Spin-Dependent Cross Section Limits for Dark Matter Particle (X^0) on Proton

For m_{X^0} in GeV range

We provide here limits for $m_{X^0} < 5$ GeV

- ¹ ABDELHAMEED 20A use LiAlO₂ target in CRESST to search for SD WIMP scatter on p; no signal; quoted limit is for m(DM) = 1 GeV.
- ² ABDELHAMEED 19 search for SD WIMP scatter on ⁷Li; limits placed on $\sigma^{SD}(\chi p)$ for m(χ) ~ 0.8–20 GeV; quoted limit is for m(χ) = 1 GeV.
- ³ AMOLE 19 search for SD WIMP scatter on C₃F₈ in PICO-60 bubble chamber; no signal; set limit for spin dependent coupling $\sigma^{SD}(\chi p) < 2 \times 10^{-4}$ pb for m(χ) = 5 GeV.
- ⁴ APRILE 19c search for light DM on Xe via Migdal/brem effect; no signal, require $\sigma^{SD}(\chi p) < 1.7 \times 10^4$ pb for m(χ) = 1 GeV.
- ⁵ ARMENGAUD 19 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SD}(\chi p)$ vs. m(χ) plane for m(χ) ~ 0.5–10 GeV; quoted limit is for m(χ) = 5 GeV.
- ⁶ XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in $\sigma^{SD}(\chi p)$ vs. m(χ) plane for m(χ) ~ 5–1 × 10⁵ GeV; quoted limit is for m(χ) = 5 GeV.
- ⁷ AGNESE 18 search for GeV scale WIMPs with CDMSlite; limits placed in $\sigma^{SD}(\chi p)$ vs. m(χ) plane for m(χ) ~ 1.5–20 GeV; quoted limit is for m(χ) = 5 GeV.
- ⁸ AKERIB 17A search for SD WIMP scatter on Xe using 129.5 kg yr exposure; limits placed in $\sigma^{SD}(\chi p)$ vs. m(χ) plane for m(χ) ~ 6–1 × 10⁵ GeV.
- ⁹ FU 17 search for SD WIMP scatter on Xe; limits set in $\sigma^{SD}(\chi p)$ vs. m(χ) plane for m(χ) ~ 4–1 × 10³ GeV; quoted limit is for m(χ) = 5 GeV.
- ¹⁰ AMOLE 15 search for WIMP scatter on C₃F₈ in PICO-2L; limits placed in $\sigma^{SD}(\chi p)$ vs. m(χ) plane for m(χ) ~ 4–1 × 10⁴ GeV; quoted limit is for m(χ) = 5 GeV.
- ¹¹ ARCHAMBAULT 12 search for SD WIMP scatter in ¹⁹F with PICASSO; limits set in $\sigma^{SD}(\chi p)$ vs. m(χ) plane for m ~ 4–500 GeV; quoted limit is for m(χ) = 5 GeV.

For m_{χ0} = 20 GeV

For limits from X⁰ annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

- ¹ AARTSEN 20c place combined IceCube and Pico-60 velocity-independent limits on spin-dependent WIMP-p scatter $\sigma^{SD}(\chi p) < 9-5$ pb for m(WIMP) = 20 GeV assuming dominant annihilation to ττ.
- ² ABDELHAMEED 20A use LiAlO₂ target in CRESST to search for spin-dependent WIMP scatter on p; limits set for m(WIMP): 0.3–30 GeV in Fig. 8. Quoted limit is for m(WIMP) = 30 GeV.
- ³ FELIZARDO 20 presents 2014 SIMPLE bounds on WIMP DM using C₂ClF₅ target.
- ⁴ ABDELHAMEED 19 uses Li₂MoO₄ target to set limit for spin dependent coupling $\sigma^{SD}(\chi p) < 3. \times 10^5$ pb for m(χ) = 20 GeV.
- ⁵ AMOLE 19 search for SD WIMP scatter on C₃F₈ in PICO-60 bubble chamber; no signal; set limit for spin dependent coupling $\sigma^{SD}(\chi p) < 2.5 \times 10^{-5}$ pb for m(χ) = 20 GeV.
- ⁶ APRILE 19A search for SD WIMP scatter on 1 t yr Xe; no signal, limits placed in $\sigma^{SD}(\chi p)$ vs. m(χ) plane for m ~ 6–1000 GeV.
- ⁷ XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in $\sigma^{SD}(\chi p)$ vs. m(χ) plane for m(χ) ~ 5–1 × 10⁵ GeV.
- ⁸ AGNESE 18 give limits for $\sigma^{SD}(\rho \chi)$ for m(WIMP) between 1.5 and 20 GeV using CDMSlite mode data.

- ⁹ AKERIB 17A search for SD WIMP scatter on Xe using 129.5 kg yr exposure; limits placed in $\sigma^{SD}(\chi p)$ vs. m(χ) plane for m(χ) ~ 6–1 × 10⁵ GeV.
- ¹⁰ BEHNKE 17 show final Picasso results based on 231.4 kg d exposure at SNOLab for WIMP scatter on C₄F₁₀ search via superheated droplet; require $\sigma(SD) < 1.32 \times 10^{-2}$ pb for m(WIMP) = 20 GeV.
- ¹¹ FU 17 search for SD WIMP scatter on Xe; limits set in $\sigma^{SD}(\chi p)$ vs. m(χ) plane for m(χ) ~ 4–1 × 10³ GeV.
- ¹² AMOLE 16A require SD WIMP-p scattering < 5 × 10⁻⁴ pb for m(WIMP) = 20 GeV; bubbles from C₃F₈ target.
- ¹³ KHACHATRYAN 16AJ require SD WIMP-p < 2 × 10⁻⁶ pb for m(WIMP) = 20 GeV from pp → Z + ET; Z → lē signal.
- ¹⁴ AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of X⁰ trapped by the sun in data taken between June 2010 and May 2011.
- ¹⁵ The value has been provided by the authors. APRILE 13 note that the proton limits on Xe are highly sensitive to the theoretical model used. See also APRILE 14A.
- ¹⁶ ARCHAMBAULT 12 search for WIMP scatter on C₄F₁₀; limits set in $\sigma^{SD}(\chi p)$ vs. m(χ) plane for m ~ 4–500 GeV.
- ¹⁷ Use a direction-sensitive detector.
- ¹⁸ TANAKA 11 search for neutrinos from the Sun arising from the pair annihilation of X⁰ trapped by the Sun. The amount of X⁰ depends on the X⁰-proton cross section.
- ¹⁹ See also AKERIB 05.

For m_{χ0} = 100 GeV

For limits from X⁰ annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

- 1 IKEDA 21 use direction sensitive TPC NEWAGE to search for SD WIMPs. No signal observed. Limits set in $\sigma^{SD}(\chi p)$ vs. m plane; $\sigma^{SD}(\chi p) < 50$ pb for $m(\text{DM}) = 100$ GeV.
- 2 AARTSEN 20c place combined IceCube and Pico-60 velocity-independent limits on spin-dependent WIMP- p scatter $\sigma^{SD}(\chi p) < 3.34 \times 10^{-4}$ pb for $m(\text{WIMP}) = 100$ GeV assuming dominant annihilation to $\tau\bar{\tau}$.
- 3 FELIZARDO 20 presents 2014 SIMPLE bounds on WIMP DM using C₂ClF₅ target.
- 4 AMOLE 19 search for SD WIMP scatter on C₃F₈ in PICO-60 bubble chamber; no signal; set limit for spin dependent coupling $\sigma^{SD}(\chi p) < 4 \times 10^{-5}$ pb for $m(\chi) = 100$ GeV.
- 5 APRILE 19A search for SD WIMP scatter on 1 t yr Xe; no signal, limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m \sim 6$ –1000 GeV.
- 6 XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5$ – 1×10^5 GeV.
- 7 AKERIB 17A search for SD WIMP scatter on Xe using 129.5 kg yr exposure; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 6$ – 1×10^5 GeV.
- 8 AMOLE 17 require $\sigma(\text{WIMP}-p)^{SD} < 5 \times 10^{-5}$ pb for $m(\text{WIMP}) = 100$ GeV using PICO-60 1167 kg-days exposure at SNOLab.
- 9 APRILE 17A require $\sigma(\text{WIMP}-p)(\text{inelastic})^{SD} < 3.3 \times 10^{-2}$ pb for $m(\text{WIMP}) = 100$ GeV, based on 7640 kg day exposure at LNGS.
- 10 BATTAT 17 use directional detection of CS₂ ions to require $\sigma(\text{SD}) < 2.8 \times 10^{-1}$ pb for 100 GeV WIMP with a 55 days exposure at the Boulby Underground Science Facility.
- 11 FU 17 from a 33000 kg d exposure at CJPL, PANDAX II derive for $m(\text{DM}) = 100$ GeV, $\sigma^{SD}(\text{WIMP}-p) < 2 \times 10^{-3}$ pb.
- 12 AABOUD 16D use ATLAS 13 TeV 3.2 fb⁻¹ of data to search for monojet plus missing E_T ; agree with SM rates; present limits on large extra dimensions, compressed SUSY spectra and wimp pair production.
- 13 AABOUD 16F search for monophoton plus missing E_T events at ATLAS with 13 Tev and 3.2 fb⁻¹; signal agrees with SM background; place limits on SD WIMP-proton scattering vs. mediator mass and large extra dimension models.
- 14 AARTSEN 16c search for high energy ν s from WIMP annihilation in solar core; limits set on SD WIMP- p scattering (Fig. 8).
- 15 ADRIAN-MARTINEZ 16 search for WIMP annihilation into ν s from solar core; exclude SD cross section < few 10^{-4} depending on $m(\text{WIMP})$.
- 16 AKERIB 16A using 2013 data exclude SD WIMP-proton scattering $> 3 \times 10^{-3}$ pb for $m(\text{WIMP}) = 100$ GeV.
- 17 AMOLE 16 use bubble technique on CF₃I target to exclude SD WIMP- p scattering $> 5 \times 10^{-4}$ pb for $m(\text{WIMP}) = 100$ GeV.
- 18 Use a direction-sensitive detector.
- 19 AVRORIN 14 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun in data taken between 1998 and 2003. See their Table 1 for limits assuming annihilation into neutrino pairs.
- 20 AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between June 2010 and May 2011.
- 21 ADRIAN-MARTINEZ 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between Jan. 2007 and Dec. 2008.
- 22 The value has been provided by the authors. APRILE 13 note that the proton limits on Xe are highly sensitive to the theoretical model used. See also APRILE 14A.
- 23 BOLIEV 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken from 1978 to 2009. See also SUVOROVA 13 for an older analysis of the same data.
- 24 ABBASI 12 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun. The amount of X^0 depends on the X^0 -proton cross section.
- 25 ARCHAMBAULT 12 search for WIMP scatter on C₄F₁₀; limits set in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m \sim 4$ –500 GeV.
- 26 TANAKA 11 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun. The amount of X^0 depends on the X^0 -proton cross section.
- 27 See their Fig. 3 for limits on spin-dependent proton couplings for X^0 mass of 50 GeV.
- 28 See also AKERIB 05.
- 29 GIULIANI 05A analyze available data and give combined limits.
- 30 GIULIANI 04 reanalyze COLLAR 00 data and give limits for spin-dependent X^0 -proton coupling.
- 31 GIULIANI 04A give limits for spin-dependent X^0 -proton couplings from existing data.

For $m_{X^0} = 1$ TeV

For limits from X^0 annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

- 1 IKEDA 21 use direction sensitive TPC NEWAGE to search for SD WIMPs. No signal observed. Limits set in $\sigma^{SD}(\chi p)$ vs. m plane; $\sigma^{SD}(\chi p) < 200$ pb for $m(\text{DM}) = 1000$ GeV.
- 2 AARTSEN 20c place combined IceCube and Pico-60 velocity-independent limits on spin-dependent WIMP- p scatter $\sigma^{SD}(\chi p) < 3 \times 10^{-3}$ pb for $m(\text{WIMP}) = 1$ TeV assuming dominant annihilation to W^+W^- .
- 3 AMOLE 19 search for SD WIMP scatter on C₃F₈ in PICO-60 bubble chamber; no signal; set limit for spin dependent coupling $\sigma^{SD}(\chi p) < 3 \times 10^{-4}$ pb for $m(\chi) = 1000$ GeV.
- 4 APRILE 19A search for SD WIMP scatter on 1 t yr Xe; no signal, limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m \sim 6$ –1000 GeV.
- 5 XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5$ – 1×10^5 GeV.
- 6 ALBERT 18c search for DM annihilation in Sun to long-lived mediator (LLM) which decays outside Sun, for DM masses above 1 TeV; assuming LLM, limits set on $\sigma^{SD}(\chi p)$.
- 7 AARTSEN 17A search for neutrinos from solar WIMP annihilation into $\tau^+\tau^-$ in 532 days of live time.
- 8 AKERIB 17A search for SD WIMP scatter on Xe using 129.5 kg yr exposure; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 6$ – 1×10^5 GeV.
- 9 FU 17 search for SD WIMP scatter on Xe; limits set in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4$ – 1×10^3 GeV.
- 10 ADRIAN-MARTINEZ 16B search for secluded DM via WIMP annihilation in solar core into light mediator which later decays to μ or ν s; limits presented in Figures 3 and 4.
- 11 AVRORIN 14 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun in data taken between 1998 and 2003. See their Table 1 for limits assuming annihilation into neutrino pairs.
- 12 AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between June 2010 and May 2011.
- 13 ADRIAN-MARTINEZ 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between Jan. 2007 and Dec. 2008.
- 14 The value has been provided by the authors. APRILE 13 note that the proton limits on Xe are highly sensitive to the theoretical model used. See also APRILE 14A.
- 15 BOLIEV 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken from 1978 to 2009. See also SUVOROVA 13 for an older analysis of the same data.
- 16 ABBASI 12 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun. The amount of X^0 depends on the X^0 -proton cross section.
- 17 Use a direction-sensitive detector.
- 18 TANAKA 11 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun. The amount of X^0 depends on the X^0 -proton cross section.
- 19 ABBASI 10 search for ν_μ from annihilations of Kaluza-Klein photon dark matter in the Sun.
- 20 See also AKERIB 05.

———— Spin-Dependent Cross Section Limits ————
———— for Dark Matter Particle (χ^0) on Neutron ————

For m_{χ^0} in GeV rangeWe provide here limits for $m_{\chi^0} < 5$ GeV

- 1 ABDELHAMEED 20A use LiAlO₂ target in CRESST to search for SD WIMP scatter; no signal; quoted limit is for $m(\text{DM}) = 1$ GeV.
- 2 ABDELHAMEED 19 search for GeV-scale WIMP SD scatter on ⁷Li crystal; set limit $\sigma^{SD}(\chi n)$ for $m(\chi) \sim 0.8\text{--}20$ GeV; quoted limit for $m(\chi) = 1$ GeV.
- 3 APRILE 19C search for light DM on Xe via Migdal/bremstrahlung effect; no signal, require $\sigma^{SD}(\chi n) < 230$ pb for $m(\chi) = 1$ GeV.
- 4 APRILE 19D search for light DM scatter on Xe via ionization; no signal, limits placed in σ vs. $m(\text{DM}) \sim 3\text{--}6$ GeV; quoted limit is for $m(\text{DM}) = 5$ GeV.
- 5 ARMENGAUD 19 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 0.5\text{--}10$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 6 XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5\text{--}1 \times 10^5$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 7 AGNESE 18 search for GeV scale WIMPs scatter at CDMSlite; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m \sim 1.5\text{--}20$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 8 JIANG 18 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 3\text{--}10$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 9 YANG 18 search for WIMP scatter on Ge; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 2\text{--}10$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 10 AKERIB 17A search for SD WIMP scatter on Xe with 129.5 kg yr exposure; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5\text{--}1 \times 10^5$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 11 FU 17 search for SD WIMP scatter on Xe; limits set in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}1 \times 10^3$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 12 ZHAO 16 search for GeV-scale WIMP scatter on Ge; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}30$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 13 AHMED 11B search for GeV scale WIMP scatter on Ge in CDMS II; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m \sim 4\text{--}12$ GeV. Limit given for $m(\chi) = 5$ GeV.

