¹ Mass errors enlarged by us to Γ/\sqrt{N} ; see the note with the $K^*(892)$ mass.
² Uses same data as HYAMS 75.
³ From a phase shift solution containing a $f_2'(1525)$ width two times larger than the $K\bar{K}$ result.
⁴ From phase-shift analysis. Error takes account of spread of different phase-shift solutions.

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 10 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 14.7$ for 7 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

1740 ± 20		ANTONELLI 88	DM2	$e^+e^- \rightarrow \eta\pi^+\pi^-$	
1701 ± 15		³ FUKUI 88	SPEC	8.95 $\pi^-\rho \rightarrow \eta\pi^+\pi^-\pi$	

¹ Mass and width of the $\rho(770)$ fixed at 775 and 149 MeV, respectively; solution 2 of model 2, $\eta \rightarrow \gamma\gamma$ decays used.
² From the combined fit of AULCHENKO 15 and ACHASOV 18 in the model with the interfering $\rho(1450)$, $\rho(1700)$ and $\rho(2150)$ with the parameters of the $\rho(1450)$ and $\rho(1700)$ floating and the mass and width of the $\rho(2150)$ fixed at 2155 MeV and 320 MeV, respectively. The phases of the resonances are π , 0 and π , respectively.
³ Assuming $\rho^+ f_0(1370)$ decay mode interferes with $a_1(1260)^+\pi$ background. From a two Breit-Wigner fit.

- Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of LEES 12c and ABLIKIM 16c.
- Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of ACHASOV 06, AKHMETSHIN 07, AUBERT 09AS, and AMBROSINO 11A.
- Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of FUJIKAWA 08.
- From a Dalitz plot analysis in an isobar model with $\rho(1450)$ and $\rho(1700)$ masses and widths floating.
- Using the KUHN 90 parametrization of the pion form factor, neglecting $p-\omega$ interference.
- Using the GOUNARIS 68 parametrization of the pion form factor leaving the masses and widths of the $\rho(1450)$, $\rho(1700)$, and $\rho(2150)$ resonances as free parameters of the fit.
- $|F_\pi(0)|^2$ fixed to 1.
- From the GOUNARIS 68 parametrization of the pion form factor.
- T-matrix pole.
- From phase shift analysis of HYAMS 73 data.
- Simple relativistic Breit-Wigner fit with constant width.
- An additional 40 MeV uncertainty in both the mass and width is present due to the choice of the background shape.
- Included in BECKER 79 analysis.

 $\pi\omega$ MODE

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
••• We do not use the following data for averages, fits, limits, etc. •••				
1708 ± 41	7815	1 ACHASOV	13	SND 1.05-2.00 $e^+ e^- \rightarrow \pi^0 \pi^0 \gamma$
1550 to 1620		2 ACHASOV	00i	SND $e^+ e^- \rightarrow \pi^0 \pi^0 \gamma$

¹ Simple relativistic Breit-Wigner fit with model-dependent width.
² Simple relativistic Breit-Wigner fit with constant width.
³ One peak fit result.
⁴ Parameters roughly estimated, not from a fit.
⁵ Skew mass distribution compensated by Ross-Stodolsky factor.
⁶ Width errors enlarged by us to $4\Gamma\sqrt{N}$; see the note with the $K^*(892)$ mass.

1 T-matrix pole.
2 From T-matrix pole based on combined fit of Crystal Barrel and $\pi\pi$ scattering data (ALBRECHT 20), and COMPASS data (ADOLPH 15), using a coupled-channel model of $\eta\pi$, $\eta'\pi$ and $K\bar{K}$ systems.

3 T-matrix pole, 2 poles, 2 channels ($\pi\eta$, $K\bar{K}$).
4 The coupled-channel analysis of both the $\eta\pi$ and $\eta'\pi$ systems using ADOLPH 15 data. The mass is extracted from the T-matrix pole.
5 Statistical error negligible.
6 Breit-Wigner mass.
7 Superseded by RODAS 19.
8 From analysis of L3 data at 183–209 GeV.
9 Statistical error only.
10 Spin 2 dominant, isospin not determined, could also be $I=1$.
11 Possibly two $J^P = 2^+$ resonances with isospins 0 and 1.

¹ Breit-Wigner mass.
² From partial wave analysis including all possible combinations of $0^{++}, 2^{++}$, and 4^{++} resonances.
³ Spin 0 favored over spin 2.
⁴ In the SU(3) based model with a specific interference pattern of the $f_2(1270)$, $a_2^0(1320)$, and $f_2'(1525)$ mesons incoherently added to the $f_0(1710)$ and non-resonant background.
⁵ $J^P = 0^+$, superseded by ARMSTRONG 89D.
⁶ T-matrix pole from coupled channel K-matrix fit to data on $J/\psi \rightarrow \gamma\pi^0\pi^0$ (ABLIKIM 15AE) and $J/\psi \rightarrow \gamma K_S^0 K_S^0$ (ABLIKIM 18AA).
⁷ From partial wave analysis of $\omega\phi$ invariant mass including $0^{++}, 2^{++}$, and 0^{-+} resonances.
⁸ T-matrix pole.
⁹ Close-by state with mass 1765 ± 15 MeV and width 180 ± 20 MeV.
¹⁰ T-matrix pole, 5 poles, 5 channels, including scattering data from HYAMS 75 ($\pi\pi$), LONGACRE 86 ($K\bar{K}$), BINON 83 ($\eta\eta$), and BINON 84C ($\eta\eta'$).

See key on page 1127

Meson Particle Listings

$f_0(1710)$

- 11 Using CLEO-c data but not authored by the CLEO Collaboration.
- 12 From a fit to a Breit-Wigner line shape with fixed $\Gamma = 135$ MeV.
- 13 Not seen by LIU 09 in $B^\pm \rightarrow K^\pm \omega \phi$.
- 14 Systematic errors not estimated.
- 15 This state may be different from $f_0(1710)$, see CLOSE 05.
- 16 K-matrix pole, assuming $J^P = 0^+$, from combined analysis of $\pi^- p \rightarrow \pi^0 \pi^0 n, \pi^- p \rightarrow K^+ K^- n, \pi^+ \pi^- \rightarrow \pi^+ \pi^- \pi^0, \bar{p} p \rightarrow \pi^0 \pi^0 \pi^0, \pi^0 \eta \eta, \pi^0 \pi^0 \eta, \pi^+ \pi^- \pi^0, K^+ K^- \pi^0, K_S^0 K_S^0 \pi^0, K^+ K_S^0 \pi^-$ at rest, $\bar{p} n \rightarrow \pi^- \pi^- \pi^+, K_S^0 K^- \pi^0, K_S^0 K_S^0 \pi^-$ at rest.
- 17 Decaying to $f_0(1370) \pi \pi$.
- 18 Not seen by AMSLER 02.
- 19 Supersedes BARBERIS 99 and BARBERIS 99b.
- 20 T-matrix pole, assuming $J^P = 0^+$
- 21 No J^{PC} determination.
- 22 No J^{PC} determination, width not determined.
- 23 $J^P = 2^+$.
- 24 From a fit to the 0^+ partial wave.
- 25 No J^{PC} determination.
- 26 ALDE 92d combines all the GAMS-2000 data.
- 27 $J^P = 2^+$, superseded by FRENCH 99.
- 28 From an analysis ignoring interference with $f_2'(1525)$.
- 29 From an analysis including interference with $f_2'(1525)$.
- 30 Superseded by ALDE 92d.
- 31 Uses MRK3 data. From a partial-wave analysis of data using a K-matrix formalism with 5 poles, but assuming spin 2. Fit with constrained inelasticity.
- 32 $J^P = 2^+$ preferred.
- 33 From fit neglecting nearby $f_2'(1525)$. Replaced by BLOOM 83.
- 34 Superseded by LONGACRE 86.

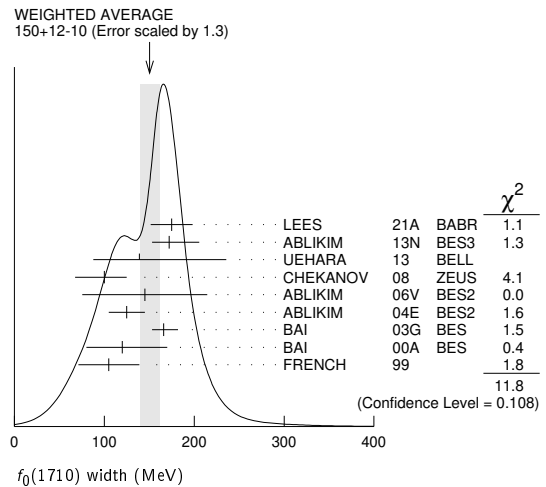

$f_0(1710)$ WIDTH

- 1 Breit-Wigner width.
- 2 From partial wave analysis including all possible combinations of $0^{++}, 2^{++}$, and 4^{++} resonances.
- 3 Spin 0 favored over spin 2.
- 4 In the SU(3) based model with a specific interference pattern of the $f_2(1270)$, $a_2'(1320)$, and $f_2'(1525)$ mesons incoherently added to the $f_0(1710)$ and non-resonant background.
- 5 $J^P = 0^+$, superseded by ARMSTRONG 89D.

Meson Particle Listings

$f_0(1710)$

- 6 T-matrix pole from coupled channel K-matrix fit to data on $J/\psi \rightarrow \gamma \pi^0 \pi^0$ (ABLIKIM 15AE) and $J/\psi \rightarrow \gamma K_S^0 K_S^0$ (ABLIKIM 18AA).
- 7 From partial wave analysis of $\omega \phi$ invariant mass including 0^{++} , 2^{++} , and 0^{-+} resonances.
- 8 Close-by state with mass 1765 ± 15 MeV and width 180 ± 20 MeV.
- 9 T-matrix pole.
- 10 T-matrix pole, 5 poles, 5 channels, including scattering data from HYAMS 75 ($\pi\pi$), LONGACRE 86 ($K\bar{K}$), BINON 83 ($\eta\eta$), and BINON 84C ($\eta\eta'$).
- 11 Not seen by LIU 09 in $B^\pm \rightarrow K^\pm \omega \phi$.
- 12 Systematic errors not estimated.
- 13 This state may be different from $f_0(1710)$, see CLOSE 05.
- 14 (Solution I)
- 15 K-matrix pole, assuming $J^P = 0^+$, from combined analysis of $\pi^- p \rightarrow \pi^0 \pi^0 n$, $\pi^- p \rightarrow K\bar{K}n$, $\pi^+ \pi^- \rightarrow \pi^+ \pi^-$, $\bar{p} p \rightarrow \pi^0 \pi^0 \pi^0$, $\pi^0 \eta\eta$, $\pi^0 \pi^0 \eta$, $\pi^+ \pi^- \pi^0$, $K^+ K^- \pi^0$, $K_S^0 K_S^0 \pi^0$, $K^+ K_S^0 \pi^-$ at rest, $\bar{p} n \rightarrow \pi^- \pi^- \pi^+$, $K_S^0 K^- \pi^0$, $K_S^0 K_S^0 \pi^-$ at rest.
- 16 Solution I.
- 17 Decaying to $f_0(1370) \pi \pi$.
- 18 $J^P = 0^+$.
- 19 Not seen by AMSLER 02.
- 20 Supersedes BARBERIS 99 and BARBERIS 99b.
- 21 T-matrix pole, assuming $J^P = 0^+$
- 22 No J^{PC} determination.
- 23 $J^P = 2^+$.
- 24 From a fit to the 0^+ partial wave.
- 25 No J^{PC} determination.
- 26 ALDE 92d combines all the GAMS-2000 data.
- 27 $J^P = 2^+$, (0^+ excluded).
- 28 From an analysis ignoring interference with $f_2'(1525)$.
- 29 From an analysis including interference with $f_2'(1525)$.
- 30 Uses MRK3 data. From a partial-wave analysis of data using a K-matrix formalism with 5 poles, but assuming spin 2. Fit with constrained inelasticity.
- 31 No J^{PC} determination.
- 32 $J^P = 2^+$ preferred.
- 33 From fit neglecting nearby $f_2'(1525)$. Replaced by BLOOM 83.
- 34 From an amplitude analysis of the $K_S^0 K_S^0$ system, superseded by LONGACRE 86.

$\eta(1760)$

$$J^G(J^{PC}) = 0^+(0^{-+})$$

OMITTED FROM SUMMARY TABLE

Seen by DM2 in the $\rho\rho$ system (BISELLO 89B). Structure in this region has been reported before in the same system (BALTRUSAITIS 86B) and in the $\omega\omega$ system (BALTRUSAITIS 85C, BISELLO 87).

- ¹ From a fit of the measured $\pi^+\pi^-\eta'$ lineshape that accounts for the abrupt distortion observed at the $p\bar{p}$ threshold through interference with a second previously unseen narrow resonance near 1870 MeV. The fit uses Breit-Wigner functions for the signal shapes and includes known backgrounds and contributors.
² From a fit to $\gamma\phi$ invariant mass. Angular analysis consistent with $J^{PC} = 0^{-+}$. Other J^{PC} not excluded.
³ Pole mass from a fit of the measured $\pi^+\pi^-\eta'$ lineshape to a Flatté formula that accounts for the abrupt distortion observed at the $p\bar{p}$ threshold; the fit also includes known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner function ($M \approx 1919$ MeV; $\Gamma \approx 51$ MeV) that is required for a good fit.
⁴ From the fit including final state interaction effects in isospin 0 S-wave according to SIBIRTEV 05A. Supersedes ABLIKIM 10G.
⁵ From a fit of the $\pi^+\pi^-\eta'$ mass distribution to a combination of $\gamma f_1(1510)$, $\gamma X(1835)$, and two states $\gamma X(2120)$ and $\gamma X(2370)$, for $M(\pi^+\pi^-\eta') < 2.8$ GeV, and accounting for backgrounds from non- η' events and $J/\psi \rightarrow \pi^0\pi^+\pi^-\eta'$.
⁶ The selected process is $J/\psi \rightarrow \omega\phi(980)\pi$. This state may be due also to $\eta_2(1870)$ or to a combination of $X(1835)$ and $\eta_2(1870)$.
⁷ From a fit of the $p\bar{p}$ mass distribution to a combination of $\gamma X(1835)$, γR with $M(R) = 2100$ MeV and $\Gamma(R) = 160$ MeV, and $\gamma p\bar{p}$ phase space, for $M(p\bar{p}) < 2.85$ GeV.
⁸ Evidence for a threshold enhancement in the $p\bar{p}$ mass spectrum was also reported by ABE 02K, AUBERT, B 05L, and WANG 05A in $B^+ \rightarrow p\bar{p}K^+$, WANG 05A in $B^0 \rightarrow p\bar{p}K_S^0$, ABE 02w in $\bar{B}^0 \rightarrow p\bar{p}D^0$, DEL-AMO-SANCHEZ 12 in $B \rightarrow D(D^*)p\bar{p}(\pi)$, and WEI 08 in $B^+ \rightarrow p\bar{p}\pi^+$ decays. Not seen by ATHAR 06 in $\Upsilon(1S) \rightarrow p\bar{p}$.
⁹ From the fit including final state interaction effects in isospin 0 S-wave according to SIBIRTEV 05A. Systematic errors not estimated.

6.7 ± 1.8	¹ ABLIKIM 15T	BES3	$J/\psi \rightarrow \gamma K_S^0 K_S^0 \eta$
¹ Using results from ABLIKIM 05R.			

$\Gamma(\eta'\pi^+\pi^-)/\Gamma_{\text{total}}$	Γ_2/Γ		
VALUE	DOCUMENT ID	TECN	COMMENT
seen	¹ ABLIKIM 16J	BES3	$J/\psi \rightarrow \gamma\pi^+\pi^-\eta'$

¹ ABLIKIM 16J quotes $B(J/\psi \rightarrow \gamma X(1835)) \times B(X(1835) \rightarrow \pi^+\pi^-\eta') = (3.93 \pm 0.38^{+0.31}_{-0.84}) \times 10^{-4}$ from a fit of the measured $\pi^+\pi^-\eta'$ lineshape that accounts for the abrupt distortion observed at the $p\bar{p}$ threshold with a Flatte formula in addition to known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner ($M \approx 1919$ MeV; $\Gamma \approx 51$ MeV) that is required for a good fit. Another explanation for the distortion provided by ABLIKIM 16J is that a second resonance near 1870 MeV interferes with the X(1835); fits to this possibility yield product branching fraction values compatible with that shown within the respective systematic uncertainties.

WEIGHTED AVERAGE
1936 ± 12 (Error scaled by 1.3)

$f_2(1950)$ mass (MeV)

- Decaying into $\pi^+ \pi^- 2\pi^0$.
- Decaying into $2(\pi^+ \pi^-)$.
- T-matrix pole from coupled channel K-matrix fit to data on $J/\psi \rightarrow \gamma \pi^0 \pi^0$ (ABLIKIM 15AE) and $J/\psi \rightarrow \gamma K_S^0 K_S^0$ (ABLIKIM 18AA).
- T-matrix pole, 4 poles, 4 channels, including scattering data from HYAMS 75 ($\pi\pi$), LONGACRE 86 ($K\bar{K}$), BINON 83 ($\eta\eta$).
- Taking into account $f_4(2050)$.
- First solution, PWA is ambiguous.
- T-matrix pole.
- From solution B of amplitude analysis of data on $\bar{p}p \rightarrow \pi\pi$. See however KLOET 96 who fit $\pi^+ \pi^-$ only and find waves only up to $J = 3$ to be important but not significantly resonant.

WEIGHTED AVERAGE 2018±11 (Error scaled by 2.1)

- From the first PWA solution.
- From a partial-wave analysis of the data.
- From an amplitude analysis of the reaction $\pi^+\pi^- \rightarrow 2\pi^0$.
- K matrix pole.
- Taking into account the $f_2(1950)$. Helicity-2 production favored.
- Energy-dependent analysis.
- Single energy analysis.
- From solution A of amplitude analysis of data on $\bar{p}p \rightarrow \pi\pi$. See however KLOET 96 who fit $\pi^+\pi^-$ only and find waves only up to $J = 3$ to be important but not significantly resonant.
- From solution B of amplitude analysis of data on $\bar{p}p \rightarrow \pi\pi$. See however KLOET 96 who fit $\pi^+\pi^-$ only and find waves only up to $J = 3$ to be important but not significantly resonant.
- $I(J^{PC}) = 0(4^+)$ from amplitude analysis assuming one-pion exchange.
- Width errors enlarged by us to $4\Gamma/\sqrt{N}$; see the note with the $K^*(892)$ mass.

~ 2150	⁸ DULUDE	78B	OSPK $1-2 \bar{p}p \rightarrow \pi^0 \pi^0$

⁵ OAKDEN 94 makes an amplitude analysis of LEAR data on $\bar{p}p \rightarrow \pi\pi$ using a method based on Barrelet zeros. This is solution A. The amplitude analysis of HASAN 94 includes earlier data as well, and assume that the data can be parametrized in terms of towers of nearly degenerate resonances on the leading Regge trajectory. See also KLOET 96 and MARTIN 97 who make related analyses.

⁶ From solution B of amplitude analysis of data on $\bar{p}p \rightarrow \pi\pi$.

⁷ $I(J^P) = 0(2^+)$ from simultaneous analysis of $p\bar{p} \rightarrow \pi^- \pi^+$ and $\pi^0 \pi^0$.

⁸ $I^G(J^P) = 0^+(2^+)$ from partial-wave amplitude analysis.

- From a fit to the cross section between 2.00 and 3.08 GeV with a coherent sum of Breit-Wigner amplitudes, including contributions from $\rho(770)$, $\rho(1450)$ and $\rho(1700)$. Could be another state.
- From a Breit-Wigner fit to the Born cross section, including an s -dependent continuum amplitude.
- Seen in $\psi(2S)$ decay with branching ratio $\psi(2S) \rightarrow X\eta \rightarrow K^+K^-\eta = (21.7 \pm 1.9^{+7.7}_{-8.3}) \times 10^{-6}$.
- From the fit to the BABAR data of LEES 13Q assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution. The resonance significance is 3.5 σ .
- From the fit to the BABAR data of LEES 13Q and BESIII data of ABLIKIM 19L assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution.
- Could also be another state. Seen in J/ψ decay with branching ratio $J/\psi \rightarrow X\pi^0 \rightarrow K^+K^-\pi^0 = (6.7 \pm 1.1^{+2.2}_{-1.8}) \times 10^{-6}$.
- The observed structure can be due to both the $\phi(2170)$ and $\rho(2150)$.
- Using the GOUNARIS 68 parametrization of the pion form factor leaving the masses and widths of the $\rho(1450)$, $\rho(1700)$, and $\rho(2150)$ resonances as free parameters of the fit.
- Includes ATKINSON 85.

1 Seen in $\psi(2S)$ decay with branching ratio $\psi(2S) \rightarrow X\eta \rightarrow K^+ K^- \eta = (1.9 \pm 0.4^{+0.5}_{-1.3}) \times 10^{-6}$.
 2 See however KLOET 96 who fit $\pi^+ \pi^-$ only and find waves only up to $J = 3$ to be important but not significantly resonant.
 3 $I(J^P) = 1(3^-)$ from simultaneous analysis of $p\bar{p} \rightarrow \pi^- \pi^+$ and $\pi^0 \pi^0$.
 4 $I = 0, 1$. $J^P = 3^-$ from Barrelet-zero analysis.
 5 $I(J^P) = 1(3^-)$ from amplitude analysis.

11 Seen in $\psi(2S)$ decay with branching ratio $\psi(2S) \rightarrow X\eta \rightarrow K^+ K^- \eta = (1.9 \pm 0.4^{+0.5}_{-1.3}) \times 10^{-6}$.
 12 See however KLOET 96 who fit $\pi^+ \pi^-$ only and find waves only up to $J = 3$ to be important but not significantly resonant.
 13 $I(J^P) = 1(3^-)$ from simultaneous analysis of $p\bar{p} \rightarrow \pi^- \pi^+$ and $\pi^0 \pi^0$.
 14 $I = 0, 1$. $J^P = 3^-$ from Barrelet-zero analysis.
 15 $I(J^P) = 1(3^-)$ from amplitude analysis.

CHARGED KAON MASS

Revised 1994 by T.G. Trippe (LBNL).

The average of the six charged kaon mass measurements which we use in the Particle Listings is

$$m_{K^\pm} = 493.677 \pm 0.013 \text{ MeV } (S = 2.4), \quad (1)$$

where the error has been increased by the scale factor S . The large scale factor indicates a serious disagreement between different input data. The average before scaling the error is

$$m_{K^\pm} = 493.677 \pm 0.005 \text{ MeV }, \quad (2)$$

$$\chi^2 = 22.9 \text{ for } 5 \text{ D.F.}, \text{ Prob. } = 0.04\%,$$

where the high χ^2 and correspondingly low χ^2 probability further quantify the disagreement.

The main disagreement is between the two most recent and precise results,

$$m_{K^\pm} = 493.696 \pm 0.007 \text{ MeV} \quad \text{DENISOV 91}$$

$$m_{K^\pm} = 493.636 \pm 0.011 \text{ MeV } (S = 1.5) \quad \text{GALL 88}$$

$$\text{Average} = 493.679 \pm 0.006 \text{ MeV}$$

$$\chi^2 = 21.2 \text{ for } 1 \text{ D.F.}, \text{ Prob. } = 0.0004\%, \quad (3)$$

both of which are measurements of x-ray energies from kaonic atoms. Comparing the average in Eq. (3) with the overall average in Eq. (2), it is clear that DENISOV 91 [1] and GALL 88 [2] dominate the overall average, and that their disagreement is responsible for most of the high χ^2 .

The GALL 88 measurement was made using four different kaonic atom transitions, $K^- \text{Pb } (9 \rightarrow 8)$, $K^- \text{Pb } (11 \rightarrow 10)$, $K^- \text{W } (9 \rightarrow 8)$, and $K^- \text{W } (11 \rightarrow 10)$. The m_{K^\pm} values they obtain from each of these transitions is shown in the Particle Listings and in Fig. 1. Their $K^- \text{Pb } (9 \rightarrow 8)$ m_{K^\pm} is below and somewhat inconsistent with their other three transitions. The average of their four measurements is

$$m_{K^\pm} = 493.636 \pm 0.007,$$

$$\chi^2 = 7.0 \text{ for } 3 \text{ D.F.}, \text{ Prob. } = 7.2\%. \quad (4)$$

This is a low but acceptable χ^2 probability so, to be conservative, GALL 88 scaled up the error on their average by $S=1.5$ to obtain their published error ± 0.011 shown in Eq. (3) above and used in the Particle Listings average.

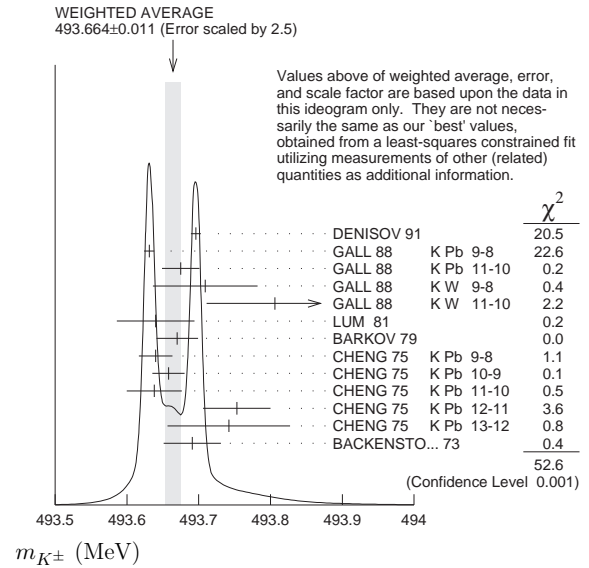

Figure 1: Ideogram of m_{K^\pm} mass measurements. GALL 88 and CHENG 75 measurements are shown separately for each transition they measured.

The ideogram in Fig. 1 shows that the DENISOV 91 measurement and the GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ measurement yield two well-separated peaks. One might suspect the GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ measurement since it is responsible both for the internal inconsistency in the GALL 88 measurements and the disagreement with DENISOV 91.

To see if the disagreement could result from a systematic problem with the $K^- \text{Pb } (9 \rightarrow 8)$ transition, we have separated the CHENG 75 [3] data, which also used $K^- \text{Pb}$, into its separate transitions. Figure 1 shows that the CHENG 75 and GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ values are consistent, suggesting the possibility of a common effect such as contaminant nuclear γ rays near the $K^- \text{Pb } (9 \rightarrow 8)$ transition energy, although the CHENG 75 errors are too large to make a strong conclusion. The average of all 13 measurements has a χ^2 of 52.6 as shown in Fig. 1 and the first line of Table 1, yielding an unacceptable χ^2 probability of 0.00005%. The second line of Table 1 excludes both the GALL 88 and CHENG 75 measurements of the $K^- \text{Pb } (9 \rightarrow 8)$ transition and yields a χ^2 probability of 43%. The third [fourth] line of Table 1 excludes only the GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ [DENISOV 91] measurement and yields a χ^2 probability of 20% [8.6%]. Table 1 shows that removing both measurements of the $K^- \text{Pb } (9 \rightarrow 8)$ transition produces the most consistent set of data, but that excluding only the GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ transition or DENISOV 91 also produces acceptable probabilities.

Meson Particle Listings

 K^\pm **Table 1:** m_{K^\pm} averages for some combinations of Fig. 1 data.

m_{K^\pm} (MeV)	χ^2	D.F.	Prob. (%)	Measurements used
493.664 ± 0.004	52.6	12	0.00005	all 13 measurements
493.690 ± 0.006	10.1	10	43	no K^- Pb(9→8)
493.687 ± 0.006	14.6	11	20	no GALL 88 K^- Pb(9→8)
493.642 ± 0.006	17.8	11	8.6	no DENISOV 91

Yu.M. Ivanov, representing DENISOV 91, has estimated corrections needed for the older experiments because of improved ^{192}Ir and ^{198}Au calibration γ -ray energies. He estimates that CHENG 75 and BACKENSTOSS 73 [4] m_{K^\pm} values could be raised by about 15 keV and 22 keV, respectively. With these estimated corrections, Table 1 becomes Table 2. The last line of Table 2 shows that if such corrections are assumed, then GALL 88 K^- Pb (9 → 8) is inconsistent with the rest of the data even when DENISOV 91 is excluded. Yu.M. Ivanov warns that these are rough estimates. Accordingly, we do not use Table 2 to reject the GALL 88 K^- Pb (9 → 8) transition, but we note that a future reanalysis of the CHENG 75 data could be useful because it might provide supporting evidence for such a rejection.

Table 2: m_{K^\pm} averages for some combinations of Fig. 1 data after raising CHENG 75 and BACKENSTOSS 73 values by 0.015 and 0.022 MeV respectively.

m_{K^\pm} (MeV)	χ^2	D.F.	Prob. (%)	Measurements used
493.666 ± 0.004	53.9	12	0.00003	all 13 measurements
493.693 ± 0.006	9.0	10	53	no K^- Pb(9→8)
493.690 ± 0.006	11.5	11	40	no GALL 88 K^- Pb(9→8)
493.645 ± 0.006	23.0	11	1.8	no DENISOV 91

The GALL 88 measurement uses a Ge semiconductor spectrometer which has a resolution of about 1 keV, so they run the risk of some contaminant nuclear γ rays. Studies of γ rays following stopped π^- and Σ^- absorption in nuclei (unpublished) do not show any evidence for contaminants according to GALL 88 spokesperson, B.L. Roberts. The DENISOV 91 measurement uses a crystal diffraction spectrometer with a resolution of 6.3 eV for radiation at 22.1 keV to measure the 4f-3d transition in K^- ^{12}C . The high resolution and the light nucleus reduce the probability for overlap by contaminant γ rays, compared with the measurement of GALL 88. The DENISOV 91 measurement is supported by their high-precision measurement of the 4d-2p transition energy in π^- ^{12}C , which is good agreement with the calculated energy.