For $m_{\chi^0} = 20$ GeV

- ¹CHENG 21 search for MeV-scale DM scatter from e in PANDAX-II. No signal detected. Limits set in $\sigma(\chi e)$ vs. $m(\text{DM})$ plane for two choices of form factors; $\sigma(\chi e) < 10$ pb for $m(\chi) = 10$ MeV and $F_{DM} = 1$.
- ²AKERIB 20 search for mirror DM with LUX 95 d × 118 kg data for mirror e scatter from Xe; no signal, limits placed in kinetic mixing parameter ν , mirror e temperature $T \sim 0.1$ –0.9 keV plane.
- ³AMARAL 20 search SuperCDMS data for low mass DM scatter from e in Si; no signal; quoted limit $\sigma_e < 8.7 \times 10^2$ pb for $m(\text{DM}) = 10$ MeV with form factor $F_{DM} = 1$.
- ⁴APRILE 20 report excess at electron recoil around 2–3 keV in Xe; data compared to unforeseen tritium background, and various signal models (bosonic DM, solar axion, and neutrino magnetic moment).
- ⁵ARNAUD 20 search for MeV DM scatter from e in Ge; no signal; quoted limit is for $m(\text{DM}) = 10$ MeV with form factor $F_{DM} = 1$.
- ⁶BARAK 20 report search for MeV scale DM scatter from e in Si; limits placed in σ_e vs. $m(\text{DM})$ plane; quoted limit is for $m(\text{DM}) = 10$ MeV and form factor $F_{DM} = 1$.
- ⁷ABRAMOFF 19 search for MeV-scale WIMP scatter from Si skipper-CCD; limits placed on $\sigma(\chi e)$ for $m(\chi) \sim 0.5$ –100 MeV depending on DM form factors. Limit given for $m(\text{DM}) = 1$ MeV.
- ⁸AGUILAR-AREVALO 19A search for MeV scale DM scatter from e in Si CCDs at SNO-LAB; no signal, limits placed in $\sigma(e)$ vs. $m(\text{DM})$ plane for $m(\text{DM}) \sim 0.6$ –100 MeV.
- ⁹APRILE 17D search for light DM scatter on Xe via ionization; no signal, limits placed in σ on nucleus vs. $m(\text{DM})$ plane for $m(\text{DM}) \sim 0.02$ –10 GeV; quoted limit is for $m(\text{DM}) = 0.2$ GeV.
- ¹⁰AGNES 18b search for MeV scale WIMP scatter from e in Ar; no signal, limits set in σ_e vs. $m(\chi)$ plane for $m \sim 20$ –1000 MeV and two choices of form factor $F(\text{DM})$; quoted limit for $m(\chi) = 100$ MeV and $F = 1$.
- ¹¹AGNESE 18b search for e χ scatter in SuperCDMS; limits placed in $\sigma(e\chi)$ vs. $m(\chi)$ plane for $m \sim 0.3$ –1 × 10⁴ MeV for two assumed form factors and also in $m(\text{dark photon})$ vs. kinetic mixing plane. Limit given for $m(\chi) = 1$ GeV and $F = 1$.
- ¹²CRISLER 18 search for $\chi e \rightarrow \chi e$ scatter in Si CCD; place limits on MeV DM in σ_e vs. $m(\chi)$ plane for $m \sim 0.5$ –1000 MeV for different form factors; quoted limit is for $F(\text{DM}) = 1$ and $m(\chi) = 10$ MeV.
- ¹³APRILE 17 search for WIMP-e annual modulation signal for recoil energy in the 2.0–5.8 keV interval using 4 years data with Xe. No significant effect seen.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- ¹UCHIDA 14 limit is for inelastic scattering $X^0 + ^{129}\text{Xe}^* \rightarrow X^0 + ^{129}\text{Xe}^*$ (39.58 keV).
- ²ANGLOHER 02 limit is for spin-dependent WIMP-Aluminum cross section.
- ³BENOIT 00 find four event categories in Ge detectors and suggest that low-energy surface nuclear recoils can explain anomalous events reported by UKDMC and Slacly Nal experiments.
- ⁴KLIMENKO 98 limit is for inelastic scattering $X^0 \text{ } ^{73}\text{Ge} \rightarrow X^0 \text{ } ^{73}\text{Ge}^*$ (13.26 keV).
- ⁵BELLI 96 limit for inelastic scattering $X^0 \text{ } ^{129}\text{Xe} \rightarrow X^0 \text{ } ^{129}\text{Xe}^*$ (39.58 keV).
- ⁶BELLI 96c use background subtraction and obtain $\sigma < 150$ pb (< 1.5 fb) (90% CL) for spin-dependent (independent) X^0 -proton cross section. The confidence level is from R. Bernabei, private communication, May 20, 1999.
- ⁷BERNABEI 96 use pulse shape discrimination to enhance the possible signal. The limit here is from R. Bernabei, private communication, September 19, 1997.
- ⁸SARSA 96 search for annual modulation of WIMP signal. See SARSA 97 for details of the analysis. The limit here is from M.L. Sarsa, private communication, May 26, 1997.
- ⁹SMITH 96 use pulse shape discrimination to enhance the possible signal. A dark matter density of 0.4 GeV cm⁻³ is assumed.
- ¹⁰GARCIA 95 limit is from the event rate. A weaker limit is obtained from searches for diurnal and annual modulation.
- ¹¹SNOWDEN-IFFT 95 look for recoil tracks in an ancient mica crystal. Similar limits are also given for ²⁷Al and ²⁸Si. See COLLAR 96 and SNOWDEN-IFFT 96 for discussion on potential backgrounds.
- ¹²REUSSER 91 limit here is changed from published (0.04) after reanalysis by authors. J.L. Vuilleumier, private communication, March 29, 1996.

For $m_{X^0} = 100$ GeV

WIMP and Dark Matter Searches

- 1 APRILE 21A search for inelastic DM scatter off ^{129}Xe nuclei with 0.83 yr exposure. No signal observed. Limits placed in $\sigma(\chi\text{Xe})$ vs. $m(\text{DM})$ plane for WIMP mass between 20 GeV and 10 TeV.
- 2 UCHIDA 14 limit is for inelastic scattering $\chi^0 + ^{129}\text{Xe}^* \rightarrow \chi^0 + ^{129}\text{Xe}^*$ (39.58 keV).
- 3 ANGIOHER 02 limit is for spin-dependent WIMP-Aluminum cross section.
- 4 BELLI 02 discuss dependence of the extracted WIMP cross section on the assumptions of the galactic halo structure.
- 5 BERNABEI 02c analyze the DAMA data in the scenario in which χ^0 scatters into a slightly heavier state as discussed by SMITH 01.
- 6 GREEN 02 discusses dependence of extracted WIMP cross section limits on the assumptions of the galactic halo structure.
- 7 ULLIO 01 disfavor the possibility that the BERNABEI 99 signal is due to spin-dependent WIMP coupling.
- 8 BENOIT 00 find four event categories in Ge detectors and suggest that low-energy surface nuclear recoils can explain anomalous events reported by UKDMC and Saclay Nal experiments.
- 9 BERNABEI 00d limit is for inelastic scattering $\chi^0 ^{129}\text{Xe} \rightarrow \chi^0 ^{129}\text{Xe}$ (39.58 keV).
- 10 AMBROSIO 99 search for ongoing muon events induced by neutrinos originating from WIMP annihilations in the Sun and Earth.
- 11 BRHLIK 99 discuss the effect of astrophysical uncertainties on the WIMP interpretation of the BERNABEI 99 signal.
- 12 KLIMENKO 98 limit is for inelastic scattering $\chi^0 ^{73}\text{Ge} \rightarrow \chi^0 ^{73}\text{Ge}^*$ (13.26 keV).
- 13 KLIMENKO 98 limit is for inelastic scattering $\chi^0 ^{73}\text{Ge} \rightarrow \chi^0 ^{73}\text{Ge}^*$ (66.73 keV).
- 14 BELLI 96 limit for inelastic scattering $\chi^0 ^{129}\text{Xe} \rightarrow \chi^0 ^{129}\text{Xe}^*$ (39.58 keV).
- 15 BELLI 96c use background subtraction and obtain $\sigma < 0.35 \text{ pb}$ ($< 0.15 \text{ fb}$) (90% CL) for spin-dependent (independent) χ^0 -proton cross section. The confidence level is from R. Bernabei, private communication, May 20, 1999.
- 16 BERNABEI 96 use pulse shape discrimination to enhance the possible signal. The limit here is from R. Bernabei, private communication, September 19, 1997.
- 17 SARSA 96 search for annual modulation of WIMP signal. See SARSA 97 for details of the analysis. The limit here is from M.L. Sarsa, private communication, May 26, 1997.
- 18 SMITH 96 use pulse shape discrimination to enhance the possible signal. A dark matter density of 0.4 GeV cm^{-3} is assumed.
- 19 GARCIA 95 limit is from the event rate. A weaker limit is obtained from searches for diurnal and annual modulation.
- 20 SNOWDEN-IFFT 95 look for recoil tracks in an ancient mica crystal. Similar limits are also given for ^{27}Al and ^{28}Si . See COLLAR 96 and SNOWDEN-IFFT 96 for discussion on potential backgrounds.
- 21 BECK 94 uses enriched ^{76}Ge (86% purity).
- 22 REUSSER 91 limit here is changed from published (0.3) after reanalysis by authors. J.L. Vuilleumier, private communication, March 29, 1996.

For $m_{\chi^0} = 1 \text{ TeV}$

- 1 ADHIKARI 22 search for multiple scatter of Planck scale DM on Ar using DEAP detector. No signal observed. Limits placed in mass vs. cross section plane for $m(\text{DM})$: 10^7 – 10^{19} GeV.
- 2 AKERIB 21b place limits on 15 WIMP non-relativistic EFT couplings for $m(\text{DM})$: 10–4000 GeV using 3.14 kg d exposure.
- 3 AMARE 21 search for WIMP annual modulation signal on Nal target in the Canfranc Underground Laboratory (LSC). With an effective exposure of 313.95 kg y, and a sensitivity of 2.5σ no signal is observed. Incompatible with DAMA/LIBRA at 3.3σ level.
- 4 AGOSTINI 20 search for keV–MeV scale super-WIMP absorption in Ge in GERDA; no signal; limits placed on keV–MeV scale bosonic super-WIMPs in coupling vs. mass plane.
- 5 ANDRIANAVALOMAHEFA 20 search for hidden photon DM in eV range; place limits in $m(\text{DM})$ vs $\ln(\chi)$ plane: exclude coupling $\chi \lesssim 1 \times 10^{-12}$ for $m(\text{DM}) \sim 2.5$ –7 eV.
- 6 CLARK 20 use Majorana and Xe-1-ton data to constrain superheavy multiply interacting dark matter (MIMP) in range $m \sim 10^8$ – 10^{17} GeV depending on interaction cross section.
- 7 ABRAMOFF 19 search for MeV scale DM via DM–e scattering and dark photon DM via absorption in Si; limits set in coupling vs. $m(\chi)$ plane and on dark photon in $m(A)$ vs. kinetic mixing parameter plane.
- 8 ADHIKARI 19 search for annual modulation signal from WIMP scatter on Nal with 1.7 yr exposure; result consistent with both DAMA/LIBRA and null hypothesis.
- 9 AMARE 19 is ANAIS-112 search for WIMP scatter annual modulation on Nal; 157.55 kg yr exposure; result compatible with null hypothesis; confirm goal of reaching sensitivity at 3σ to DAMA/LIBRA result in 5 years.
- 10 APRILE 19 search for WIMP-pion scattering in Xe; no signal: require $\sigma(\chi\pi) < 6.4 \times 10^{-10} \text{ pb}$ for $m(\chi) = 30 \text{ GeV}$.
- 11 BRINGMANN 19 derive theoretically limits on GeV and sub-GeV mass dark matter, in its high energy component generated by interaction with cosmic rays; place limits on σ_{SI} and $\sigma_{SD} < 10^9 \text{ pb}$.
- 12 BRUNE 19 examine possibility of Majoron dark matter; limits placed on Majoron mass vs. coupling from SN1987a and ν -less double beta decay.
- 13 CHOI 19 from multimessenger observation finds limit on $\sigma(\nu\chi)/m(\text{DM}) < 5.1 \times 10^{-23} \text{ cm}^2/\text{GeV}$ based on 290 TeV IceCube neutrino event.
- 14 HA 19 search for inelastic boosted MeV scale dark photon using COSINE-100 data; limits placed in m vs. epsilon plane for various mediators.
- 15 KLOPF 19 search for DM via $n \rightarrow \chi e^+ e^-$; no signal: limits placed in branching fraction vs. $m(e^+ e^-)$ plane.
- 16 AARTSEN 18d search for long-lived DM particles decaying $\chi \rightarrow \nu X$; no excess seen; for DM masses above 10 TeV, excluding lifetimes shorter than 10^{28} s .

Searches Particle Listings

WIMP and Dark Matter Searches

- 17 ABE 18f search for keV mass ALPs and hidden photons (HP) scatter on electrons; limits set on mass vs. coupling.
- 18 AGNES 18b search for MeV-scale DM scatter on electrons in Ar; no signal; require $\sigma(\chi e) < 9 \times 10^{-3}$ pb for DM form factor $F(\text{DM}) = 1$ and < 300 pb for $F(\text{DM})$ proportional to $1/q^2$ for $m(\chi) = 100$ MeV.
- 19 AGNESE 18b search for MeV scale DM via DM- e scattering and dark photon DM via absorption in Si; limits set on MeV DM in coupling vs. $m(\chi)$ plane and on dark photon in $m(A')$ vs. kinetic mixing plane.
- 20 AKERIB 18a search for annual and diurnal modulation of DM scattering rate on electrons for recoil energy between 2 and 6 keVee; no signal found.
- 21 ARMENGAUD 18 search for ALP from the Sun and galactic bosonic DM, interacting in Ge; no signal; limits set for 0.8–500 keV DM particles.
- 22 KACHULIS 18 search for an excess of elastically scattered electrons above the atmospheric neutrino background in Super-K; limits placed for simple annihilation or decay in the Sun or galactic center producing "boosted" dark matter.
- 23 AGUILAR-AREVALO 17 search for hidden photon DM scatter on Si target CCD; limit kinetic mixing $\kappa < 1 \times 10^{-12}$ for $m = 10$ eV.
- 24 APRILE 17 search for WIMP- e annual modulation signal for recoil energy in the 2.0–5.8 keV interval using 4 years data with Xe. No significant effect seen.
- 25 APRILE 17d set limits on 14 WIMP-nucleon different interaction operators. No deviations found using 225 live days in the 6.6–240 keV recoil energy range.
- 26 APRILE 17h search for keV bosonic DM via $e\chi \rightarrow e$, looking for electronic recoils with 224.6 live days of data and 34 kg of LXe. Limits set on $\chi e e$ coupling for $m(\chi) = 8$ –125 keV.
- 27 APRILE 17k search for magnetic inelastic DM via $\chi N \rightarrow \chi^* \rightarrow \chi\gamma$. Limits set in DM magnetic moment vs. mass splitting plane for two DM masses corresponding to the DAMA/LIBRA best fit values.
- 28 ANGLOHER 16a require q^2 dependent scattering $< 8 \times 10^{-3}$ pb for asymmetric DM $m(\text{WIMP}) = 3$ GeV on CaWO_4 target. It uses a local dark matter density of 0.38 GeV/cm^3 .
- 29 APRILE 15 search for periodic variation of electronic recoil event rate in the data between Feb. 2011 and Mar. 2012. No significant modulation is found for periods up to 500 days.
- 30 APRILE 15a search for χ^0 scattering off electrons. See their Fig. 4 for limits on cross section through axial-vector coupling for m_{χ^0} between 0.6 GeV and 1 TeV. For $m_{\chi^0} = 2$ GeV, $\sigma < 60$ pb (90%CL) is obtained.

 χ^0 Annihilation Cross SectionLimits are on σv for χ^0 pair annihilation at threshold.

- 1 ABDALLAH 21 search for WIMP-WIMP annihilation into 2 monoenergetic γ rays in WLM dwarf irregular galaxy using HESS data. No signal. Limits placed in $\langle\sigma v\rangle$ vs. $m(\text{WIMP})$ plane for a mass of 370 GeV.
- 2 CIRELLI 21 derive limits on light DM annihilation to $ee, \mu\mu, \pi\pi$ that then produce X-rays using data published by INTEGRAL telescope. Limits placed in $\langle\sigma v\rangle$ vs. $m(\text{DM})$ plane for $m(\text{DM}) = 1$ –5000 MeV.
- 3 JOHN 21 derive limits on leptophilic DM annihilating to positrons by comparing expected spectra to AMS-02 data. The range $m(\text{DM}): 60$ –300 GeV appears excluded for this type of model, see Fig. 3.
- 4 ABAZAJIAN 20 derive new limits on WIMP annihilation in galactic center (GC): $\sigma \cdot v < 2.5 \times 10^{-27} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 50$ GeV; seems to rule out WIMP explanation for GC γ excess, favouring an astrophysics origin.
- 5 ABDALLAH 20 search for WIMP annihilation in newly discovered by DES dwarf satellite galaxies using HESS; limits placed in $\langle\sigma v\rangle$ vs. $m(\text{DM})$ plane depending on annihilation channel and which dwarf satellite.
- 6 ABE 20c search Super-Kamiokande data for WIMP annihilation to neutrinos in galactic center/halo; no signal; limits placed in $\langle\sigma v\rangle$ vs. $m(\text{DM})$ plane depending on annihilation channel and $m(\text{WIMP})$. Reported limit for annihilation to $\nu\bar{\nu}$ at 1 GeV.
- 7 ALBERT 20 search for TeV-scale WIMP annihilation to $\gamma\gamma$ in dwarf spheroidal galaxies; no signal; limits placed in σv vs $m(\text{WIMP})$ plane: e.g. $\sigma v < 2.2 \times 10^{-24} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 1$ TeV.
- 8 ALBERT 20a search for WIMP annihilation to $\nu\bar{\nu}$ in galactic center using Antares; limits placed in $\sigma \cdot v$ vs $m(\text{WIMP})$ plane e.g. $\sigma \cdot v < 5 \times 10^{-24} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 1$ TeV assuming annihilation dominantly to $\tau\bar{\tau}$.
- 9 ALBERT 20c report combined Antares + IceCube search for WIMP annihilation to $\tau\bar{\tau}$; for NFW halo profile report $\sigma v < 1 \times 10^{-23} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 100$ GeV.
- 10 ALVAREZ 20 use profiling over J-factor distributions and background to derive new limits on $\sigma \cdot v$; e.g. $\sigma \cdot v < 8 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 100$ GeV.
- 11 HOOF 20 examine γ rays from 27 dwarf spheroidals using Fermi-LAT data; place limits in $\sigma \cdot v$ vs $m(\text{WIMP})$ plane using profile likelihood and marginalized posterior techniques for DM annihilation to $\tau\bar{\tau}$ and $b\bar{b}$; quoted limit uses first technique and $b\bar{b}$ channel for $m(\text{WIMP}) = 100$ GeV; results rule out WIMP explanation of galactic center excess.
- 12 MAZZIOTTA 20 use Fermi-LAT pointed-at-Sun data to search for DM annihilation in the Sun to long-lived mediators decaying into gamma rays, i.e. $\chi\chi \rightarrow \phi\phi \rightarrow 4\gamma$. Limits placed on the SI and SD DM-nucleon cross sections in the σ -DM mass plane for DM masses in the range 3 GeV – 1.8 TeV. Limits are evaluated in both cases of equilibrium and non-equilibrium.
- 13 ABEYSEKARA 19 search for $\gamma\bar{\gamma}$ from DM annihilation in galactic substructures with HAWC; no signal, limits placed in $J(\sigma v)$ vs. declination plane for $m(\text{DM}) \sim 1$ –108 TeV.
- 14 ALBERT 19b search for DM signal from M31 galaxy in μ, τ, t, b, W channels using HAWC for $m(\text{DM}) \sim 1$ –100 TeV; no signal, limits placed in $\langle\sigma v\rangle$ vs. $m(\text{DM})$ plane.
- 15 CHEUNG 19 derive model-dependent bounds on $\langle\sigma v\rangle$ from EDGES data: $< 4 \times 10^{-26} \text{ cm}^3/\text{s}$ for e^+e^- and $b\bar{b}$ for $m(\chi) = 100$ GeV (including boost factor).
- 16 DI-MAURO 19 place limits on WIMP annihilation via Fermi-LAT observation of M31 and M33 galaxies: $\langle\sigma v\rangle < 7 \times 10^{-27} \text{ cm}^3/\text{s}$ for $m(\chi) = 20$ GeV from M31.
- 17 JOHNSON 19 search for γ -rays, 10–600 GeV energy, from P-wave annihilating DM around SgrA* BH using Fermi-LAT; limits set for various models.
- 18 LI 19d search for $\chi\chi \rightarrow \gamma$ in Fermi-LAT data; no signal, require $\langle\sigma v\rangle < 2 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\chi) = 100$ GeV.
- 19 NG 19 search for X-ray line from sterile ν decay/annihilation using NuStar M-31; no signal: limits placed in $m(\nu)$ vs mixing angle and $\langle\sigma v\rangle$ vs $m(\nu)$.
- 20 QUEIROZ 19 examine $\chi\chi \rightarrow \chi SM$ semi-annihilation of DM reaction; limits placed for various assumed SM particles in $\langle\sigma v\rangle$ vs. $m(\chi)$ plane.
- 21 ABDALLAH 18 search for WIMP WIMP $\rightarrow \gamma X$ in central galactic halo, 10 years of data; limits placed in $\langle\sigma v\rangle$ vs. $m(\text{WIMP})$ plane for $m(\text{WIMP}): 0.3$ –70 TeV.
- 22 AHNEN 18 search for WIMP WIMP $\rightarrow \gamma X$ from Ursa Major II; limits set in $\langle\sigma v\rangle$ vs. $m(\text{WIMP})$ plane for $b\bar{b}, W^+W^-, \tau^+\tau^-,$ and $\mu^+\mu^-$ annihilation modes.
- 23 ALBERT 18b search for TeV-scale WIMPs with WIMP WIMP $\rightarrow \gamma X$ in Andromeda galaxy using HAWC Observatory; limits set in $\langle\sigma v\rangle$ vs $m(\text{WIMP})$ plane.

- 24 CHANG 18A examine $\chi\chi \rightarrow b\bar{b} \rightarrow \gamma$ using Fermi Pass 8 data; no signal; require $\langle\sigma v\rangle < 10^{-26} \text{ cm}^3/\text{s}$ for $m(\chi) = 50 \text{ GeV}$.
- 25 LISANTI 18 examine Fermi Pass 8 γ -ray data from galaxy groups; report $m(\text{WIMP}) > 30 \text{ GeV}$ for annihilation in $b\bar{b}$ channel.
- 26 MAZZIOTTA 18 examine Fermi-LAT electron and positron spectra searching for features originating from DM particles annihilation into e^+e^- pairs, from 45 GeV to 2 TeV; no signal found, limits are obtained.
- 27 AARTSEN 17c use 1005 days of IceCube data to search for $\chi\chi \rightarrow$ neutrinos via various annihilation channels. Limits set.
- 28 ALBERT 17A search for DM annihilation to νs using ANTARES data from 2007–2015. No signal. Limits set in $\langle\sigma v\rangle$ vs. $m(\text{DM})$ plane for $m(\text{DM}) \sim 10\text{--}10^5 \text{ GeV}$. The listed limit is for $m(\text{DM}) = 100 \text{ TeV}$.
- 29 ARCHAMBAULT 17 set limits for WIMP mass between 100 GeV and 1 TeV on $\langle\sigma v\rangle$ for $W^+W^-, ZZ, b\bar{b}, s\bar{s}, u\bar{u}, d\bar{d}, t\bar{t}, e^+e^-, gg, c\bar{c}, hh, \gamma\gamma, \mu^+\mu^-, \tau^+\tau^-$ annihilation channels.
- 30 AVORIN 17 find upper limits for the annihilation cross section in various channels for DM particle mass between 30 GeV and 10 TeV. Strongest upper limits coming from the two neutrino channel require $\langle\sigma v\rangle < 6 \times 10^{-20} \text{ cm}^3/\text{s}$ in dwarf galaxies and $\langle\sigma v\rangle < 7 \times 10^{-21} \text{ cm}^3/\text{s}$ in LMC for 5 TeV WIMP mass.
- 31 BOUDAUD 17 use data from the spacecraft Voyager 1, beyond the heliopause, and from AMS02 on $\chi\chi \rightarrow e^+e^-$ to require $\langle\sigma v\rangle < 1. \times 10^{-28} \text{ cm}^3/\text{s}$ for $m(\chi) = 10 \text{ MeV}$.
- 32 AARTSEN 16d search for GeV νs from WIMP annihilation in galaxy; limits set on $\langle\sigma v\rangle$ in Fig. 6, 7.
- 33 ABDALLAH 16 require $\langle\sigma v\rangle < 6 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 1.5 \text{ TeV}$ from 254 hours observation (WW channel) and $< 2 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 1.0 \text{ TeV}$ in $\tau^+\tau^-$ channel.
- 34 ABDALLAH 16A search for line spectra from WIMP + WIMP $\rightarrow \gamma\gamma$ in 18 hr HESS data; rule out previous 130 GeV WIMP hint from Fermi-LAT data.
- 35 AHNEN 16 require $\langle\sigma v\rangle < 3 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 100 \text{ GeV}$ (WW channel).
- 36 AVORIN 16 require $\langle\sigma v\rangle < 1.91 \times 10^{-21} \text{ cm}^3/\text{s}$ from WIMP annihilation to νs via WW channel for $m(\text{WIMP}) = 1 \text{ TeV}$.
- 37 CAPUTO 16 place limits on WIMPs from annihilation to gamma rays in Small Magellanic Cloud using Fermi-LAT data: $\langle\sigma v\rangle < 3 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 10 \text{ GeV}$.
- 38 FORNASA 16 use anisotropies in the γ -ray diffuse emission detected by Fermi-LAT to bound $\langle\sigma v\rangle < 10^{-25} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 100 \text{ GeV}$ in $b\bar{b}$ channel: see Fig. 28. The limit is driven by dark-matter subhalos in the Milky Way and it refers to their Most Constraining Scenario.
- 39 LEITE 16 constrain WIMP annihilation via search for radio emissions from Smith cloud; $\langle\sigma v\rangle < 5 \times 10^{-27} \text{ cm}^3/\text{s}$ in ee channel for $m(\text{WIMP}) = 5 \text{ GeV}$.
- 40 LI 16 re-analyze Fermi-LAT data on 8 dwarf spheroidal; set limit $\langle\sigma v\rangle < 2 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 100 \text{ GeV}$ in $b\bar{b}$ mode with substructures included.
- 41 LI 16A constrain $\langle\sigma v\rangle < 10^{-25} \text{ cm}^3/\text{s}$ in $b\bar{b}$ channel for $m(\text{WIMP}) = 100 \text{ GeV}$ using Fermi-LAT data from M31; see Fig. 6.
- 42 LIANG 16 search dwarf spheroidal galaxies, Large Magellanic Cloud, and Small Magellanic Cloud for γ -line in Fermi-LAT data.
- 43 LU 16 re-analyze Fermi-LAT and AMS-02 data; require $\langle\sigma v\rangle < 10^{-25} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 1 \text{ TeV}$ in $b\bar{b}$ channel.
- 44 SHIRASAKI 16 re-analyze Fermi-LAT extra-galactic data; require $\langle\sigma v\rangle < 10^{-23} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 1 \text{ TeV}$ in $b\bar{b}$ channel; see Fig. 8.
- 45 AARTSEN 15c search for neutrinos from X^0 annihilation in the Galactic halo. See their Figs. 16 and 17, and Table 5 for limits on $\sigma \cdot v$ for X^0 mass between 100 GeV and 100 TeV.
- 46 AARTSEN 15E search for neutrinos from X^0 annihilation in the Galactic center. See their Figs. 7 and 9, and Table 3 for limits on $\sigma \cdot v$ for X^0 mass between 30 GeV and 10 TeV.
- 47 ABRAMOWSKI 15 search for γ from X^0 annihilation in the Galactic center. See their Fig. 4 for limits on $\sigma \cdot v$ for X^0 mass between 250 GeV and 10 TeV.
- 48 ACKERMANN 15 search for monochromatic γ from X^0 annihilation in the Galactic halo. See their Fig. 8 and Tables 2–4 for limits on $\sigma \cdot v$ for X^0 mass between 0.2 GeV and 500 GeV.
- 49 ACKERMANN 15A search for γ from X^0 annihilation (both Galactic and extragalactic) in the isotropic γ background. See their Fig. 7 for limits on $\sigma \cdot v$ for X^0 mass between 10 GeV and 30 TeV.
- 50 ACKERMANN 15B search for γ from X^0 annihilation in 15 dwarf spheroidal satellite galaxies of the Milky Way. See their Figs. 1 and 2 for limits on $\sigma \cdot v$ for X^0 mass between 2 GeV and 10 TeV.
- 51 ADRIAN-MARTINEZ 15 search for neutrinos from X^0 annihilation in the Galactic center. See their Figs. 10 and 11 and Tables 1 and 2 for limits on $\sigma \cdot v$ for X^0 mass between 25 GeV and 10 TeV.
- 52 ACKERMANN 14 search for γ from X^0 annihilation in 25 dwarf spheroidal satellite galaxies of the Milky Way. See their Tables II–VII for limits assuming annihilation into $e^+e^-, \mu^+\mu^-, \tau^+\tau^-, u\bar{u}, b\bar{b}$, and W^+W^- , for X^0 mass ranging from 2 GeV to 10 TeV.
- 53 Limit assuming X^0 pair annihilation into $b\bar{b}$.
- 54 Limit assuming X^0 pair annihilation into W^+W^- .
- 55 ALEKSIC 14 search for γ from X^0 annihilation in the dwarf spheroidal galaxy Segue 1. The listed limit assumes annihilation into W^+W^- . See their Figs. 6, 7, and 16 for limits on $\sigma \cdot v$ for annihilation channels $\mu^+\mu^-, \tau^+\tau^-, b\bar{b}, t\bar{t}, \gamma\gamma, \gamma Z, W^+W^-, ZZ$ for X^0 mass between 10^2 and 10^4 GeV .
- 56 AARTSEN 13c search for neutrinos from X^0 annihilation in nearby galaxies and galaxy clusters. See their Figs. 5–7 for limits on $\sigma \cdot v$ for $X^0 \rightarrow \nu\bar{\nu}, \mu^+\mu^-, \tau^+\tau^-$, and W^+W^- for X^0 mass between 300 GeV and 100 TeV.
- 57 ABRAMOWSKI 13 search for monochromatic γ from X^0 annihilation in the Milky Way halo in the central region. Limit on $\sigma \cdot v$ between 10^{-28} and $10^{-25} \text{ cm}^3 \text{ s}^{-1}$ (95% CL) is obtained for X^0 mass between 500 GeV and 20 TeV for $X^0 \rightarrow \gamma\gamma$. (95% density distribution in the Galaxy by Einasto is assumed. See their Fig. 4.
- 58 ACKERMANN 13A search for monochromatic γ from X^0 annihilation in the Milky Way. Limit on $\sigma \cdot v$ for the process $X^0 X^0 \rightarrow \gamma\gamma$ in the range 10^{-29} – $10^{-27} \text{ cm}^3 \text{ s}^{-1}$ (95% CL) is obtained for X^0 mass between 5 and 300 GeV. The limit depends slightly on

the assumed density profile of X^0 in the Galaxy. See their Tables VII–X and Fig. 10. Supersedes ACKERMANN 12.