While we suspect that the GALL 88 K^- Pb (9 → 8) measurements could be the problem, we are unable to find clear grounds for rejecting it. Therefore, we retain their measurement in the average and accept the large scale factor until further information can be obtained from new measurements and/or from reanalysis of GALL 88 and CHENG 75 data.

We thank B.L. Roberts (Boston Univ.) and Yu.M. Ivanov (Petersburg Nuclear Physics Inst.) for their extensive help in understanding this problem.

 493.677 ± 0.013 (Error scaled by 2.4)

¹ Error increased from 0.0059 based on the error analysis in IVANOV 92.

² This value is the authors' combination of all of the separate transitions listed for this paper.

³ The CHENG 75 values for separate transitions were calculated from their Table 7 transition energies. The first error includes a 20% systematic error in the noncircular contaminant shift. The second error is due to a ± 5 eV uncertainty in the theoretical transition energies.

 $m_{K^+} - m_{K^-}$

Test of CPT.

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	CHG
-0.032 ± 0.090	1.5M	¹ FORD	72	ASPK ±

¹ FORD 72 uses $m_{\pi^+} - m_{\pi^-} = +28 \pm 70$ keV.

WEIGHTED AVERAGE
1.2379 ± 0.0021 (Error scaled by 1.9)

Values above of weighted average, error, and scale factor are based upon the data in this ideogram only. They are not necessarily the same as our 'best' values, obtained from a least-squares constrained fit utilizing measurements of other (related) quantities as additional information.

¹ Result obtained by averaging the decay length and decay time analyses taking correlations into account.
² KOPTEV 95 report this weighted average of their U-target and Cu-target results, where they have weighted by 1/σ rather than 1/σ².

$$(\tau_{K^+} - \tau_{K^-}) / \tau_{\text{average}}$$

This quantity is a measure of CPT invariance in weak interactions.

Γ ₄₉ π ⁰ e ⁺ νℓ	L	< 3 × 10 ⁻³	CL=90%
Γ ₅₀ π ⁺ γ	[g]	< 2.3 × 10 ⁻⁹	CL=90%

- [a] See the Particle Listings below for the energy limits used in this measurement.
- [b] Most of this radiative mode, the low-momentum γ part, is also included in the parent mode listed without γ's.
- [c] Structure-dependent part.
- [d] See the review on "Form Factors for Radiative Pion and Kaon Decays" for definitions and details.
- [e] Direct-emission branching fraction.
- [f] Derived from an analysis of neutrino-oscillation experiments.
- [g] Violates angular-momentum conservation.

CONSTRAINED FIT INFORMATION

An overall fit to the mean life, a decay rate, and 15 branching ratios uses 35 measurements and one constraint to determine 8 parameters. The overall fit has a χ² = 53.4 for 28 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients ⟨δp_iδp_j⟩/(δp_iδp_j), in percent, from the fit to parameters p_i, including the branching fractions, x_i ≡ Γ_i/Γ_{total}. The fit constrains the x_i whose labels appear in this array to sum to one.

5.83 ± 0.63	269	ELY	69	HLBC +

¹ BATLEY 12 uses data collected in 2003–2004. The result is inclusive of $K^\pm \rightarrow \pi^+ \pi^- e^\pm \nu \gamma$ decays. Using PDG 12 value for $\Gamma(\pi^+ \pi^- \pi^+) / \Gamma = (5.59 \pm 0.04) \times 10^{-2}$.
 BATLEY 12 obtains $B(\pi^+ \pi^- e \nu) = (4.257 \pm 0.004 \pm 0.035) \times 10^{-5}$ where the syst. error is dominated by the error on the normalization mode.
² PISLAK 01 reports $\Gamma(\pi^+ \pi^- e^+ \nu_e) / \Gamma_{total} = (4.109 \pm 0.008 \pm 0.110) \times 10^{-5}$ using the PDG 00 value $\Gamma(\pi^+ \pi^+ \pi^-) / \Gamma_{total} = (5.59 \pm 0.05) \times 10^{-2}$. We divide by the PDG value and unfold its error from the systematic error. PISLAK 03 and PISLAK 10A give additional details on the branching ratio measurement and give improved errors on the S-wave π - π scattering length: $a_0^0 = 0.235 \pm 0.013$ and $a_0^2 = -0.0410 \pm 0.0027$.

Hadronic modes with photons

$\Gamma(\pi^+ \pi^0 \gamma (\text{INT})) / \Gamma_{\text{total}}$ Γ_{21} / Γ
 The $K^+ \rightarrow \pi^+ \pi^0 \gamma$ differential decay rate can be described in terms of T_{π^+} , the charged pion kinetic energy, and $W^2 = (P_{K^+} \cdot P_\gamma) (P_{\pi^+} \cdot P_\gamma) / (m_K m_\pi)^2$; then we can write $d^2\Gamma(K^+ \rightarrow \pi^+ \pi^0 \gamma) / (dT_{\pi^+} dW^2) = d^2\Gamma(K^+ \rightarrow \pi^+ \pi^0 \gamma)_{IB} / (dT_{\pi^+} dW^2) [1 + 2 \cos(\pm\phi + \delta_1^+ - \delta_2^+) m_\pi^2 m_K^2 W^2 X_E + m_\pi^4 m_K^4 (X_E^2 + X_M^2) W^4]$. The IB differential and total branching ratios are expressed in terms of the non-radiative experimental width $\Gamma(K^+ \rightarrow \pi^+ \pi^0)$ by Low's theorem. Using PDG 10 $B(K^+ \rightarrow \pi^+ \pi^0) = 0.2066 \pm 0.0008$, one obtains respectively $B(K^+ \rightarrow \pi^+ \pi^0 \gamma)_{IB} (55 < T_{\pi^+} < 90 \text{ MeV}) = 2.55 \times 10^{-4}$ and $B(K^+ \rightarrow \pi^+ \pi^0 \gamma)_{IB} (0 < T_{\pi^+} < 80 \text{ MeV}) = 1.80 \times 10^{-4}$. Fitting respectively the piece proportional to W^2 and the piece proportional to W^4 , the interference contribution (INT), proportional to X_E , and the direct contribution (DE) proportional to $X_E^2 + X_M^2$ are extracted.

 < 500 90 0 KLEMS 71 OSPK + $T_\pi < 117 \text{ MeV}$
 -100 ± 600 CHEN 68 OSPK + T_π 60-90 MeV

¹ LAZZERONI 14 combines NA62 and NA48/2 results. The result for the full kinematic range is extrapolated from the model-independent branching fraction $(9.65 \pm 0.61 \pm 0.14) \times 10^{-7}$ for $(m_{\gamma\gamma}/m_K)^2 > 0.2$. The measured ChPT parameter $\tilde{c} = 1.86 \pm 0.25$.

² KITCHING 97 is extrapolated from their model-independent branching fraction $(6.0 \pm 1.5 \pm 0.7) \times 10^{-7}$ for $100 \text{ MeV}/c < P_{\pi^+} < 180 \text{ MeV}/c$ using Chiral Perturbation Theory.

³ BATLEY 14 uses data collected in 2003 and 2004. Branching ratio is obtained by determining the parameter $\tilde{c} = 1.41 \pm 0.38 \pm 0.11$ and integrating the $O(p^6)$ chiral spectrum. A model independent value for the branching ratio is also obtained $(8.77 \pm 0.87 \pm 0.17) \times 10^{-7}$ for kinematic range $(m_{\gamma\gamma}/m_K)^2 > 0.2$.

⁴ ARTAMONOV 05 limit assumes ChPT with $\tilde{c} = 1.8$ with unitarity corrections. With $\tilde{c} = 1.6$ and no unitarity corrections they obtain $< 2.3 \times 10^{-8}$ at 90% CL. This partial branching ratio is predicted to be 6.10×10^{-9} and 0.49×10^{-9} for the cases with and without unitarity correction.

WEIGHTED AVERAGE
9.4 ± 0.6 (Error scaled by 2.6)

¹ BATLEY 11A also studies the form factor $f(z)$ dependence of the decay, described via single photon exchange: i) assuming a linear form factor, $f(z) = f_0(1 + \delta z)$, $z = (M_{\mu\mu}/m_K)^2$, finding $f_0 = 0.470 \pm 0.040$ and $\delta = 3.11 \pm 0.57$ and ii) assuming a linear

form factor including $\pi\text{-}\pi$ rescattering, $W_{\pi\pi}$, as in DAMBROSIO 98A, finding $f(z) = G_F m_K^2 (a_+ + b_+ z) + W_{\pi\pi}(z)$, $a_+ = -0.575 \pm 0.039$, $b_+ = -0.813 \pm 0.145$.
² PARK 02 “±” result comes from combining $K^+ \rightarrow \pi^+ \mu^+ \mu^-$ and $K^- \rightarrow \pi^- \mu^+ \mu^-$, assuming CP is conserved.
³ MA 00 establishes vector nature of this decay and determines form factor $f(z) = f_0(1 + \delta z)$, $z = (M_{\mu\mu}/m_K)^2$, $\delta = 2.45^{+1.30}_{-0.95}$.
⁴ ADLER 97c gives systematic error 0.7×10^{-8} and theoretical uncertainty 0.6×10^{-8} , which we combine in quadrature to obtain our second error.

¹ CORTINA-GIL 21B analysis of the NA62 data taken in 2016–2018 observed 20 candidate events with an expected background of 7 events. The achieved single event sensitivity is $(0.839 \pm 0.054) \times 10^{-11}$. The quoted branching ratio includes result from CORTINA-GIL 20c which observed two candidate events. This provides evidence for the very rare $K^+ \rightarrow \pi^+ \nu \bar{\nu}$ decay, observed with a significance of 3.4σ . Search for a feebly interacting scalar or pseudo-scalar particle X in the decay $K^+ \rightarrow \pi^+ X$ was performed and an upper limit from $< 3 \times 10^{-11}$ to $< 6 \times 10^{-11}$ at the 90% C.L. was set for an invisible particle with a mass of 0–110 MeV/c² and $< 1 \times 10^{-11}$ for mass of 160–260 MeV/c².
² Value obtained combining ANISIMOVSKY 04, ADLER 04, and the present ARTAMONOV 08 results.
³ CORTINA-GIL 20c analysis of the NA62 data taken in 2017 observed two candidate events with an expected background of 1.5 events. The achieved single event sensitivity is $(0.389 \pm 0.024) \times 10^{-10}$. The quoted branching ratio includes result from CORTINA-GIL 19b which observed one candidate event. The corresponding upper limit $B(K^+ \rightarrow \pi^+ \nu \bar{\nu}) < 1.78 \times 10^{-10}$ at 90% C.L. Superseded by CORTINA-GIL 21B.
⁴ Based on a sample of 1.21×10^{11} K^+ decays collected in 2016. One signal candidate is observed while the expected background is 0.152 events. The single-event-sensitivity is estimated to be 3.15×10^{-10} .
⁵ Observed 3 events with an estimated background of $0.93 \pm 0.17^{+0.32}_{-0.24}$. Signal-to-background ratio for each of these 3 events is 0.20, 0.42, and 0.47.
⁶ Value obtained combining the previous result ADLER 02c with 1 event and the present result with 0 events to obtain an expected background 1.22 ± 0.24 events and 1 event observed.
⁷ Value obtained combining the previous E787 result ADLER 02 with 2 events and the present E949 with 1 event. The additional event has a signal-to-background ratio 0.9. Superseded by ARTAMONOV 08.
⁸ Superseded by ADLER 04.
⁹ Combining ATIYA 93 and ATIYA 93B results. Superseded by ADLER 96.

DALITZ PLOT PARAMETERS FOR $K \rightarrow 3\pi$ DECAYS

Revised 1999 by T.G. Trippe (LBNL).

The Dalitz plot distribution for $K^\pm \rightarrow \pi^\pm \pi^\pm \pi^\mp$, $K^\pm \rightarrow \pi^0 \pi^0 \pi^\pm$, and $K_L^0 \rightarrow \pi^+ \pi^- \pi^0$ can be parameterized by a series expansion such as that introduced by Weinberg [1]. We use the form

$$\begin{aligned} |M|^2 &\propto 1 + g \frac{(s_3 - s_0)}{m_{\pi^+}^2} + h \left[\frac{s_3 - s_0}{m_{\pi^+}^2} \right]^2 \\ &+ j \frac{(s_2 - s_1)}{m_{\pi^+}^2} + k \left[\frac{s_2 - s_1}{m_{\pi^+}^2} \right]^2 \\ &+ f \frac{(s_2 - s_1)(s_3 - s_0)}{m_{\pi^+}^2} + \dots, \end{aligned} \quad (1)$$

where $m_{\pi^+}^2$ has been introduced to make the coefficients g , h , j , and k dimensionless, and

$$s_i = (P_K - P_i)^2 = (m_K - m_i)^2 - 2m_K T_i, \quad i = 1, 2, 3,$$

$$s_0 = \frac{1}{3} \sum_i s_i = \frac{1}{3} (m_K^2 + m_1^2 + m_2^2 + m_3^2).$$

Here the P_i are four-vectors, m_i and T_i are the mass and kinetic energy of the i^{th} pion, and the index 3 is used for the odd pion.

The coefficient g is a measure of the slope in the variable s_3 (or T_3) of the Dalitz plot, while h and k measure the quadratic dependence on s_3 and $(s_2 - s_1)$, respectively. The coefficient j is related to the asymmetry of the plot and must be zero if CP invariance holds. Note also that if CP is good, g , h , and k must be the same for $K^+ \rightarrow \pi^+ \pi^+ \pi^-$ as for $K^- \rightarrow \pi^- \pi^- \pi^+$.

Since different experiments use different forms for $|M|^2$, in order to compare the experiments we have converted to g , h , j , and k whatever coefficients have been measured. Where such conversions have been done, the measured coefficient a_y , a_t , a_u , or a_v is given in the comment at the right. For definitions of these coefficients, details of this conversion, and discussion of the data, see the April 1982 version of this note [2].

¹ BATLEY 07E includes data from BATLEY 06A. Uses quadratic parametrization and PDG 06 value $g = 0.626 \pm 0.007$ to obtain $g_+ - g_- = (2.2 \pm 2.1 \pm 0.7) \times 10^{-4}$. Neglects any possible charge asymmetries in higher order slope parameters h or k .
² Asymmetry obtained assuming that $g_+ + g_- = 2 \times 0.652$ (PDG 02) and that asymmetries in h and k are zero.
³ Linear and quadratic slopes from PDG 04 are used. Any possible charge asymmetries in higher order slope parameters h or k are neglected.

ALTERNATIVE PARAMETRIZATIONS OF $K^\pm \rightarrow \pi^\pm \pi^0 \pi^0$ DALITZ PLOT

The following functional form for the matrix element suggested by $\pi\pi$ rescattering in $K^+ \rightarrow \pi^+ \pi^+ \pi^- \pi^0 \rightarrow \pi^+ \pi^0 \pi^0$ is used for this fit (CABIBBO 04A, CABIBBO 05): Matrix element = $M_0 + M_1$ where $M_0 = 1 + (1/2)g_0 u + (1/2)h' u^2 + (1/2)k_0 v^2$ with $u = (s_3 - s_0)/(m_{\pi^+})^2$, $v = (s_2 - s_1)/(m_{\pi^+})^2$ and where M_1 takes into account the non-analytic piece due to $\pi\pi$ rescattering amplitudes a_0 and a_2 ; The parameters g_0 and h' are related to the parameters g and h of the matrix element squared given in the previous section by the approximations $g_0 \sim g^{PDG}$ and $h' \sim h^{PDG} - (g/2)^2$ and $k_0 \sim k^{PDG}$.

In addition, we also consider the effective field theory framework of COLANGELO 06A and BISSEGGER 09 to extract g_{BB} and h'_{BB} .

$K_{\frac{2}{3}}^\pm$ FORM FACTORS

In the form factor comments, the following symbols are used.

f_+ and f_- are form factors for the vector matrix element.

f_S and f_T refer to the scalar and tensor term.

$$f_0 = f_+ + f_- t / (m_{K^\pm}^2 - m_{\pi^0}^2)$$

t = momentum transfer to the π .

λ_+ and λ_0 are the linear expansion coefficients of f_+ and f_0 :

$$f_+(t) = f_+(0) (1 + \lambda_+ t / m_{\pi^+}^2)$$

For quadratic expansion

$$f_+(t) = f_+(0) (1 + \lambda_+ t / m_{\pi^+}^2 + \frac{\lambda_+''}{2} t^2 / m_{\pi^+}^4)$$

as used by KTeV. If there is a non-vanishing quadratic term, then λ_+ represents an average slope, which is then different from λ_+' .

NA48/2 and OKA quadratic expansion coefficients are converted with

$$\lambda_+' PDG = \lambda_+' NA48/2 \text{ and } \lambda_+'' PDG = 2 \lambda_+'' NA48/2$$

$$\lambda_+' PDG = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_+' OKA \text{ and}$$

$$\lambda_+'' PDG = 2 (\frac{m_{\pi^+}}{m_{\pi^0}})^4 \lambda_+'' OKA$$

OKA linear expansion coefficients are converted with

$$\lambda_+ PDG = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_+ OKA \text{ and } \lambda_0 PDG = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_0 OKA$$

The pole parametrization is

$$f_+(t) = f_+(0) (\frac{M_V^2}{M_V^2 - t})$$

$$f_0(t) = f_0(0) (\frac{M_S^2}{M_S^2 - t})$$

where M_V and M_S are the vector and scalar pole masses.

The following abbreviations are used:

DP = Dalitz plot analysis.

PI = π spectrum analysis.

MU = μ spectrum analysis.

POL = μ polarization analysis.

BR = $K_{\frac{2}{3}}^\pm / K_{e3}^\pm$ branching ratio analysis.

E = positron or electron spectrum analysis.

RC = radiative corrections.

For previous λ_+' and λ_+'' parametrizations used by NA48 (e.g. LAI 07A) and ISTR (e.g. YUSHCHENKO 04B) see PDG 18.

 K^\pm λ_+ (LINEAR ENERGY DEPENDENCE OF f_+ IN K_{e3}^\pm DECAY)

These results are for a linear expansion only. See the next section for fits including a quadratic term. For radiative correction of the K_{e3}^\pm Dalitz plot, see GINSBERG 67, BECHERRAWY 70, CIRIGLIANO 02, CIRIGLIANO 04, and ANDRE 07. Results labeled OUR FIT are discussed in the review “ K_{e3}^\pm and $K_{\mu 3}^0$ Form Factors” above. For earlier, lower statistics results, see the 2004 edition of this review, Physics Letters **B592** 1 (2004).

 K_{24}^\pm FORM FACTORS

Based on the parametrizations of AMOROS 99, the K_{24}^\pm form factors can be expressed as

$$F_S = f_S + f'_S q^2 + f''_S q^4 + f'_e S_e / 4m_\pi^2$$

$$F_P = f_P$$

$$G_P = g_P + g'_P q^2$$

$$H_P = h_P$$

where $q^2 = (S_\pi / 4m_\pi^2) - 1$, S_π is the invariant mass squared of the dipion, and S_e is the invariant mass squared of the dilepton.

$86.8 \pm 1.0 \pm 1.0$	1.13M	¹ BATLEY	10c	NA48 ±
••• We do not use the following data for averages, fits, limits, etc. •••				
$87.3 \pm 1.3 \pm 1.2$	670k	² BATLEY	08A	NA48 ±
$80.9 \pm 0.9 \pm 1.2$	400k	³ PISLAK	03	B865 ±

¹Radiative corrections included. Using Roy equations and including isospin breaking, BATLEY 10c obtains the following scattering lengths $a_0^0 = 0.2220 \pm 0.0128 \pm 0.0050 \pm 0.0037$ (theor.), $a_0^2 = -0.0432 \pm 0.0086 \pm 0.0034 \pm 0.0028$ (theor.). Supersedes BATLEY 08A. The correlation with $g'_P/f_S = -0.914$. Supersedes BATLEY 08A.

²Radiative corrections included. Using Roy equations and not including isospin breaking, BATLEY 08A obtains the following $\pi\pi$ scattering length $a_0^0 = 0.233 \pm 0.016 \pm 0.007$ and $a_0^2 = -0.0471 \pm 0.011 \pm 0.004$.

³Radiative corrections included. Using Roy equations PISLAK 03 obtains the following scattering lengths $a_0^0 = 0.203 \pm 0.033 \pm 0.004$, $a_0^2 = -0.055 \pm 0.023 \pm 0.003$.

DECAY FORM FACTOR FOR $K^\pm \rightarrow \pi^0 \pi^0 e^\pm \nu$

Given in BOLOTOV 86B, BARMIN 88B, and SHIMIZU 04.

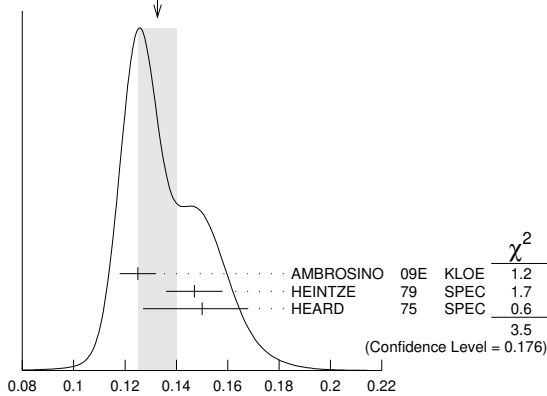

$K^\pm \rightarrow \ell^\pm \nu \gamma$ FORM FACTORS

For definitions of the axial-vector F_A and vector F_V form factor, see the "Note on $\pi^\pm \rightarrow \ell^\pm \nu \gamma$ and $K^\pm \rightarrow \ell^\pm \nu \gamma$ Form Factors" in the π^\pm section. In the kaon literature, often different definitions $a_K = F_A/m_K$ and $v_K = F_V/m_K$ are used.

$F_A + F_V$, SUM OF AXIAL-VECTOR AND VECTOR FORM FACTOR FOR $K \rightarrow e\nu\gamma$

VALUE	EVTS	DOCUMENT ID	TECN	COMMENT
0.133 ± 0.008 OUR AVERAGE				Error includes scale factor of 1.3. See the ideogram below.

$F_A + F_V$, SUM OF AXIAL-VECTOR AND VECTOR FORM FACTOR FOR $K \rightarrow e\nu\gamma$

¹ AMBROSINO 09E measures the absolute value $|F_A + F_V|$ which is parametrized as $|F_A + F_V| = F_V (1 + \lambda(1-x)) + F_A$, $x = 2E_\gamma/m_K$. ($F_A + F_V$) and λ are fit parameters. The fitted value of $\lambda = 0.38 \pm 0.20 \pm 0.02$ with a correlation of -0.93 between ($F_A + F_V$) and λ .

² HEINTZE 79 quotes absolute value of $|F_A + F_V| \sin\theta_C$. We use $\sin\theta_C = V_{us} = 0.2205$.

³ HEARD 75 quotes absolute value of $|F_A + F_V| \sin\theta_C$. We use $\sin\theta_C = V_{us} = 0.2205$.

T-VIOLATION PARAMETER IN $K^0\text{-}\bar{K}^0$ MIXING

The asymmetry $A_T = \frac{\Gamma(\bar{K}^0 \rightarrow K^0) - \Gamma(K^0 \rightarrow \bar{K}^0)}{\Gamma(\bar{K}^0 \rightarrow K^0) + \Gamma(K^0 \rightarrow \bar{K}^0)}$ must vanish if T invariance holds.

ASYMMETRY A_T IN $K^0\text{-}\bar{K}^0$ MIXING

VALUE (units 10^{-3})	EVTS	DOCUMENT ID	TECN
6.6 ± 1.3 ± 1.0	640k	¹ ANGELOPO... 98E	CPLR

¹ ANGELOPOULOS 98E measures the asymmetry $A_T = [\Gamma(\bar{K}^0_{t=0} \rightarrow e^+ \pi^- \nu_{t=\tau}) - \Gamma(K^0_{t=0} \rightarrow e^- \pi^+ \bar{\nu}_{t=\tau})] / [\Gamma(\bar{K}^0_{t=0} \rightarrow e^+ \pi^- \nu_{t=\tau}) + \Gamma(K^0_{t=0} \rightarrow e^- \pi^+ \bar{\nu}_{t=\tau})]$ as a function of the neutral-kaon eigentime τ . The initial strangeness of the neutral kaon is tagged by the charge of the accompanying charged kaon in the reactions $p\bar{p} \rightarrow K^- \pi^+ K^0$ and $p\bar{p} \rightarrow K^+ \pi^- \bar{K}^0$. The strangeness at the time of the decay is tagged by the lepton charge. The reported result is the average value of A_T over the interval $1\tau_S < \tau < 20\tau_S$. From this value of A_T ANGELOPOULOS 01B, assuming CP invariance in the $e\nu$ decay amplitude, determine the T -violating as $\Delta S = \Delta S$ conserving parameter (for its definition, see Review below) $4\text{Re}(\epsilon) = (6.2 \pm 1.4 \pm 1.0) \times 10^{-3}$.

See the related review(s):

[CPT Invariance Tests in Neutral Kaon Decay](#)

CP-VIOLATION PARAMETERS

Re(ϵ)

VALUE (units 10^{-3})	DOCUMENT ID	TECN
1.596 ± 0.013	¹ AMBROSINO 06H	KLOE

• • • We do not use the following data for averages, fits, limits, etc. • • •

1.664 ± 0.010	² LAI 05A	NA48
---------------	----------------------	------

¹ AMBROSINO 06H uses Bell-Steinberger relations with the following measurements: $B(K_L^0 \rightarrow \pi^+ \pi^-)$ in AMBROSINO 06F, $B(K_S^0 \rightarrow \pi^0 \pi^0 \pi^0)$ in AMBROSINO 05B, the K_S^0 -semileptonic charge asymmetry in AMBROSINO 06E, and K^0 -semileptonic results in ANGELOPOULOS 98F.

² LAI 05A values are obtained through unitarity (Bell-Steinberger relations), improving determination of η_{000} and combining other data from PDG 04 and APOSTOLAKIS 99B.

CPT-VIOLATION PARAMETERS

In $K^0\text{-}\bar{K}^0$ mixing, if CP -violating interactions include a T conserving part then

$$|K_S\rangle = [|K_1\rangle + (\epsilon + \delta)|K_2\rangle] / \sqrt{1 + |\epsilon + \delta|^2}$$

$$|K_L\rangle = [|K_2\rangle + (\epsilon - \delta)|K_1\rangle] / \sqrt{1 + |\epsilon - \delta|^2}$$

where

$$|K_1\rangle = [|K^0\rangle + |\bar{K}^0\rangle] / \sqrt{2}$$

$$|K_2\rangle = [|K^0\rangle - |\bar{K}^0\rangle] / \sqrt{2}$$

and

$$|\bar{K}^0\rangle = CP|K^0\rangle.$$

The parameter δ specifies the CP -violating part.

Estimates of δ are given below assuming the validity of the $\Delta S = \Delta Q$ rule. See also THOMSON 95 for a test of CP -symmetry conservation in K^0 decays using the Bell-Steinberger relation.

REAL PART OF δ

A nonzero value violates CP invariance.

Meson Particle Listings

K^0, K_S^0

Re(y)

A non-zero value would violate CPT invariance in $\Delta S = \Delta Q$ amplitude. $Re(y)$ is the following combination of K_{e3} decay amplitudes:

$$Re(y) = Re\left(\frac{A(K^0 \rightarrow e^- \pi^+ \bar{\nu}_e) - A(K^0 \rightarrow e^+ \pi^- \nu_e)}{A(K^0 \rightarrow e^- \pi^+ \bar{\nu}_e) + A(K^0 \rightarrow e^+ \pi^- \nu_e)}\right)$$

VALUE (units 10^{-3})	EVTS	DOCUMENT ID	TECN
0.4 ± 2.5	13k	1 AMBROSINO 06E	KLOE
0.3 ± 3.1		2 APOSTOLA... 99B	CPLR

- We do not use the following data for averages, fits, limits, etc. •••
- 1 They use the PDG 04 for the K_L^0 semileptonic charge asymmetry and PDG 04 (CP review, CPT NOT ASSUMED) for $Re(\epsilon)$.
- 2 Constrained by Bell-Steinberger (or unitarity) relation.