- 59 ABRAMOWSKI 12 search for γ 's from X^0 annihilation in the Fornax galaxy cluster. See their Fig. 7 for limits on $\sigma \cdot v$ for X^0 mass between 0.1 and 100 TeV for the annihilation channels $\tau^+\tau^-, b\bar{b}$, and W^+W^- .
- 60 ACKERMANN 12 search for monochromatic γ from X^0 annihilation in the Milky Way. Limit on $\sigma \cdot v$ in the range 10^{-28} – $10^{-26} \text{ cm}^3 \text{ s}^{-1}$ (95% CL) is obtained for X^0 mass between 7 and 200 GeV if X^0 annihilates into $\gamma\gamma$. The limit depends slightly on the assumed density profile of X^0 in the Galaxy. See their Table III and Fig. 15.
- 61 ACKERMANN 12 search for γ from X^0 annihilation in the Milky Way in the diffuse γ background. Limit on $\sigma \cdot v$ of 10^{-24} – $10^{-23} \text{ cm}^3 \text{ s}^{-1}$ or larger is obtained for X^0 mass between 5 GeV and 10 TeV for various annihilation channels including $W^+W^-, b\bar{b}, gg, e^+e^-, \mu^+\mu^-, \tau^+\tau^-$. The limit depends slightly on the assumed density profile of X^0 in the Galaxy. See their Figs. 17–20.
- 62 ALIU 12 search for γ 's from X^0 annihilation in the dwarf spheroidal galaxy Segue 1. Limit on $\sigma \cdot v$ in the range 10^{-24} – $10^{-20} \text{ cm}^3 \text{ s}^{-1}$ (95% CL) is obtained for X^0 mass between 10 GeV and 2 TeV for annihilation channels $e^+e^-, \mu^+\mu^-, \tau^+\tau^-, b\bar{b}$, and W^+W^- . See their Fig. 3.
- 63 ABBASI 11c search for ν_μ from X^0 annihilation in the outer halo of the Milky Way. The limit assumes annihilation into $\nu\nu$. See their Fig. 9 for limits with other annihilation channels.
- 64 ABRAMOWSKI 11 search for γ from X^0 annihilation near the Galactic center. The limit assumes Einasto DM density profile.
- 65 ACKERMANN 11 search for γ from X^0 annihilation in ten dwarf spheroidal satellite galaxies of the Milky Way. The limit for $m = 10 \text{ GeV}$ assumes annihilation into $b\bar{b}$, the others W^+W^- . See their Fig. 2 for limits with other final states. See also GERINGER-SAMETH 11 for a different analysis of the same data.

Dark Matter Particle (X^0) Production in Hadron Collisions

Searches for X^0 production in association with observable particles (γ , jets, ...) in high energy hadron collisions. If a specific form of effective interaction Lagrangian is assumed, the limits may be translated into limits on X^0 -nucleon scattering cross section.

WIMP and Dark Matter Searches

- | | | | | | | | | |
|----|-------------|------|------|--|----|-----------------|------|---|
| 50 | SIRUNYAN | 17G | CMS | $pp \rightarrow j + E_T$ | 28 | AGUILAR-AREVALO | 18B | search for WIMP production in MiniBooNE p beam dump; no signal; limits set for $m(\chi) \sim 5\text{--}50$ MeV in vector portal DM model. |
| 51 | SIRUNYAN | 17U | CMS | $pp \rightarrow Z\chi\chi; Z \rightarrow \ell\bar{\ell}$ | 29 | KHACHATRYAN | 18 | search for $pp \rightarrow Z(\ell\ell) + E_T$; no signal; limits set on effective dark matter interactions and other exotic physics models. |
| 52 | AABOUD | 16AD | ATLS | $(W \text{ or } Z \rightarrow \text{jets}) + E_T$ | 30 | SIRUNYAN | 18BF | search for $pp \rightarrow t E_T$ at 13 TeV and 36 fb^{-1} ; no signal; limits placed on DM models involving a flavor changing neutral current, scalar resonance decaying to top quark and DM. |
| 53 | AAD | 16AF | ATLS | $VV \rightarrow \text{forward jets} + E_T$ | 31 | SIRUNYAN | 18B0 | search for high mass dijet resonances at 13 TeV and 36 fb^{-1} ; no signal; limits placed on various models, including simplified DM models involving a spin = 1 Z' mediator. |
| 54 | AAD | 16AG | ATLS | $\ell + \text{jets}$ | 32 | SIRUNYAN | 18BV | search for $pp \rightarrow Z E_T$ at 13 TeV; no signal, limits placed for various exotic physics models including DM. |
| 55 | AAD | 16M | ATLS | $pp \rightarrow H + E_T, H \rightarrow b\bar{b}$ | 33 | SIRUNYAN | 18C | search for new physics in $pp \rightarrow$ final states with two oppositely charged leptons at 13 TeV with 35.9 fb^{-1} . Limits placed on $m(\text{mediator})$ and top squark for various simplified models. |
| 56 | KHACHATRYAN | 16BZ | CMS | $\text{jet}(s) + E_T$ | 34 | SIRUNYAN | 18CU | search for $pp \rightarrow Z E_T$ at 13 TeV and 2.3 fb^{-1} ; no signal; limits placed for various exotic models including DM. |
| 57 | KHACHATRYAN | 16CA | CMS | $\text{jets} + E_T$ | 35 | SIRUNYAN | 18DH | search for $pp \rightarrow \chi\chi h; h \rightarrow \gamma\gamma \text{ or } \tau\tau$ at 13 TeV, 35.9 fb^{-1} ; no signal; limits placed on massive boson mediator Z' in the context of $Z'+2\text{HDM}$ and baryonic Z' models. Limits also cast in terms of spin-independent WIMP-nucleon cross section for masses 1–200 GeV. |
| 58 | KHACHATRYAN | 16N | CMS | $pp \rightarrow \gamma + E_T$ | 36 | SIRUNYAN | 18S | search for $pp \rightarrow \text{jets } E_T$ at 13 TeV; no signal; limits placed on simplified dark matter models, on the branching ratio of the Higgs boson to invisible particles, and on several other exotic physics models including fermion portal DM. |
| 59 | AAD | 15AS | ATLS | $b(\bar{b}) + E_T, t(\bar{t}) + E_T$ | 37 | AABOUD | 17A | search for $H \rightarrow b\bar{b} + E_T$. See Fig. 4b for limits set on VB mediator vs WIMP mass. |
| 60 | AAD | 15BH | ATLS | $\text{jet} + E_T$ | 38 | AABOUD | 17AM | search for $pp \rightarrow Z' \rightarrow Ah \rightarrow h(b\bar{b}) + E_T$ at 13 TeV. Limits set in $m(Z')$ vs. $m(A)$ plane and on the visible cross section of $h(b\bar{b}) + E_T$ events in bins of E_T . |
| 61 | AAD | 15CF | ATLS | $H^0 + E_T$ | 39 | AABOUD | 17AQ | search for WIMP in $pp \rightarrow h(\gamma\gamma) + E_T$ in 36.1 fb^{-1} of data. Limits on the visible cross section are also provided. Model dependent limits on spin independent DM - Nucleon cross-section are also presented, which are more stringent than those from direct searches for DM mass smaller than 2.5 GeV. |
| 62 | AAD | 15CS | ATLS | $\gamma + E_T$ | 40 | AABOUD | 17BD | search for $pp \rightarrow \text{jet}(s) + E_T$ at 13 TeV with 3.2 fb^{-1} of data. Limits set for simplified models. Observables corrected for detector effects can be used to constrain other models. |
| 63 | KHACHATRYAN | 15AG | CMS | $t\bar{t} + E_T$ | 41 | AABOUD | 17R | for an axial vector mediator in the s-channel, excludes $m(\text{mediator}) < 750\text{--}1200$ GeV for $m(\text{DM}) < 230\text{--}480$ GeV, depending on the couplings. |
| 64 | KHACHATRYAN | 15AL | CMS | $\text{jet} + E_T$ | 42 | AGUILAR-AREVALO | 17A | search for DM produced in 8 GeV proton collisions with steel beam dump followed by DM-nucleon scattering in MiniBooNE detector. Limit placed on DM cross section parameter $Y < 2 \times 10^{-8}$ for $\alpha_D = 0.5$ and for $0.01 < m(\text{DM}) < 0.3$ GeV. |
| 65 | KHACHATRYAN | 15T | CMS | $\ell + E_T$ | 43 | BANERJEE | 17 | search for dark photon invisible decay via eN scattering; exclude $m(\gamma') < 100$ MeV as an explanation of $(g_\mu - 2)$ muon anomaly. |
| 66 | AAD | 14AI | ATLS | $W + E_T$ | 44 | KHACHATRYAN | 17A | search for WIMPs in forward jets + E_T channel with 18.5 fb^{-1} at 8 TeV; limits set in effective theory model, Fig. 3. |
| 67 | AAD | 14BK | ATLS | $W, Z + E_T$ | 45 | KHACHATRYAN | 17F | search for $H \rightarrow$ invisibles in pp collisions at 7, 8, and 13 TeV; place limits on Higgs portal DM. |
| 68 | AAD | 14K | ATLS | $Z + E_T$ | 46 | SIRUNYAN | 17 | search for $pp \rightarrow Z + E_T$ with 2.3 fb^{-1} at 13 TeV; no signal seen; limits placed on WIMPs and unparticles. |
| 69 | AAD | 14O | ATLS | $Z + E_T$ | 47 | SIRUNYAN | 17AP | search for $pp \rightarrow Z' \rightarrow Ah \rightarrow h + E_T$ with $h \rightarrow b\bar{b}$ or $\gamma\gamma$ and $A \rightarrow \chi\chi$ with 2.3 fb^{-1} at 13 TeV. Limits set in $m(Z')$ vs. $m(A)$ plane. |
| 70 | AAD | 13AD | ATLS | $\text{jet} + E_T$ | 48 | SIRUNYAN | 17AQ | search for $pp \rightarrow \gamma + E_T$ at 13 TeV with 12.9 fb^{-1} . Limits derived for simplified DM models, effective electroweak-DM interaction and Extra Dimensions models. |
| 71 | AAD | 13C | ATLS | $\gamma + E_T$ | 49 | SIRUNYAN | 17BB | search for WIMPs via $pp \rightarrow t\bar{t} + E_T, pp \rightarrow b\bar{b} + E_T$ at 13 TeV with 2.2 fb^{-1} . Limits derived for various simplified models. |
| 72 | AALTONEN | 12K | CDF | $t + E_T$ | 50 | SIRUNYAN | 17G | search for $pp \rightarrow j + E_T$ with 12.9 fb^{-1} at 13 TeV; limits placed on WIMP mass/mediators in DM simplified models. |
| 73 | AALTONEN | 12M | CDF | $\text{jet} + E_T$ | 51 | SIRUNYAN | 17U | search for WIMPs/unparticles via $pp \rightarrow Z\chi\chi, Z \rightarrow \ell\bar{\ell}$ at 13 TeV with 2.3 fb^{-1} . Limits derived for various simplified models. |
| 74 | CHATRCHYAN | 12AP | CMS | $\text{jet} + E_T$ | 52 | AABOUD | 16AD | place limits on $VVXX$ effective theory via search for hadronic W or Z plus WIMP pair production. See Fig. 5. |
| 75 | CHATRCHYAN | 12T | CMS | $\gamma + E_T$ | 53 | AAD | 16AF | search for $VV \rightarrow (H \rightarrow \text{WIMP pair}) + \text{forward jets}$ with 20.3 fb^{-1} at 8 TeV; set limits in Higgs portal model, Fig. 8. |
- 1 AAD 21AZ search for DM in $H E_T \rightarrow \gamma\gamma E_T$ events with 139 fb^{-1} at 13 TeV. No signal observed. Limits placed for several simplified models.
- 2 AAD 21BB search for DM in $H E_T \rightarrow b\bar{b} E_T$ events with 139 fb^{-1} at 13 TeV. No signal observed. Limits placed for several simplified models.
- 3 AAD 21D search for $VV + \chi\chi, V \rightarrow q\bar{q}$ with 139 fb^{-1} at 13 TeV LHC. No signal detected. Limits placed in dark Higgs boson mass vs. $m(Z')$ plane. Here VV stand for $W^\pm W^\mp, ZZ$.
- 4 AAD 21F search for monojet recoiling against invisibles with 139 fb^{-1} at 13 TeV LHC. No signal detected. Limits placed in various simplified dark matter models.
- 5 AAD 21K search for a photon recoiling against dark matter with 139 fb^{-1} at 13 TeV LHC. No signal detected. Limits placed on parameter space of various simplified models.
- 6 AAD 21O search for $\ell + \text{jets} + E_T$ to search for t -pairs + DM particles with 139 fb^{-1} at LHC 13 TeV LHC. No signal detected. Limits placed in the cross-section vs. mediator mass plane, assuming light DM states.
- 7 AAD 21P search for $\ell^+\ell^- + \text{jets} + E_T$ in context of various BSM models with 139 fb^{-1} at 13 TeV LHC. No signal observed. Limits placed in parameter space of dark matter models and SUSY.
- 8 AAD 21S search for b -jets + E_T signal from BSM/DM models with 139 fb^{-1} at 13 TeV LHC. No signal observed. Limits placed on parameter space of DM models.
- 9 SIRUNYAN 21A search for DM production in association with leptonically decaying Z boson in 137 fb^{-1} at 13 TeV; no signal; limits set in large variety of simplified DM models.
- 10 TUMASYAN 21D search for DM and other exotica at CMS in jets + E_T events with 137 fb^{-1} at 13 TeV. No signal observed. Limits placed for a variety of simplified models.
- 11 SIRUNYAN 20X search for DM in $pp \rightarrow Z' \rightarrow A(Z')h \rightarrow h + E_T$ in CMS at 13 TeV with 35.9 fb^{-1} ; no signal; limits placed in σSI vs. $m(\chi)$, and $\sigma, m(A)$ and $\tan\beta$ vs $m(Z')$ for considered DM models.
- 12 AABOUD 19AA searches for BSM physics in more than 700 event classes with more than 10^5 regions at 13 TeV with 3.2 fb^{-1} ; no significant signal.
- 13 AABOUD 19AI searches for vector boson fusion $pp \rightarrow Hqq, H \rightarrow$ invisible at 13 TeV with 36.1 fb^{-1} ; no signal; require $B(H \rightarrow \text{invisible}) < 0.37$ (0.28 expected).
- 14 AABOUD 19AL perform search in three different channels for $H \rightarrow \chi\chi$ at 7, 8 and 13 TeV; combined result $BF(H \rightarrow \text{invisible}) < 0.26$ (0.17 expected).
- 15 AABOUD 19Q search for single $t + E_T$ at 13 TeV with 36.1 fb^{-1} of data; no signal; limits set in σ or coupling vs. mass plane for simplified models.
- 16 AABOUD 19V review ATLAS results from 7, 8 and 13 TeV searches for mediator-based DM and DE scalar which couples to gravity; no signal; limits set for large variety of simplified models.
- 17 BANERJEE 19 search for dark photon via $eN \rightarrow eN + E$ in NA64; no signal, limits placed in kinetic mixing ϵ vs. $m(\text{DM})$ plane for $m(\text{DM}) \sim 0.001\text{--}1$ GeV.
- 18 SIRUNYAN 19AN search at 13 TeV with 35.9 fb^{-1} for $pp \rightarrow H\chi\chi \rightarrow b\bar{b} E_T$; no signal; limits set in the context of a 2HDM + pseudoscalar (a) model and a baryonic Z' model.
- 19 SIRUNYAN 19BC search for DM via LeptoQuark pair annihilation $LQ LQ \rightarrow \mu j\chi\chi \rightarrow \mu j E_T$ with 77.4 fb^{-1} , 13 TeV; no signal; limits placed in $m(\chi)$ vs. $m(LQ)$ plane. Model dependent limits on DM mass up to 600 GeV depending on $m(LQ)$ placed.
- 20 SIRUNYAN 19B0 search for vector boson fusion $VV \rightarrow qqH$ with $H \rightarrow \chi\chi$ at 13 TeV with 38.2 fb^{-1} ; no signal; limits placed for several models. Also search for $H \rightarrow$ invisible at 7, 8, and 13 TeV; no signal; limit placed on $BF < 0.19$.
- 21 SIRUNYAN 19C search for DM via $pp \rightarrow t\bar{t}\chi\chi$ at 13 TeV, 35.9 fb^{-1} ; no signal; limits placed on coupling vs. mediator mass for various simplified models.
- 22 SIRUNYAN 19O search for $pp \rightarrow \gamma$ at 13 TeV with 35.9 fb^{-1} ; no signal; limits placed on parameters of various models.
- 23 SIRUNYAN 19X search for $pp \rightarrow t\bar{t} E_T$ and $pp \rightarrow t E_T + \dots$ at 13 TeV with 35.9 fb^{-1} ; no signal; limits placed on χ production σ for various simplified models with $m(\chi) = 1$ GeV.
- 24 AABOUD 18 search for $pp \rightarrow Z + E_T$ with $Z \rightarrow \ell\ell$ at 13 TeV with 36.1 fb^{-1} of data. Limits set for simplified models.
- 25 AABOUD 18A search for $pp \rightarrow t\bar{t} E_T$ or $pp \rightarrow b\bar{b} E_T$ at 13 TeV, 36.1 fb^{-1} of data. Limits set for simplified models.
- 26 AABOUD 18CA search for $pp \rightarrow V\chi\chi$ with $V \rightarrow jj$ at 13 TeV, 36.1 fb^{-1} ; no signal; limits set in $m(\text{DM})$ vs $m(\text{mediator})$ simplified model plane.
- 27 AABOUD 18I search for $pp \rightarrow j + E_T$ at 13 TeV with 36.1 fb^{-1} of data. Limits set for simplified models with pair-produced weakly interacting dark-matter candidates.
- 28 AGUILAR-AREVALO 18B search for WIMP production in MiniBooNE p beam dump; no signal; limits set for $m(\chi) \sim 5\text{--}50$ MeV in vector portal DM model.
- 29 KHACHATRYAN 18 search for $pp \rightarrow Z(\ell\ell) + E_T$; no signal; limits set on effective dark matter interactions and other exotic physics models.
- 30 SIRUNYAN 18BF search for $pp \rightarrow t E_T$ at 13 TeV and 36 fb^{-1} ; no signal; limits placed on DM models involving a flavor changing neutral current, scalar resonance decaying to top quark and DM.
- 31 SIRUNYAN 18B0 search for high mass dijet resonances at 13 TeV and 36 fb^{-1} ; no signal; limits placed on various models, including simplified DM models involving a spin = 1 Z' mediator.
- 32 SIRUNYAN 18BV search for $pp \rightarrow Z E_T$ at 13 TeV; no signal, limits placed for various exotic physics models including DM.
- 33 SIRUNYAN 18C search for new physics in $pp \rightarrow$ final states with two oppositely charged leptons at 13 TeV with 35.9 fb^{-1} . Limits placed on $m(\text{mediator})$ and top squark for various simplified models.
- 34 SIRUNYAN 18CU search for $pp \rightarrow Z E_T$ at 13 TeV and 2.3 fb^{-1} ; no signal; limits placed for various exotic models including DM.
- 35 SIRUNYAN 18DH search for $pp \rightarrow \chi\chi h; h \rightarrow \gamma\gamma \text{ or } \tau\tau$ at 13 TeV, 35.9 fb^{-1} ; no signal; limits placed on massive boson mediator Z' in the context of $Z'+2\text{HDM}$ and baryonic Z' models. Limits also cast in terms of spin-independent WIMP-nucleon cross section for masses 1–200 GeV.
- 36 SIRUNYAN 18S search for $pp \rightarrow \text{jets } E_T$ at 13 TeV; no signal; limits placed on simplified dark matter models, on the branching ratio of the Higgs boson to invisible particles, and on several other exotic physics models including fermion portal DM.
- 37 AABOUD 17A search for $H \rightarrow b\bar{b} + E_T$. See Fig. 4b for limits set on VB mediator vs WIMP mass.
- 38 AABOUD 17AM search for $pp \rightarrow Z' \rightarrow Ah \rightarrow h(b\bar{b}) + E_T$ at 13 TeV. Limits set in $m(Z')$ vs. $m(A)$ plane and on the visible cross section of $h(b\bar{b}) + E_T$ events in bins of E_T .
- 39 AABOUD 17AQ search for WIMP in $pp \rightarrow h(\gamma\gamma) + E_T$ in 36.1 fb^{-1} of data. Limits on the visible cross section are also provided. Model dependent limits on spin independent DM - Nucleon cross-section are also presented, which are more stringent than those from direct searches for DM mass smaller than 2.5 GeV.
- 40 AABOUD 17BD search for $pp \rightarrow \text{jet}(s) + E_T$ at 13 TeV with 3.2 fb^{-1} of data. Limits set for simplified models. Observables corrected for detector effects can be used to constrain other models.
- 41 AABOUD 17R, for an axial vector mediator in the s-channel, excludes $m(\text{mediator}) < 750\text{--}1200$ GeV for $m(\text{DM}) < 230\text{--}480$ GeV, depending on the couplings.
- 42 AGUILAR-AREVALO 17A search for DM produced in 8 GeV proton collisions with steel beam dump followed by DM-nucleon scattering in MiniBooNE detector. Limit placed on DM cross section parameter $Y < 2 \times 10^{-8}$ for $\alpha_D = 0.5$ and for $0.01 < m(\text{DM}) < 0.3$ GeV.
- 43 BANERJEE 17 search for dark photon invisible decay via eN scattering; exclude $m(\gamma') < 100$ MeV as an explanation of $(g_\mu - 2)$ muon anomaly.
- 44 KHACHATRYAN 17A search for WIMPs in forward jets + E_T channel with 18.5 fb^{-1} at 8 TeV; limits set in effective theory model, Fig. 3.
- 45 KHACHATRYAN 17F search for $H \rightarrow$ invisibles in pp collisions at 7, 8, and 13 TeV; place limits on Higgs portal DM.
- 46 SIRUNYAN 17 search for $pp \rightarrow Z + E_T$ with 2.3 fb^{-1} at 13 TeV; no signal seen; limits placed on WIMPs and unparticles.
- 47 SIRUNYAN 17AP search for $pp \rightarrow Z' \rightarrow Ah \rightarrow h + E_T$ with $h \rightarrow b\bar{b}$ or $\gamma\gamma$ and $A \rightarrow \chi\chi$ with 2.3 fb^{-1} at 13 TeV. Limits set in $m(Z')$ vs. $m(A)$ plane.
- 48 SIRUNYAN 17AQ search for $pp \rightarrow \gamma + E_T$ at 13 TeV with 12.9 fb^{-1} . Limits derived for simplified DM models, effective electroweak-DM interaction and Extra Dimensions models.
- 49 SIRUNYAN 17BB search for WIMPs via $pp \rightarrow t\bar{t} + E_T, pp \rightarrow b\bar{b} + E_T$ at 13 TeV with 2.2 fb^{-1} . Limits derived for various simplified models.
- 50 SIRUNYAN 17G search for $pp \rightarrow j + E_T$ with 12.9 fb^{-1} at 13 TeV; limits placed on WIMP mass/mediators in DM simplified models.
- 51 SIRUNYAN 17U search for WIMPs/unparticles via $pp \rightarrow Z\chi\chi, Z \rightarrow \ell\bar{\ell}$ at 13 TeV with 2.3 fb^{-1} . Limits derived for various simplified models.
- 52 AABOUD 16AD place limits on $VVXX$ effective theory via search for hadronic W or Z plus WIMP pair production. See Fig. 5.
- 53 AAD 16AF search for $VV \rightarrow (H \rightarrow \text{WIMP pair}) + \text{forward jets}$ with 20.3 fb^{-1} at 8 TeV; set limits in Higgs portal model, Fig. 8.
- 54 AAD 16AG search for lepton jets with 20.3 fb^{-1} of data at 8 TeV; Fig. 13 excludes dark photons around 0.1–1 GeV for kinetic mixing $10^{-6}\text{--}10^{-2}$.
- 55 AAD 16M search with 20.3 fb^{-1} of data at 8 TeV pp collisions; limits placed on EFT model (Fig. 7) and simplified Z' model (Fig. 6).
- 56 KHACHATRYAN 16BZ search for $\text{jet}(s) + E_T$ in 19.7 fb^{-1} at 8 TeV; limits set for variety of simplified models.
- 57 KHACHATRYAN 16CA search for WIMPs via $\text{jet}(s) + E_T$ using razor variable; require mediator scale > 1 TeV for various effective theories.
- 58 KHACHATRYAN 16N search for $\gamma + \text{WIMPs}$ in 19.6 fb^{-1} at 8 TeV; limits set on SI and SD WIMP- p scattering in Fig. 3.
- 59 AAD 15AS search for events with one or more bottom quark and missing E_T , and also events with a top quark pair and missing E_T in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$. See their Figs. 5 and 6 for translated limits on X^0 -nucleon cross section for $m = 1\text{--}700$ GeV.
- 60 AAD 15BH search for events with a jet and missing E_T in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$. See their Fig. 12 for translated limits on X^0 -nucleon cross section for $m = 1\text{--}1200$ GeV.
- 61 AAD 15CF search for events with a $H^0 (\rightarrow \gamma\gamma)$ and missing E_T in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$. See paper for limits on the strength of some contact interactions containing X^0 and the Higgs fields.
- 62 AAD 15CS search for events with a photon and missing E_T in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$. See their Fig. 13 (see also erratum) for translated limits on X^0 -nucleon cross section for $m = 1\text{--}1000$ GeV.
- 63 KHACHATRYAN 15AG search for events with a top quark pair and missing E_T in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 19.7 \text{ fb}^{-1}$. See their Fig. 8 for translated limits on X^0 -nucleon cross section for $m = 1\text{--}200$ GeV.