Re(x₋)

A non-zero value would violate CPT invariance in decay amplitudes with $\Delta S \neq \Delta Q$. x_{-} , used here to define $Re(x_{-})$, and x_{+} , used below in the $\Delta S = \Delta Q$ section are the following combinations of K_{e3} decay amplitudes:

$$x_{\pm} = \frac{1}{2} \left(\frac{A(K^0 \rightarrow \pi^+ e^- \nu_e)}{A(K^0 \rightarrow \pi^- e^+ \bar{\nu}_e)} \pm \frac{A(K^0 \rightarrow \pi^+ e^- \bar{\nu}_e)}{A(K^0 \rightarrow \pi^- e^+ \nu_e)} \right)$$

- 1 The two ABOUZAID 11 values use the same full KTeV dataset from 1996, 1997, and 1999. The first enters the "assuming CP^T " fit and the second enters the "not assuming CP^T " fit.
- 2 ABOUZAID 11 fit has Δm , τ_S , ϕ_e , $Re(\epsilon'/\epsilon)$, and $Im(\epsilon'/\epsilon)$ as free parameters. See $Im(\epsilon'/\epsilon)$ in the " K_L^0 CP violation" section for correlation information.
- 3 ABOUZAID 11 fit has Δm and τ_S free but constrains ϕ_e to the Superweak value, i.e. assumes CP^T . This τ_S value is correlated with their $\Delta m = m_{K_L^0} - m_{K_S^0}$ measurement in the K_L^0 listings. The correlation coefficient $\rho(\tau_S, \Delta m) = -0.670$.
- 4 Fit to the proper time distribution.
- 5 This ALAVI-HARATI 03 fit has Δm and τ_S free but constrains ϕ_{+-} to the Superweak value, i.e. assumes CPT . This τ_S value is correlated with their $\Delta m = m_{K_L^0} - m_{K_S^0}$ measurement in the K_L^0 listings. The correlation coefficient $\rho(\tau_S, \Delta m) = -0.396$. Superseded by ABOUZAID 11.
- 6 This ALAVI-HARATI 03 fit has Δm , ϕ_{+-} , and τ_{KS} free. See ϕ_{+-} in the " K_L CP violation" section for correlation information. Superseded by ABOUZAID 11.
- 7 ARONSON 82 find that K_S^0 mean life may depend on the kaon energy.
- 8 CARITHERS 75 measures the Δm dependence of the total decay rate (inverse mean life) to be $\Gamma(K_S^0) = [(1.122 \pm 0.004) + 0.16(\Delta m - 0.5348)/\Delta m] 10^{10} /s$, or, in terms of mean life, CARITHERS 75 measures $\tau_S = (0.8913 \pm 0.0032) - 0.238 [\Delta m - 0.5348] (10^{-10} \text{ s})$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ } \hbar \text{ s}^{-1})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.

Meson Particle Listings

 K_S^0

⁹HILL 68 has been changed by the authors from the published value (0.865 ± 0.009) because of a correction in the shift due to η_{+-} . SKJEGGESTAD 72 and HILL 68 give detailed discussions of systematics encountered in this type of experiment.
¹⁰Pre-1971 experiments are excluded from the average because of disagreement with later more precise experiments.

Γ_{14}	$\pi^0 \mu^+ \mu^-$	S1	$(2.9 \pm_{-1.2}^{+1.5})$	$\times 10^{-9}$	

[a] See the Particle Listings below for the energy limits used in this measurement.

[b] Most of this radiative mode, the low-momentum γ part, is also included in the parent mode listed without γ 's.

[c] The value is for the sum of the charge states or particle/antiparticle states indicated.

[d] Not a measurement. Calculated as $0.666 \cdot B(\pi^\pm e^\mp \nu_e)$.

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 5 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 0.1$ for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

4.1 $\pm_{-1.9}^{+2.5}$		⁴ ADLER	96E	CPLR Sup. by ADLER 97b
3.9 $\pm_{-1.8}^{+5.4}$		⁵ THOMSON	94	E621 Sup. by ZOU 96

¹BATLEY 05 is obtained by measuring the interference parameters in $K_S, K_L \rightarrow \pi^+ \pi^- \pi^0$. $\text{Re}(\lambda) = 0.038 \pm 0.008 \pm 0.006$ and $\text{Im}(\lambda) = -0.013 \pm 0.005 \pm 0.004$; the correlation coeff. between $\text{Re}(\lambda)$ and $\text{Im}(\lambda)$ is 0.66 (statistical only).

²ADLER 97b find the CP-conserving parameters $\text{Re}(\lambda) = (28 \pm 7 \pm 3) \times 10^{-3}$, $\text{Im}(\lambda) = (-10 \pm 8 \pm 2) \times 10^{-3}$. They estimate $B(K_S^0 \rightarrow \pi^+ \pi^- \pi^0)$ from $\text{Re}(\lambda)$ and the K_L^0 decay parameters. See also ANGELOPOULOS 98c.

³ZOU 96 is from the the measured quantities $|\rho_{+-0}| = 0.039 \pm_{-0.006}^{+0.009} \pm 0.005$ and $\phi_\rho = (-9 \pm 18)^\circ$.

⁴ADLER 96E is from the measured quantities $\text{Re}(\lambda) = 0.036 \pm 0.010 \pm_{-0.003}^{+0.002}$ and $\text{Im}(\lambda)$ consistent with zero. Note that the quantity λ is the same as ρ_{+-0} used in other footnotes.

⁵THOMSON 94 calculates this branching ratio from their measurements $|\rho_{+-0}| = 0.035 \pm_{-0.011}^{+0.019} \pm 0.004$ and $\phi_\rho = (-59 \pm 48)^\circ$ where $|\rho_{+-0}| e^{i\phi_\rho} = A(K_S^0 \rightarrow \pi^+ \pi^- \pi^0, I = 2) / A(K_L^0 \rightarrow \pi^+ \pi^- \pi^0)$.

 K_S^0 FORM FACTORS

For discussion, see note on $K_{\ell 3}$ form factors in the K^\pm section of the Particle Listings above. Because the semileptonic branching fraction is smaller in K_S^0 than K_L^0 by the ratio of the mean lives, the K_S^0 semileptonic form factor has so far been measured only in the K_{e3} mode using the linear expansion $f_+(t) = f_+(0) (1 + \lambda_+ t / m_{\pi^+}^2)$, which gives the vector form factor $f_+(t)$ relative to its value at $t = 0$.

CP VIOLATION IN $K_S \rightarrow 3\pi$

Written 1996 by T. Nakada (Paul Scherrer Institute) and L. Wolfenstein (Carnegie-Mellon University).

The possible final states for the decay $K^0 \rightarrow \pi^+ \pi^- \pi^0$ have isospin $I = 0, 1, 2$, and 3 . The $I = 0$ and $I = 2$ states have $CP = +1$ and K_S can decay into them without violating CP symmetry, but they are expected to be strongly suppressed by centrifugal barrier effects. The $I = 1$ and $I = 3$ states, which have no centrifugal barrier, have $CP = -1$ so that the K_S decay to these requires CP violation.

In order to see CP violation in $K_S \rightarrow \pi^+ \pi^- \pi^0$, it is necessary to observe the interference between K_S and K_L decay, which determines the amplitude ratio

$$\eta_{+-0} = \frac{A(K_S \rightarrow \pi^+ \pi^- \pi^0)}{A(K_L \rightarrow \pi^+ \pi^- \pi^0)}. \quad (1)$$

If η_{+-0} is obtained from an integration over the whole Dalitz plot, there is no contribution from the $I = 0$ and $I = 2$ final states and a nonzero value of η_{+-0} is entirely due to CP violation.

Only $I = 1$ and $I = 3$ states, which are $CP = -1$, are allowed for $K^0 \rightarrow \pi^0 \pi^0 \pi^0$ decays and the decay of K_S into $3\pi^0$ is an unambiguous sign of CP violation. Similarly to η_{+-0} , η_{000} is defined as

$$\eta_{000} = \frac{A(K_S \rightarrow \pi^0 \pi^0 \pi^0)}{A(K_L \rightarrow \pi^0 \pi^0 \pi^0)}. \quad (2)$$

If one assumes that CPT invariance holds and that there are no transitions to $I = 3$ (or to nonsymmetric $I = 1$ states), it can be shown that

$$\eta_{+-0} = \eta_{000} = \epsilon + i \frac{\text{Im } a_1}{\text{Re } a_1}. \quad (3)$$

With the Wu-Yang phase convention, a_1 is the weak decay amplitude for K^0 into $I = 1$ final states; ϵ is determined from CP violation in $K_L \rightarrow 2\pi$ decays. The real parts of η_{+-0} and η_{000} are equal to $\text{Re}(\epsilon)$. Since currently-known upper limits on $|\eta_{+-0}|$ and $|\eta_{000}|$ are much larger than $|\epsilon|$, they can be interpreted as upper limits on $\text{Im}(\eta_{+-0})$ and $\text{Im}(\eta_{000})$ and so as limits on the CP -violating phase of the decay amplitude a_1 .

CP-VIOLATION PARAMETERS IN K_S^0 DECAY

$$A_S = [\Gamma(K_S^0 \rightarrow \pi^- e^+ \nu_e) - \Gamma(K_S^0 \rightarrow \pi^+ e^- \bar{\nu}_e)] / \text{SUM}$$

Such asymmetry violates CP . If CPT is assumed then $A_S = 2 \text{Re}(\epsilon)$.

$$I(J^P) = \frac{1}{2}(0^-)$$

$$m_{K_L^0} - m_{K_S^0}$$

For earlier measurements, beginning with GOOD 61 and FITCH 61, see our 1986 edition, Physics Letters **170B** 132 (1986).

OUR FIT is described in the note on "CP violation in K_L decays" in the K_L^0 Particle Listings. The result labeled "OUR FIT Assuming CP^T " ["OUR FIT Not assuming CP^T "] includes all measurements except those with the comment "Not assuming CP^T " ["Assuming CP^T "]. Measurements with neither comment do not assume CP^T and enter both fits.

¹ The two ABOUZAID 11 values use the same data. The first enters the "assuming CP^T " fit and the second enters the "not assuming CP^T " fit.
² ABOUZAID 11 fit has Δm , τ_S , ϕ_e , $\text{Re}(e'/\epsilon)$, and $\text{Im}(e'/\epsilon)$ as free parameters. See $\text{Im}(e'/\epsilon)$ in the " K_L^0 CP violation" section for correlation information.
³ ABOUZAID 11 fit has Δm and τ_S free but constrains ϕ_e to the Superweak value, i.e. assumes CP^T . See " K_S^0 Mean Life" section for correlation information.
⁴ Fits Δm and ϕ_{+-} simultaneously. GIBBONS 93C systematic error is from B. Winstein via private communication. 20-160 GeV K beams.
⁵ GIBBONS 93 value assume $\phi_{+-} = \phi_{00} = \phi_{SW} = (43.7 \pm 0.2)^\circ$, i.e. assumes CP^T . 20-160 GeV K beams.
⁶ These two experiments have a common systematic error due to the uncertainty in the momentum scale, as pointed out in WAHL 89.
⁷ GJESDAL 74 uses charge asymmetry in K_{e3}^0 decays.
⁸ ALAVI-HARATI 03 fit Δm and $\tau_{K_S^0}$ simultaneously. ϕ_{+-} is constrained to the Superweak value, i.e. CP^T is assumed. See " K_S^0 Mean Life" section for correlation information. Superseded by ABOUZAID 11.
⁹ ALAVI-HARATI 03 fit Δm , ϕ_{+-} , and $\tau_{K_S^0}$ simultaneously. See ϕ_{+-} in the " K_L CP violation" section for correlation information. Superseded by ABOUZAID 11.
¹⁰ ANGELOPOULOS 01 uses strong interactions strangeness tagging at two different times.
¹¹ Uses K_{e3}^0 and $K_{\mu 3}^0$ strangeness tagging at production and decay. Assumes CP^T conservation on $\Delta S = -\Delta Q$ transitions.

¹ ABOUZAID 07D includes 1997 (ALAVI-HARATI 01E) and 1999 data. It measures the ratio of $B(K_L^0 \rightarrow \pi^0\gamma e^+e^-) / B(K_L^0 \rightarrow \pi^0\pi_D^0)$, where π_D^0 is the Dalitz decaying π^0 , and uses PDG 06 values $B(K_L^0 \rightarrow \pi^0\pi^0) = (8.69 \pm 0.04) \times 10^{-4}$, and $B(\pi_D^0 \rightarrow e^+e^-) = (1.198 \pm 0.032) \times 10^{-2}$. Supersedes ALAVI-HARATI 01E result.

Linear coeff. g for $K_L^0 \rightarrow \pi^+ \pi^- \pi^0$ matrix element squared

¹Quadratic dependence required by some experiments. (See sections on "QUADRATIC COEFFICIENT h " and "QUADRATIC COEFFICIENT k " below.) Correlations prevent us from averaging results of fits not including $g, h,$ and k terms.

²BISI 74 value comes from quadratic fit with quad. term consistent with zero. g error is thus larger than if linear fit were used.

³BUCHANAN 70 result revised by BUCHANAN 75 to include radiative correlations and to use more reliable K_L^0 momentum spectrum of second experiment (had same beam).

QUADRATIC COEFFICIENT h FOR $K_L^0 \rightarrow \pi^+ \pi^- \pi^0$

See notes in section "LINEAR COEFFICIENT g FOR $K_L^0 \rightarrow \pi^+ \pi^- \pi^0$ [MATRIX ELEMENT]²" above.

¹Result obtained using CI3pl model of CABIBBO 05 to include $\pi\pi$ rescattering effects. The systematic error includes an external error of 1.06×10^{-3} from the parametrization input of $(a_0 - a_2) m_{\pi^+} = 0.268 \pm 0.017$ from BATLEY 06B.

Meson Particle Listings

K_L^0

²LAI 01B and SOMALWAR 92 results do not include $\pi\pi$ final state rescattering effects.
³SOMALWAR 92 chose m_{π^+} as normalization to make it compatible with the Particle Data Group $K_L^0 \rightarrow \pi^+\pi^-\pi^0$ definitions.

K_L^0 FORM FACTORS

For discussion, see note on form factors in the K^\pm section of the Particle Listings above.

In the form factor comments, the following symbols are used.

- f_+ and f_- are form factors for the vector matrix element.
- f_S and f_T refer to the scalar and tensor term.
- $f_0(t) = f_+(t) + f_-(t) t / (m_{K^0}^2 - m_{\pi^+}^2)$.
- $t =$ momentum transfer to the π .
- λ_+ and λ_0 are the linear expansion coefficients of f_+ and f_0 :
- $f_+(t) = f_+(0) (1 + \lambda_+ t / m_{\pi^+}^2)$

For quadratic expansion

$$f_+(t) = f_+(0) (1 + \lambda'_+ t / m_{\pi^+}^2 + \frac{\lambda''_+}{2} t^2 / m_{\pi^+}^4)$$

as used by KTeV. If there is a non-vanishing quadratic term, then λ_+ represents an average slope, which is then different from λ'_+ .

NA48 (K_{e3}) and ISTRA quadratic expansion coefficients are converted with $\lambda'_+ PDG = \lambda_+ NA48$ and $\lambda''_+ PDG = 2 \lambda'_+ NA48$

$$\lambda'_+ PDG = (\frac{m_{\pi^+}}{m_{K^0}})^2 \lambda_+ ISTRA \text{ and}$$

$$\lambda''_+ PDG = 2 (\frac{m_{\pi^+}}{m_{K^0}})^4 \lambda'_+ ISTRA$$

ISTRA linear expansion coefficients are converted with $\lambda_+ PDG = (\frac{m_{\pi^+}}{m_{K^0}})^2 \lambda_+ ISTRA$ and $\lambda_0 PDG = (\frac{m_{\pi^+}}{m_{K^0}})^2 \lambda_0 ISTRA$

The pole parametrization is

$$f_+(t) = f_+(0) (\frac{M_V^2}{M_V^2 - t})$$

$$f_0(t) = f_0(0) (\frac{M_S^2}{M_S^2 - t})$$

where M_V and M_S are the vector and scalar pole masses.

The dispersive parametrization is

$$f_+(t) = f_+(0) \exp[\frac{t}{m_{\pi^+}^2} (\Lambda_+ + H(t))];$$

$$f_0(t) = f_+(0) \exp[\frac{t}{m_K^2 - m_{\pi^+}^2} (\ln[C] - G(t))],$$

where Λ_+ is the slope parameter and $\ln[C] = \ln[f_0(m_K^2 - m_{\pi^+}^2)]$

is the logarithm of the scalar form factor at the Callan-Treiman point.

$H(t)$ and $G(t)$ are dispersive integrals.

The following abbreviations are used:

- DP = Dalitz plot analysis.
- PI = π spectrum analysis.
- MU = μ spectrum analysis.
- POL = μ polarization analysis.
- BR = $K_{\mu 3}^0 / K_{e 3}^0$ branching ratio analysis.
- E = positron or electron spectrum analysis.
- RC = radiative corrections.

λ_+ (LINEAR ENERGY DEPENDENCE OF f_+ IN $K_{e 3}^0$ DECAY)

$\alpha_{K^*}^{\text{eff}}$ DECAY FORM FACTOR FOR $K_L \rightarrow e^+ e^- e^+ e^-$

$\alpha_{K^*}^{\text{eff}}$ is the parameter describing the relative strength of an intermediate pseudoscalar decay amplitude and a vector meson decay amplitude in the model of BERGSTROM 83. It takes into account both the radiative effects and the form factor. Since there are two $e^+ e^-$ pairs here compared with one in $e^+ e^- \gamma$ decays, a factorized expression is used for the $e^+ e^- e^+ e^-$ decay form factor.

[CP Violation in \$K_L^0\$ Decays](#)

CP-VIOLATION PARAMETERS IN K_L^0 DECAYS

CHARGE ASYMMETRY IN K_{L3}^0 DECAYS

Such asymmetry violates CP. It is related to $\text{Re}(\epsilon)$.

A_L = weighted average of $A_L(\mu)$ and $A_L(e)$

In previous editions and in the literature the symbol used for this asymmetry was δ_L or δ . We use A_L for consistency with B^0 asymmetry notation and with recent K_S^0 notation.

PARAMETERS FOR $K_L^0 \rightarrow 2\pi$ DECAY

$$\eta_{+-} = A(K_L^0 \rightarrow \pi^+ \pi^-) / A(K_S^0 \rightarrow \pi^+ \pi^-)$$

$$\eta_{00} = A(K_L^0 \rightarrow \pi^0 \pi^0) / A(K_S^0 \rightarrow \pi^0 \pi^0)$$

The fitted values of $|\eta_{+-}|$ and $|\eta_{00}|$ given below are the results of a fit to $|\eta_{+-}|$, $|\eta_{00}|$, $|\eta_{00}/\eta_{+-}|$, and $\text{Re}(\epsilon'/\epsilon)$. Independent information on $|\eta_{+-}|$ and $|\eta_{00}|$ can be obtained from the fitted values of the $K_L^0 \rightarrow \pi\pi$ and $K_S^0 \rightarrow \pi\pi$ branching ratios and the K_L^0 and K_S^0 lifetimes. This information is included as data in the $|\eta_{+-}|$ and $|\eta_{00}|$ sections with a Document ID "BRFIT." See the note "CP violation in K_L decays" above for details.

$|\eta_{00}| = |A(K_L^0 \rightarrow 2\pi^0) / A(K_S^0 \rightarrow 2\pi^0)|$

- • • We do not use the following data for averages, fits, limits, etc. • • •
- ¹ Value obtained from the NA48 measurements of $\Gamma(K_L^0 \rightarrow \pi^+ \pi^-)/\Gamma(K_L^0 \rightarrow \pi^0 \nu_e)$ and $\tau_{K_S^0}$ and KLOE measurements of $B(K_S^0 \rightarrow \pi^+ \pi^-)$ and $\tau_{K_L^0}$. $\Gamma(K_L^0 \rightarrow \pi^+ \pi^-)$ is defined to include the inner bremsstrahlung component $\Gamma(K_L^0 \rightarrow \pi^+ \pi^- \gamma(\text{IB}))$ but exclude the direct emission component $B(K_S^0 \rightarrow \pi^+ \pi^- (\text{DE}))$. Their $|\eta_{+-}|$ value is not directly used in our fit, but enters the fit via their branching ratio and lifetime measurements.
- ² AMBROSINO 06f uses KLOE branching ratios and τ_L together with τ_S from PDG 04. Their $|\eta_{+-}|$ value is not directly used in our fit, but enters the fit via their branching ratio and lifetime measurements.

Meson Particle Listings

K_L^0

³ALEXOPOULOS 04 $|\eta_{+-}|$ uses their $K_L^0 \rightarrow \pi\pi$ branching fractions, $\tau_S = (0.8963 \pm 0.0005) \times 10^{-10}$ s from the average of KTeV and NA48 τ_S measurements, and assumes that $\Gamma(K_S^0 \rightarrow \pi\ell\nu_\ell) = \Gamma(K_L^0 \rightarrow \pi\ell\nu_\ell)$ giving $B(K_S^0 \rightarrow \pi\ell\nu_\ell) = 0.118\%$. Their η_{+-} is not directly used in our fit, but enters our fit via their branching ratio measurements.
⁴APOSTOLAKIS 99c report $(2.264 \pm 0.023 \pm 0.026 + 9.1[\tau_S - 0.8934]) \times 10^{-3}$. We evaluate for our 2006 best value $\tau_S = (0.8958 \pm 0.0005) \times 10^{-10}$ s.
⁵ADLER 95B report $(2.312 \pm 0.043 \pm 0.030 - 1[\Delta m - 0.5274] + 9.1[\tau_S - 0.8926]) \times 10^{-3}$. We evaluate for our 1996 best values $\Delta m = (0.5304 \pm 0.0014) \times 10^{-10} \text{ h s}^{-1}$ and $\tau_S = (0.8927 \pm 0.0009) \times 10^{-10}$ s. Superseded by APOSTOLAKIS 99c.

$$|\epsilon| = (2|\eta_{+-}| + |\eta_{00}|)/3$$

This expression is a very good approximation, good to about one part in 10^{-4} because of the small measured value of $\phi_{00} - \phi_{+-}$ and small theoretical ambiguities.

WEIGHTED AVERAGE
 1.68 ± 0.20 (Error scaled by 1.4)

Values above of weighted average, error, and scale factor are based upon the data in this ideogram only. They are not necessarily the same as our 'best' values, obtained from a least-squares constrained fit utilizing measurements of other (related) quantities as additional information.

¹The two ABOUZAID 11 values use the same data. The fits are performed with and without CPT invariance requirement.
²These values are derived from $|\eta_{00}/\eta_{+-}|$ measurements. They enter the average in this section but enter the fit via the $|\eta_{00}/\eta_{+-}|$ only.
³This is the combined results from BARR 93D and BURKHARDT 88, taking into account their common systematic uncertainty.
⁴We use ABOUZAID 11 $\text{Re}(\epsilon'/\epsilon)$ value with CPT assumption in our fits for $|\eta_{+-}|$, $|\eta_{00}|$, and $\text{Re}(\epsilon'/\epsilon)$.

⁵These values are derived from $|\eta_{00}/\eta_{+-}|$ measurements.

ϕ_{+-} , PHASE of η_{+-}

The dependence of the phase on Δm and τ_S is given for each experiment in the comments below, where Δm is the $K_L^0 - K_S^0$ mass difference in units 10^{10} h s^{-1} and τ_S is the K_S mean life in units 10^{-10} s. We also give the regeneration phase ϕ_f in the comments below.

OUR FIT is described in the note on "CP violation in K_L decays" in the K_L^0 Particle Listings. Most experiments in this section are included in both the "Not Assuming CPT" and "Assuming CPT" fits. In the latter fit, they have little direct influence on ϕ_{+-} because their errors are large compared to that assuming CPT, but they influence Δm and τ_S through their dependencies on these parameters, which are given in the footnotes.

¹APOSTOLAKIS 99c measures $\phi_{+-} = (43.19 \pm 0.53 \pm 0.28) + 300 [\Delta m - 0.5301] (^\circ)$. We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) (10^{10} h s^{-1}). Our first error is their experiment's error and our second error is the systematic error from using our best values.
²SCHWINGENHEUER 95 measures $\phi_{+-} = (43.53 \pm 0.76) + 173 [\Delta m - 0.5282] - 275 [\tau_S - 0.8926] (^\circ)$. We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) (10^{10} h s^{-1}), ($\tau_S = 0.8954 \pm 0.0004$) (10^{-10} s). Our first error is their experiment's error and our second error is the systematic error from using our best values.
³These experiments measure $\phi_{+-} - \phi_f$ and calculate the regeneration phase from the power law momentum dependence of the regeneration amplitude using analyticity and dispersion relations. SCHWINGENHEUER 95 [GIBBONS 93] includes a systematic error of $0.35^\circ [0.5^\circ]$ for uncertainties in their modeling of the regeneration amplitude.
⁴GIBBONS 93 measures $\phi_{+-} = (42.21 \pm 0.9) + 189 [\Delta m - 0.5257] - 460 [\tau_S - 0.8922] (^\circ)$. We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) (10^{10} h s^{-1}), ($\tau_S = 0.8954 \pm 0.0004$) (10^{-10} s). Our first error is their experiment's error and our second error is the systematic error from using our best values. This is actually reported in SCHWINGENHEUER 95, footnote 8. GIBBONS 93 reports $\phi_{+-} (42.2 \pm 1.4)^\circ$. They measure $\phi_{+-} - \phi_f$ and calculate the regeneration phase ϕ_f from the power law momentum dependence of the regeneration amplitude using analyticity. An error of 0.6° is included for possible uncertainties in the regeneration phase.
⁵CAROSI 90 measures $\phi_{+-} = (46.9 \pm 1.4 \pm 0.7) + 579 [\Delta m - 0.5351] + 303 [\tau_S - 0.8922] (^\circ)$. We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) (10^{10} h s^{-1}), ($\tau_S = 0.8954 \pm 0.0004$) (10^{-10} s). Our first error is their experiment's error and our second error is the systematic error from using our best values.
⁶GEWENIGER 74B measures $\phi_{+-} = (49.4 \pm 1.0) + 565 [\Delta m - 0.540] (^\circ)$. We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) (10^{10} h s^{-1}). Our first error is their experiment's error and our second error is the systematic error from using our best values.
⁷Not independent of other phase parameters reported in ABOUZAID 11.
⁸ALAVI-HARATI 03 ϕ_{+-} is correlated with their $\Delta m = m_{K_L^0} - m_{K_S^0}$ and τ_{K_S} measurements in the K_L^0 and K_S^0 sections respectively. The correlation coefficients are $\rho(\phi_{+-}, \Delta m) = +0.955$, $\rho(\phi_{+-}, \tau_S) = -0.871$, and $\rho(\tau_S, \Delta m) = -0.840$. CPT is not assumed. Uses scintillator Pb regenerator. Superseded by ABOUZAID 11.
⁹ADLER 96C measures $\phi_{+-} = (43.82 \pm 0.41) + 339 [\Delta m - 0.5307] - 252 [\tau_S - 0.8922] (^\circ)$. We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) (10^{10} h s^{-1}), ($\tau_S = 0.8954 \pm 0.0004$) (10^{-10} s). Our first error is their experiment's error and our second error is the systematic error from using our best values.
¹⁰ADLER 96C is the result of a fit which includes nearly the same data as entered into the "OUR FIT" value in the 1996 edition of this Review (Physical Review D54 1 (1996)).
¹¹ADLER 95B measures $\phi_{+-} = (42.7 \pm 0.9 \pm 0.6) + 316 [\Delta m - 0.5274] + 30 [\tau_S - 0.8926] (^\circ)$. We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) (10^{10} h s^{-1}), ($\tau_S = 0.8954 \pm 0.0004$) (10^{-10} s). Our first error is their experiment's error and our second error is the systematic error from using our best values.
¹²ADLER 92B quote separately two systematic errors: ± 0.4 from their experiment and ± 1.0 degrees due to the uncertainty in the value of Δm .
¹³KARLSSON 90 systematic error does not include regeneration phase uncertainty.
¹⁴CARITHERS 75 measures $\phi_{+-} = (45.5 \pm 2.8) + 224 [\Delta m - 0.5348] (^\circ)$. We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) (10^{10} h s^{-1}). Our first error is their experiment's error and our second error is the systematic error from using our best values. $\phi_f = -40.9 \pm 2.6^\circ$.

Meson Particle Listings

K_L^0

ϕ_{00} , PHASE OF η_{00}

See comment in ϕ_{+-} header above for treatment of Δm and τ_S dependence, as well as for the inclusion of data in both the "Assuming CPT " and "Not Assuming CPT " fits.

OUR FIT is described in the note on "CP violation in K_L decays" in the K_L^0 Particle Listings.

VALUE (%)	DOCUMENT ID	TECN	COMMENT
43.52 ± 0.05 OUR FIT			Error includes scale factor of 1.3. Assuming CPT
43.7 ± 0.6 OUR FIT			Error includes scale factor of 1.2. Not assuming CPT
44.5 ± 2.3 ± 0.5	¹ CAROSI	90	NA31
• • •			We do not use the following data for averages, fits, limits, etc. • • •
44.06 ± 0.68	² ABOUZAID	11	KTEV Not assuming CPT
41.7 ± 5.9 ± 0.2	³ ANGELOPO...	98	CPLR
50.8 ± 7.1 ± 1.7	⁴ ADLER	96B	CPLR Sup. by ANGELOPOULOS 98
47.4 ± 1.4 ± 0.9	⁵ KARLSSON	90	E731

- CAROSI 90 measures $\phi_{00} = (47.1 \pm 2.1 \pm 1.0) + 579 [\Delta m - 0.5351] + 252 [\tau_S - 0.8922]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) (10^{10} h s^{-1}), ($\tau_S = 0.8954 \pm 0.0004$) (10^{-10} s). Our first error is their experiment's error and our second error is the systematic error from using our best values.
- Not independent of other phase parameters reported in ABOUZAID 11.
- ANGELOPOULOS 98 measures $\phi_{00} = (42.0 \pm 5.6 \pm 1.9) + 240 [\Delta m - 0.5307]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) (10^{10} h s^{-1}). Our first error is their experiment's error and our second error is the systematic error from using our best values. The τ_S dependence is negligible.
- ADLER 96B identified initial neutral kaon individually as being a K^0 or a \bar{K}^0 . The systematic uncertainty is $\pm 1.5^\circ$ combined in quadrature with $\pm 0.8^\circ$ due to Δm .
- KARLSSON 90 systematic error does not include regeneration phase uncertainty.

$$\phi_\epsilon = (2\phi_{+-} + \phi_{00})/3$$

This expression is a very good approximation, good to about 10^{-3} degrees because of the small measured values of $\phi_{00} - \phi_{+-}$ and $\text{Re } \epsilon'/\epsilon$, and small theoretical ambiguities.