See key on page 1127

WIMP and Dark Matter Searches

- 64 KHACHATRYAN 15AL search for events with a jet and missing E_T in pp collisions at $E_{cm} = 8$ TeV with $L = 19.7 \text{ fb}^{-1}$. See their Fig. 5 and Tables 4–6 for translated limits on X^0 -nucleon cross section for $m = 1$ –1000 GeV.
- 65 KHACHATRYAN 15T search for events with a lepton and missing E_T in pp collisions at $E_{cm} = 8$ TeV with $L = 19.7 \text{ fb}^{-1}$. See their Fig. 17 for translated limits on X^0 -proton cross section for $m = 1$ –1000 GeV.
- 66 AAD 14Al search for events with a W and missing E_T in pp collisions at $E_{cm} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$. See their Fig. 4 for translated limits on X^0 -nucleon cross section for $m = 1$ –1500 GeV.
- 67 AAD 14Bk search for hadronically decaying W , Z in association with E_T in 20.3 fb^{-1} at 8 TeV pp collisions. Fig. 5 presents exclusion results for SI and SD scattering cross section. In addition, cross section limits on the anomalous production of W or Z bosons with large missing transverse momentum are also set in two fiducial regions.
- 68 AAD 14k search for events with a Z and missing E_T in pp collisions at $E_{cm} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$. See their Fig. 5 and 6 for translated limits on X^0 -nucleon cross section for $m = 1$ –10³ GeV.
- 69 AAD 14o search for ZH^0 production with H^0 decaying to invisible final states. See their Fig. 4 for translated limits on X^0 -nucleon cross section for $m = 1$ –60 GeV in Higgs-portal X^0 scenario.
- 70 AAD 13Ad search for events with a jet and missing E_T in pp collisions at $E_{cm} = 7$ TeV with $L = 4.7 \text{ fb}^{-1}$. See their Figs. 5 and 6 for translated limits on X^0 -nucleon cross section for $m = 1$ –1300 GeV.
- 71 AAD 13c search for events with a photon and missing E_T in pp collisions at $E_{cm} = 7$ TeV with $L = 4.6 \text{ fb}^{-1}$. See their Fig. 3 for translated limits on X^0 -nucleon cross section for $m = 1$ –1000 GeV.
- 72 AALTONEN 12K search for events with a top quark and missing E_T in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV with $L = 7.7 \text{ fb}^{-1}$. Upper limits on $\sigma(tX^0)$ in the range 0.4–2 pb (95% CL) is given for $m_{X^0} = 0$ –150 GeV.
- 73 AALTONEN 12M search for events with a jet and missing E_T in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV with $L = 6.7 \text{ fb}^{-1}$. Upper limits on the cross section in the range 2–10 pb (90% CL) is given for $m_{X^0} = 1$ –300 GeV. See their Fig. 2 for translated limits on X^0 -nucleon cross section.
- 74 CHATRCHYAN 12AP search for events with a jet and missing E_T in pp collisions at $E_{cm} = 7$ TeV with $L = 5.0 \text{ fb}^{-1}$. See their Fig. 4 for translated limits on X^0 -nucleon cross section for $m_{X^0} = 0.1$ –1000 GeV.
- 75 CHATRCHYAN 12T search for events with a photon and missing E_T in pp collisions at $E_{cm} = 7$ TeV with $L = 5.0 \text{ fb}^{-1}$. Upper limits on the cross section in the range 13–15 pb (90% CL) is given for $m_{X^0} = 1$ –1000 GeV. See their Fig. 2 for translated limits on X^0 -nucleon cross section.

Other Particle Searches

OMITTED FROM SUMMARY TABLE

OTHER PARTICLE SEARCHES

Revised February 2018 by K. Hikasa (Tohoku University).

We collect here those searches which do not appear in any other search categories. These are listed in the following order:

- Concentration of stable particles in matter
- General new physics searches
- Limits on jet-jet resonance in hadron collisions
- Limits on neutral particle production at accelerators
- Limits on charged particles in e^+e^- collisions
- Limits on charged particles in hadron reactions
- Limits on charged particles in cosmic rays
- Searches for quantum black hole production

Note that searches appear in separate sections elsewhere for Higgs bosons (and technipions), other heavy bosons (including $W_R, W', Z',$ leptiquarks, axiguons), axions (including pseudo-Goldstone bosons, Majorons, familons), WIMPs, heavy leptons, heavy neutrinos, free quarks, monopoles, supersymmetric particles, and compositeness.

We no longer list for limits on tachyons and centauros. See our 1994 edition for these limits.

CONCENTRATION OF STABLE PARTICLES IN MATTER

Concentration of Heavy (Charge +1) Stable Particles in Matter

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
••• We do not use the following data for averages, fits, limits, etc. •••				
$<4 \times 10^{-17}$	95	1 YAMAGATA	93 SPEC	Deep sea water, $M=5-1600m_p$

¹ YAMAGATA 93 used deep sea water at 4000 m since the concentration is enhanced in deep sea due to gravity.
² VERKERK 92 looked for heavy isotopes in sea water and put a bound on concentration of stable charged massive particle in sea water. The above bound can be translated into into a bound on charged dark matter particle (5×10^6 GeV), assuming the local density, $\rho=0.3$ GeV/cm³, and the mean velocity (v)=300 km/s.
³ See HEMMICK 90 Fig. 7 for other masses 100-10000 m_p .

¹ AFEK 21 search for millicharged particles bound to matter using an optomechanical device. No signal was observed. Limits placed in the abundance vs. charge plane (Fig. 3). This is translated to the mass versus charge plane by requiring bound states to be stable.
² JAVORSEK 01 search for (neutral) SIMPs (strongly interacting massive particles) bound to Au nuclei. Here M is the effective SIMP mass.
³ JAVORSEK 01B search for (neutral) SIMPs (strongly interacting massive particles) bound to Au and Fe nuclei from various origins with exposures on the earth's surface, in a satellite, heavy ion collisions, etc. Here M is the mass of the anomalous nucleus. See also JAVORSEK 02.
⁴ See HEMMICK 90 Fig. 7 for other masses 100-10000 m_p .
⁵ Bound valid up to $m_{X^-} \sim 100$ TeV.

GENERAL NEW PHYSICS SEARCHES

This subsection lists some of the search experiments which look for general signatures characteristic of new physics, independent of the framework of a specific model.

The observed events are compatible with Standard Model expectation, unless noted otherwise.