VALUE (%)	DOCUMENT ID	TECN	COMMENT
43.52 ± 0.05 OUR FIT			Error includes scale factor of 1.2. Assuming CPT
43.5 ± 0.5 OUR FIT			Error includes scale factor of 1.3. Not assuming CPT
43.5164 ± 0.0002 ± 0.0518	¹ SUPERWEAK	16	Assuming CPT
43.86 ± 0.63	² ABOUZAID	11	KTEV Not assuming CPT

- SUPERWEAK 16 is a fake measurement used to impose the CPT or Superweak constraint $\phi_{+-} = \phi_{SW} = \tan^{-1} [2 \frac{\Delta m}{\hbar} (\frac{\tau_S \tau_L}{\tau_S - \tau_L})]$. This "measurement" is linearized using values near the PDG 04 edition values of Δm , τ_S and τ_L , and then adjusted to our current values as described in the following "measurement". SUPERWEAK 16 measures $\phi_\epsilon = (43.50258 \pm 0.00021) + 54.1 [\Delta m - 0.5289] + 32.0 [\tau_S - 0.89564]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) (10^{10} h s^{-1}), ($\tau_S = 0.8954 \pm 0.0004$) (10^{-10} s). Our first error is their experiment's error and our second error is the systematic error from using our best values.
- ABOUZAID 11 uses the full KTeV dataset collected in 1996, 1997, and 1999. See $\text{Im}(\epsilon'/\epsilon)$ section for correlation information.

$$\text{Im}(\epsilon'/\epsilon) = -(\phi_{00} - \phi_{+-})/3$$

For small $|\epsilon'/\epsilon|$, $\text{Im}(\epsilon'/\epsilon)$ is related to the phases of η_{00} and η_{+-} by the above expression.

VALUE (%)	DOCUMENT ID	TECN	COMMENT

- ¹ Superseded by ANGELOPOULOS 01B.
- ² BURGUN 72 is a final result which includes BURGUN 71.
- ³ First GRAHAM 72 value is second GRAHAM 72 value combined with MANTSCH 72.
- ⁴ Footnote 10 of HILL 67 should read +0.58, not -0.58 (private communication) CHO 70 is analysis of unambiguous events in new data and HILL 67.
- ⁵ BALDO-CEOLIN 65 gives x and θ converted by us to $\text{Re}(x)$ and $\text{Im}(x)$.
- ⁶ FRANZINI 65 gives x and θ for $\text{Re}(x)$ and $\text{Im}(x)$. See SCHMIDT 67.

- 1 Extracted employing πK partial wave analysis from ESTABROOKS 78 and ASTON 88, Roy-Steiner equations and once subtracted forward dispersion relations.
- 2 Reanalysis of ESTABROOKS 78 and ASTON 88 satisfying Forward Dispersion Relations and using sequences of Pade approximants.
- 3 Extracted from Breit-Wigner parameters.
- 4 Fit to scattering phase shifts using UChPT amplitudes with explicit resonances.
- 5 Supersedes BUGG 06. Combined analysis of ASTON 88, ABLIKIM 06c, AITALA 06, and LINK 09 using an s -dependent width with couplings to $K\pi$ and $K\eta'$, and the Adler zero near thresholds.
- 6 From a complex pole included in the fit. Using parameters from the model that fits data best.
- 7 Reanalysis of ASTON 88, AITALA 02, and ABLIKIM 06c using for the κ an s -dependent width with an Adler zero near threshold.
- 8 Using Roy-Steiner equations (ROY 71) consistent with unitarity, analyticity and crossing symmetry constraints.
- 9 From UChPT fitted to MERCER 71, BINGHAM 72 and ESTABROOKS 78. Amplitude shown to be consistent with data of ABLIKIM 06c.
- 10 Reanalysis of ASTON 88 data.
- 11 Reanalysis of ASTON 88 using interfering Breit-Wigner amplitudes. Extracted from Breit-Wigner parameters.
- 12 Unitarized Quark Model.

900.7 ± 1.1	5900		BARTH	83	HBC	$70 K^+ p \rightarrow K^+ \pi^- X$

- Taking also into account the $K_0^*(1430)^0$ and $K_2^*(1430)^0$.
- Taking into account the $K^*(892)^0$, S -wave and P -wave ($K^*(1410)^0$).
- From the isobar model with a complex pole for the κ .
- Fit to $K\pi$ mass spectrum includes a non-resonant scalar component.
- Inclusive reaction. Complicated background and phase-space effects.
- From pole extrapolation.
- Mass errors enlarged by us to Γ/\sqrt{N} . See note.
- Number of events in peak reevaluated by us.
- For transverse momenta between 0.6 and 0.8 GeV/c and rapidity $0 < y < 0.5$.
- From a Dalitz plot analysis in an isobar model with charged and neutral $K^*(892)$ masses and widths floating.
- This value comes from a fit with χ^2 of 178/117.
- Systematic uncertainties not estimated.

$K^*(892)$ MASSES AND MASS DIFFERENCES

Unrealistically small errors have been reported by some experiments. We use simple “realistic” tests for the minimum errors on the determination of a mass and width from a sample of N events:

$$\delta_{\min}(m) = \frac{\Gamma}{\sqrt{N}}, \quad \delta_{\min}(\Gamma) = 4 \frac{\Gamma}{\sqrt{N}}. \quad (1)$$

We consistently increase unrealistic errors before averaging. For a detailed discussion, see the 1971 edition of this Note.

VALUE	DOCUMENT ID	TECN	COMMENT
-------	-------------	------	---------

1.0 ± 0.7 ¹ DAUM 81c CNTR 63 $K^- p \rightarrow K^- 2\pi p$

¹ Average from low and high t data.
² Assuming that decays are saturated by the $K\rho$, $K_0^*(1430)\pi$, $K^*(892)\pi$, $K\omega$ decay modes and neglecting interference between them. The values $B(\omega \rightarrow \pi^+ \pi^-) = (1.53 \pm 0.11)_{-0.13}^+$ % and $B(K_0^*(1430) \rightarrow K\pi) = (93 \pm 10)$ % are used. Systematic uncertainties not estimated.

¹ Using a $K\pi - K\eta'$ coupled channel Breit-Wigner function.
² Using both $\eta \rightarrow \gamma\gamma$ and $\eta \rightarrow \pi^+ \pi^- \pi^0$. From a likelihood scan in the presence of several interfering scalar-meson resonances with fixed width $\Gamma(K_0^*(1430)) = 210$ MeV.
³ S-Matrix pole. Supersedes BUGG 06. Combined analysis of ASTON 88, ABLIKIM 06c, AITALA 06, and LINK 09 using an s-dependent width with couplings to $K\pi$ and $K\eta'$, and the Adler zero near thresholds.
⁴ From the isobar model with a complex pole for the κ .
⁵ From a non-parametric analysis.
⁶ A Breit-Wigner mass and width.
⁷ S-matrix pole. Reanalysis of ASTON 88, AITALA 02, and ABLIKIM 06c including the κ with an s-dependent width and an Adler zero near threshold.
⁸ S-matrix pole. Using ASTON 88 and assuming $K_0^*(700)$, $K_0^*(1950)$.
⁹ Using ASTON 88 and assuming $K_0^*(700)$.
¹⁰ T-matrix pole. Reanalysis of ASTON 88 data.
¹¹ Breit-Wigner fit. Using ASTON 88.
¹² Assuming a low-mass scalar $K\pi$ resonance, $\kappa(700)$.
¹³ T-matrix pole. Using data from ESTABROOKS 78 and ASTON 88.
¹⁴ J^P not determined, could be $K_2^*(1430)$.
¹⁵ T-matrix pole.
¹⁶ Uses a model for the background, without this background they get a mass 1340 MeV, where the phase shift passes 90°.
¹⁷ Mass defined by pole position. From elastic $K\pi$ partial-wave analysis.

CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, and 10 branching ratios uses 32 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 21.1$ for 25 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 4 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 2.9$ for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 4 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 0.0$ for 1 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

K(3100)

K(3100)

$$J^G(J^{PC}) = ?^{?}(???)$$

OMITTED FROM SUMMARY TABLE

Narrow peak observed in several ($\Lambda\bar{p}$ + pions) and ($\bar{\Lambda}p$ + pions) states in Σ^- Be reactions by BOURQUIN 86 and in np and nA reactions by ALEEV 93. Not seen by BOEHNLEIN 91. If due to strong decays, this state has exotic quantum numbers ($B=0, Q=+1, S=-1$ for $\Lambda\bar{p}\pi^+\pi^+$ and $I \geq 3/2$ for $\Lambda\bar{p}\pi^-$). Needs confirmation.

¹ABUDINEN 21A determines the lifetime ratio $\tau(D^+)/\tau(D^0) = 2.510 \pm 0.013 \pm 0.007$.
²BARLAG 90c estimates the systematic error to be negligible.

D^+ DECAY MODES

Most decay modes (other than the semileptonic modes) that involve a neutral K meson are now given as K_S^0 modes, not as \bar{K}^0 modes. Nearly always it is a K_S^0 that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that $2\Gamma(K_S^0) = \Gamma(\bar{K}^0)$.

¹ABLIKIM 14F obtain $|V_{cd}| \cdot f_{D^+} = (45.75 \pm 1.20 \pm 0.39)$ MeV, and using $|V_{cd}| = 0.22520 \pm 0.00065$ gets $f_{D^+} = (203.2 \pm 5.3 \pm 1.8)$ MeV.

²EISENSTEIN 08, using the D^+ lifetime and assuming $|V_{cd}| = |V_{us}|$, gets $f_{D^+} = (205.8 \pm 8.5 \pm 2.5)$ MeV from this measurement.

³ABLIKIM 05D finds a background-subtracted 2.67 ± 1.74 $D^+ \rightarrow \mu^+ \nu_\mu$ events, and from this obtains $f_{D^+} = 371 \pm \frac{+129}{-119} \pm 25$ MeV.

⁴ARTUSO 05A obtains $f_{D^+} = 222.6 \pm 16.7 \pm \frac{+2.8}{-3.4}$ MeV from this measurement.

⁵BONVICINI 04A finds eight events with an estimated background of one, and from the branching fraction obtains $f_{D^+} = 202 \pm 41 \pm 17$ MeV.

⁶BAI 98B obtains $f_{D^+} = (300 \pm \frac{+180}{-150} \pm \frac{+80}{-40})$ MeV from this measurement.

¹ABLIKIM 15AF report $\Gamma(D^+ \rightarrow K_L^+ e^+ \nu_e)/\Gamma_{\text{total}} = (4.481 \pm 0.027 \pm 0.103)\%$. See also the form-factor parameters near the end of this D^+ Listing.

²See the form-factor parameters near the end of this D^+ Listing.

³The ABLIKIM 05A result together with the $D^0 \rightarrow K^- e^+ \nu_e$ branching fraction of ABLIKIM 04c and Particle Data Group lifetimes gives $\Gamma(D^0 \rightarrow K^- e^+ \nu_e) / \Gamma(D^+ \rightarrow \bar{K}^0 e^+ \nu_e) = 1.08 \pm 0.22 \pm 0.07$; isospin invariance predicts the ratio is 1.0.

⁴DOBBS 08 establishes $|\frac{V_{cd}}{V_{cs}} \cdot \frac{f_+^{\pi(0)}}{f_+^{K(0)}}| = 0.188 \pm 0.008 \pm 0.002$ from the D^+ and D^0 decays to $\bar{K}^0 e^+ \nu_e$ and $\pi^+ e^+ \nu_e$. It also finds $\Gamma(D^0 \rightarrow K^- e^+ \nu_e) / \Gamma(D^+ \rightarrow \bar{K}^0 e^+ \nu_e) = 1.06 \pm 0.02 \pm 0.03$; isospin invariance predicts the ratio is 1.0.

0.8323 ± 0.0150 ± 0.0008	³ LINK	07B FOCUS	See LINK 09
--------------------------	-------------------	-----------	-------------

¹ This LINK 09 model-independent partial-wave analysis of the $K^- \pi^+$ S-wave slices the $K^- \pi^+$ mass range into 39 bins.

² The BONVICINI 08A QMIPWA (quasi-model-independent partial-wave analysis) of the $K^- \pi^+$ S-wave amplitude slices the $K^- \pi^+$ mass range into 26 bins but keeps the Breit-Wigner $\bar{K}_0^*(1430)$.

³ This LINK 07B fit uses a K matrix. The $K^- \pi^+$ S-wave fit fraction given above breaks down into $(207.3 \pm 25.5 \pm 12.4)\%$ isospin-1/2 and $(40.5 \pm 9.6 \pm 3.2)\%$ isospin-3/2 — with large interference between the two. The isospin-1/2 component includes the κ (or $\bar{K}_0^*(700)$) and $\bar{K}_0^*(1430)$.

 $\Gamma(\bar{K}_0^*(700) \pi^+, \bar{K}_0^*(700) \rightarrow K^- \pi^+)/\Gamma(K^- 2\pi^+)$ Γ_{53}/Γ_{51}

VALUE	DOCUMENT ID	TECN	COMMENT
0.5600±0.0324±0.0214	1 LINK	04	FOCS Dalitz fit, 1527 ± 51 evts

¹LINK 04 borrows a K-matrix parametrization from ANISOVICH 03 of the full π-π S-wave isoscalar scattering amplitude to describe the π⁺π⁻ S-wave component of the π⁺π⁺π⁻ state. The fit fraction given above is a sum over five f₀ mesons, the f₀(980), f₀(1300), f₀(1200-1600), f₀(1500), and f₀(1750). See LINK 04 for details and discussion.

$\Gamma(\sigma\pi^+, \sigma \rightarrow \pi^+\pi^-)/\Gamma(2\pi^+\pi^-)$ Γ₉₀/Γ₈₇

D[±] χ² TESTS OF CP-VIOLATION (CPV)

We list model-independent searches for local CP violation in phase-space distributions of multi-body decays.

Most of these searches divide phase space (Dalitz plot for 3-body decays, five-dimensional equivalent for 4-body decays) into bins, and perform a χ² test comparing normalised yields N_i/N_j in CP-conjugate bin pairs i: χ² = Σ_i(N_i - α N_j)/σ(N_i - α N_j). The factor α = (Σ_jN_j)/(Σ_iN_i) removes the dependence on phase-space-integrated rate asymmetries. The result is used to obtain the probability (p-value) to obtain the measured χ² or larger under the assumption of CP conservation [AUBERT 08A0, BEDIAGA 09]. Alternative methods obtain p-values from other test variables based on unbinned analyses [WILLIAMS 11, AAIJ 14C]. Results can be combined using Fisher's method [MOSTELLER 48].

Local CPV in D[±] → π⁺π⁻π[±]

CP VIOLATING ASYMMETRIES OF P-ODD (T-ODD) MOMENTS

A_{Tviol}(K_S⁰K[±]π⁺π⁻) in D[±] → K_S⁰K[±]π⁺π⁻

C_T ≡ $\vec{p}_{K^+} \cdot (\vec{p}_{\pi^+} \times \vec{p}_{\pi^-})$ is a parity-odd correlation of the K⁺, π⁺, and π⁻ momenta for the D⁺. $\bar{C}_T \equiv \vec{p}_{K^-} \cdot (\vec{p}_{\pi^-} \times \vec{p}_{\pi^+})$ is the corresponding quantity for the D⁻. Then

A_T ≡ [Γ(C_T > 0) - Γ(C_T < 0)] / [Γ(C_T > 0) + Γ(C_T < 0)], and $\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]$, and

A_{Tviol} ≡ 1/2(A_T - \bar{A}_T). C_T and \bar{C}_T are commonly referred to as T-odd moments, because they are odd under T reversal. However, the T-conjugate process K_S⁰K[±]π⁺π⁻ → D[±] is not accessible, while the P-conjugate process is.

0.0 ± 0.5 ± 0.2	183	ANJOS	90E	E691 $\bar{K}^*(892)^0 e^+ \nu_e$

¹ DEL-AMO-SANCHEZ 111 finds the pole mass $m_A = (2.63 \pm 0.10 \pm 0.13)$ GeV (m_V is fixed at 2 GeV).
² LINK 02L includes the effects of interference with an S-wave background. This much improves the goodness of fit, but does not much shift the values of the form factors.

$r_3 \equiv A_3(0)/A_1(0)$ in $D^+ \rightarrow \bar{K}^*(892)^0 \ell^+ \nu_\ell$

See also BRIERE 10 for $\bar{K}^* \ell^+ \nu_\ell$ helicity-basis form-factor measurements.

Amplitude analyses

$D \rightarrow K \pi \pi$ partial wave analyses

Amplitude analyses of D^+ decays to a variety of 4-body kaon or pion final states, fitting simultaneously different partial wave components.

D0 MASS

The fit includes $D^\pm, D^0, D_s^\pm, D^{*0}, D_s^{*0}, D_1(2420)^0, D_2^*(2460)^0$, and $D_{s1}(2536)^\pm$ mass and mass difference measurements.

Given the recent addition of much more precise measurements, we have omitted all those masses published up through 1990. See any Review before 2015 for those earlier results.

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT

1864.847 ± 0.150 ± 0.095	0.3k	CAWLFIELD 07 CLEO		$D^0 \rightarrow K_S^0 \phi$

¹ Obtained by analyzing CLEO-c data but not authored by the CLEO Collaboration. The largest source of error in the TOMARADZE 14 value is from the uncertainties in the K^- and K_S^0 masses. The systematic error given above is the addition in quadrature of $\pm 0.022 \pm 0.053$ MeV, where the second error is from those mass uncertainties.
² The largest source of error in the LEES 13s value is from the uncertainty of the K^+ mass. The quoted systematic error is in fact $\pm 0.043 + 3 (m_{K^+} - 493.677)$, in MeV.

$m_{D^\pm} - m_{D^0}$

The fit includes $D^\pm, D^0, D_s^\pm, D^{*0}, D_s^{*0}, D_1(2420)^0, D_2^*(2460)^0$, and $D_{s1}(2536)^\pm$ mass and mass difference measurements.

¹ABUDINEN 21A determines the lifetime ratio $\tau(D^+)/\tau(D^0) = 2.510 \pm 0.013 \pm 0.007$.

²BARLAG 90c estimate systematic error to be negligible.

See the related review(s):

 $D^0 - \bar{D}^0$ Mixing

$$|m_{D_1^0} - m_{D_2^0}| = x \Gamma$$

The D_1^0 and D_2^0 are the mass eigenstates of the D^0 meson, as described in the note on “ $D^0 - \bar{D}^0$ Mixing,” above. The experiments usually present $x \pm \Delta m/\Gamma$. Then $\Delta m = x \Gamma = x \hbar/\tau$.

“OUR EVALUATION” comes from CPV allowing averages provided by the Heavy Flavor Averaging Group, see the note on “ $D^0 - \bar{D}^0$ Mixing.”

¹AAIJ 21AB measurement allows for CP violation (none seen).

²AAIJ 19X D^0 come from D^{*+} and $\bar{B} \rightarrow D^0 \mu^- X$ decays (and c.c.). Measurement allows for CP violation (none seen).

³The result was established with D^0 from prompt and secondary D^* . Based on 5 fb⁻¹ of data collected at $\sqrt{s} = 7, 8, 13$ TeV. Assumes no CP violation. Reported $x'^2 = (3.9 \pm 2.7) \times 10^{-5}$ and $y' = (5.28 \pm 0.52) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$.

⁴Model-independent measurement of the charm mixing parameters in the decay $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ using 1.0 fb⁻¹ of LHCB data at $\sqrt{s} = 7$ TeV.

⁵Time-dependent amplitude analysis of $D^0 \rightarrow \pi^+\pi^-\pi^0$.

⁶Based on 976 fb⁻¹ of data collected at $Y(nS)$ resonances. Assumes no CP violation. Reported $x'^2 = (0.09 \pm 0.22) \times 10^{-3}$ and $y' = (4.6 \pm 3.4) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$.

⁷The time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$. This value allows CP violation and is sensitive to the sign of Δm .

⁸Based on 9.6 fb⁻¹ of data collected at the Tevatron. Assumes no CP violation. Reported $x'^2 = (0.08 \pm 0.18) \times 10^{-3}$ and $y' = (4.3 \pm 4.3) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$.

⁹DEL-AMO-SANCHEZ 10D uses 540,800 $\pm 800 K_S^0 \pi^+ \pi^-$ and 79,900 $\pm 300 K_S^0 K^+ K^-$ events in a time-dependent amplitude analysis of the D^0 and \bar{D}^0 Dalitz plots. No evidence was found for CP violation, and the values here assume no such violation.

¹⁰The result was established with D^0 from prompt and secondary D^* . Based on 3 fb⁻¹ of data collected at $\sqrt{s} = 7, 8$ TeV. Assumes no CP violation. Reported $x'^2 = (3.6 \pm 4.3) \times 10^{-5}$ and $y' = (5.23 \pm 0.84) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$.

¹¹Based on 3 fb⁻¹ of data collected at $\sqrt{s} = 7, 8$ TeV. Assumes no CP violation. Reported $x'^2 = (5.5 \pm 4.9) \times 10^{-4}$ and $y' = (4.8 \pm 1.0) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$.

¹²Based on 1 fb⁻¹ of data collected at $\sqrt{s} = 7$ TeV in 2011. Assumes no CP violation. Reported $x'^2 = (-0.9 \pm 1.3) \times 10^{-4}$ and $y' = (7.2 \pm 2.4) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$.

¹³The AUBERT 09AN values are inferred from the branching ratio $\Gamma(D^0 \rightarrow K^+\pi^-\pi^0)$ via $\bar{D}^0)/\Gamma(D^0 \rightarrow K^-\pi^+\pi^0)$ given near the end of this Listings. Mixing is distinguished from DCS decays using decay-time information. Interference between mixing and DCS is allowed. The phase between $D^0 \rightarrow K^+\pi^-\pi^0$ and $\bar{D}^0 \rightarrow K^+\pi^-\pi^0$ is assumed to be small. The width difference here is y'' , which is not the same as y_{CP} in the note on $D^0 - \bar{D}^0$ mixing.

¹⁴LOWREY 09 uses quantum correlations in $e^+e^- \rightarrow D^0 \bar{D}^0$ at the $\psi(3770)$. See below for coherence factors and average relative strong phases for both $D^0 \rightarrow K^-\pi^+\pi^0$ and $D^0 \rightarrow K^-\pi^-2\pi^+$. A fit that includes external measurements of charm mixing parameters gets $\Delta m = (2.34 \pm 0.61) \times 10^{10} \hbar s^{-1}$.

¹⁵The ASNER 05 and ZHANG 07B values are from the time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$. This value allows CP violation and is sensitive to the sign of Δm .

¹⁶The AUBERT 03Z, LI 05A, and ZHANG 06 limits are inferred from the $D^0 - \bar{D}^0$ mixing ratio $\Gamma(K^+\pi^- \text{ (via } \bar{D}^0))/\Gamma(K^-\pi^+)$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from $D^0 - \bar{D}^0$ mixing. The limit allows interference between the DCS and mixing ratios, and also allows CP violation. AUBERT 03Z assumes the strong phase between $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$ amplitudes is small; if an arbitrary phase is allowed, the limit degrades by 20%. The LI 05A and ZHANG 06 limits are valid for an arbitrary strong phase.

¹⁷This LINK 05H limit is inferred from the $D^0 - \bar{D}^0$ mixing ratio $\Gamma(K^+\pi^- \text{ (via } \bar{D}^0))/\Gamma(K^-\pi^+)$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from $D^0 - \bar{D}^0$ mixing. The limit allows interference between the DCS and mixing ratios, and also allows CP violation. The strong phase between $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$ is assumed to be small. If an arbitrary relative strong phase is allowed, the limit degrades by 25%.

¹⁸This GODANG 00 limit is inferred from the $D^0 - \bar{D}^0$ mixing ratio $\Gamma(K^+\pi^- \text{ (via } \bar{D}^0))/\Gamma(K^-\pi^+)$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from $D^0 - \bar{D}^0$ mixing. The limit allows interference between the DCS and mixing ratios, and also allows CP violation. The strong phase between $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$ is assumed to be small. If an arbitrary relative strong phase is allowed, the limit degrades by a factor of two.

¹⁹AITALA 98 allows interference between the doubly Cabibbo-suppressed and mixing amplitudes, and also allows CP violation in this term, but assumes that $A_D = A_R = 0$. See the note on “ $D^0 - \bar{D}^0$ Mixing,” above.

²⁰This limit is inferred from R_M for $f = K^+\pi^-$ and $f = K^+\pi^-\pi^+\pi^-$. See the note on “ $D^0 - \bar{D}^0$ Mixing,” above. Decay-time information is used to distinguish doubly Cabibbo-suppressed decays from $D^0 - \bar{D}^0$ mixing.

²¹This limit is inferred from R_M for $f = K^+\ell^-\bar{\nu}_\ell$. See the note on “ $D^0 - \bar{D}^0$ Mixing,” above.

²²ANJOS 88c assumes that $y = 0$. See the note on “ $D^0 - \bar{D}^0$ Mixing,” above. Without this assumption, the limit degrades by about a factor of two.

$$(\Gamma_{D_1^0} - \Gamma_{D_2^0})/\Gamma = 2y$$

The D_1^0 and D_2^0 are the mass eigenstates of the D^0 meson, as described in the note on “ $D^0 - \bar{D}^0$ Mixing,” above.

Due to the strong phase difference between $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$, we exclude from the average those measurements of y' that are inferred from the $D^0 - \bar{D}^0$ mixing ratio $\Gamma(K^+\pi^- \text{ via } \bar{D}^0)/\Gamma(K^+\pi^-)$ given near the end of this D^0 Listings.

Some early results have been omitted. See our 2006 Review (Journal of Physics **G33** 1 (2006)).

“OUR EVALUATION” comes from CPV allowing averages provided by the Heavy Flavor Averaging Group, see the note on “ $D^0 - \bar{D}^0$ Mixing.”

- AAIJ 21AB analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ events allows for CP violation (none seen).
- NAYAK 20 reports $(1.92 \pm 1.82 \pm 1.24^{+0.34}_{-0.00}) \times 10^{-2}$ where the last uncertainty is due to possible presence of CP-even decays in the data sample. Extracts $y_{CP} = (\Gamma_{CP^+} - \Gamma_{CP^-}) / (\Gamma_{CP^+} + \Gamma_{CP^-})$ in $D^0 \rightarrow K_S^0 \omega$ versus $\bar{D}^0 \rightarrow K_S^0 \omega$, by measuring the decay lifetime of $D^0 \rightarrow K_S^0 \omega$ with $\omega \rightarrow \pi^+ \pi^- \pi^0$ versus $D^0 \rightarrow K^- \pi^+$. We list $2y_{CP} = 2y$ ($= \Delta\Gamma/\Gamma$) in the absence of CP violation.
- Based on 3 fb⁻¹ of data collected at $\sqrt{s} = 7, 8$ TeV. Measures the lifetime difference between $D^0 \rightarrow K^- K^+$ and $D^0 \rightarrow \pi^- \pi^+$ (CP even) decays and $D^0 \rightarrow K^- \pi^+$ (CP mixed) decays, or $y_{CP} = (\Gamma_{CP^+} - \Gamma_{CP^-}) / (\Gamma_{CP^+} + \Gamma_{CP^-})$. The D^0 mesons are required to originate from semimuonic decays of B mesons. We list $2y_{CP} = \Delta\Gamma/\Gamma$.
- AAIJ 19X D^0 come from D^{*+} and $\bar{B}^0 \rightarrow D^0 \mu^- X$ decays (and c.c.) in pp collisions at 7 and 8 TeV. Measurement allows for CP violation (none seen).
- The result was established with D^0 from prompt and secondary D^* . Based on 5 fb⁻¹ of data collected at $\sqrt{s} = 7, 8, 13$ TeV. Assumes no CP violation. Reported $x'^2 = (3.9 \pm 2.7) \times 10^{-5}$ and $y' = (5.28 \pm 0.52) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- Model-independent measurement of the charm mixing parameters in the decay $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ using 1.0 fb⁻¹ of LHCb data at $\sqrt{s} = 7$ TeV.
- Time-dependent amplitude analysis of $D^0 \rightarrow \pi^+ \pi^- \pi^0$.
- An improved measurement of $\bar{D}^0 - D^0$ mixing and a search for CP violation in D^0 decays to CP-even final states $K^+ K^-$ and $\pi^+ \pi^-$ using the final Belle data sample of 976 fb⁻¹.
- ABLIKIM 15D uses quantum correlations in $e^+e^- \rightarrow D^0 \bar{D}^0$ at the $\psi(3770)$.
- Based on 976 fb⁻¹ of data collected at Y(nS) resonances. Assumes no CP violation. Reported $x'^2 = (0.09 \pm 0.22) \times 10^{-3}$ and $y' = (4.6 \pm 3.4) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- The time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^{*+} \pi^-$ and $\bar{D}^0 \rightarrow K^{*+} \pi^-$. This value allows CP violation and is sensitive to the sign of Δm .
- Based on 9.6 fb⁻¹ of data collected at the Tevatron. Assumes no CP violation. Reported $x'^2 = (0.08 \pm 0.18) \times 10^{-3}$ and $y' = (4.3 \pm 4.3) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- Obtained $y_{CP} = (0.72 \pm 0.18 \pm 0.12)\%$ based on three effective D^0 lifetimes measured in $K^{\mp} \pi^{\pm}$, $K^- K^+$, and $\pi^- \pi^+$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.
- Compared the lifetimes of D^0 decay to the CP eigenstate $K^+ K^-$ with D^0 decay to $\pi^+ K^-$. The values here assume no CP violation.
- DEL-AMO-SANCHEZ 10D uses 540,800 ± 800 $K_S^0 \pi^+ \pi^-$ and 79,900 ± 300 $K_S^0 K^+ K^-$ events in a time-dependent amplitude analyses of the D^0 and \bar{D}^0 Dalitz plots. No evidence was found for CP violation, and the values here assume no such violation.
- ZUPANC 09 uses a method based on measuring the mean decay time of $D^0 \rightarrow K_S^0 K^+ K^-$ events for different $K^+ K^-$ mass intervals.

- LINK 00, AITALA 99E, and ABE 02I measure the lifetime difference between $D^0 \rightarrow K^- K^+$ (CP even) decays and $D^0 \rightarrow K^- \pi^+$ (CP mixed) decays, or $y_{CP} = [\Gamma(CP^+) - \Gamma(CP^-)] / [\Gamma(CP^+) + \Gamma(CP^-)]$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.
- CSORNA 02 measures the lifetime difference between $D^0 \rightarrow K^- K^+$ and $\pi^- \pi^+$ (CP even) decays and $D^0 \rightarrow K^- \pi^+$ (CP mixed) decays, or $y_{CP} = [\Gamma(CP^+) - \Gamma(CP^-)] / [\Gamma(CP^+) + \Gamma(CP^-)]$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.
- The result was established with D^0 from prompt and secondary D^* . Based on 3 fb⁻¹ of data collected at $\sqrt{s} = 7, 8$ TeV. Assumes no CP violation. Reported $x'^2 = (3.6 \pm 4.3) \times 10^{-5}$ and $y' = (5.23 \pm 0.84) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- Based on 3 fb⁻¹ of data collected at $\sqrt{s} = 7, 8$ TeV. Assumes no CP violation. Reported $x'^2 = (5.5 \pm 4.9) \times 10^{-4}$ and $y' = (4.8 \pm 1.0) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- Based on 1 fb⁻¹ of data collected at $\sqrt{s} = 7$ TeV in 2011. Assumes no CP violation. Reported $x'^2 = (-0.9 \pm 1.3) \times 10^{-4}$ and $y' = (7.2 \pm 2.4) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- This combines the $y_{CP} = (\tau_{K^+ \pi^-} / \tau_{K^+ K^-}) - 1$ using untagged $K^- \pi^+$ and $K^- K^+$ events of AUBERT 09AI with the disjoint y_{CP} using tagged $K^- \pi^+$, $K^- K^+$, and $\pi^- \pi^+$ events of AUBERT 08U.
- The AUBERT 09AN values are inferred from the branching ratio $\Gamma(D^0 \rightarrow K^+ \pi^- \pi^0 \text{ via } \bar{D}^0) / \Gamma(D^0 \rightarrow K^- \pi^+ \pi^0)$ given near the end of this Listings. Mixing is distinguished from DCS decays using decay-time information. Interference between mixing and DCS is allowed. The phase between $D^0 \rightarrow K^+ \pi^- \pi^0$ and $\bar{D}^0 \rightarrow K^+ \pi^- \pi^0$ is assumed to be small. The width difference here is y'' , which is not the same as y_{CP} in the note on $D^0 - \bar{D}^0$ mixing.
- LOWREY 09 uses quantum correlations in $e^+e^- \rightarrow D^0 \bar{D}^0$ at the $\psi(3770)$. See below for coherence factors and average relative strong phases for both $D^0 \rightarrow K^- \pi^+ \pi^0$ and $D^0 \rightarrow K^- \pi^- 2\pi^+$. A fit that includes external measurements of charm mixing parameters gets $2y = (1.62 \pm 0.32) \times 10^{-2}$.
- The GODANG 00, AUBERT 03Z, LINK 05H, LI 05A, ZHANG 06, AUBERT 07W, and AALTONEN 08E limits are inferred from the $D^0 - \bar{D}^0$ mixing ratio $\Gamma(K^+ \pi^- \text{ via } \bar{D}^0) / \Gamma(K^- \pi^+ \text{ via } D^0)$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from $D^0 - \bar{D}^0$ mixing. The limits allow interference between the DCS and mixing ratios, and all except AUBERT 07W and AALTONEN 08E also allow CP violation. The phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$ is assumed to be small. This is a measurement of y' and is not the same as the y_{CP} of our note above on " $D^0 - \bar{D}^0$ Mixing."
- This value combines the results of AUBERT 08U and AUBERT 03P.
- STARIC 07 compares the lifetimes of D^0 decay to the CP eigenstates $K^+ K^-$ and $\pi^+ \pi^-$ with D^0 decay to $K^- \pi^+$.
- The ASNER 05 and ZHANG 07b values are from the time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^{*+} \pi^-$ and $\bar{D}^0 \rightarrow K^{*+} \pi^-$. This limit allows CP violation.
- The ranges of AUBERT 03Z, LINK 05H, LI 05A, and ZHANG 06 measurements are for 95% confidence level.
- AUBERT 03P measures $Y \equiv 2\tau^0 / (\tau^+ + \tau^-) - 1$, where τ^0 is the $D^0 \rightarrow K^- \pi^+$ (and $\bar{D}^0 \rightarrow K^+ \pi^-$) lifetime, and τ^+ and τ^- are the D^0 and \bar{D}^0 lifetimes to CP-even states (here $K^- K^+$ and $\pi^- \pi^+$). In the limit of CP conservation, $Y = \Delta\Gamma / 2\Gamma$ (We list $2y = \Delta\Gamma/\Gamma$). AUBERT 03P also uses $\tau^+ - \tau^-$ to get $\Delta Y = -0.008 \pm 0.006 \pm 0.002$.

|q/p|

The mass eigenstates D_1^0 and D_2^0 are related to the $C = \pm 1$ states by $|D_{1,2}^0\rangle = p|D^0\rangle + q|\bar{D}^0\rangle$. See the note on " $D^0 - \bar{D}^0$ Mixing" above.

"OUR EVALUATION" comes from CPV allowing averages provided by the Heavy Flavor Averaging Group. This would include as-yet-unpublished results, see the note on " $D^0 - \bar{D}^0$ Mixing."

- • • We do not use the following data for averages, fits, limits, etc. • • •
- AAIJ 21AB result comes from analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ events.
- AAIJ 19X measurement comes from analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays. D^0 come from D^{*+} and $\bar{B}^0 \rightarrow D^0 \mu^- X$ decays (and c.c.) in pp collisions at 7 and 8 TeV.
- Based on 5 fb⁻¹ of data collected at $\sqrt{s} = 7, 8, 13$ TeV. Allowing for CP violation, the direct CP violation in mixing is reported $1.00 < |q/p| < 1.35$ at the 68.3% CL for the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- The time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^{*+} \pi^-$ and $\bar{D}^0 \rightarrow K^{*+} \pi^-$. This value allows CP violation and is sensitive to the sign of Δm .

Meson Particle Listings

D^0

⁵ Based on 3 fb^{-1} of data collected at $\sqrt{s} = 7, 8 \text{ TeV}$. Allowing for CP violation, the direct CP violation in mixing is reported $0.75 < |q/p| < 1.24$ at the 68.3% CL for the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.

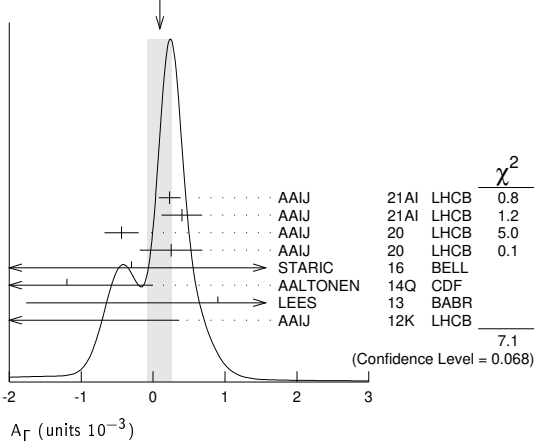

⁶ The phase of p/q is $(-14^{+16}_{-18} \pm 5)^\circ$. The ZHANG 07B value is from the time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^* \pi^-$ and $\bar{D}^0 \rightarrow K^* \pi^-$. This value allows CP violation.

A_Γ

A_Γ is the decay-rate asymmetry for CP -even final states $A_\Gamma = (\bar{\tau}_+ - \tau_+) / (\bar{\tau}_+ + \tau_+)$. See the note on " D^0 - \bar{D}^0 Mixing" above.

WEIGHTED AVERAGE
0.09±0.17 (Error scaled by 1.5)

- Requires D^0 to originate from $D^*(2010)^+ \rightarrow D^0 \pi^+$. AAIJ 21AI measures the parameter $\Delta Y_f \approx -A_\Gamma^f$ up to 1% corrections from y_{CP}^f .
- Measured using $D^0 \rightarrow K^+ K^-$ decays, combines measurements with D^0 either from partially reconstructed semileptonic B hadron decays or from $D^{*+} \rightarrow D^0 \pi^+$.
- Measured using $D^0 \rightarrow \pi^+ \pi^-$ decays, combines measurements with D^0 either from partially reconstructed semileptonic B hadron decays or from $D^{*+} \rightarrow D^0 \pi^+$.
- An improved measurement of $\bar{D}^0 - D^0$ mixing and a search for CP violation in D^0 decays to CP -even final states $K^+ K^-$ and $\pi^+ \pi^-$ using the final Belle data sample of 976 fb^{-1} .
- Combined result from $D^0 \rightarrow K^+ K^-$ and $D^0 \rightarrow \pi^+ \pi^-$, with D^0 from $D^{*+} \rightarrow D^0 \pi^+$ (and cc).
- Measured using $D^{*+} \rightarrow D^0 \pi^+$, $D^0 \rightarrow K^+ K^-$ decays (and cc).
- Measured using $D^{*+} \rightarrow D^0 \pi^+$, $D^0 \rightarrow \pi^+ \pi^-$ decays (and cc).
- Measured using $D^0 \rightarrow K^+ K^-$ decays, with D^0 from partially reconstructed semileptonic B hadron decays.
- Measured using $D^0 \rightarrow \pi^+ \pi^-$ decays, with D^0 from partially reconstructed semileptonic B hadron decays.

$\phi_{K_S^0 \pi \pi}$

Parametrizes CP violation in the interference between D^0 mixing and decay. The mass eigenstates D_1^0 and D_2^0 are related to the $C = \pm 1$ states by $|D_{1,2}^0\rangle = p|D^0\rangle + q|\bar{D}^0\rangle$. In the absence of CP violation in the decay, and using the usual phase

convention where CP conservation implies q/p is real, $\phi_{K_S^0 \pi \pi}$ is identical to the decay-mode-independent parameter $\phi = \arg(q/p)$.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- Uses quantum correlations in $e^+ e^- \rightarrow D^0 \bar{D}^0$ at the $\psi(3770)$ to measure the asymmetry of the branching fraction of $D^0 \rightarrow K^- \pi^+$ in CP -odd and CP -even eigenstates to be $(12.7 \pm 1.3 \pm 0.7)\%$. A fit that includes external measurements of charm mixing parameters finds the value quoted above.
 - Uses quantum correlations in $e^+ e^- \rightarrow D^0 \bar{D}^0$ at the $\psi(3770)$, where decay rates of CP -tagged $K\pi$ final states depend on the strong phases between the decays of $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$. The measurements obtained $\sin(\delta) = -0.01 \pm 0.41 \pm 0.04$ and $|\delta| = (10^{+28}_{-53} + 13_{-0}^\circ)$ as well. A fit that includes external measurements of charm mixing parameters finds $\cos(\delta) = 1.15^{+0.19}_{-0.17} + 0.00_{-0.08}$, $\sin(\delta) = 0.56^{+0.32}_{-0.31} - 0.21_{-0.20}$, and $|\delta| = (18^{+11}_{-17})^\circ$.
 - ASNER 08 uses quantum correlations in $e^+ e^- \rightarrow D^0 \bar{D}^0$ at the $\psi(3770)$, where decay rates of CP -tagged $K\pi$ final states depend on $\cos \delta$ because of interfering amplitudes. The above measurement implies $|\delta| < 75^\circ$ with a confidence level of 95%. A fit that includes external measurements of charm mixing parameters finds $\cos \delta = 1.10 \pm 0.35 \pm 0.07$. See also the note on " D^0 - \bar{D}^0 Mixing" p. 783 in our 2008 Review (PDG 08).

$D^0 \rightarrow K^- \pi^+ \pi^0$ COHERENCE FACTOR $R_{K\pi\pi^0}$

See the note on " D^0 - \bar{D}^0 Mixing" for the definition. $R_{K\pi\pi^0}$ can have any value between 0 and 1. A value near 1 indicates the decay is dominated by a few intermediate states with limited interference.

A fit that includes external measurements of charm mixing parameters gets $\delta^{K\pi\pi^0} = (227^{+14}_{-17})^\circ$.

$D^0 \rightarrow K^- \pi^- 2\pi^+$ COHERENCE FACTOR $R_{K3\pi}$

See the note on ' D^0 - \bar{D}^0 Mixing' for the definition. $R_{K3\pi}$ can have any value between 0 and 1. A value near 1 indicates the decay is dominated by a few intermediate states with limited interference.

0.36 ± 0.24 -0.30		⁵ LOWREY	09 CLEO	Repl. by LIBBY 14

- ¹ Uses quantum correlations in $e^+e^- \rightarrow D^0\bar{D}^0$ at the $\psi(3770)$, where the decay rates of CP-tagged $K^-\pi^-2\pi^+$ final states depend on $R_{K3\pi}$ and $\delta K3\pi$.
- ² A combined fit with a recent LHCb $D^0\bar{D}^0$ mixing results in AAIJ 16f is also reported, to be $0.43^{+0.17}_{-0.13}$.
- ³ Obtained by analyzing CLEO-c data but not authored by the CLEO Collaboration.
- ⁴ Calculated from amplitude models to $D^0 \rightarrow K^-\pi^-2\pi^+$ and $D^0 \rightarrow K^+\pi^+2\pi^-$ and cc. Reports $0.458 \pm 0.010 \pm 0.012 \pm 0.020$ value where the 3rd uncertainty is the model uncertainty. We combined both systematic uncertainties in quadrature. Because of the importance of model independence in the practical use of the coherence factor, we do not include model-derived results in the average.
- ⁵ LOWREY 09 uses quantum correlations in $e^+e^- \rightarrow D^0\bar{D}^0$ at the $\psi(3770)$, where the decay rates of CP-tagged $K^-\pi^-2\pi^+$ final states depend on $R_{K3\pi}$ and $\delta K3\pi$. A fit that includes external measurements of charm mixing parameters gets $R_{K3\pi} = 0.33^{+0.26}_{-0.23}$.

$D^0 \rightarrow K^- \pi^- 2\pi^+$ AVERAGE RELATIVE STRONG PHASE $\delta K3\pi$

The quoted value of δ is based on the same sign CP phase of D^0 and \bar{D}^0 convention.

D^0 DECAY MODES

Most decay modes (other than the semileptonic modes) that involve a neutral K meson are now given as K_S^0 modes, not as \bar{K}^0 modes. Nearly always it is a K_S^0 that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that $2\Gamma(K_S^0) = \Gamma(\bar{K}^0)$.

[a] This value is obtained by subtracting the branching fractions for 2-, 4- and 6-prongs from unity.

[b] This is the sum of our $K^- 2\pi^+ \pi^-$, $K^- 2\pi^+ \pi^- \pi^0$, $\bar{K}^0 2\pi^+ 2\pi^-$, $K^+ 2K^- \pi^+$, $2\pi^+ 2\pi^-$, $2\pi^+ 2\pi^- \pi^0$, $K^+ K^- \pi^+ \pi^-$, and $K^+ K^- \pi^+ \pi^- \pi^0$, branching fractions.

[c] This is the sum of our $K^- 3\pi^+ 2\pi^-$ and $3\pi^+ 3\pi^-$ branching fractions.

[d] The branching fractions for the $K^- e^+ \nu_e$, $K^*(892)^- e^+ \nu_e$, $\pi^- e^+ \nu_e$, and $\rho^- e^+ \nu_e$ modes add up to $6.17 \pm 0.17 \%$.

[e] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.

[f] This is a doubly Cabibbo-suppressed mode.

[g] Submodes of the $D^0 \rightarrow K_S^0 \pi^+ \pi^- \pi^0$ mode with a K^* and/or ρ were studied by COFFMAN 92B, but with only 140 events. With nothing new for 18 years, we refer to our 2008 edition, Physics Letters **B667** 1 (2008), for those results.

[h] This branching fraction includes all the decay modes of the resonance in the final state.

[i] This mode is not a useful test for a $\Delta C=1$ weak neutral current because both quarks must change flavor in this decay.

[j] The value is for the sum of the charge states or particle/antiparticle states indicated.

[k] This limit is for either D^0 or \bar{D}^0 to $p e^-$.

[l] This limit is for either D^0 or \bar{D}^0 to $\bar{p} e^+$.

4.3 ± 1.0	130	10 PERUZZI	77 LGW	e^+e^- 3.77 GeV

¹ ABLIKIM 18w measured the combined $K^{\mp}\pi^{\pm}$ branching fraction to be 3.898%. We have subtracted off the doubly Cabibbo-suppressed branching fraction $B(D^0 \rightarrow K^+\pi^-) = (1.50 \pm 0.07) \times 10^{-4}$, even though it is less than one-third of the uncertainty of the combined measurement, in order to treat this as a measurement of $B(D^0 \rightarrow K^-\pi^+)$.

² This combines the CLEO results of ARTUSO 98, COAN 98, and AKERIB 93.

³ ABACHI 88, DECAMP 91J, AKERIB 93, ALBRECHT 94F, and BARATE 97c use $D^*(2010)^+ \rightarrow D^0\pi^+$ decays. The π^+ is both slow and of low p_T with respect to the event thrust axis or nearest jet ($\approx D^{*+}$ direction). The excess number of such π^+ 's over background gives the number of $D^*(2010)^+ \rightarrow D^0\pi^+$ events, and the fraction with $D^0 \rightarrow K^-\pi^+$ gives the $D^0 \rightarrow K^-\pi^+$ branching fraction.

⁴ DOBBS 07 and HE 05 use single- and double-tagged events in an overall fit. DOBBS 07 supersedes HE 05.

⁵ ARTUSO 98, following ALBRECHT 94, uses D^0 mesons from $\bar{B}^0 \rightarrow D^*(2010)^+ X \ell^- \bar{\nu}_\ell$ decays. Our average uses the CLEO average of this value with the values of COAN 98 and AKERIB 93.

⁶ COAN 98 assumes that $\Gamma(B \rightarrow \bar{D} X \ell^+ \nu)/\Gamma(B \rightarrow X \ell^+ \nu) = 1.0 - 3|V_{ub}/V_{cb}|^2 - 0.010 \pm 0.005$, the last term accounting for $\bar{B} \rightarrow D_s^+ K X \ell^- \bar{\nu}$. COAN 98 is included in the CLEO average in ARTUSO 98.

⁷ ALBRECHT 94 uses D^0 mesons from $\bar{B}^0 \rightarrow D^{*+} \ell^- \bar{\nu}_\ell$ decays. This is a different set of events than used by ALBRECHT 94F.

⁸ This AKERIB 93 value includes radiative corrections; without them, the value is $0.0391 \pm 0.0008 \pm 0.0017$. AKERIB 93 is included in the CLEO average in ARTUSO 98.

⁹ SCHINDLER 81 (MARK-2) measures $\sigma(e^+e^- \rightarrow \psi(3770)) \times$ branching fraction to be 0.24 ± 0.02 nb. We use the MARK-3 (ADLER 88c) value of $\sigma = 5.8 \pm 0.5 \pm 0.6$ nb.

¹⁰ PERUZZI 77 (MARK-1) measures $\sigma(e^+e^- \rightarrow \psi(3770)) \times$ branching fraction to be 0.25 ± 0.05 nb. We use the MARK-3 (ADLER 88c) value of $\sigma = 5.8 \pm 0.5 \pm 0.6$ nb.

$\Gamma(K_S^0\pi^+\pi^-\pi^0)/\Gamma(K_S^0\pi^+\pi^-)$
Γ₈₃/Γ₄₀

Branching fractions for submodes of this mode with narrow resonances (the η, ω, η') are fairly well determined (see below). COFFMAN 92B gives fractions of K* and ρ submodes, but with only 140 ± 28 events above background could not determine them with much accuracy. We omit those measurements here; they are in our 2008 Review (Physics Letters **B667** 1 (2008)).

1 LI 21G reports $[\Gamma(D^0 \rightarrow \phi(1020)\eta)/\Gamma(D^0 \rightarrow K^-\pi^+\eta)] \times [\text{B}(\phi(1020) \rightarrow K^+K^-)] = (4.82 \pm 0.23 \pm 0.16) \times 10^{-3}$ which we divide by our best value $\text{B}(\phi(1020) \rightarrow K^+K^-) = (49.1 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. $\Gamma(K^+K^-\eta \text{ nonresonant})/\Gamma(K^-\pi^+\eta)$ Γ_{230}/Γ_{94}

Doubly Cabibbo-suppressed / Mixing modes

$\Gamma(K^+ \ell^- \bar{\nu}_\ell \text{ via } \bar{D}^0)/\Gamma(K^- \ell^+ \nu_\ell)$		Γ_{272}/Γ_{18}		
VALUE	CL%	DOCUMENT ID	TECN	COMMENT
$< 6.1 \times 10^{-4}$	90	¹ BITENC	08 BELL	$e^+ e^-$, 10.58 GeV
$<50 \times 10^{-4}$	90	² AITALA	96C E791	π^- nucleus, 500 GeV

• • • We do not use the following data for averages, fits, limits, etc. • • •

¹ The BITENC 08 right-sign sample includes about 15% of $D^0 \rightarrow K^- \pi^0 \ell^+ \nu_\ell$ and other decays.
² AITALA 96c uses $D^{*+} \rightarrow D^0 \pi^+$ (and charge conjugate) decays to identify the charm at production and $D^0 \rightarrow K^- \ell^+ \nu_\ell$ (and charge conjugate) decays to identify the charm at decay.

$$\Gamma(K^+ \text{ or } K^*(892)^+ e^- \bar{\nu}_e \text{ via } \bar{D}^0) / [\Gamma(K^- e^+ \nu_e) + \Gamma(K^*(892)^- e^+ \nu_e)]$$

This is a limit on R_M without the complications of possible doubly Cabibbo-suppressed decays that occur when using hadronic modes. The experiments use $D^{*+} \rightarrow D^0 \pi^+$ (and charge conjugate) decays to identify the charm at production and the charge of the e to identify the charm at decay. These limits do not allow CP violation. For the limits on $|m_1 - m_2|$ and $(\Gamma_1 - \Gamma_2)/\Gamma$ that come from the best mixing limit, see near the beginning of these D^0 Listings.

$0.194 \pm 0.006 \pm 0.009$	1254	TAJIMA	04 BELL	$e^+ e^-$ at $\Upsilon(4S)$

This is R , the time-integrated wrong-sign rate compared to the right-sign rate. See the note on " D^0 - \bar{D}^0 Mixing," near the start of the D^0 Listings.

The experiments here use the charge of the pion in $D^*(2010)^\pm \rightarrow (D^0 \text{ or } \bar{D}^0) \pi^\pm$ decay to tell whether a D^0 or a \bar{D}^0 was born. The $D^0 \rightarrow K^+ \pi^-$ decay can occur directly by doubly Cabibbo-suppressed (DCS) decay, or indirectly by $D^0 \rightarrow \bar{D}^0$ mixing followed by $\bar{D}^0 \rightarrow K^+ \pi^-$ decay. Some of the experiments can use the decay-time information to disentangle the two mechanisms. Here, we list the experimental branching ratio, which if there is no mixing is the DCS ratio. See the next data block for values of the DCS ratio R_D , and the following data block for limits on the mixing ratio R_M . See the section on CP -violating asymmetries near the end of this D^0 Listing for values of A_D , and the note on " D^0 - \bar{D}^0 Mixing" for limits on x' and y' .

Some early limits have been omitted from this Listing; see our 1998 edition (The European Physical Journal **C3** 1 (1998)) and our 2006 edition (Journal of Physics **G33** 1 (2006)).

WEIGHTED AVERAGE
3.45 ± 0.06 (Error scaled by 1.5)

- 1 This AAIJ 18K value is for direct and indirect CP violation allowed. The value is the same if either one or the other is not allowed, but in each case the error then is $(0.028 \pm 0.014) \times 10^{-3}$.
- 2 Based on 976 fb^{-1} of data collected at $Y(nS)$ resonances. Assumes no CP violation.
- 3 Based on 9.6 fb^{-1} of data collected at the Tevatron. Assumes no CP violation.
- 4 Result is the same whether or not CP violation is allowed.
- 5 This ZHANG 06 assumes no CP violation.
- 6 This LINK 05H result allows CP violation. Allowing mixing but not CP violation, $R_D = (3.81^{+1.67}_{-1.63} \pm 0.92) \times 10^{-3}$.
- 7 This GODANG 00 result allows CP violation.
- 8 The result was established with D^0 from prompt and secondary D^* assuming no CPV or no direct CPV .
- 9 Based on 3 fb^{-1} of data collected at $\sqrt{s} = 7, 8$ TeV. Assumes no CP violation.
- 10 Based on 1 fb^{-1} of data collected at $\sqrt{s} = 7$ TeV in 2011. Assumes no CP violation.

$\Gamma(K^+\pi^- \text{ via } \bar{D}^0)/\Gamma(K^-\pi^+)$ Γ_{276}/Γ_{37}

This is R_M in the note on " D^0 - \bar{D}^0 Mixing" near the start of the D^0 Listings. The experiments here (1) use the charge of the pion in $D^*(2010)^\pm \rightarrow (D^0 \text{ or } \bar{D}^0) \pi^\pm$ decay to tell whether a D^0 or a \bar{D}^0 was born; and (2) use the decay-time distribution to disentangle doubly Cabibbo-suppressed decay and mixing. For the limits on $|m_1 - m_2|$ and $(\Gamma_1 - \Gamma_2)/\Gamma$ that come from the best mixing limit, see near the beginning of these D^0 Listings.

$\Gamma(2K^- e^+ \mu^+)/\Gamma_{total}$ Γ_{336}/Γ
A test of lepton-number conservation.

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data points like 5.8×10^{-7} and 5.7×10^{-5} with associated experiments like LEES, AITALA.

$\Gamma(pe^-)/\Gamma_{total}$ Γ_{337}/Γ
A test of baryon- and lepton-number conservation.

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data point 1.0×10^{-5} from RUBIN 09.

$\Gamma(\bar{p}e^+)/\Gamma_{total}$ Γ_{338}/Γ
A test of baryon- and lepton-number conservation.

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data point 1.1×10^{-5} from RUBIN 09.

D⁰ CP-VIOLATING DECAY-RATE ASYMMETRIES

This is the difference between D⁰ and D⁰ partial widths for the decay to state f, divided by the sum of the widths:
 $A_{CP}(f) = [\Gamma(D^0 \to f) - \Gamma(\bar{D}^0 \to \bar{f})] / [\Gamma(D^0 \to f) + \Gamma(\bar{D}^0 \to \bar{f})]$.

$A_{CP}(K^+ K^-)$ in D⁰, D⁰ → K⁺ K⁻

Table with columns: VALUE (%), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data points like 0.04 ± 0.12 ± 0.10 and -0.07 ± 0.11 OUR AVERAGE.

- We do not use the following data for averages, fits, limits, etc. •••
- 1 See also "D⁰ CP-violating asymmetry differences" at the end of the CP-violating asymmetries.
- 2 AUBERT 08m uses corrected numbers of events directly, not ratios with K[±]π[±] events.
- 3 STARIC 08 uses D⁰ → K⁻π⁺ and D⁰ → K⁺π⁻ decays to correct for detector-induced asymmetries.
- 4 AITALA 98c, LINK 00b, CSORNA 02, and ACOSTA 05c measure N(D⁰ → K⁺K⁻)/N(D⁰ → K⁻π⁺), the ratio of numbers of events observed, and similarly for the D⁰.

$A_{CP}(K_S^0 K_S^0)$ in D⁰, D⁰ → K_S⁰ K_S⁰

Table with columns: VALUE (%), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data points like -1.9 ± 1.1 OUR AVERAGE and -3.1 ± 1.2 ± 0.5.

- We do not use the following data for averages, fits, limits, etc. •••
- 1 AAIJ 21x reports a value of (-3.1 ± 1.2 ± 0.4 ± 0.2) × 10⁻² where the third uncertainty is from A_{CP}(K⁺K⁻) = 0.04 ± 0.12 ± 0.10%, as measured by LHCb. We have added the systematic uncertainties in quadrature. Supersedes AAIJ 18av.
- 2 The systematic uncertainty is dominated by the uncertainty on A_{CP} in the control channel D⁰ → K_S⁰π⁰.