¹ ALKHATIB 21A search for lightly ionizing fractionally charged relics scattering from Ge. No signal observed. Limits plotted in fractional charge f vs. vertical intensity plane for $m \sim 5$ MeV to 100 TeV.
² AGUILAR-AREVALO 20B search for light BSM mediator effect on ν elastic scatter on nuclei; no signal; limits placed in $m(\text{mediator})$ vs. coupling plane for two models of MeV-scale mediators.
³ FEDDERKE 20 place limits on cosmic relic charged massive particles (CHAMPs) due to their capture and subsequent disruption of old white dwarf stars; limits placed in the $m(\text{CHAMP})$ vs. relic density parameter plane.
⁴ SIRUNYAN 20A search for SUSY and LQ production using mT2 or presence of long-lived charged particle; no signal, limits placed in various mass planes for different BSM scenarios and various assumed lifetimes.
⁵ ALCANTARA 19 place limits on $m(\text{WIMPzilla}=X)$ vs lifetime from upper bound on ultra high energy cosmic rays at Auger experiment: e.g. $\tau(X) < 4 \times 10^{22}$ yr for $m(X) = 10^{16}$ GeV.
⁶ PORAYKO 18 search for deviations in the residuals of pulsar timing data using PPTA. No signal observed. Limits set on fuzzy DM with $3 \times 10^{-24} < m(\text{DM}) < 2 \times 10^{-22}$ eV.
⁷ AAD 15AT search for events with a top quark and missing E_T in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$.
⁸ KHACHATRYAN 15F search for events with a top quark and missing E_T in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 19.7 \text{ fb}^{-1}$.
⁹ AALTONEN 14J examine events with a W and two jets in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV with $L = 8.9 \text{ fb}^{-1}$. Invariant mass distributions of the two jets are consistent with the Standard Model expectation.
¹⁰ AAD 13A search for resonant WW production in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 4.7 \text{ fb}^{-1}$.
¹¹ AAD 13C search for events with a photon and missing \cancel{E}_T in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 4.6 \text{ fb}^{-1}$.
¹² AALTONEN 13I search for events with a photon and missing E_T , where the photon is detected after the expected timing, in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV with $L = 6.3 \text{ fb}^{-1}$. The data are consistent with the Standard Model expectation.
¹³ CHATRCHYAN 13 search for events with an opposite-sign lepton pair, jets, and missing E_T in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 4.98 \text{ fb}^{-1}$.
¹⁴ AAD 12C search for events with a $t\bar{t}$ pair and missing \cancel{E}_T in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 1.04 \text{ fb}^{-1}$.
¹⁵ AALTONEN 12M search for events with a jet and missing E_T in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV with $L = 6.7 \text{ fb}^{-1}$.

Searches Particle Listings

Other Particle Searches

- 16 CHATRCHYAN 12AP search for events with a jet and missing E_T in pp collisions at $E_{cm} = 7$ TeV with $L = 5.0$ fb $^{-1}$.
- 17 CHATRCHYAN 12Q search for events with a Z , jets, and missing E_T in pp collisions at $E_{cm} = 7$ TeV with $L = 4.98$ fb $^{-1}$.
- 18 CHATRCHYAN 12T search for events with a photon and missing E_T in pp collisions at $E_{cm} = 7$ TeV with $L = 5.0$ fb $^{-1}$.
- 19 AAD 11s search for events with one jet and missing E_T in pp collisions at $E_{cm} = 7$ TeV with $L = 33$ pb $^{-1}$.
- 20 AALTONEN 11AF search for high- p_T like-sign dileptons in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV with $L = 6.1$ fb $^{-1}$.
- 21 CHATRCHYAN 11C search for events with an opposite-sign lepton pair, jets, and missing E_T in pp collisions at $E_{cm} = 7$ TeV with $L = 34$ pb $^{-1}$.
- 22 CHATRCHYAN 11U search for events with one jet and missing E_T in pp collisions at $E_{cm} = 7$ TeV with $L = 36$ pb $^{-1}$.
- 23 AALTONEN 10AF search for $\gamma\gamma$ events with e, μ, τ , or missing E_T in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV with $L = 1.1$ – 2.0 fb $^{-1}$.
- 24 AALTONEN 09AF search for $\ell\gamma$ events with missing E_T in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV with $L = 1.9$ fb $^{-1}$. The observed events are compatible with Standard Model expectation including $t\bar{t}\gamma$ production.
- 25 AALTONEN 09G search for $\mu\mu\mu$ and $\mu\mu e$ events with missing E_T in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV with $L = 976$ pb $^{-1}$.

LIMITS ON JET-JET RESONANCES

Heavy Particle Production Cross Section

Limits are for a particle decaying to two hadronic jets.

- 1 AAD 20AD search for weakly supervised dijet resonance in ATLAS with 139 fb $^{-1}$ at 13 TeV; no signal; various limits placed depending on kinematics and production cross section.
- 2 AAD 20T search for dijet resonance with or without b -jets at 13 TeV and 139 fb $^{-1}$; no signal; limits placed in $\sigma \cdot \text{BF}$ vs mass plane for various BSM models.
- 3 AAD 20W search for dijet resonance plus lepton with ATLAS at 13 TeV and 139 fb $^{-1}$; no signal; limits placed in $\sigma \cdot \text{BF}$ vs. mass plane for various BSM models.
- 4 SIRUNYAN 20AI search for dijet resonance in CMS at 13 TeV with 137 fb $^{-1}$; no signal; limits set in σ vs. mass plane for various BSM models.
- 5 AABOUD 19AJ search for low mass dijet resonance in $pp \rightarrow \gamma X, X \rightarrow jj$ at 13 TeV with 79.8 fb $^{-1}$ of data; no signal found; limits placed on Z' model in coupling vs. $m(Z')$ plane.
- 6 SIRUNYAN 19B search for low mass resonance $pp \rightarrow jA, A \rightarrow b\bar{b}$ at 13 TeV using 35.9 fb $^{-1}$; no signal; exclude resonances 50–350 GeV depending on production and decay.
- 7 SIRUNYAN 19CD search for $pp \rightarrow Z'\gamma, Z' \rightarrow jj$ with fat jet (jj); no signal; limits placed in $m(Z')$ vs. coupling plane for Z' masses from 10 to 125 GeV.
- 8 AABOUD 18AD search for new heavy particle $Y \rightarrow HX \rightarrow (bb) + (qq)$. No signal observed. Limits set on $m(Y)$ vs. $m(X)$ in the ranges of $m(Y)$ in 1–4 TeV and $m(X)$ in 50–1000 GeV.

- 9 AABOUD 18CK search for SUSY Higgsinos in gauge-mediation via $pp \rightarrow bbb + E_T$ at 13 TeV using two complementary analyses with 24.3/36.1 fb $^{-1}$; no signal is found and Higgsinos with masses between 130 and 230 GeV and between 290 and 880 GeV are excluded at the 95% confidence level.
- 10 AABOUD 18CL search for $pp \rightarrow$ vector-like quarks \rightarrow jets at 13 TeV with 36 fb $^{-1}$; no signal seen; limits set on various VLQ scenarios. For pure $B \rightarrow Hb$ or $T \rightarrow Ht$, set the mass limit $m > 1010$ GeV.
- 11 AABOUD 18N search for dijet resonance at ATLAS with 13 TeV and 29.3 fb $^{-1}$; limits set on $m(Z')$ in the mass range of 450–1800 GeV.
- 12 SIRUNYAN 18DJ search for $pp \rightarrow ZZ$ or $WZ \rightarrow \ell\bar{\ell}jj$ resonance at 13 TeV, 35.9 fb $^{-1}$; no signal; limits set in the 400–4500 GeV mass range, exclusion of W' up to 2270 GeV in the HVT model A, and up to 2330 GeV for HVT model B. WED bulk graviton exclusion up to 925 GeV.
- 13 SIRUNYAN 18DY search for $pp \rightarrow RR; R \rightarrow jj$ two dijet resonances at 13 TeV 35.9 fb $^{-1}$; no signal; limits placed on RPV top-squark pair production.
- 14 KHACHATRYAN 17W search for dijet resonance in 12.9 fb $^{-1}$ data at 13 TeV; see Fig. 2 for limits on axiguons, diquarks, dark matter mediators etc.
- 15 KHACHATRYAN 17Y search for $pp \rightarrow (8-10) j$ in 19.7 fb $^{-1}$ at 8 TeV. No signal seen. Limits set on colorons, axiguons, RPV, and SUSY.
- 16 SIRUNYAN 17F measure $pp \rightarrow jj$ angular distribution in 2.6 fb $^{-1}$ at 13 TeV; limits set on LEDs and quantum black holes.
- 17 AABOUD 16 search for resonant dijets including one or two b -jets with 3.2 fb $^{-1}$ at 13 TeV; exclude excited b^* quark from 1.1–2.1 TeV; exclude leptophilic Z' with SM couplings from 1.1–1.5 TeV.
- 18 AAD 16N search for ≥ 3 jets with 3.6 fb $^{-1}$ at 13 TeV; limits placed on micro black holes (Fig. 10) and string balls (Fig. 11).
- 19 AAD 16S search for high mass jet-jet resonance with 3.6 fb $^{-1}$ at 13 TeV; exclude portions of excited quarks, W', Z' and contact interaction parameter space.
- 20 KHACHATRYAN 16K search for dijet resonance in 2.4 fb $^{-1}$ data at 13 TeV; see Fig. 3 for limits on axiguons, diquarks etc.
- 21 KHACHATRYAN 16L use data scouting technique to search for jj resonance on 18.8 fb $^{-1}$ of data at 8 TeV. Limits on the coupling of a leptophobic Z' to quarks are set, improving on the results by other experiments in the mass range between 500–800 GeV.
- 22 AAD 13D search for dijet resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 4.8$ fb $^{-1}$. The observed events are compatible with Standard Model expectation. See their Fig. 6 and Table 2 for limits on resonance cross section in the range $m = 1.0$ – 4.0 TeV.
- 23 AALTONEN 13R search for production of a pair of jet-jet resonances in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV with $L = 6.6$ fb $^{-1}$. See their Fig. 5 and Tables I, II for cross section limits.
- 24 CHATRCHYAN 13A search for $qq, qg,$ and gg resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 4.8$ fb $^{-1}$. See their Fig. 3 and Table 1 for limits on resonance cross section in the range $m = 1.0$ – 4.3 TeV.
- 25 CHATRCHYAN 13A search for $b\bar{b}$ resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 4.8$ fb $^{-1}$. See their Fig. 8 and Table 4 for limits on resonance cross section in the range $m = 1.0$ – 4.0 TeV.
- 26 AAD 12S search for dijet resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 1.0$ fb $^{-1}$. See their Fig. 3 and Table 2 for limits on resonance cross section in the range $m = 0.9$ – 4.0 TeV.
- 27 CHATRCHYAN 12BL search for $t\bar{t}$ resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 4.4$ fb $^{-1}$. See their Fig. 4 for limits on resonance cross section in the range $m = 0.5$ – 3.0 TeV.
- 28 AAD 11AG search for dijet resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 36$ pb $^{-1}$. Limits on number of events for $m = 0.6$ – 4 TeV are given in their Table 3.
- 29 AALTONEN 11M find a peak in two jet invariant mass distribution around 140 GeV in $W + 2$ jet events in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV with $L = 4.3$ fb $^{-1}$.
- 30 ABAZOV 11I search for two-jet resonances in $W + 2$ jet events in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV with $L = 4.3$ fb $^{-1}$ and give limits $\sigma < (2.6-1.3)$ pb (95% CL) for $m = 110$ – 170 GeV. The result is incompatible with AALTONEN 11M.
- 31 AAD 10 search for narrow dijet resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 315$ nb $^{-1}$. Limits on the cross section in the range 10 – 10^3 pb is given for $m = 0.3$ – 1.7 TeV.
- 32 KHACHATRYAN 10 search for narrow dijet resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 2.9$ pb $^{-1}$. Limits on the cross section in the range 1 – 300 pb is given for $m = 0.5$ – 2.6 TeV separately in the final states $qq, qg,$ and gg .
- 33 ABE 99F search for narrow $b\bar{b}$ resonances in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. Limits on $\sigma(p\bar{p} \rightarrow X + \text{anything}) \times \text{B}(X \rightarrow b\bar{b})$ in the range 3 – 10^3 pb (95% CL) are given for $m_X = 200$ – 750 GeV. See their Table I.
- 34 ABE 97G search for narrow dijet resonances in $p\bar{p}$ collisions with 106 pb $^{-1}$ of data at $E_{cm} = 1.8$ TeV. Limits on $\sigma(p\bar{p} \rightarrow X + \text{anything}) \times \text{B}(X \rightarrow jj)$ in the range 10^4 – 10^{-1} pb (95% CL) are given for dijet mass $m = 200$ – 1150 GeV with both jets having $|\eta| < 2.0$ and the dijet system having $|\cos\theta^*| < 0.67$. See their Table I for the list of limits. Supersedes ABE 93c.
- 35 ABE 93c give cross section times branching ratio into light (d, u, s, c, b) quarks for $\Gamma = 0.02$ M. Their Table II gives limits for $M = 200$ – 900 GeV and $\Gamma = (0.02-0.2)$ M.

Searches Particle Listings

Other Particle Searches

- ALBERT 18c search for WIMP annihilation in Sun to long-lived, radiatively decaying mediator; no signal; limits set on $\sigma^{SD}(\chi p)$ assuming long-lived mediator.
- KHACHATRYAN 17D search for new scalar resonance decaying to $Z\gamma$ with $Z \rightarrow e^+e^-$, $\mu^+\mu^-$ in pp collisions at 8 and 13 TeV; no signal seen.
- AAD 16A search for excited quarks (EQ) and quantum black holes (QBH) in 3.2 fb⁻¹ at 13 TeV of data; exclude EQ below 4.4 TeV and QBH below 3.8 (6.2) TeV for RS1 (ADD) models. The visible cross section limit was obtained for 5 TeV resonance with $\sigma_G/M_G = 2\%$.
- KHACHATRYAN 16M search for $\gamma\gamma$ resonance using 19.7 fb⁻¹ at 8 TeV and 3.3 fb⁻¹ at 13 TeV; slight excess at 750 GeV noted; limit set on RS graviton.
- ABBIENDI 00D associated production limit is for $m_{X0} = 90\text{--}188$ GeV, $m_{Y0}=0$ at $E_{cm}=189$ GeV. See also their Fig. 9.
- ABBIENDI 00D pair production limit is for $m_{X0} = 45\text{--}94$ GeV, $m_{Y0}=0$ at $E_{cm}=189$ GeV. See also their Fig. 12.
- ACKERSTAFF 97B associated production limit is for $m_{X0} = 80\text{--}160$ GeV, $m_{Y0}=0$ from 10.0 pb⁻¹ at $E_{cm} = 161$ GeV. See their Fig. 3(a).
- ACKERSTAFF 97B pair production limit is for $m_{X0} = 40\text{--}80$ GeV, $m_{Y0}=0$ from 10.0 pb⁻¹ at $E_{cm} = 161$ GeV. See their Fig. 3(b).

- AAD 21F search for hard monojet production at ATLAS with 139⁻¹ of 13 TeV data. No signal observed. Limits placed on invisible production cross-section recoiling against ISR and interpreted in variety of BSM models.
- AAIJ 20AL search for dimuon resonance from promptly decaying X particle; no signal; limits placed on $m(X)$ up to 60 GeV depending on mixing in 2HDM.
- SIRUNYAN 20AY measured $\Upsilon(1S)\mu^+\mu^-$ at CMS with 13 TeV with 35.9 fb⁻¹. No signal is found and limits are set in σ -BF vs. mass plane for tetra- b -quarks with masses between 17.5 and 19 GeV and for generic search for narrow resonances with mass between 16.5 and 27 GeV.
- SIRUNYAN 20Z search for BSM physics via multilepton production with CMS at 13 TeV with 137 fb⁻¹; no signal is found and limits are set on type-III seesaw and other BSM models.
- AABOUD 19H searches for di-photon-jet resonance at 13 TeV and 36.7 fb⁻¹ of data; no signal found and limits placed on σ -BR vs. mass plane for various simplified models.
- AABOUD 19V review ATLAS searches for mediator-based DM at 7, 8, and 13 TeV with up to 37 fb⁻¹ of data; no signal found and limits set for wide variety of simplified models of dark matter.
- SIRUNYAN 19Q search for $pp \rightarrow \gamma \cancel{E}_T$ at 13 TeV with 36.1 fb⁻¹; no signal found and limits set for various simplified models.
- AABOUD 18CJ make multichannel search for $pp \rightarrow VV/\ell\ell/\ell\nu, V = W, Z, h$ at 13 TeV, 36.1 fb⁻¹; no signal found; limits placed for several BSM models.
- AABOUD 18CM search for lepton-flavor violating resonance in $pp \rightarrow e\mu/e\tau/\mu\tau$ at 13 TeV, 36.1 fb⁻¹; no signal is found and limits placed for various BSM models.
- AAIJ 18AJ search for prompt and delayed dark photon decay $A' \rightarrow \mu^+\mu^-$ at LHCb detector using 1.6 fb⁻¹ of pp collisions at 13 TeV; limits on $m(A')$ vs. kinetic mixing are set.