$A_{CP}(\pi^+ \pi^-)$ in D⁰, D⁰ → π⁺ π⁻

Table with columns: VALUE (%), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data points like 0.13 ± 0.14 OUR AVERAGE and 0.07 ± 0.14 ± 0.11.

- We do not use the following data for averages, fits, limits, etc. •••
- 1 AAIJ 17m value combines ΔA_{CP}(ππ, KK) from AAIJ 16d, A_{CP}(KK) from AAIJ 17M, and A_{CP}(ππ) from AAIJ 14AK.
- 2 See also "D⁰ CP-violating asymmetry differences" at the end of the CP-violating asymmetries.
- 3 AUBERT 08m uses corrected numbers of events directly, not ratios with K[±]π[±] events.
- 4 STARIC 08 uses D⁰ → K⁻π⁺ and D⁰ → K⁺π⁻ decays to correct for detector-induced asymmetries.
- 5 AITALA 98c, LINK 00b, CSORNA 02, and ACOSTA 05c measure N(D⁰ → π⁺π⁻)/N(D⁰ → K⁻π⁺), the ratio of numbers of events observed, and similarly for the D⁰.
- 6 AAIJ 14AK uses ΔA_{CP}(ππ, KK) and A_{CP}(KK) reported in the same paper.

$A_{CP}(\pi^0 \pi^0)$ in D⁰, D⁰ → π⁰ π⁰

Table with columns: VALUE (%), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data points like 0.0 ± 0.6 OUR AVERAGE and -0.03 ± 0.64 ± 0.10.

$A_{CP}(\rho \gamma)$ in D⁰, D⁰ → ρ γ

Table with columns: VALUE (units 10⁻²), DOCUMENT ID, TECN, COMMENT. Includes data point 5.6 ± 15.2 ± 0.6.

$A_{CP}(\phi \gamma)$ in D⁰, D⁰ → φ γ

Table with columns: VALUE (units 10⁻²), DOCUMENT ID, TECN, COMMENT. Includes data point -9.4 ± 6.6 ± 0.1.

$A_{CP}(K^*(892)^0 \gamma)$ in D⁰, D⁰ → K^{*}(892)⁰ γ

Table with columns: VALUE (units 10⁻²), DOCUMENT ID, TECN, COMMENT. Includes data point -0.3 ± 2.0 ± 0.0.

$A_{CP}(\pi^+ \pi^- \pi^0)$ in D⁰, D⁰ → π⁺ π⁻ π⁰

- 8.0 ± 7.7	0.8k	7 LI	05A BELL	See ZHANG 06

1 Based on 3 fb⁻¹ of data collected at $\sqrt{s} = 7, 8$ TeV. Allowing for CP violation, the direct CP-violation in mixing is reported for the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
 2 The CPV is derived from $A_{CP} = (R_D^- - R_D^0)/(R_D^+ + R_D^0)$.
 3 This ZHANG 06 result allows mixing.
 4 This LINK 05H result assumes no mixing. If mixing is allowed, it becomes $0.13^{+0.33}_{-0.25} \pm 0.10$.
 5 This AUBERT 03Z limit assumes no mixing. If mixing is allowed, the 95% confidence-level interval is $(-2.8 < A_D < 4.9) \times 10^{-3}$.
 6 This GODANG 00 result assumes no D^0 - \bar{D}^0 mixing and becomes $-0.43 < A_{CP} < +0.34$ at 95% CL. If mixing is allowed $A_{CP} = -0.01^{+0.16}_{-0.17} \pm 0.01$.
 7 This LI 05A result allows mixing.

$A_{CP}(K^- \pi^+)$ in $D_{CP(\pm 1)} \rightarrow K^\mp \pi^\pm$

$A_{CP}(K^- \pi^+) = [B(D_{CP(-)} \rightarrow K^- \pi^+ + c.c.) - B(D_{CP(+)} \rightarrow K^- \pi^+ + c.c.)] / \text{Sum}$

	1 ABLIKIM	14c BES3	e ⁺ e ⁻ → D ⁰ \bar{D}^0 , 3.77 GeV

1 ABLIKIM 14c uses quantum correlations in e⁺e⁻ → D⁰ \bar{D}^0 at the $\psi(3770)$ to measure the asymmetry of the branching fraction of D⁰ → K⁻π⁺ in CP-odd and CP-even eigenstates. It then extracts the strong-phase difference $\delta_{K\pi}$.

$A_{CP}(K^\mp \pi^\pm \pi^0)$ in $D^0 \rightarrow K^- \pi^+ \pi^0, \bar{D}^0 \rightarrow K^+ \pi^- \pi^0$

 D^0 CP-EVEN FRACTIONS

The CP -even fraction F_{\pm} , defined for self-conjugate final states, like the coherence factor is useful for measuring the unitary triangle angle γ in $B \rightarrow DK$ decays. A purely CP -even state has $F_{\pm} = 1$, a CP -odd one has $F_{\pm} = 0$. For details, see NAYAK 15.

D⁰ CP-VIOLATING ASYMMETRY DIFFERENCES

$\Delta A_{CP} = A_{CP}(K^+ K^-) - A_{CP}(\pi^+ \pi^-)$

CP violation in these modes can come from the decay amplitudes (direct) and/or from mixing or interference of mixing and decay (indirect). The difference ΔA_{CP} is primarily sensitive to the direct component, and only retains a second-order dependence on the indirect component for measurements where the mean decay time of the $K^+ K^-$ and $\pi^+ \pi^-$ samples are not identical. The results below are averaged assuming the indirect component can be neglected.

¹ Calculated from the AUBERT 08M values of $A_{CP}(K^+ K^-)$ and $A_{CP}(\pi^+ \pi^-)$. The systematic error here combines the systematic errors in quadrature, and therefore somewhat over-estimates it.

D⁰ TESTS OF LOCAL CP-VIOLATION (CPV)

We list model-independent searches for local CP violation in phase-space distributions of multi-body decays.

Most of these searches divide phase space (Dalitz plot for 3-body decays, five-dimensional equivalent for 4-body decays) into bins, and perform a χ^2 test comparing normalised yields N_i, \bar{N}_i in CP-conjugate bin pairs i : $\chi^2 = \sum_i (N_i - \alpha \bar{N}_i) / \sigma(N_i - \alpha \bar{N}_i)$. The factor $\alpha = (\sum_i N_i) / (\sum_i \bar{N}_i)$ removes the dependence on phase-space-integrated rate asymmetries. The result is used to obtain the probability (p-value) to obtain the measured χ^2 or larger under the assumption of CP conservation [AUBERT 08Ao, BEDIAGA 09]. Alternative methods obtain p-values from other test variables based on unbinned analyses [WILLIAMS 11, AAIJ 14c]. Results can be combined using Fisher's method [MOSTELLER 48].

CP VIOLATING ASYMMETRIES OF P-ODD (T-ODD) MOMENTS

The CP-sensitive P-odd (T -odd) correlation in D^0, \bar{D}^0 decays. The D^0 and \bar{D}^0 are distinguished by the charge of the parent D^* : $D^{*+} \rightarrow D^0 \pi^+$ and $D^{*-} \rightarrow \bar{D}^0 \pi^-$.

$A_{Tviol}(K^+ K^- \pi^+ \pi^-)$ in $D^0, \bar{D}^0 \rightarrow K^+ K^- \pi^+ \pi^-$

$C_T \equiv \bar{p}_{K^+} \cdot (\bar{p}_{\pi^+} \times \bar{p}_{\pi^-})$ is a parity-odd correlation of the K^+ , π^+ , and π^- momenta (evaluated in the D^0 rest frame) for the D^0 . $\bar{C}_T \equiv \bar{p}_{K^-} \cdot (\bar{p}_{\pi^-} \times \bar{p}_{\pi^+})$ is the corresponding quantity for the \bar{D}^0 . Then $A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T \leq 0)] / [\Gamma(C_T > 0) + \Gamma(C_T \leq 0)]$, and $\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T \leq 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T \leq 0)]$, and $A_{Tviol} \equiv \frac{1}{2}(A_T - \bar{A}_T)$. C_T and \bar{C}_T are commonly referred to as T -odd moments, because they are odd under T reversal. However, the T -conjugate process $K^+ K^- \pi^+ \pi^- \rightarrow D^0$ is not accessible, while the P -conjugate process is.

¹ PRASANTH 17 also measures A_{Tviol} in sub-regions of the $D^0 \rightarrow K_S \pi^+ \pi^- \pi^0$ phase-space. No evidence of T violation is found.

D⁰ CPT-VIOLATING DECAY-RATE ASYMMETRIES

$A_{CPT}(K^\mp \pi^\pm)$ in $D^0 \rightarrow K^- \pi^+, \bar{D}^0 \rightarrow K^+ \pi^-$

$A_{CPT}(t)$ is defined in terms of the time-dependent decay probabilities $P(D^0 \rightarrow K^- \pi^+)$ and $\bar{P}(\bar{D}^0 \rightarrow K^+ \pi^-)$ by $A_{CPT}(t) = (\bar{P} - P) / (\bar{P} + P)$. For small mixing parameters $x \equiv \Delta m / \Gamma$ and $y \equiv \Delta \Gamma / 2\Gamma$ (as is the case), and times t , $A_{CPT}(t)$ reduces to $[y \operatorname{Re} \xi - x \operatorname{Im} \xi] / \Gamma t$, where ξ is the CPT-violating parameter.

The following is actually $y \operatorname{Re} \xi - x \operatorname{Im} \xi$.

$\bar{D}^{*0}(2007)^0$ modes are charge conjugates of modes below.

Mode	Fraction (Γ_i/Γ)
Γ_1 $D^0\pi^0$	(64.7 ± 0.9) %
Γ_2 $D^0\gamma$	(35.3 ± 0.9) %
Γ_3 $D^0e^+e^-$	(3.91 ± 0.33) × 10 ⁻³

CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 5 measurements and one constraint to determine 2 parameters. The overall fit has a $\chi^2 = 2.5$ for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$$x_2 \begin{bmatrix} -100 \\ x_1 \end{bmatrix}$$

$D_0^*(2300)$

$$I(J^P) = \frac{1}{2}(0^+)$$

was $D_0^*(2400)$

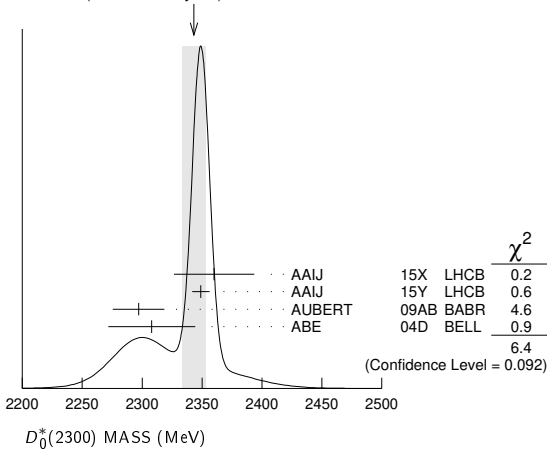

There is a strong evidence that recent data on $B \rightarrow D\pi\pi$ (AAIJ 15Y, AAIJ 16AH) and $B \rightarrow D\pi K$ (AAIJ 14BH, AAIJ 15V, AAIJ 15X) call for two poles in the scalar $I = 1/2$ πD amplitude in this mass range. The data are consistent with a lower pole at $(2105^{+6}_{-8}) - i(102^{+10}_{-11})$ MeV and a higher pole at $(2451^{+35}_{-26}) - i(134^{+7}_{-8})$ MeV (DU 18A, DU 19, DU 21). For details see review on "Heavy Non- $q\bar{q}$ Mesons."

2425 ± 3	235	⁶ ABREU	98M DLPH	0	$e^+ e^- \rightarrow D^{*+} \pi^- X$

- From a full four-body amplitude analysis of the $B^- \rightarrow D^{*+} \pi^- \pi^-$ decay.
- From the combined fit of the $M(D^+ \pi^-)$ and $M(D^{*+} \pi^-)$ distributions. and A_{D_2} fixed to the theoretical prediction of -1.
- From the fit of the $M(D^0 \pi^+)$ distribution. The widths of the D_1^+ and D_2^{*+} are fixed to 25 MeV and 37 MeV, and A_{D_1} and A_{D_2} are fixed to the theoretical predictions of 3 and -1, respectively.
- Fit includes the contribution from $D_1^*(2430)^0$.
- Calculated using the mass difference $m(D_1^0) - m(D^{*+})_{PDG}$ reported below and $m(D^{*+})_{PDG} = 2010.27 \pm 0.17$ MeV. The 0.17 MeV uncertainty of the PDG mass value should be added to the experimental uncertainty of 0.9 MeV.

⁶ No systematic error given.

$D_1(2420)$ POLARIZATION AMPLITUDE A_{D_1}

A polarization amplitude A_{D_1} is a parameter that depends on the initial polarization of the D_1 and is sensitive to a possible S-wave contribution to its decay. For D_1 decays the helicity angle, θ_h , distribution varies like $1 + A_{D_1} \cos^2 \theta_h$, where θ_h is the angle in the D^* rest frame between the two pions emitted by the $D_1 \rightarrow D^* \pi$ and the $D^* \rightarrow D \pi$.

Unpolarized D_1 decaying purely via D-wave is predicted to give $A_{D_1} = 3$.

WEIGHTED AVERAGE
2461.1 ± 0.7 (Error scaled by 5.2)

$D_2^*(2460)$ mass (MeV)

- From the amplitude analysis in the model describing the $D^+ \pi^-$ wave together with virtual contributions from the $D^*(2007)^0$ and B^{*0} states, and components corresponding to the $D_2^*(2460)^0, D_1^*(2680)^0, D_3^*(2760)^0,$ and $D_2^*(3000)^0$ resonances.
- From the amplitude analysis in the model describing the $D^+ \pi^-$ wave together with virtual contributions from the $D^*(2007)^0$ and B^{*0} states, nonresonant spin-0 and spin-1 components as well as the $D_0^*(2400)^0, D_2^*(2460)^0$ and $D_3^*(2760)^0$ resonances.
- From the Dalitz plot analysis including various K^* and D^{**} mesons as well as broad structures in the $K\pi$ S-wave and the $D\pi$ S- and P-waves.
- Modeling the $\pi^+ \pi^-$ S-wave with the Isobar formalism.
- From the combined fit of the $M(D^+ \pi^-)$ and $M(D^{*+} \pi^-)$ distributions. and A_{D_2} fixed to the theoretical prediction of -1.
- From the fit of the $M(D^0 \pi^+)$ distribution. The widths of the D_1^+ and D_2^{*+} are fixed to 25 MeV and 37 MeV, and A_{D_1} and A_{D_2} are fixed to the theoretical predictions of 3 and -1, respectively.
- At a fixed width of 50.5 MeV.
- Fit includes the contribution from $D_0^*(2400)^0$.
- Modeling the $\pi^+ \pi^-$ S-wave with the K-matrix formalism.
- Calculated using the mass difference $m(D_2^{*0}) - m(D^{*+})_{PDG}$ reported below and $m(D^{*+})_{PDG} = 2010.27 \pm 0.17$ MeV. The 0.17 MeV uncertainty of the PDG mass value should be added to the experimental uncertainty of ± 1.2 MeV.
- Fit includes the contribution from $D_0^*(2400)^{\pm}$. Not independent of the corresponding mass difference measurement, $(m_{D_2^*(2460)^{\pm}} - (m_{D_2^*(2460)^0})$.
- No systematic error given.

See key on page 1127

Meson Particle Listings

D_s^\pm

CHARMED, STRANGE MESONS ($C = \pm 1, S = \pm 1$) (including possibly non- $q\bar{q}$ states)

$$D_s^+ = c\bar{s}, D_s^- = \bar{c}s, \text{ similarly for } D_s^{*\prime}s$$

D_s^\pm

$$I(J^P) = 0(0^-)$$

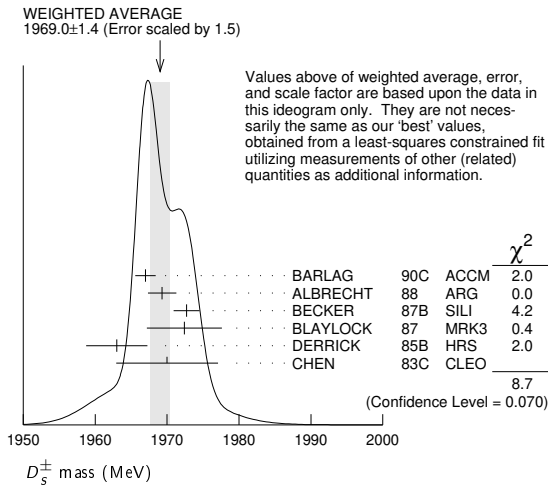

The angular distributions of the decays of the ϕ and $\bar{K}^*(892)^0$ in the $\phi\pi^+$ and $K^+\bar{K}^*(892)^0$ modes strongly indicate that the spin is zero. The parity given is that expected of a $c\bar{s}$ ground state.

D_s^\pm MASS

The fit includes $D^\pm, D^0, D_s^\pm, D^{*\pm}, D^{*0}, D_1^*(2420)^0, D_2^*(2460)^0,$ and $D_{s1}(2536)^\pm$ mass and mass difference measurements. Measurements of the D_s^\pm mass with an error greater than 10 MeV are omitted from the fit and average. A number of early measurements have been omitted altogether.

¹This AAIJ 17AN value is derived from the difference between the D_s^- and D^- widths.

The 3rd uncertainty, $\pm 1.7 \times 10^{-15}$ s, arises from the uncertainty of the D^- width.

²BONVICINI 99 obtains 1.19 ± 0.04 for the ratio of D_s^+ to D^0 lifetimes.

D_s^\pm DECAY MODES

Unless otherwise noted, the branching fractions for modes with a resonance in the final state include all the decay modes of the resonance. D_s^\pm modes are charge conjugates of the modes below.

Mode	Fraction (Γ_i/Γ)	Scale factor/ Confidence level
Inclusive modes		
Γ_1 e^+ semileptonic	[a] (6.33 ± 0.15) %	
Γ_2 π^+ anything	(119.3 ± 1.4) %	
Γ_3 π^- anything	(43.2 ± 0.9) %	
Γ_4 π^0 anything	(123 ± 7) %	
Γ_5 K^- anything	(18.7 ± 0.5) %	
Γ_6 K^+ anything	(28.9 ± 0.7) %

Meson Particle Listings

 D_s^\pm

- [a] This is the purely e^+ semileptonic branching fraction: the e^+ fraction from τ^+ decays has been subtracted off. The sum of our (non- τ) e^+ exclusive fractions — an $e^+\nu_e$ with an η , η' , ϕ , K^0 , or K^{*0} — is $5.99 \pm 0.31\%$.
- [b] This fraction includes η from η' decays.
- [c] The sum of our exclusive η' fractions — $\eta' e^+\nu_e$, $\eta' \mu^+\nu_\mu$, $\eta' \pi^+$, $\eta' \rho^+$, and $\eta' K^+$ — is $11.8 \pm 1.6\%$.
- [d] This branching fraction includes all the decay modes of the final-state resonance.
- [e] A test for $u\bar{u}$ or $d\bar{d}$ content in the D_s^+ . Neither Cabibbo-favored nor Cabibbo-suppressed decays can contribute, and ω - ϕ mixing is an unlikely explanation for any fraction above about 2×10^{-4} .
- [f] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.
- [g] We decouple the $D_s^+ \rightarrow \phi\pi^+$ branching fraction obtained from mass projections (and used to get some of the other branching fractions) from the $D_s^+ \rightarrow \phi\pi^+$, $\phi \rightarrow K^+K^-$ branching fraction obtained from the Dalitz-plot analysis of $D_s^+ \rightarrow K^+K^-\pi^+$. That is, the ratio of these two branching fractions is not exactly the $\phi \rightarrow K^+K^-$ branching fraction 0.491.
- [h] This is the average of a model-independent and a K -matrix parametrization of the $\pi^+\pi^-$ S -wave and is a sum over several f_0 mesons.
- [i] This mode is not a useful test for a $\Delta C=1$ weak neutral current because both quarks must change flavor in this decay.
- [j] This is *not* a test for the $\Delta C=1$ weak neutral current, but leads to the $\pi^+\ell^+\ell^-$ final state.

CONSTRAINED FIT INFORMATION

An overall fit to 13 branching ratios uses 21 measurements and one constraint to determine 10 parameters. The overall fit has a $\chi^2 = 11.6$ for 12 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

D_s^+ Branching Fractions

 D_s^+ BRANCHING RATIOS

A number of older, now obsolete results have been omitted. They may be found in earlier editions.

Inclusive modes

$\Gamma(e^+ \text{ semileptonic}) / \Gamma_{\text{total}}$	Γ_1 / Γ			
This is the purely e^+ semileptonic branching fraction: the e^+ fraction from τ^+ decays has been subtracted off.				
VALUE (%)	EVTS	DOCUMENT ID	TECN	COMMENT
6.33 ± 0.15 OUR AVERAGE				
6.30 ± 0.13 ± 0.10	17k	^{1,2} ABLIKIM	21AC BES3	e^+e^- at 4.178–4.230 GeV
6.52 ± 0.39 ± 0.15	0.5k	³ ASNER	10 CLEO	e^+e^- at 3774 MeV

- ¹ ABLIKIM 21AC finds that the ratio of the D_s^+ and D^0 semielectronic widths is $0.790 \pm 0.016 \pm 0.020$.
- ² ABLIKIM 21AC reports a value of $(6.30 \pm 0.13 \pm 0.09 \pm 0.04) \times 10^{-2}$, where the last uncertainty is an external systematic from $B(D_s^+ \rightarrow \tau\nu)$. We have added the systematic uncertainties in quadrature.
- ³ Using the D_s^+ and D^0 lifetimes, ASNER 10 finds that the ratio of the D_s^+ and D^0 semileptonic widths is $0.828 \pm 0.051 \pm 0.025$.

6.8 ± 1.1 ± 1.8 553 6 HEISTER 02I ALEP Z decays

1 ABLIKIM 16o also reports that when constrained by the Standard Model ratio of $\Gamma(D_s^+ \to \tau^+ \nu_\tau)/\Gamma(D_s^+ \to \mu^+ \nu_\mu) = 9.76$, the branching fraction is found to be (0.495 ± 0.067 ± 0.026)%. The constrained value is used to obtain the decay constant, $f_{D_s^+} = (241.0 \pm 16.3 \pm 6.6)$ MeV.
2 ZUPANC 13 uses both $\mu^+ \nu$ and $\tau^+ \nu$ events to get $f_{D_s} = (255.5 \pm 4.2 \pm 5.1)$ MeV.
3 DEL-AMO-SANCHEZ 10J uses $\mu^+ \nu_\mu$ and $\tau^+ \nu_\tau$ events together to get $f_{D_s} = (258.6 \pm 6.4 \pm 7.5)$ MeV.
4 WIDHALM 08 gets $f_{D_s} = (275 \pm 16 \pm 12)$ MeV from the branching fraction.
5 PEDLAR 07A also fits μ^+ and τ^+ events together and gets an effective $\mu^+ \nu_\mu$ branching fraction of (6.38 ± 0.59 ± 0.33) × 10^-3
6 This HEISTER 02i result is not actually an independent measurement of the absolute $\mu^+ \nu_\mu$ branching fraction, but is in fact based on our $\phi \pi^+$ branching fraction of 3.6 ± 0.9%, so it cannot be included in our overall fit. HEISTER 02i combines its $D_s^+ \to \tau^+ \nu_\tau$ and $\mu^+ \nu_\mu$ branching fractions to get $f_{D_s} = (285 \pm 19 \pm 40)$ MeV.

Table with 5 columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Row 1: 0.143 ± 0.018 ± 0.006 489 ± 55 1 AUBERT 07v BABR e+ e- ≈ $\Upsilon(4S)$

0.23 ± 0.06 ± 0.04 18 2 ALEXANDROV 00 BEAT π- nucleus, 350 GeV
0.173 ± 0.023 ± 0.035 182 3 CHADHA 98 CLE2 e+ e- ≈ $\Upsilon(4S)$
0.245 ± 0.052 ± 0.074 39 4 ACOSTA 94 CLE2 See CHADHA 98
1 AUBERT 07v gets $f_{D_s^+} = (283 \pm 17 \pm 16)$ MeV, using $\Gamma(D_s^+ \to \phi \pi^+)/\Gamma(\text{total}) = (4.71 \pm 0.46)\%$.
2 ALEXANDROV 00 uses $f_D^2/f_{D_s}^2 = 0.82 \pm 0.09$ from a lattice-gauge-theory calculation to get the relative numbers of $D^+ \to \mu^+ \nu_\mu$ and $D_s^+ \to \mu^+ \nu_\mu$ events. The present result leads to $f_{D_s} = (323 \pm 44 \pm 36)$ MeV.
3 CHADHA 98 obtains $f_{D_s} = (280 \pm 19 \pm 28 \pm 34)$ MeV from this measurement, using $\Gamma(D_s^+ \to \phi \pi^+)/\Gamma(\text{total}) = 0.036 \pm 0.009$.
4 ACOSTA 94 obtains $f_{D_s} = (344 \pm 37 \pm 52 \pm 42)$ MeV from this measurement, using $\Gamma(D_s^+ \to \phi \pi^+)/\Gamma(\text{total}) = 0.037 \pm 0.009$.

7.4 ± 2.8 ± 2.4 16 11 ACCIARRI 97F L3 D_s^{*+} → γ D_s^+ from Z's

1 ABLIKIM 21F uses τ+ → π+ π0 ν decays.
2 ABLIKIM 21AZ uses τ+ → e+ νe ντ decays.
3 ABLIKIM 21BE uses τ+ → e+ νe ντ decays. When constrained by the Standard Model ratio of $\Gamma(D_s^+ \to \tau^+ \nu_\tau)/\Gamma(D_s^+ \to \mu^+ \nu_\mu) = 9.75$, the branching fraction is found to be (5.22 ± 0.10 ± 0.14)%.
4 ABLIKIM 16o also reports that when constrained by the Standard Model ratio of $\Gamma(D_s^+ \to \tau^+ \nu_\tau)/\Gamma(D_s^+ \to \mu^+ \nu_\mu) = 9.76$; the branching fraction is found to be (4.83 ± 0.65 ± 0.26)%.
5 ZUPANC 13 uses both μ+ ν and τ+ ν events to get $f_{D_s} = (255.5 \pm 4.2 \pm 5.1)$ MeV.
6 DEL-AMO-SANCHEZ 10J (with a small correction; see LEES 15D) uses μ+ νμ and τ+ ντ events together to get $f_{D_s} = (259.9 \pm 6.6 \pm 7.6)$ MeV.
7 ALEXANDER 09, NAIK 09A, and ONYISI 09 use different τ decay modes and are independent. The three papers combined give $f_{D_s} = (259.7 \pm 7.8 \pm 3.4)$ MeV.
8 ECKLUND 08 and PEDLAR 07A are independent; ECKLUND 08 uses τ+ → e+ νe ντ events, PEDLAR 07A uses τ+ → π+ ντ events.
9 HEISTER 02i combines its D_s^+ → τ+ ντ and μ+ νμ branching fractions to get $f_{D_s} = (285 \pm 19 \pm 40)$ MeV.
10 This ABBIENDI 01L value gives a decay constant f_{D_s} of (286 ± 44 ± 41) MeV.
11 The second ACCIARRI 97F error here combines in quadrature systematic (0.016) and normalization (0.018) errors. The branching fraction gives $f_{D_s} = (309 \pm 58 \pm 33 \pm 38)$ MeV.

Table with 5 columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Row 1: 10.73 ± 0.69 ± 0.56 -0.53 2.2k/492 1 ZUPANC 13 BELL e+ e- at $\Upsilon(4S)$, $\Upsilon(5S)$

11.0 ± 1.4 ± 0.6 102 2 ECKLUND 08 CLEO See ONYISI 09
1 This ZUPANC 13 ratio is not independent of the separate τν and μν fractions listed above.
2 This ECKLUND 08 value also uses results from PEDLAR 07A, and it is not independent of other results in these Listings. Combined with earlier CLEO results, the decay constant f_{D_s} is 274 ± 10 ± 5 MeV.

 $\Gamma(\phi\pi^+)/\Gamma_{\text{total}}$ Γ_{40}/Γ

The results here are model-independent. For earlier, model-dependent results, see our PDG 06 edition. We decouple the $D_s^+ \rightarrow \phi\pi^+$ branching fraction obtained from mass projections (and used to get some of the other branching fractions) from the $D_s^+ \rightarrow \phi\pi^+$, $\phi \rightarrow K^+ K^-$ branching fraction obtained from the Dalitz-plot analysis of $D_s^+ \rightarrow \phi\pi^+$. That is, the ratio of these two branching fractions is not exactly the $\phi \rightarrow K^+ K^-$ branching fraction 0.491.

$3.59 \pm 0.77 \pm 0.48$		³ ARTUSO	96	CLE2 e^+e^- at $\Upsilon(4S)$

••• We do not use the following data for averages, fits, limits, etc. •••

3.9 $^{+5.1}_{-1.9} \pm 1.8$ ⁴BAI 95c BES e^+e^- 4.03 GeV

¹ This AUBERT 06N measurement uses $\bar{B}^0 \rightarrow D_s^{(*)-} D^{(*)+}$ and $B^- \rightarrow D_s^{(*)-} D^{(*)+}$ decays, including some from other papers. However, the result is independent of AUBERT 05V.