- BANERJEE 18 search for dark photon $A'/16.7$ MeV boson X at NA64 via $eZ \rightarrow eZX(A')$; no signal found and limits set on the X - e^- coupling ϵ_e in the range $1.3 \times 10^{-4} \leq \epsilon_e \leq 4.2 \times 10^{-4}$ excluding part of the allowed parameter space.
- BANERJEE 18A search for invisibly decaying dark photons in $eZ \rightarrow eZA', A' \rightarrow$ invisible; no signal found and limits set on mixing for $m(A') < 1$ GeV.
- MARSICANO 18 search for dark photon $e^+e^- \rightarrow A'(\gamma)$ visible decay in SLAC E137 e beam dump data. No signal observed and limits set in ϵ coupling vs $m(A')$ plane, see their figure 7.
- SIRUNYAN 18BB search for high mass dilepton resonance; no signal found and exclude portions of p -space of Z' , KK graviton models.
- SIRUNYAN 18DA search for $pp \rightarrow$ Black Hole, string ball, sphaleron via high multiplicity events at 13 TeV, 35.9 fb⁻¹; no signal, require e.g. $m(\text{BH}) > 10.1$ TeV.
- SIRUNYAN 18DD search for $pp \rightarrow jj$ deviations in dijet angular distribution. No signal observed. Set limits on large extra dimensions, black holes and DM mediators e.g. $m(\text{BH}) > 5.9\text{--}8.2$ TeV.
- SIRUNYAN 18DR search for dimuon resonance in $pp \rightarrow b\mu\bar{\mu}$ at 8 and 13 TeV. Slight excess seen at $m(\mu\bar{\mu}) \sim 28$ GeV in some channels.
- SIRUNYAN 18DU search for high mass diphoton resonance in $pp \rightarrow \gamma\gamma$ at 13 TeV using 35.9 fb⁻¹; no signal; limits placed on RS Graviton, LED, and clockwork.
- SIRUNYAN 18ED search for $pp \rightarrow V \rightarrow Wh; h \rightarrow b\bar{b}; W \rightarrow \ell\nu$ at 13 TeV with 35.9 fb⁻¹; no signal; limits set on $m(W')$ > 2.9 TeV.
- AABOUD 17B exclude $m(W', Z') < 1.49\text{--}2.31$ TeV depending on the couplings and W'/Z' degeneracy assumptions via WH, ZH search in pp collisions at 13 TeV with 3.2 fb⁻¹ of data.
- AAIJ 17BR search for long-lived hidden valley pions from Higgs decay. Limits are set on the signal strength as a function of the mass and lifetime of the long-lived particle in their Fig. 4 and Tab. 4.
- AAD 16O search for high $E_T \ell + (\ell s \text{ or jets})$ with 3.2 fb⁻¹ at 13 TeV; exclude micro black holes mass < 8 TeV (Fig. 3) for models with two extra dimensions.
- AAD 16R search for WW, WZ, ZZ resonance in 20.3 fb⁻¹ at 8 TeV data; limits placed on massive RS graviton (Fig. 4).
- KRASZNAHORKAY 16 report $p\text{Li} \rightarrow \text{Be} \rightarrow e\bar{\nu}N$ 5 σ resonance at 16.7 MeV— possible evidence for nuclear interference or new light boson. However, such nuclear interference was ruled out already by ZANG 17.
- LEES 15E search for long-lived neutral particles produced in e^+e^- collisions in the Upsilon region, which decays into $e^+e^-, \mu^+\mu^-, e^+\mu^\pm, \pi^+\pi^-, K^+K^-, \text{ or } \pi^\pm K^\mp$. See their Fig. 2 for cross section limits.
- ADAMS 97B search for a hadron-like neutral particle produced in pN interactions, which decays into a p^0 and a weakly interacting massive particle. Upper limits are given for the ratio to K_L production for the mass range 1.2–5 GeV and lifetime 10⁻⁹–10⁻⁴ s. See also our Light Gluino Section.
- GALLAS 95 limit is for a weakly interacting neutral particle produced in 800 GeV/c pN interactions decaying with a lifetime of 10⁻⁴–10⁻⁸ s. See their Figs. 8 and 9. Similar limits are obtained for a stable particle with interaction cross section 10⁻²⁹–10⁻³³ cm². See Fig. 10.
- AKESSON 91 limit is from weakly interacting neutral long-lived particles produced in pN reaction at 450 GeV/c performed at CERN SPS. Bourquin-Gaillard formula is used as the production model. The above limit is for $\tau > 10^{-7}$ s. For $\tau > 10^{-9}$ s, $\sigma < 10^{-30}$ cm²/nucleon is obtained.
- BADIER 86 looked for long-lived particles at 300 GeV π^- beam dump. The limit applies for nonstrongly interacting neutral or charged particles with mass > 2 GeV. The limit applies for particle modes, $\mu^+\pi^-, \mu^+\mu^-, \pi^+\pi^-, X, \pi^+\pi^-\pi^\pm$ etc. See their figure 5 for the contours of limits in the mass- τ plane for each mode.
- GUSTAFSON 76 is a 300 GeV FNAL experiment looking for heavy ($m > 2$ GeV) long-lived neutral hadrons in the M4 neutral beam. The above typical value is for $m = 3$ GeV and assumes an interaction cross section of 1 mb. Values as a function of mass and production cross section are given in figure 2.

Production of New Penetrating Non- ν Like States in Beam Dump

VALUE	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •			
	1 ANDREEV	21 NA64	search for new boson X in $eZ \rightarrow eZX$
	2 LOSECCO	81 CALO	28 GeV protons

- ANDREEV 21 search for new invisibly decaying boson X in $eZ \rightarrow eZX$ at NA64. No signal observed. Limits set in coupling vs. $m(X)$ plane for $m(X) \sim 10^{-3}$ to 1 GeV.
- No excess neutral-current events leads to $\sigma(\text{production}) \times \sigma(\text{interaction}) \times \text{acceptance} < 2.26 \times 10^{-71}$ cm⁴/nucleon² (CL = 90%) for light neutrals. Acceptance depends on models (0.1 to 4. × 10⁻⁴).

LIMITS ON CHARGED PARTICLES IN e^+e^-

Heavy Particle Production Cross Section in e^+e^-

Ratio to $\sigma(e^+e^- \rightarrow \mu^+\mu^-)$ unless noted. See also entries in Free Quark Search and Magnetic Monopole Searches.

Searches Particle Listings

Other Particle Searches

- ¹ KILE 18 investigate archived ALEPH $e^+e^- \rightarrow 4$ jets data and see 4–5 σ excess at 110 GeV.
- ² ABLIKIM 17AA search for dark photon $A \rightarrow \ell\bar{\ell}$ at 3.773 GeV with 2.93 fb⁻¹. Limits are set in ϵ vs $m(A)$ plane.
- ³ ACKERSTAFF 98P search for pair production of long-lived charged particles at E_{cm} between 130 and 183 GeV and give limits $\sigma < (0.05-0.2)$ pb (95%CL) for spin-0 and spin-1/2 particles with $m=45-89.5$ GeV, charge 1 and 2/3. The limit is translated to the cross section at $E_{cm}=183$ GeV with the s dependence described in the paper. See their Figs. 2–4.
- ⁴ ABREU 97D search for pair production of long-lived particles and give limits $\sigma < (0.4-2.3)$ pb (95%CL) for various center-of-mass energies $E_{cm}=130-136, 161,$ and 172 GeV, assuming an almost flat production distribution in $\cos\theta$.
- ⁵ BARATE 97K search for pair production of long-lived charged particles at $E_{cm} = 130, 136, 161,$ and 172 GeV and give limits $\sigma < (0.2-0.4)$ pb (95%CL) for spin-0 and spin-1/2 particles with $m=45-85$ GeV. The limit is translated to the cross section at $E_{cm}=172$ GeV with the E_{cm} dependence described in the paper. See their Figs. 2 and 3 for limits on $J = 1/2$ and $J = 0$ cases.
- ⁶ AKERS 95R is a CERN-LEP experiment with $W_{cm} \sim m_Z$. The limit is for the production of a stable particle in multihadron events normalized to $\sigma(e^+e^- \rightarrow \text{hadrons})$. Constant phase space distribution is assumed. See their Fig. 3 for bounds for $Q = \pm 2/3, \pm 4/3$.
- ⁷ BUSKULIC 93c is a CERN-LEP experiment with $W_{cm} = m_Z$. The limit is for a pair or single production of heavy particles with unusual ionization loss in TPC. See their Fig. 5 and Table 1.
- ⁸ ADACHI 90C is a KEK-TRISTAN experiment with $W_{cm} = 52-60$ GeV. The limit is for pair production of a scalar or spin-1/2 particle. See Figs. 3 and 4.
- ⁹ ADACHI 90E is KEK-TRISTAN experiment with $W_{cm} = 52-61.4$ GeV. The above limit is for inclusive production cross section normalized to $\sigma(e^+e^- \rightarrow \mu^+\mu^-) \cdot \beta(3-\beta^2)/2$, where $\beta = (1 - 4m^2/W_{cm}^2)^{1/2}$. See the paper for the assumption about the production mechanism.
- ¹⁰ KINOSHITA 82 is SLAC PEP experiment at $W_{cm} = 29$ GeV using lexan and ³⁹Cr plastic sheets sensitive to highly ionizing particles.
- ¹¹ BARTEL 80 is DESY-PETRA experiment with $W_{cm} = 27-35$ GeV. Above limit is for inclusive pair production and ranges between $1. \times 10^{-1}$ and $1. \times 10^{-2}$ depending on mass and production momentum distributions. (See their figures 9, 10, 11).

Branching Fraction of Z^0 to a Pair of Stable Charged Heavy Fermions

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
$< 5 \times 10^{-6}$	95	¹ AKERS 95R	OPAL	$m = 40.4-45.6$ GeV
$< 1 \times 10^{-3}$	95	AKRAWY 90O	OPAL	$m = 29-40$ GeV

- • • We do not use the following data for averages, fits, limits, etc. • • •
- ¹ AKERS 95R give the 95% CL limit $\sigma(X\bar{X})/\sigma(\mu\mu) < 1.8 \times 10^{-4}$ for the pair production of singly- or doubly-charged stable particles. The limit applies for the mass range 40.4–45.6 GeV for X^\pm and < 45.6 GeV for $X^{\pm\pm}$. See the paper for bounds for $Q = \pm 2/3, \pm 4/3$.

LIMITS ON CHARGED PARTICLES IN HADRONIC REACTIONS

MASS LIMITS for Long-Lived Charged Heavy Fermions

Limits are for spin 1/2 particles with no color and SU(2)_L charge. The electric charge Q of the particle (in the unit of e) is therefore equal to its weak hypercharge. Pair production by Drell-Yan like γ and Z exchange is assumed to derive the limits.

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
> 660	95	¹ SIRUNYAN 20N	CMS	disappearing track LLP
> 200	95	² AAD 15BJ	ATLS	$ Q = 2$

- ¹ SIRUNYAN 21T perform model unspecific search for deviations from SM with CMS at 13 TeV with 35.9 fb⁻¹ data in numerous signature channels. No deviations from SM found.
- ² SIRUNYAN 20c search for four top-quark production with decay to multileptons at CMS at 13 TeV with 137 fb⁻¹; no signal is found and limits are placed on the Higgs boson oblique parameter in the effective field theory framework (EFT) and the model parameters ($\tan\beta$).
- ³ AABOUD 19AA search for BSM physics at 13 TeV with 3.2 fb⁻¹ in $> 10^5$ regions of > 700 event classes; no significant signal found.
- ⁴ AABOUD 19Q search for single top+MET events at 13 TeV with 36.1 fb⁻¹ of data; no signal found and limits set in σ or coupling vs. mass plane for variety of simplified models including DM and vector-like top quark T .
- ⁵ AABOUD 17D search for $WWjj, WZjj$ in pp collisions at 8 TeV with 3.2 fb⁻¹; set limits on anomalous couplings.
- ⁶ AABOUD 17L search for the pair production of heavy vector-like T quarks in the $Z(\rightarrow \nu\nu)tX$ final state.
- ⁷ SIRUNYAN 17b search for vector-like quark $pp \rightarrow TX \rightarrow tHX$ in 2.3 fb⁻¹ at 13 TeV; no signal seen; limits placed.
- ⁸ SIRUNYAN 17c search for vector-like quark $pp \rightarrow TX \rightarrow Z + (t \text{ or } b)$ in 2.3 fb⁻¹ at 13 TeV; no signal seen; limits placed.
- ⁹ SIRUNYAN 17j search for $pp \rightarrow X_{5/3}X_{5/3} \rightarrow tWtW$ with 2.3 fb⁻¹ at 13 TeV. No signal seen: $m(X) > 1020$ (990) GeV for RH (LH) new charge 5/3 quark.
- ¹⁰ AAIJ 15BD search for production of long-lived particles in pp collisions at $E_{cm} = 7$ and 8 TeV. See their Table 6 for cross section limits.
- ¹¹ AAD 13AH search for production of long-lived particles with $|q|=(2-6)e$ in pp collisions at $E_{cm} = 7$ TeV with 4.4 fb⁻¹. See their Fig. 8 for cross section limits.
- ¹² AAD 11I search for production of highly ionizing massive particles in pp collisions at $E_{cm} = 7$ TeV with $L = 3.1$ pb⁻¹. See their Table 5 for similar limits for $|q| = 6e$ and $17e$, Table 6 for limits on pair production cross section.
- ¹³ AALTONEN 09Z search for long-lived charged particles in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV with $L = 1.0$ fb⁻¹. The limits are on production cross section for a particle of mass above 100 GeV in the region $|\eta| \lesssim 0.7, p_T > 40$ GeV, and $0.4 < \beta < 1.0$.
- ¹⁴ Limit for weakly interacting charge-1 particle.
- ¹⁵ Limit for up-quark like particle.
- ¹⁶ ABAZOV 09M search for pair production of long-lived charged particles in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV with $L = 1.1$ fb⁻¹. Limit on the cross section of (0.31–0.04) pb (95% CL) for the mass range of 60–300 GeV, assuming the kinematics of stau pair production.
- ¹⁷ AKTAS 04c look for charged particle photoproduction at HERA with mean c.m. energy of 200 GeV.
- ¹⁸ ABE 92I look for pair production of unit-charged particles which leave detector before decaying. Limit shown here is for $m=50$ GeV. See their Fig. 5 for different charges and stronger limits for higher mass.
- ¹⁹ CARROLL 78 look for neutral, $S = -2$ dihyperon resonance in $pp \rightarrow 2K^+X$. Cross section varies within above limits over mass range and $p_{lab} = 5.1-5.9$ GeV/ c .
- ²⁰ LEIPUNER 73 is an NAL 300 GeV p experiment. Would have detected particles with lifetime greater than 200 ns.