²AUBERT 05v uses the ratio of $B^0 \rightarrow D^{*-} D_S^{*+}$ events seen in two different ways, in both of which the $D^{*-} \rightarrow \bar{D}^0 \pi^-$ decay is fully reconstructed: (1) The $D_S^{*+} \rightarrow D_S^+ \gamma$, $D_S^+ \rightarrow \phi \pi^+$ decay is fully reconstructed. (2) The number of events in the D_S^+ peak in the missing mass spectrum against the D^{*-} is measured.

³ARTUSO 96 uses partially reconstructed $\bar{B}^0 \rightarrow D^{*+} D_S^{*-}$ decays to get a model-independent value for $\Gamma(D_S^- \rightarrow \phi \pi^-)/\Gamma(D^0 \rightarrow K^- \pi^+)$ of $0.92 \pm 0.20 \pm 0.11$.

⁴BAI 95c uses $e^+ e^- \rightarrow D_S^+ D_S^-$ events in which one or both of the D_S^\pm are observed to obtain the first model-independent measurement of the $D_S^+ \rightarrow \phi \pi^+$ branching fraction, without assumptions about $\sigma(D_S^\pm)$. However, with only two “doubly-tagged” events, the statistical error is very large.

$\Gamma(\phi \pi^+, \phi \rightarrow K^+ K^-)/\Gamma(K^+ K^- \pi^+)$ Γ₄₁/Γ₃₉

This is the “fit fraction” from the Dalitz-plot analysis. We decouple the $D_S^+ \rightarrow \phi \pi^+$ branching fraction obtained from mass projections (and used to get some of the other branching fractions) from the $D_S^+ \rightarrow \phi \pi^+, \phi \rightarrow K^+ K^-$ branching fraction obtained from the Dalitz-plot analysis of $D_S^+ \rightarrow K^+ K^- \pi^+$. That is, the ratio of these two branching fractions is not exactly the $\phi \rightarrow K^+ K^-$ branching fraction 0.491.

$\Gamma(\pi^+(\pi^+\pi^-)_{S\text{-wave}})/\Gamma(2\pi^+\pi^-)$ Γ_{78}/Γ_{76}

This is the "fit fraction" from the Dalitz-plot analysis. See also KLEMP 08, which uses 568 $D_s^+ \rightarrow 3\pi$ decays (over 280 background events) from FNAL E791 to study various parametrizations of the decay amplitudes. The emphasis there is more on S-wave $\pi\pi$ decay products — 20 different solutions are given — than on D_s^+ fit fractions.

 $D_s^+ - D_s^-$ CP-VIOLATING DECAY-RATE ASYMMETRIES

This is the difference between D_s^+ and D_s^- partial widths for the decay to state f , divided by the sum of the widths:

$$A_{CP}(f) = [\Gamma(D_s^+ \rightarrow f) - \Gamma(D_s^- \rightarrow \bar{f})] / [\Gamma(D_s^+ \rightarrow f) + \Gamma(D_s^- \rightarrow \bar{f})].$$

CP VIOLATING ASYMMETRIES OF P-ODD (T-ODD) MOMENTS

$A_{Tviol}(K_S^0 K^\pm \pi^+ \pi^-)$ in $D_s^\pm \rightarrow K_S^0 K^\pm \pi^+ \pi^-$

$C_T \equiv \bar{p}_{K^+} \cdot (\bar{p}_{\pi^+} \times \bar{p}_{\pi^-})$ is a parity-odd correlation of the K^+ , π^+ , and π^- momenta for the D_s^+ . $\bar{C}_T \equiv \bar{p}_{K^-} \cdot (\bar{p}_{\pi^-} \times \bar{p}_{\pi^+})$ is the corresponding quantity for the D_s^- . Then

$A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] / [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$, and

$\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]$, and

$A_{Tviol} \equiv \frac{1}{2}(A_T - \bar{A}_T)$. C_T and \bar{C}_T are commonly referred to as T-odd moments, because they are odd under T reversal. However, the T-conjugate process $K_S^0 K^\pm \pi^+ \pi^- \rightarrow D_s^\pm$ is not accessible, while the P-conjugate process is.

CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 3 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 0.0$ for 1 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$$\begin{matrix} x_2 & \begin{matrix} -97 \\ -19 \end{matrix} \\ x_3 & \begin{matrix} -19 & -4 \\ x_1 & x_2 \end{matrix} \end{matrix}$$

$D_{s0}^*(2317)^\pm$

$I(J^P) = 0(0^+)$
 J, P need confirmation.

AUBERT 06P and CHOI 15A do not observe neutral and doubly charged partners of the $D_{s0}^*(2317)^\pm$. See the review on "Heavy Non- $q\bar{q}$ Mesons."

$D_{s0}^*(2317)^\pm$ MASS

The fit includes $D_s^\pm, D^0, D_s^\pm, D^{*+}, D^{*0}, D_s^{*\pm}, D_1(2420)^0, D_2^*(2460)^0$, and $D_{s1}(2536)^\pm$ mass and mass difference measurements.

CONSTRAINED FIT INFORMATION

An overall fit to 7 branching ratios uses 8 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 3.4$ for 4 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

 $D_{s1}(2536)^\pm$

$J(P) = 0(1^+)$
 J, P need confirmation.

Seen in $D^*(2010)^+ K^0, D^*(2007)^0 K^+,$ and $D_s^+ \pi^+ \pi^-$. Not seen in $D^+ K^0$ or $D^0 K^+$. $J^P = 1^+$ assignment strongly favored.

 $D_{s1}(2536)^\pm$ MASS

The fit includes $D^\pm, D^0, D_s^\pm, D^{*\pm}, D^{*0}, D_s^{*\pm}, D_1(2420)^0, D_2^*(2460)^0,$ and $D_{s1}(2536)^\pm$ mass and mass difference measurements.

¹ From a fit of the D_s^+ recoil mass distribution with an incoherent sum of the S-wave and D-wave Breit-Wigner line shapes.

² Using the $D^*(2010)^\pm$ mass of 2010.0 ± 0.4 MeV from PDG 06.

³ Calculated using $m(D^*(2010)^\pm) = 2010.0 \pm 0.5$ MeV, $m(D^*(2007)^0) = 2006.7 \pm 0.5$ MeV, and the mass difference below.

⁴ Systematic uncertainties not evaluated.

⁵ Calculated using the mass difference $m(D_{s1}^+) - m(D^{*+})$ PDG below and $m(D^{*+})$ PDG = 2010.25 ± 0.14 MeV. Assuming S-wave decay of the $D_{s1}(2536)$ to $D^{*+} K_S^0$, using a Breit-Wigner line shape corresponding to L=0.

⁶ Calculated using the mass difference $m(D_{s1}^+) - m(D^{*+})$ PDG reported below and $m(D^{*+})$ PDG = 2010.27 ± 0.17 MeV.

⁷ Calculated using $m(D^*(2007)^0) = 2006.6 \pm 0.5$ MeV and the mass difference below.

⁸ Calculated using $m(D^*(2010)^\pm) = 2010.1 \pm 0.6$ MeV and the mass difference below.

⁹ Not seen in $D^* K$.

 $m_{D_{s1}(2536)^\pm} - m_{D_s^*(2111)}$

The fit includes $D^\pm, D^0, D_s^\pm, D^{*\pm}, D^{*0}, D_s^{*\pm}, D_1(2420)^0, D_2^*(2460)^0,$ and $D_{s1}(2536)^\pm$ mass and mass difference measurements.

BOTTOM MESONS**($B = \pm 1$)** $B^+ = u\bar{b}, B^0 = d\bar{b}, \bar{B}^0 = \bar{d}b, B^- = \bar{u}b$, similarly for B^{*s} **B-particle organization**

Many measurements of B decays involve admixtures of B hadrons. Previously we arbitrarily included such admixtures in the B^\pm section, but because of their importance we have created two new sections: " B^\pm/B^0 Admixture" for $T(4S)$ results and " $B^\pm/B^0/B_S^0/b$ -baryon Admixture" for results at higher energies. Most inclusive decay branching fractions and χ_b at high energy are found in the Admixture sections. $B^0\text{-}\bar{B}^0$ mixing data are found in the B^0 section, while $B_S^0\text{-}\bar{B}_S^0$ mixing data and $B\text{-}\bar{B}$ mixing data for a B^0/B_S^0 admixture are found in the B_S^0 section. CP -violation data are found in the B^\pm, B^0 , and B^\pm/B^0 Admixture sections. b -baryons are found near the end of the Baryon section. Recently, we also created a new section: " V_{cb} and V_{ub} CKM Matrix Elements."

The organization of the B sections is now as follows, where bullets indicate particle sections and brackets indicate reviews.

[Production and Decay of *b*-flavored Hadrons]

[Production and Decay of *b*-flavored Hadrons](#)**HEAVY FLAVOR AVERAGING GROUP**

Revised June 2021 by U. Egede (Monash University) and A. Soffer (Tel Aviv University)

The Heavy Flavor Averaging Group (HFLAV) is an international collaboration of physicists from experiments measuring properties of heavy flavored particles, *i.e.*, hadrons containing b and c quarks, and τ leptons. HFLAV calculates and publishes [1] world average values of quantities such as lifetimes, branching fractions, form factors, mixing parameters, and CP -violating asymmetries. Most parameters concern decays of B and D mesons, and many are related to elements of the Cabibbo-Kobayashi-Maskawa (CKM) quark mixing matrix [2], [3].

HFLAV was originally formed in 2002 to continue the activities of the LEP Heavy Flavor Steering group. Since its inception, a wide range of results have become available from increasingly larger data sets. Consequently, HFLAV has expanded to include eight subgroups:

- b -hadron lifetimes and oscillations, including parameters of CP violation in b mixing;
- decay-time-dependent CP violation in B decays, and angles of the CKM Unitarity Triangle;
- semileptonic decays of b -hadrons ($B \rightarrow X\ell\nu$, $\ell = e, \mu, \tau$), including determinations of the CKM matrix elements $|V_{cb}|$ and $|V_{ub}|$;
- b -hadron decays to hadronic final states containing c -quarks (open charm and charmonium);
- (rarer) b -hadron decays to final states not containing c -quarks, including fully hadronic, semileptonic ($B \rightarrow X\ell\ell, X\nu\bar{\nu}$), leptonic, and radiative decays;
- CP - and T -violating asymmetries of D mesons and $D^0\text{-}\bar{D}^0$ mixing;
- c -hadron decays (hadronic, semileptonic, leptonic), properties of excited D states and charm baryons and determination of $|V_{cs}|$ and $|V_{cd}|$;
- τ -lepton physics including branching fractions, tests of lepton universality, determination of $|V_{us}|$, and searches for lepton flavor violation.

Meson Particle Listings

b -flavored hadrons, B^\pm

Each subgroup has one or two conveners and typically a half-dozen members representing experiments that conduct measurements in that area. Most groups contain representatives from the Belle II and LHCb experiments, and some groups have representatives from the ATLAS, BABAR, Belle, BESIII and CMS experiments. Members of HFLAV are appointed by their respective experimental collaborations. HFLAV has two co-leaders, who are appointed by the managements of Belle II and LHCb.

The averaging procedures used by HFLAV are similar to those of the PDG [4]. When sufficient information is available in publications when calculating world averages, common parameters used for different input measurements are adjusted (rescaled) to common values. The p -value of the fit is provided to indicate the consistency of the measurements included in the average. However, unlike the PDG, when obtaining a world average with a low p -value (*i.e.*, a large χ^2 per degree of freedom), HFLAV does not usually scale the resulting uncertainty. Rather, the systematic uncertainties of the measurements are reviewed with experts from the experiments to understand the discrepancy. Unless inconsistencies among measurements are found, no correction is made to the calculated uncertainty. Close communication between representatives of the experiments and HFLAV members who perform averages helps ensure that measurement uncertainties, known correlations, and systematic effects are properly accounted for. If a special treatment is needed to calculate an average, or if an approximation used in an average calculation might not be sufficiently accurate (*e.g.*, assuming Gaussian uncertainties when the likelihood function is non-Gaussian), a note is included in the HFLAV publication and online documentation to describe this.

In general, HFLAV uses all publicly available results that have written documentation such as a journal publication, preprint, or conference note. These include preliminary results presented at conferences and workshops. However, preliminary results that remain unpublished for an extended period of time, or for which no publication is planned, are not included. A special subset of HFLAV averages are included in the PDG listings; for these averages, only measurements that are published or accepted for publication are used. The averages provided by HFLAV are listed by the PDG as “OUR EVALUATION” with a corresponding note.

All HFLAV averages and input measurements are documented in an approximately biennial journal paper or preprint; the most recent version is Ref. [1]. The latest results and plots are posted on an extensive set of webpages that are updated several times per year; these are available at

<https://hflav.web.cern.ch>.

¹ Uses $B^+ \rightarrow J/\psi K^+$ fully reconstructed decays. ² Uses exclusively reconstructed final states containing a $J/\psi \rightarrow \mu^+\mu^-$ decays. ³ CSORNA 00 uses fully reconstructed 526 $B^+ \rightarrow J/\psi(\ell) K^+$ events and invariant masses without beam constraint. ⁴ ALBRECHT 90J assumes 10580 for $\Upsilon(4S)$ mass. Supersedes ALBRECHT 87C and ALBRECHT 87D. ⁵ Found using fully reconstructed decays with $J/\psi(1S)$. ALBRECHT 87D assume $m_{\Upsilon(4S)} = 10577$ MeV.				

B^\pm MEAN LIFE

See $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE section for data on B -hadron mean life averaged over species of bottom particles.

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

¹ Measured mean life using fully reconstructed decays ($J/\psi K^{(*)}$).

- 2 Measured using $B^- \rightarrow D^0 \pi^-$ with $D^0 \rightarrow K^- \pi^+$ events that were selected using a silicon vertex trigger.
- 3 Measurement performed using a combined fit of CP -violation, mixing and lifetimes.
- 4 Measurement performed using an inclusive reconstruction and B flavor identification technique.
- 5 Measured mean life using fully reconstructed decays.
- 6 Events are selected in which one B meson is fully reconstructed while the second B meson is reconstructed inclusively.
- 7 Data analyzed using $D/D^* \ell X$ event vertices.
- 8 Data analyzed using charge of secondary vertex.
- 9 ABREU 95Q assumes $B(B^0 \rightarrow D^{*-} \ell^+ \nu_\ell) = 3.2 \pm 1.7\%$.
- 10 Data analyzed using vertex-charge technique to tag B charge.
- 11 Combined result of $D/D^* \ell X$ analysis and fully reconstructed B analysis.
- 12 Combined ABREU 95Q and ADAM 95 result.

1 Measured using $B^\pm \rightarrow J/\psi K^\pm$ decays.

B^\pm DECAY MODES

B^- modes are charge conjugates of the modes below. Modes which do not identify the charge state of the B are listed in the B^\pm/B^0 ADMIXTURE section.

The branching fractions listed below assume 50% $B^0 \bar{B}^0$ and 50% $B^+ B^-$ production at the $T(4S)$. We have attempted to bring older measurements up to date by rescaling their assumed $T(4S)$ production ratio to 50:50 and their assumed D, D_s, D^* , and ψ branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, e.g., $B \rightarrow D^\pm X$, the values usually are multiplicities, not branching fractions. They can be greater than one.

Mode	Fraction (Γ_i/Γ)	Scale factor/ Confidence level
Semileptonic and leptonic modes		
$\Gamma_1 \ell^+ \nu_\ell X$	[a] (10.99 ± 0.28) %

 6.50 ± 0.20 ± 0.43 ⁵ BRIERE 02 CLE2 $e^+e^- \rightarrow \Upsilon(4S)$
 5.13 ± 0.54 ± 0.64 ⁶ BARISH 95 CLE2 Repl. by ADAM 03
 seen ⁷ SANGHERA 93 CLE2 $e^+e^- \rightarrow \Upsilon(4S)$
 4.1 ± 0.8 ± 0.8 ⁸ FULTON 91 CLEO $e^+e^- \rightarrow \Upsilon(4S)$
 -0.9
 7.0 ± 1.8 ± 1.4 ⁹ ANTREASYAN 90B CBAL $e^+e^- \rightarrow \Upsilon(4S)$
¹ Measured using the dependence of $B^- \rightarrow D^{*0} e^- \bar{\nu}_e$ decay differential rate and the form factor description by CAPRINI 98.
² Simultaneous measurements of both $B^0 \rightarrow D^*(2010)^- \ell \nu$ and $B^+ \rightarrow \bar{D}^*(2007)^0 \ell \nu$.
³ ALBRECHT 92C reports $0.058 \pm 0.014 \pm 0.013$. We rescale using the method described in STONE 94 but with the updated PDG 94 $B(D^0 \rightarrow K^- \pi^+)$. Assumes equal production of $B^0\bar{B}^0$ and B^+B^- at the $\Upsilon(4S)$.
⁴ Uses a fully reconstructed B meson as a tag on the recoil side.
⁵ The results are based on the same analysis and data sample reported in ADAM 03.
⁶ BARISH 95 use $B(D^0 \rightarrow K^- \pi^+) = (3.91 \pm 0.08 \pm 0.17)\%$ and $B(D^{*0} \rightarrow D^0 \pi^0) = (63.6 \pm 2.3 \pm 3.3)\%$.

⁷ Combining $\bar{D}^{*0} \ell^+ \nu_\ell$ and $\bar{D}^{*-} \ell^+ \nu_\ell$ SANGHERA 93 test $V-A$ structure and fit the decay angular distributions to obtain $A_{FB} = 3/4 * (\Gamma^- - \Gamma^+) / \Gamma = 0.14 \pm 0.06 \pm 0.03$. Assuming a value of V_{cb} , they measure $V, A_1,$ and A_2 , the three form factors for the $D^* \ell \nu_\ell$ decay, where results are slightly dependent on model assumptions.

⁸ Assumes equal production of $B^0\bar{B}^0$ and B^+B^- at the $\Upsilon(4S)$. Uncorrected for D and D^* branching ratio assumptions.
⁹ ANTREASYAN 90B is average over B and $\bar{D}^*(2010)$ charge states.

• • • We do not use the following data for averages, fits, limits, etc. • • •

¹ Measures absolute branching fractions using a missing-mass technique.

² Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

³ ABULENCIA 06J reports $[\Gamma(B^+ \rightarrow \bar{D}^0 \pi^+)/\Gamma_{total}] / [B(B^0 \rightarrow D^- \pi^+)] = 1.97 \pm 0.10 \pm 0.21$ which we multiply by our best value $B(B^0 \rightarrow D^- \pi^+) = (2.51 \pm 0.08) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁴ Uses a missing-mass method. Does not depend on D branching fractions or B^+/B^0 production rates.

⁵ AHMED 02B reports an additional uncertainty on the branching ratios to account for 4.5% uncertainty on relative production of B^0 and B^+ , which is not included here.

⁶ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses the MarkIII branching fractions for the D .

⁷ BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.

⁸ AUBERT,B 04P reports $[\Gamma(B^+ \rightarrow \bar{D}^0 \pi^+)/\Gamma_{total}] \times [B(D^0 \rightarrow K^- \pi^+)] = (1.846 \pm 0.032 \pm 0.097) \times 10^{-4}$ which we divide by our best value $B(D^0 \rightarrow K^- \pi^+) = (3.947 \pm 0.030) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁹ ALAM 94 assume equal production of B^+ and B^0 at the $\Upsilon(4S)$ and use the CLEOII absolute $B(D^0 \rightarrow K^- \pi^+)$ and the PDG 1992 $B(D^0 \rightarrow K^- \pi^+ \pi^0)/B(D^0 \rightarrow K^- \pi^+)$ and $B(D^0 \rightarrow K^- 2\pi^+ \pi^-)/B(D^0 \rightarrow K^- \pi^+)$.

¹⁰ ALBRECHT 88K assumes $B^0 \bar{B}^0, B^+ B^-$ ratio is 45:55. Superseded by ALBRECHT 90J.

$\Gamma(\bar{D}^0 \rho^+)/\Gamma_{total}$ Γ_{54}/Γ

¹ Uses the ratio of $B^- \rightarrow [K^+ \pi^-]_D K^-$ and $B^- \rightarrow [K^- \pi^+]_D K^-$. AAIJ 21Q gives the charge-averaged rate as 0.0173 ± 0.0006 , where the statistical and systematic uncertainties have been combined according to the correlations between the observables.

² Uses the ratio of $B^+ \rightarrow [K^- \pi^+]_D K^+$ and $B^+ \rightarrow [K^+ \pi^-]_D K^+$. AAIJ 21Q gives the charge-averaged rate as 0.0173 ± 0.0006 , where the statistical and systematic uncertainties have been combined according to the correlations between the observables.

³ AALTONEN 11AJ also measures the ratio separately for B^+ ($R^+(K)$) and B^- ($R^-(K)$) and obtains: $R^+(K) = (42.6 \pm 13.7 \pm 2.8) \times 10^{-3}$, $R^-(K) = (3.8 \pm 10.3 \pm 2.7) \times 10^{-3}$.

⁴ Superseded by AAIJ 21Q.

⁵ AUBERT 05G extract a constraint on the magnitude of the ratio of amplitudes $|A(B^+ \rightarrow D^0 K^+) / A(B^+ \rightarrow \bar{D}^0 K^+)| < 0.23$ at 90% CL (Bayesian). Similar measurements from $B^+ \rightarrow D^{*0} K^+$ are also reported.

⁶ SAIGO 05 extract a constraint on the magnitude of the ratio of amplitudes $|A(B^+ \rightarrow D^0 K^+) / A(B^+ \rightarrow \bar{D}^0 K^+)| < 0.27$ at 90% CL.

⁷ AUBERT,B 04L extract a constraint on the magnitude of the ratio of amplitudes $|A(B^+ \rightarrow D^0 K^+) / A(B^+ \rightarrow \bar{D}^0 K^+)| < 0.22$ at 90% CL.

¹ LEES 20c measurement's last uncertainty is due to the used $B(B^\pm \rightarrow K^\pm J/\psi)$ value.

² Measures absolute branching fractions using a missing-mass technique.

³ CHILIKIN 19 reports $[\Gamma(B^+ \rightarrow \chi_{c0} K^+) / \Gamma_{total}] \times [B(\chi_{c0}(1P) \rightarrow p\bar{p}\pi^+\pi^-)] = (3.7^{+1.2}_{-1.0} \pm 0.2) \times 10^{-7}$ which we divide by our best value $B(\chi_{c0}(1P) \rightarrow p\bar{p}\pi^+\pi^-) = (2.1 \pm 0.7) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁴ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

⁵ Measured in the $B^+ \rightarrow K^+ K^- K^+$ decay.

⁶ Measured in the $B^+ \rightarrow K^+ K_S^0 K_S^0$ decay.

⁷ LEES 11i reports $[\Gamma(B^+ \rightarrow \chi_{c0} K^+) / \Gamma_{total}] \times [B(\chi_{c0}(1P) \rightarrow \pi\pi)] = (1.53 \pm 0.66 \pm 0.27) \times 10^{-6}$ which we divide by our best value $B(\chi_{c0}(1P) \rightarrow \pi\pi) = (8.51 \pm 0.33) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁸ AUBERT 08A1 reports $(0.70 \pm 0.10 \pm 0.12 \pm 0.10) \times 10^{-6}$ for $B(B^+ \rightarrow \chi_{c0} K^+) \times B(\chi_{c0} \rightarrow \pi^+\pi^-)$. We compute $B(B^+ \rightarrow \chi_{c0} K^+)$ using the PDG value $B(\chi_{c0} \rightarrow \pi\pi) = (8.51 \pm 0.33) \times 10^{-3}$ and 2/3 for the $\pi^+\pi^-$ fraction. Our first error is their experiment's error and the second error is systematic error from using our best value.

⁹ AUBERT,BE 06M reports $[\Gamma(B^+ \rightarrow \chi_{c0} K^+) / \Gamma_{total}] \times [B(\chi_{c0}(1P) \rightarrow \gamma J/\psi(1S))] = (6.1 \pm 2.6 \pm 1.1) \times 10^{-6}$ which we divide by our best value $B(\chi_{c0}(1P) \rightarrow \gamma J/\psi(1S)) = (1.40 \pm 0.05) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. The significance of the observed signal is 2.4 σ .

¹⁰ AAJ 13s reports $[\Gamma(B^+ \rightarrow \chi_{c0} K^+) / \Gamma_{total}] \times [B(\chi_{c0}(1P) \rightarrow p\bar{p})] < 6 \times 10^{-8}$ which we divide by our best value $B(\chi_{c0}(1P) \rightarrow p\bar{p}) = 2.21 \times 10^{-4}$.

¹¹ WICHT 08 reports $[\Gamma(B^+ \rightarrow \chi_{c0} K^+) / \Gamma_{total}] \times [B(\chi_{c0}(1P) \rightarrow \gamma\gamma)] < 0.11 \times 10^{-6}$ which we divide by our best value $B(\chi_{c0}(1P) \rightarrow \gamma\gamma) = 2.04 \times 10^{-4}$.

¹² Measured in the $B^+ \rightarrow K^+ K^- K^+$ decay.

¹³ AUBERT,B 05N reports $(0.66 \pm 0.22 \pm 0.08) \times 10^{-6}$ for $B(B^+ \rightarrow \chi_{c0}^0 K^+) \times B(\chi_{c0}^0 \rightarrow \pi^+\pi^-)$. We compute $B(B^+ \rightarrow \chi_{c0}^0 K^+)$ using the PDG value $B(\chi_{c0}^0 \rightarrow \pi^+\pi^-) = (7.1 \pm 0.6) \times 10^{-3}$ and 2/3 for the $\pi^+\pi^-$ fraction.

¹⁴ The measurement performed using decay channels $\chi_{c0} \rightarrow \pi^+\pi^-$ and $\chi_{c0} \rightarrow K^+ K^-$. The ratio of the branching ratios for these channels is found to be consistent with world average.

¹⁵ AUBERT 04P reports $B(B^+ \rightarrow \chi_{c0} K^+) \times B(\chi_{c0} \rightarrow \pi^+\pi^-) = (1.5 \pm 0.4 \pm 0.1) \times 10^{-6}$ and used PDG value of $B(\chi_{c0} \rightarrow \pi\pi) = (7.4 \pm 0.8) \times 10^{-3}$ and Clebsch-Gordan coefficient to compute $B(B^\pm \rightarrow \chi_{c0} K^+)$.

¹⁶ ABE 02B measures the ratio of $B(B^+ \rightarrow \chi_{c0} K^+) / B(B^+ \rightarrow J/\psi(1S) K^+) = 0.60 \pm 0.21 - 0.18 \pm 0.05 \pm 0.08$, where the third error is due to the uncertainty in the $B(\chi_{c0} \rightarrow \pi^+\pi^-)$, and uses $B(B^+ \rightarrow J/\psi(1S) K^+) = (10.0 \pm 1.0) \times 10^{-4}$ to obtain the result.

¹⁷ EDWARDS 01 assumes equal production of B^0 and B^+ at the $\Upsilon(4S)$. The correlated uncertainties (28.3%) from $B(J/\psi(1S) \rightarrow \gamma\eta_c)$ in those modes have been accounted for.

19 ± 13 ± 6	⁹ ALBRECHT	92E	ARG $e^+ e^- \rightarrow \Upsilon(4S)$

¹ Measures absolute branching fractions using a missing-mass technique.

² LEES 20c measurement's last uncertainty is due to the used $B(B^\pm \rightarrow K^\pm J/\psi)$ value.

³ CHILIKIN 19 reports $[\Gamma(B^+ \rightarrow \chi_{c1}(1P) K^+) / \Gamma_{total}] \times [B(\chi_{c1}(1P) \rightarrow p\bar{p}\pi^+\pi^-)] = (4.7^{+1.3}_{-1.2} \pm 0.4) \times 10^{-7}$ which we divide by our best value $B(\chi_{c1}(1P) \rightarrow p\bar{p}\pi^+\pi^-) = (5.0 \pm 1.9) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁴ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

⁵ Uses $\chi_{c1,2} \rightarrow J/\psi\gamma$. Assumes $B(\Upsilon(4S) \rightarrow B^+ B^-) = (51.6 \pm 0.6)\%$ and $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = (48.4 \pm 0.6)\%$.

⁶ ACOSTA 02f uses as reference of $B(B \rightarrow J/\psi(1S) K^+) = (10.1 \pm 0.6) \times 10^{-4}$. The second error includes the systematic error and the uncertainties of the branching ratio.

⁷ AUBERT,BE 06M reports $[\Gamma(B^+ \rightarrow \chi_{c1}(1P) K^+) / \Gamma_{total}] \times [B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S))] = (1.76 \pm 0.07 \pm 0.12) \times 10^{-4}$ which we divide by our best value $B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S)) = (34.3 \pm 1.0) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁸ AUBERT 02 reports $(7.5 \pm 0.9 \pm 0.8) \times 10^{-4}$ from a measurement of $[\Gamma(B^+ \rightarrow \chi_{c1}(1P) K^+) / \Gamma_{total}] \times [B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S))]$ assuming $B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S)) = 0.273 \pm 0.016$, which we rescale to our best value $B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S)) = (34.3 \pm 1.0) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

⁹ ALBRECHT 92E assumes no $\chi_{c2}(1P)$ production and $B(\Upsilon(4S) \rightarrow B^+ B^-) = 50\%$.