- ¹ BALDIN 76 is a 70 GeV Serpukhov experiment. Value is per Al nucleus at $\theta = 0$. For other charges in range -0.5 to -3.0 , CL = 90% limit is $(2.6 \times 10^{-36})/|(charge)|$ for mass range (2.1–9.4 GeV) $\times |(charge)|$. Assumes stable particle interacting with matter as do antiprotons.
- ² ALBROW 75 is a CERN ISR experiment with $E_{cm} = 53$ GeV. $\theta = 40$ mr. See figure 5 for mass ranges up to 35 GeV.
- ³ JOVANOVIĆ 75 is a CERN ISR 26+26 and 15+15 GeV pp experiment. Figure 4 covers ranges $Q = 1/3$ to 2 and $m = 3$ to 26 GeV. Value is per GeV momentum.
- ⁴ APPEL 74 is NAL 300 GeV pW experiment. Studies forward production of heavy (up to 24 GeV) charged particles with momenta 24–200 GeV (–charge) and 40–150 GeV (+charge). Above typical value is for 75 GeV and is per GeV momentum per nucleon.
- ⁵ ALPER 73 is CERN ISR 26+26 GeV pp experiment. $p > 0.9$ GeV, $0.2 < \beta < 0.65$.
- ⁶ ANTIPOV 71B is from same 70 GeV p experiment as ANTIPOV 71C and BINON 69.
- ⁷ ANTIPOV 71C limit inferred from flux ratio. 70 GeV p experiment.
- ⁸ DORFAN 65 is a 30 GeV/ c p experiment at BNL. Units are per GeV momentum per nucleus.

Long-Lived Heavy Particle Invariant Cross Section

VALUE ($\text{cm}^2/\text{GeV}^2/N$)	CL%	DOCUMENT ID	TECN	CHG	COMMENT

$< 1.1 \times 10^{-37}$	90	4 BOZZOLI 79	CNTR	\pm	$Q = (2/3, 1, 4/3, 2)$
$< 3.0 \times 10^{-37}$	90	5 CUTTS 78	CNTR		$m = 4\text{--}10 \text{ GeV}$
		6 VIDAL 78	CNTR		$m = 4.5\text{--}6 \text{ GeV}$

1 BERNSTEIN 88 limits apply at $x = 0.2$ and $p_T = 0$. Mass and lifetime dependence of limits are shown in the regions: $m = 1.5\text{--}7.5 \text{ GeV}$ and $\tau = 10^{-8}\text{--}2 \times 10^{-6} \text{ s}$. First number is for hadrons; second is for weakly interacting particles.

2 THRON 85 is FNAL 400 GeV proton experiment. Mass determined from measured velocity and momentum. Limits are for $\tau > 3 \times 10^{-9} \text{ s}$.

3 ARMITAGE 79 is CERN-ISR experiment at $E_{\text{cm}} = 53 \text{ GeV}$. Value is for $x = 0.1$ and $p_T = 0.15$. Observed particles at $m = 1.87 \text{ GeV}$ are found all consistent with being antideuterons.

4 BOZZOLI 79 is CERN-SPS 200 GeV pN experiment. Looks for particle with τ larger than 10^{-8} s . See their figure 11-18 for production cross-section upper limits vs mass.

5 CUTTS 78 is pBe experiment at FNAL sensitive to particles of $\tau > 5 \times 10^{-8} \text{ s}$. Value is for $-0.3 < x < 0$ and $p_T = 0.175$.

6 VIDAL 78 is FNAL 400 GeV proton experiment. Value is for $x = 0$ and $p_T = 0$. Puts lifetime limit of $< 5 \times 10^{-8} \text{ s}$ on particle in this mass range.

Long-Lived Heavy Particle Production

1 AAD 21AL reports on ATLAS search for long-lived charged particles with 139 fb^{-1} at 13 TeV. No signal observed. Limits placed in lifetime vs. mass plane: e.g. for $\tau(\text{LLP}) \sim 0.1 \text{ ns}$, $m(\text{electron}) > 720 \text{ GeV}$.

2 AAD 21BA search for long-lived particles from ZH production ($H \rightarrow b\bar{b}$) with 2 displaced vertices in 139 fb^{-1} of data at 13 TeV. No signal detected. Limits placed in branching fraction vs. lifetime plane.

3 AAIJ 21V search for $pp \rightarrow \text{LLP} + \text{LLP}$ with $\text{LLP} \rightarrow e\mu\nu$ in the lifetime range between 2 and 50 ps at LHCB with 5.4 fb^{-1} at 13 TeV. No signal observed. Limits placed in LLP cross section vs. mass or lifetime plane for $m(\text{LLP}) \sim 7$ to 50 GeV.

4 SIRUNYAN 21AF search for LLPs at CMS via jets with 2 displaced vertices in 140 fb^{-1} of data at 13 TeV. No signal observed. Limits placed for RPV SUSY models in which a long-lived neutralino or gluino decays into a multijet final state with top, bottom, and strange quarks.

5 SIRUNYAN 21U search for long-lived particles (LLPs) via displaced jets at CMS with LHCB and 132 fb^{-1} . No signal detected. Limits placed on simplified model production of LLP $X \rightarrow q\bar{q}$ with $\sigma < 0.07 \text{ fb}$ for $m(X) > 500 \text{ GeV}$ and $c\tau \sim 2$ to 250 mm.

6 TUMASYAN 21 search for long-lived particles in CMS muon endcap detector in 137 fb^{-1} of data at 13 TeV. No signal detected. Limits are placed depending on the branching fraction of Higgs boson to LLP decaying to dd, bb , and $\tau^+\tau^-$, depending on proper decay length, and LLP masses.

7 AAD 20D search for opposite-sign dileptons originating from long-lived particles in pp collisions at 13 TeV with 32.8 fb^{-1} ; limits placed in squark cross section vs. $c\tau$ plane for RPV SUSY.

8 AAD 20J search for scalar boson decay to two long-lived particles; no signal; limits placed in BF vs $c\tau$ plane for various mass hypotheses. This search is also combined with other ATLAS displaced-jet searches.

9 AAD 20M search for long-lived top-squarks decay to μ and hadrons; no signal; limits placed in cross section vs. mass and mass vs. lifetime planes.

10 AAD 20P search for long-lived dark photons produced from the decay of a scalar boson, with each dark photon decaying into displaced collimated leptons or light hadrons at 13 TeV with 36 fb^{-1} ; no signal; limits placed in $\sigma \cdot \text{BF}$ vs. $c\tau$ and other planes.

11 AAIJ 20AL search for long-lived $X \rightarrow \mu^+\mu^-$ decays in 5.1 fb^{-1} of LHCB data at 13 TeV; no signal; limits placed on $m(X)$ up to 3 GeV depending on kinetic mixing.

12 BALL 20 search for long-lived milli-charged particles produced at LHC; limits placed in charge vs. mass plane (Fig. 8).

13 AABOUD 19AE search for long-lived particles via displaced jets using 10.8 fb^{-1} or 33.0 fb^{-1} data (depending on a trigger) at 13 TeV; no signal found and limits set in branching ratio vs. decay length plane.

14 AABOUD 19AK searches for long-lived particle Z_d via $pp \rightarrow \Phi \rightarrow ZZ_d$ at 13 TeV with 36.1 fb^{-1} ; no signal found and limits set in $\sigma \times \text{BR}$ vs. lifetime plane for simplified model.

15 AABOUD 19AM search for Drell-Yan (DY) production of long-lived multi-charge particles at 13 TeV with 36.1 fb^{-1} of data; no signal found and exclude $50 \text{ GeV} < m(\text{LLMCP}) < 980\text{--}1220 \text{ GeV}$ for electric charge $|q| = (2\text{--}7)e$.

16 AABOUD 19AO search for neutral long-lived particles producing displaced jets at 13 TeV with 36.1 fb^{-1} of data; no signal found and exclude regions of $\sigma \cdot \text{BR}$ vs. lifetime plane for various models.

17 AABOUD 19AT search for heavy, charged long-lived particles at 13 TeV with 36.1 fb^{-1} ; no signal found and upper limits set on masses of various hypothetical particles.

18 AABOUD 19G search for long-lived particle with decay to $\mu^+\mu^-$ at 13 TeV with 32.9 fb^{-1} ; no signal found and limits set in combinations of lifetime, mass and coupling planes for various simplified models.

19 SIRUNYAN 19BH search for long-lived SUSY particles via displaced jets at 13 TeV with 35.9 fb^{-1} ; no signal found and limits placed in mass vs lifetime plane for various hypothetical models.

20 SIRUNYAN 19BT search for displaced jet(s)+ E_T at 13 TeV with 137 fb^{-1} ; no signal found and limits placed in mass vs lifetime plane for gauge mediated SUSY breaking models.

21 SIRUNYAN 19CA search for gluino/squark decay to long-lived neutralino, LHC decay to γ in GMSB; no signal, limits placed in $m(X)$ vs. lifetime plane for SP58 GMSB benchmark point.

22 SIRUNYAN 19Q search for $pp \rightarrow j +$ displaced jet via dark quark with 13 TeV at 16.1 fb^{-1} ; no signal found and limits set in mass vs lifetime plane for dark quark/dark pion model.

23 SIRUNYAN 18AW search for very long lived particles (LLPs) decaying hadronically or to $\mu\pi$ in CMS detector; none seen/limits set on lifetime vs. cross section.

24 AAIJ 16AR search for long lived particles from $H \rightarrow XX$ with displaced X decay vertex using 0.62 fb^{-1} at 7 TeV; limits set in Fig. 7.

25 KHACHATRYAN 16BW search for heavy stable charged particles via ToF with 2.5 fb^{-1} at 13 TeV; require stable $m(\text{gluino}) > 1610 \text{ GeV}$.

26 BADIER 86 looked for long-lived particles at 300 GeV π^- beam dump. The limit applies for nonstrongly interacting neutral or charged particles with mass $> 2 \text{ GeV}$. The limit applies for particle modes, $\mu^+\pi^-$, $\mu^+\mu^-$, $\pi^+\pi^-X$, $\pi^+\pi^-\pi^{\pm}$ etc. See their figure 5 for the contours of limits in the mass- τ plane for each mode.

Long-Lived Heavy Particle Cross Section

VALUE (pb/sr)	CL%	DOCUMENT ID	TECN	COMMENT
••• We do not use the following data for averages, fits, limits, etc. •••				
< 34	95	1 RAM 94	SPEC	$1015 < m_{X^{++}} < 1085 \text{ MeV}$
< 75	95	1 RAM 94	SPEC	$920 < m_{X^{++}} < 1025 \text{ MeV}$

1 RAM 94 search for a long-lived doubly-charged fermion X^{++} with mass between m_N and $m_N + m_\pi$ and baryon number +1 in the reaction $pp \rightarrow X^{++}n$. No candidate is found. The limit is for the cross section at 15° scattering angle at 460 MeV incident energy and applies for $\tau(X^{++}) \gg 0.1 \mu\text{s}$.

- ALVIS 18 search for fractional charged flux of cosmic matter at Majorana demonstrator; no signal observed and limits are set on the flux of lightly ionizing particles for charge as low as $e/1000$.
- AGNESE 15 Fig. 6 for limits extending down to $Q = 1/200$.
- SAITO 90 candidates carry about 450 MeV/nucleon. Cannot be accounted for by conventional backgrounds. Consistent with strange quark matter hypothesis.
- MINCER 85 is high statistics study of calorimeter signals delayed by 20–200 ns. Calibration with AGS beam shows they can be accounted for by rare fluctuations in signals from low-energy hadrons in the shower. Claim that previous delayed signals including BJORNBOE 68, DARDO 72, BHAT 82, SAKUYAMA 83b below may be due to this fake effect.
- SAKUYAMA 83b analyzed 6000 extended air shower events. Increase of delayed particles and change of lateral distribution above 10^{17} eV may indicate production of very heavy parent at top of atmosphere.
- BHAT 82 observed 12 events with delay $> 2. \times 10^{-8}$ s and with more than 40 particles. 1 eV has good hadron shower. However all events are delayed in only one of two detectors in cloud chamber, and could not be due to strongly interacting massive particle.
- MARINI 82 applied PEP-counter for TOF. Above limit is for velocity $= 0.54$ of light. Limit is inconsistent with YOCK 80 YOCK 81 events if isotropic dependence on zenith angle is assumed.
- YOCK 81 saw another 3 events with $Q = \pm 1$ and m about $4.5 m_p$ as well as 2 events with $m > 5.3 m_p$, $Q = \pm 0.75 \pm 0.05$ and $m > 2.8 m_p$, $Q = \pm 0.70 \pm 0.05$ and 1 event with $m = (9.3 \pm 3.) m_p$, $Q = \pm 0.89 \pm 0.06$ as possible heavy candidates.
- YOCK 80 events are with charge exactly or approximately equal to unity.
- BHAT 78 is at Kolar gold fields. Limit is for $\tau > 10^{-6}$ s.
- YOCK 74 events could be tritons.

- ADRIANI 15 search for relatively light quark matter with charge $Z = 1-8$. See their Figs. 2 and 3 for flux upper limits.
- AMBROSIO 00b searched for quark matter ("nuclearites") in the velocity range ($10^{-5}-1$) c. The listed limit is for 2×10^{-3} c.
- ASTONE 93 searched for quark matter ("nuclearites") in the velocity range ($10^{-3}-1$) c. Their Table 1 gives a compilation of searches for nuclearites.
- AHLEN 92 searched for quark matter ("nuclearites"). The bound applies to velocity $< 2.5 \times 10^{-3}$ c. See their Fig. 3 for other velocity/c and heavier mass range.
- NAKAMURA 91 searched for quark matter in the velocity range ($4 \times 10^{-5}-1$) c.
- ORITO 91 searched for quark matter. The limit is for the velocity range ($10^{-4}-10^{-3}$) c.
- LIU 88 searched for quark matter ("nuclearites") in the velocity range ($2.5 \times 10^{-3}-1$) c. A less stringent limit of 5.8×10^{-11} applies for $(1-2.5) \times 10^{-3}$ c.
- BARISH 87 searched for quark matter ("nuclearites") in the velocity range ($2.7 \times 10^{-4}-5 \times 10^{-3}$) c.
- NAKAMURA 85 at KEK searched for quark-matter. These might be lumps of strange quark matter with roughly equal numbers of u, d, s quarks. These lumps or nuclearites were assumed to have velocity of $(10^{-4}-10^{-3})$ c.
- ULLMAN 81 is sensitive for heavy slow singly charge particle reaching earth with vertical velocity 100–350 km/s.

	11 AAD	11AG ATLS	7 TeV $pp \rightarrow 2$ jets

- AABOUD 16P set limits on quantum BH production in $n = 6$ ADD or $n = 1$ RS models.
- AAD 15AN search for black hole or string ball formation followed by its decay to multijet final states, in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$. See their Figs. 6–8 for limits.
- AAD 14A search for quantum black hole formation followed by its decay to a γ and a jet, in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20 \text{ fb}^{-1}$. See their Fig. 3 for limits.
- AAD 14AL search for quantum black hole formation followed by its decay to a lepton and a jet, in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$. See their Fig. 2 for limits.
- AAD 14C search for microscopic (semiclassical) black hole formation followed by its decay to final states with a lepton and ≥ 2 (leptons or jets), in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$. See their Figures 8–11, Tables 7, 8 for limits.
- AAD 13D search for quantum black hole formation followed by its decay to two jets, in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 4.8 \text{ fb}^{-1}$. See their Fig. 8 and Table 3 for limits.
- CHATRCHYAN 13A search for quantum black hole formation followed by its decay to two jets, in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 5 \text{ fb}^{-1}$. See their Figs. 5 and 6 for limits.
- CHATRCHYAN 13AD search for microscopic (semiclassical) black hole formation followed by its evaporation to multiparticle final states, in multijet (including γ, ℓ) events in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 12 \text{ fb}^{-1}$. See their Figs. 5–7 for limits.
- AAD 12AK search for microscopic (semiclassical) black hole formation followed by its decay to final states with a lepton and ≥ 2 (leptons or jets), in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 1.04 \text{ fb}^{-1}$. See their Fig. 4 and 5 for limits.
- CHATRCHYAN 12W search for microscopic (semiclassical) black hole formation followed by its evaporation to multiparticle final states, in multijet (including γ, ℓ) events in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 4.7 \text{ fb}^{-1}$. See their Figs. 5–8 for limits.
- AAD 11AG search for quantum black hole formation followed by its decay to two jets, in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 36 \text{ pb}^{-1}$. See their Fig. 11 and Table 4 for limits.