-------	----	----------------	------	-----------------------------------

¹ AAJ 19AL reports 0.075 ± 0.008 ± 0.007 fit fraction for $B^+ \rightarrow f_2(1270)\pi^+$ from the amplitude analysis of $B^\pm \rightarrow \pi^\pm K^+ K^-$ decays. We use the PDG 19 value $B(B^+ \rightarrow K^+ K^- \pi^+) = (5.2 \pm 0.4) \times 10^{-6}$ to obtain $B(B^+ \rightarrow f_2(1270)\pi^+, f_2(1270) \rightarrow K^+ K^-)$. We compute $B(B^+ \rightarrow f_2(1270)\pi^+)$ using 1/2 of PDG 19 value of $B(f_2(1270) \rightarrow K\bar{K}) = (4.6 \pm 0.5)\%$ for $K^+ K^-$ fraction. Our first error is the experiment's error and the second error is systematic error from using our best value.

² AUBERT 09L reports $[\Gamma(B^+ \rightarrow \pi^+ f_2(1270))/\Gamma_{\text{total}}] \times [B(f_2(1270) \rightarrow \pi^+ \pi^-)] = (0.9 \pm 0.2 \pm 0.1 \pm 0.3) \times 10^{-6}$ which we divide by our best value $B(f_2(1270) \rightarrow \pi^+ \pi^-) = (56.2 \pm 1.9 \pm 0.6) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

³ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
⁴ AUBERT,B 05G reports $[\Gamma(B^+ \rightarrow \pi^+ f_2(1270))/\Gamma_{\text{total}}] \times [B(f_2(1270) \rightarrow \pi^+ \pi^-)] = (2.3 \pm 0.6 \pm 0.4) \times 10^{-6}$ which we divide by our best value $B(f_2(1270) \rightarrow \pi^+ \pi^-) = (56.2 \pm 1.9 \pm 0.6) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁵ BORTOLETTO 89 reports < 2.1×10^{-4} assuming the $\Upsilon(4S)$ decays 43% to $B^0\bar{B}^0$. We rescale to 50%.

< 15300	90	⁴ ABE	00C SLD	$e^+e^- \rightarrow Z$
< 500	90	³ BERGFELD	98 CLE2	

¹ AAIJ 19AL reports $(0.3 \pm 0.1 \pm 0.1) \times 10^{-2}$ fit fraction for $B^+ \rightarrow \phi(1020)\pi^+$ from the amplitude analysis of $B^\pm \rightarrow \pi^\pm K^+ K^-$ decays. We use the PDG 19 value $B(B^+ \rightarrow K^+ K^- \pi^+) = (5.2 \pm 0.4) \times 10^{-6}$ to obtain $B(B^+ \rightarrow \phi(1020)\pi^+) = \phi(1020) \rightarrow K^+ K^-$. We compute $B(B^+ \rightarrow \phi(1020)\pi^+)$ using the PDG 19 value of $B(\phi(1020) \rightarrow K^+ K^-) = (49.2 \pm 0.5)\%$. Our first error is the experiment's error and the second error is systematic error from using our best value.

² Measures $B(B^+ \rightarrow \phi\pi^+)/B(B^+ \rightarrow \phi K^+) < 0.018$ at 90% C.L. and assumes $B(B^+ \rightarrow \phi K^+) = (8.8^{+0.7}_{-0.6}) \times 10^{-6}$.

³ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

⁴ ABE 00c assumes $B(Z \rightarrow b\bar{b}) = (21.7 \pm 0.1)\%$ and the B fractions $f_{B^0} = f_{B^+} = (39.7^{+1.8}_{-2.2})\%$ and $f_{B_s} = (10.5^{+1.8}_{-2.2})\%$.

$< 1.4 \times 10^{-5}$	90	1 GRYGIER 17	BELL	$e^+e^- \rightarrow \Upsilon(4S)$

Test for $\Delta B=1$ weak neutral current. Allowed by higher-order electroweak interactions.

¹GRYGIER 17 reports $< 1.4 \times 10^{-5}$ from a measurement of $[\Gamma(B^+ \rightarrow \pi^+ \nu \nu)/\Gamma_{\text{total}}] / [B(B^+ \rightarrow J/\psi(1S) K^+)] / [B(J/\psi(1S) \rightarrow \mu^+ \mu^-)]$ assuming $B(B^+ \rightarrow J/\psi(1S) K^+) = (1.020 \pm 0.019) \times 10^{-3}$, $B(J/\psi(1S) \rightarrow \mu^+ \mu^-) = (5.961 \pm 0.033) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best values.

²Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

• • • We do not use the following data for averages, fits, limits, etc. • • •

POLARIZATION IN B^+ DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal (L) or both are transverse and parallel (||) or perpendicular (\perp) to each other with the parameters Γ_L/Γ , Γ_{\perp}/Γ , and the relative phases $\phi_{||}$ and ϕ_{\perp} . See the definitions in the note on "Polarization in B Decays" review in the B^0 Particle Listings.

CP VIOLATION

A_{CP} is defined as

$$\frac{B(B^- \rightarrow \bar{f}) - B(B^+ \rightarrow f)}{B(B^- \rightarrow \bar{f}) + B(B^+ \rightarrow f)}$$

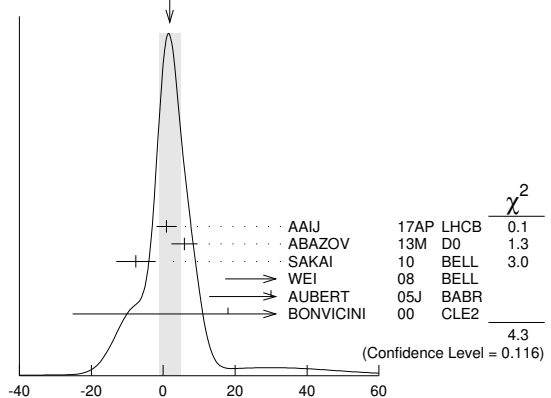

the CP-violation charge asymmetry of exclusive B^- and B^+ decay.

$A_{CP}(B^+ \rightarrow J/\psi(1S)K^+)$

WEIGHTED AVERAGE
 1.8 ± 3.0 (Error scaled by 1.5)

$A_{CP}(B^+ \rightarrow J/\psi(1S)K^+)$ (units 10^{-3})

- Uses $B^+ \rightarrow J/\psi K^+$, where $J/\psi \rightarrow p\bar{p}$.
- The result reported corresponds to $-A_{CP}$.
- A +0.3% correction is applied due to a slightly higher reconstruction efficiency for the positive kaons.
- Uses $J/\psi \rightarrow \mu^+ \mu^-$ decay.

CP VIOLATION PARAMETERS IN $B^+ \rightarrow DK^+$ AND SIMILAR DECAYS

The parameters r_{B^+} and δ_{B^+} are the magnitude ratio and strong phase difference between the amplitudes of $A(B^+ \rightarrow \bar{D}^{(*)0}K^{(*)+})$ and $A(B^+ \rightarrow D^{(*)0}K^{(*)+})$. The measured observables are defined as $x_\pm = r_{B^+} \cos(\delta_{B^+} \pm \gamma)$ and $y_\pm = r_{B^+} \sin(\delta_{B^+} \pm \gamma)$, and can be used to measure the CKM angle γ .

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV). It is derived from combinations of their results on $B^+ \rightarrow DK^+$ and related processes.

γ

For angle $\gamma(\phi_3)$ of the CKM unitarity triangle, see the review on "CP Violation" in the Reviews section.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV).

¹ AAIJ 21AM presents a combination of existing measurements from LHCb collaboration. It includes also charm mixing parameters.

² Uses binned Dalitz plot analysis of $D \rightarrow K_S^0 \pi^+ \pi^-$ and $K_S^0 K^+ K^-$ from $B^\pm \rightarrow DK^\pm$ modes. Strong phase measurements from CLEO-c and BES-III of the D decay over the Dalitz plot are used as input. Value is modulo 180° .

³ Measured in $B_S^0 \rightarrow D_S^\pm K^\mp \pi^\pm \pi^\mp$ decays in restricted phase space with $m(K^+ \pi^+ \pi^-) < 1950 \text{ MeV}$, $m(K^+ \pi^-) < 1200 \text{ MeV}$ and $m(\pi^+ \pi^-) < 1200 \text{ MeV}$. The value is modulo 180° .

⁴ A model-independent coherence factor for the decay $B_S \rightarrow D_S K \pi \pi$ (in the restricted phase space region) is also reported.

⁵ Uses binned analysis of $D \rightarrow K_S^0 \pi^+ \pi^- \pi^0$ from $B^\pm \rightarrow DK^\pm$ modes over the phase space. Strong phase measurements from RESMI 18 analysis of CLEO-c data of the D decay over the phase space binning are used as input.

⁶ Uses binned Dalitz plot analysis of $D \rightarrow K_S^0 \pi^+ \pi^-$ and $K_S^0 K^+ K^-$ from $B^\pm \rightarrow DK^\pm$ modes. Strong phase measurements from CLEO-c of the D decay over the Dalitz plot are used as input.

⁷ Measured in $B_S^0 \rightarrow D_S^\mp K^\pm$ decays, constraining $-2\beta_S$ by the measurement of $\phi_S = 0.030 \pm 0.033$ from HFLAV. The value is modulo 180° .

⁸ AAIJ 18Z reports the intervals $(5-86)^\circ$ or $(185-266)^\circ$ at 68% C.L. The extraction uses the time dependent CP violation measurement in $B^0 \rightarrow D^\mp \pi^\pm$ decays with external input and some theoretical assumptions.

⁹ Uses Dalitz plot analysis of $D \rightarrow K_S^0 \pi^+ \pi^-$ decays coming from $B^0 \rightarrow DK^*(892)^0$ modes. Measures $r_{B^0} = 0.39 \pm 0.13$, and $\delta_{B^0} = 197^{+24}_{-20}$ degrees.

¹⁰ A combination of measurements from analyses of time-integrated $B^+ \rightarrow DK^+$, $B^0 \rightarrow DK^{(*)0}$, $B^0 \rightarrow DK^+ \pi^-$, and $B^+ \rightarrow DK^+ \pi^+$ tree-level decays. In addition, results from a time-dependent analysis of $B_S^0 \rightarrow D_S K$ decays are included.

¹¹ A model-independent binned Dalitz plot analysis of the decays $B^0 \rightarrow DK^{*0}$, with $D \rightarrow K_S^0 \pi^+ \pi^-$ and $D \rightarrow K_S^0 K^+ K^-$. The results cannot be combined with the model-dependent analysis of the same dataset reported in AAIJ 16AA.

¹² Angle γ required to satisfy $0 < \gamma < 180$ degrees.

¹³ Obtained by measuring time-dependent CP asymmetry in $B_S^0 \rightarrow K^+ K^-$ and using a U-spin relation between $B_S^0 \rightarrow K^+ K^-$ and $B^0 \rightarrow \pi^+ \pi^-$.

¹⁴ Results are also presented using additional inputs on $B^0 \rightarrow \pi^0 \pi^0$ and $B^+ \rightarrow \pi^+ \pi^0$ decays from other experiments and isospin symmetry assumptions. The dependence of the results on the maximum allowed amount of U-spin breaking up to 50% is also included.

¹⁵ Uses binned Dalitz plot analysis of $B^+ \rightarrow DK^+$ decays, with $D \rightarrow K_S^0 \pi^+ \pi^-$ and $D \rightarrow K_S^0 K^+ K^-$. Strong phase measurements from CLEO-c (LIBBY 10) of the D

- decay over the Dalitz plot are used as input. Solution that satisfies $0 < \gamma < 180$ is chosen.
- 16 AAIJ 14BE uses model-dependent analysis of $D \rightarrow K_S^0 \pi^+ \pi^-$ amplitudes. The model is the same as in DEL-AMO-SANCHEZ 10F.
- 17 Measured in $B_S^0 \rightarrow D_S^+ K^\pm$ decays, constraining $-2\beta_S$ by the measurement of $\phi_S = 0.01 \pm 0.07 \pm 0.0$ from AAIJ 13AR. The value is modulo 180° at 68% CL.
- 18 Presents a confidence region $55.4^\circ < \gamma < 82.3^\circ$ at 68% CL with best fit value 72.6° and includes both statistical and systematic uncertainties. The corresponding 95% CL is $40.2^\circ < \gamma < 92.7^\circ$. The value is determined from combination of measurements using D meson decaying to $K^+ K^-$, $\pi^+ \pi^-$, $K^\pm \pi^\mp$, $K_S^0 \pi^+ \pi^-$, $K_S^0 K^+ K^-$, and $K^\pm \pi^\mp \pi^\pm \pi^\mp$. Combines $B^\pm \rightarrow D K^\pm$ and $B^\pm \rightarrow D \pi^\pm$.
- 19 Reports combination of published measurements using GGSZ, GLW, and ADS methods. Reports also 2σ range of $41-102^\circ$ and a 5.9σ significance for $\gamma(B^+ \rightarrow D^{(*)0} K^{(*)+}) \neq 0$ hypothesis.
- 20 Reports combined statistical and systematic uncertainties.
- 21 Uses binned Dalitz plot of $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays from $B^+ \rightarrow \overline{D}^0 K^+$. Measurement of strong phases in $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ Dalitz plot from LIBBY 10 is used as input.
- 22 We combined the systematics in quadrature. The authors report separately the contribution to the systematic uncertainty due to the uncertainty on the bin-averaged strong phase difference between D^0 and \overline{D}^0 amplitudes.
- 23 Uses Dalitz plot analysis of $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$, $K_S^0 K^+ K^-$ decays from $B^+ \rightarrow D^{(*)} K^+$, $D K^{*+}$ modes. The corresponding two standard deviation interval for γ is $39^\circ < \gamma < 98^\circ$. CP conservation in the combined result is ruled out with a significance of 3.5 standard deviations.
- 24 Reports confidence intervals for the CKM angle γ from the measured values of the GLW parameters using $B^\pm \rightarrow D K^\pm$ decays with D mesons decaying to non-CP($K\pi$), CP-even ($K^+ K^-$, $\pi^+ \pi^-$), and CP-odd ($K_S^0 \pi^0$, $K_S^0 \omega$) states.
- 25 Uses Dalitz plot analysis of $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays from $B^+ \rightarrow D^{(*)} K^+$ modes. The corresponding two standard deviation interval for γ is $54.2^\circ < \gamma < 100.5^\circ$. CP conservation in the combined result is ruled out with a significance of 3.5 standard deviations.
- 26 Uses Dalitz plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays coming from $B^0 \rightarrow D^0 K^{*0}$ modes. The corresponding 95% CL interval is $77^\circ < \gamma < 247^\circ$. A 180 degree ambiguity is implied.
- 27 Uses Dalitz plot analysis of $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ and $\overline{D}^0 \rightarrow K_S^0 K^+ K^-$ decays coming from $B^\pm \rightarrow D^{(*)} K^{(*)\pm}$ modes. The corresponding two standard deviation interval is $29^\circ < \gamma < 122^\circ$.
- 28 Uses a Dalitz plot analysis of the $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays; Combines the $D K^+$, $D^* K^+$ and $D K^{*+}$ modes. The corresponding two standard deviations interval for gamma is $8^\circ < \gamma < 111^\circ$.
- 29 Uses a Dalitz plot analysis of neutral $D \rightarrow K_S^0 \pi^+ \pi^-$ decays coming from $B^\pm \rightarrow D K^\pm$ and $B^\pm \rightarrow D^{*0} K^\pm$ followed by $D^{*0} \rightarrow D \pi^0$, $D \gamma$. The corresponding two standard deviations interval for gamma is $12^\circ < \gamma < 137^\circ$. AUBERT,B 05Y also reports the amplitude ratios and the strong phases.
- 30 Uses a Dalitz plot analysis of the 3-body $D \rightarrow K_S^0 \pi^+ \pi^-$ decays coming from $B^\pm \rightarrow D K^\pm$ and $B^\pm \rightarrow D^* K^\pm$ followed by $D^* \rightarrow D \pi^0$; here we use D to denote that the neutral D meson produced in the decay is an admixture of D^0 and \overline{D}^0 . The corresponding two standard deviations interval for γ is $26^\circ < \gamma < 126^\circ$. POLUEKTOV 04 also reports the amplitude ratios and the strong phases.

$r_B(B^+ \rightarrow D^0 K^+)$

r_B and δ_B are the amplitude ratio and relative strong phase between the amplitudes of $A(B^+ \rightarrow D^0 K^+)$ and $A(B^+ \rightarrow \overline{D}^0 K^+)$,

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV).

- 1 Uses binned analysis of $D \rightarrow K_S^0 \pi^+ \pi^- \pi^0$ from $B^\pm \rightarrow D K^\pm$ modes over the phase space. Strong phase measurements from CLEO-c and BES-III data of the D decay over the phase space binning are used as input.
- 2 Uses binned analysis of $D \rightarrow K_S^0 \pi^+ \pi^- \pi^0$ from $B^\pm \rightarrow D K^\pm$ modes over the phase space. Strong phase measurements from RESMI 18 analysis of CLEO-c data of the D decay over the phase space binning are used as input.

- 3 Uses binned Dalitz plot analysis of $D \rightarrow K_S^0 \pi^+ \pi^-$ and $K_S^0 K^+ K^-$ from $B^\pm \rightarrow D K^\pm$ modes. Strong phase measurements from CLEO-c of the D decay over the Dalitz plot are used as input.
- 4 Uses binned Dalitz plot analysis of $B^+ \rightarrow D K^+$ decays, with $D \rightarrow K_S^0 \pi^+ \pi^-$ and $D \rightarrow K_S^0 K^+ K^-$. Strong phase measurements from CLEO-c (LIBBY 10) of the D decay over the Dalitz plot are used as input.
- 5 AAIJ 14BE uses model-dependent analysis of $D \rightarrow K_S^0 \pi^+ \pi^-$ amplitudes. The model is the same as in DEL-AMO-SANCHEZ 10F.
- 6 Uses $B^\pm \rightarrow [K^\pm \pi^\mp \pi^\pm \pi^\mp]_D h^\pm$ mode.
- 7 Reports combination of published measurements using GGSZ, GLW, and ADS methods.
- 8 Reports combined statistical and systematic uncertainties.
- 9 Uses binned Dalitz plot of $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays from $B^+ \rightarrow \overline{D}^0 K^+$. Measurement of strong phases in $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ Dalitz plot from LIBBY 10 is used as input.
- 10 We combined the systematics in quadrature. The authors report separately the contribution to the systematic uncertainty due to the uncertainty on the bin-averaged strong phase difference between D^0 and \overline{D}^0 amplitudes.
- 11 Uses decays of neutral D to $K^- \pi^+ \pi^0$.
- 12 Uses Dalitz plot analysis of $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$, $K_S^0 K^+ K^-$ decays from $B^+ \rightarrow D^{(*)} K^{(*)+}$ modes. The corresponding two standard deviation interval is $0.037 < r_B < 0.155$.
- 13 Uses the Cabibbo suppressed decay of $B^+ \rightarrow \overline{D} K^+$ followed by $\overline{D} \rightarrow K^- \pi^+$.
- 14 Uses Dalitz plot analysis of $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays from $B^+ \rightarrow D^0 K^+$ modes. The corresponding two standard deviation interval is $0.084 < r_B < 0.239$.
- 15 Uses Dalitz plot analysis of $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ and $\overline{D}^0 \rightarrow K_S^0 K^+ K^-$ decays coming from $B^\pm \rightarrow D^{(*)} K^{(*)\pm}$ modes.
- 16 Uses a Dalitz plot analysis of the $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays; Combines the $D K^+$, $D^* K^+$ and $D K^{*+}$ modes.
- 17 Uses a Dalitz analysis of neutral D decays to $K_S^0 \pi^+ \pi^-$ in the processes $B^\pm \rightarrow D^{(*)} K^\pm$, $D^* \rightarrow D \pi^0$, $D \gamma$.

$\delta_B(B^+ \rightarrow D^0 K^+)$

Meson Particle Listings

B±, B0

Table listing meson particles with columns for name, code, and reference. Includes entries like AUBERT 03K PRL 90 231801, AUBERT 03L PRL 91 021801, etc.

Table listing meson particles with columns for name, code, and reference. Includes entries like AKERS 95T ZPHY C67 379, ALBRECHT 95D PL B353 554, etc.

B0

I(J^P) = 1/2(0^-)

Quantum numbers not measured. Values shown are quark-model predictions.

See also the B±/B0 ADMIXTURE and B±/B0/B0s/b-baryon ADMIXTURE sections.

See the Note "Production and Decay of b-flavored Hadrons" at the beginning of the B± Particle Listings and the Note on "B0-B0 Mixing" near the end of the B0 Particle Listings.

B0 MASS

The fit uses mB±, (mB0 - mB±), and mB0 to determine mB±, mB0, and the mass difference.

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Contains fit results for B0 mass and various decay channels.

Meson Particle Listings

 B^0

$m_{B^0} - m_{B^+}$	
VALUE (MeV)	DOCUMENT ID TECN COMMENT
0.32 ± 0.05 OUR FIT	
0.33 ± 0.05 OUR AVERAGE	
$0.57 \pm 0.49 \pm 0.10$	1 SIRUNYAN 18DF CMS pp at 8 TeV
$0.20 \pm 0.17 \pm 0.11$	1 AAIJ 12E LHCb pp at 7 TeV
$0.33 \pm 0.05 \pm 0.03$	2 AUBERT 08AF BABR $e^+e^- \rightarrow \Upsilon(4S)$
$0.53 \pm 0.67 \pm 0.14$	1 ACOSTA 06 CDF $p\bar{p}$ at 1.96 TeV
$0.41 \pm 0.25 \pm 0.19$	ALAM 94 CLE2 $e^+e^- \rightarrow \Upsilon(4S)$
$-0.4 \pm 0.6 \pm 0.5$	BORTOLETTO 92 CLEO $e^+e^- \rightarrow \Upsilon(4S)$
$-0.9 \pm 1.2 \pm 0.5$	ALBRECHT 90J ARG $e^+e^- \rightarrow \Upsilon(4S)$
$2.0 \pm 1.1 \pm 0.3$	3 BEBEK 87 CLEO $e^+e^- \rightarrow \Upsilon(4S)$

¹ Uses exclusively reconstructed final states containing a $J/\psi \rightarrow \mu^+\mu^-$ decay.

² Uses the B -momentum distributions in the e^+e^- rest frame.

³ BEBEK 87 actually measure the difference between half of E_{cm} and the B^\pm or B^0 mass, so the $m_{B^0} - m_{B^\pm}$ is more accurate. Assume $m_{\Upsilon(4S)} = 10580$ MeV.

$m_{B_H^0} - m_{B_L^0}$	
See the $B^0\text{-}\bar{B}^0$ MIXING PARAMETERS section near the end of these B^0 Listings.	

 B^0 MEAN LIFE

See $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE section for data on B -hadron mean life averaged over species of bottom particles.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

¹ Measured using $B^0 \rightarrow J/\psi K^*(892)^0$ and $B^0 \rightarrow J/\psi K_S^0$ decays.

² Measured using $B^0 \rightarrow D^-\mu^+\nu X$ decays.

³ Measured mean life using $B^0 \rightarrow J/\psi K_S^0$ decays.

⁴ Measured using $B^0 \rightarrow J/\psi K^*0$ decays.

⁵ Measured using $B^0 \rightarrow K^+\pi^-$ decays.

⁶ Measured with $B_d^0 \rightarrow J/\psi(\mu^+\mu^-) K_S^0(\pi^+\pi^-)$ decays.

⁷ Measured mean life using fully reconstructed decays ($J/\psi K^{(*)}$).

⁸ Measured mean life using $B^0 \rightarrow J/\psi K^*0$ decays.

⁹ Measured using a simultaneous fit of the B^0 lifetime and $\bar{B}^0 B^0$ oscillation frequency Δm_d in the partially reconstructed $B^0 \rightarrow D^{*-}\ell\nu$ decays.

¹⁰ Measurement performed using a combined fit of CP -violation, mixing and lifetimes.

¹¹ Measurement performed using an inclusive reconstruction and B flavor identification technique.

¹² AUBERT 03C uses a sample of approximately 14,000 exclusively reconstructed $B^0 \rightarrow D^*(2010)^-\ell\nu$ and simultaneously measures the lifetime and oscillation frequency.

¹³ Measurement performed with decays $B^0 \rightarrow D^{*-}\pi^+$ and $B^0 \rightarrow D^{*-}\rho^+$ using a partial reconstruction technique.

¹⁴ Measured mean life using fully reconstructed decays.

¹⁵ Data analyzed using partially reconstructed $\bar{B}^0 \rightarrow D^{*+}\ell^-\bar{\nu}$ decays.

¹⁶ Events are selected in which one B meson is fully reconstructed while the second B meson is reconstructed inclusively.

¹⁷ Data analyzed using $D/D^* \ell X$ event vertices.

¹⁸ Data analyzed using charge of secondary vertex.

¹⁹ Data analyzed using inclusive $D/D^* \ell X$.

²⁰ Measured mean life using partially reconstructed $D^{*-}\pi^+ X$ vertices.

²¹ ABREU 95Q assumes $B(B^0 \rightarrow D^{*-}\ell^+\nu_\ell) = 3.2 \pm 1.7\%$.

²² Data analyzed using vertex-charge technique to tag B charge.

²³ AKERS 95T assumes $B(B^0 \rightarrow D_s^{(*)}D^0) = 5.0 \pm 0.9\%$ to find B^+/B^0 yield.

²⁴ Measured using the time-dependent angular analysis of $B_d^0 \rightarrow J/\psi K^*0$ decays.

²⁵ Combined result of $D/D^* \ell X$ analysis, fully reconstructed B analysis, and partially reconstructed $D^{*-}\pi^+ X$ analysis.

²⁶ Combined ABREU 95Q and ADAM 95 result.

²⁷ WAGNER 90 tagged B^0 mesons by their decays into $D^{*-}e^+\nu$ and $D^{*-}\mu^+\nu$ where the D^{*-} is tagged by its decay into π^-D^0 .

²⁸ AVERILL 89 is an estimate of the B^0 mean lifetime assuming that $B^0 \rightarrow D^{*+} + X$ always.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

- Measured using $B \rightarrow J/\psi K^{(*)}$ decays.
- Measured mean life using fully reconstructed decays ($J/\psi K^{(*)}$).
- Data analyzed using $D/D^* \mu X$ vertices.
- Measurement performed using a combined fit of CP -violation, mixing and lifetimes.
- Measurement performed using an inclusive reconstruction and B flavor identification technique.
- Measured using fully reconstructed decays.
- Events are selected in which one B meson is fully reconstructed while the second B meson is reconstructed inclusively.
- Data analyzed using charge of secondary vertex.
- ABREU 95Q assumes $B(B^0 \rightarrow D^{*-} \ell^+ \nu_\ell) = 3.2 \pm 1.7\%$.
- Data analyzed using vertex-charge technique to tag B charge.
- AKERS 95T assumes $B(B^0 \rightarrow D_s^{(*)} D^{(*)}) = 5.0 \pm 0.9\%$ to find B^+/B^0 yield.
- Combined result of $D/D^* \ell X$ analysis and fully reconstructed B analysis.

τ_{B^+}/τ_{B^0} (Inferred from branching fractions)

These measurements are inferred from the branching fractions for semileptonic decay or other spectator-dominated decays by assuming that the rates for such decays are equal for B^0 and B^+ . We do not use measurements which assume equal production of B^0 and B^+ because of the large uncertainty in the production ratio.

“OUR EVALUATION” has been obtained by the Heavy Flavor Averaging Group (HFLAV) by taking into account correlations between measurements.

0.49 to 2.3	90		6	BEAN	87B CLEO $e^+e^- \rightarrow \Upsilon(4S)$

- ARTUSO 97 uses partial reconstruction of $B \rightarrow D^* \ell \nu_\ell$ and independent of B^0 and B^+ production fraction.
- Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
- ATHANAS 94 uses events tagged by fully reconstructed B^- decays and partially or fully reconstructed B^0 decays.
- Assumes equal production of B^0 and B^+ .
- ALBRECHT 92G data analyzed using $B \rightarrow D_s \bar{D}, D_s \bar{D}^*, D_s^* \bar{D}, D_s^* \bar{D}^*$ events.
- BEAN 87B assume the fraction of $B^0 \bar{B}^0$ events at the $\Upsilon(4S)$ is 0.41.

$\Delta\Gamma_{B_d^0}/\Gamma_{B_d^0}$

$\Gamma_{B_d^0}$ and $\Delta\Gamma_{B_d^0}$ are the decay rate average and difference between two B_d^0 CP eigenstates (light – heavy). The λ_{CP} characterizes B^0 and \bar{B}^0 decays to states of charmonium plus K_L^0 , see the review on “ CP Violation” in the reviews section.

- Measured using $B^0 \rightarrow J/\psi K^*(892)^0$ and $B^0 \rightarrow J/\psi K_S^0$ decays, and assuming $\beta = 21.9 \pm 0.7$ degrees.
- Measured from the ratio of decay time distributions of $B^0 \rightarrow J/\psi K_S^0$ and $B^0 \rightarrow J/\psi K^{*0}$ decays.
- Measured using the effective lifetimes of $B^0 \rightarrow J/\psi K_S^0$ and $B^0 \rightarrow J/\psi K^{*0}$ decays.
- Reports $-\Delta\Gamma_d/\Gamma_d$ using $B^0 \rightarrow J/\psi K_S^0, J/\psi K_L^0, D^- \pi^+, D^{*-} \pi^+, D^{*-} \rho^+$, and $D^{*-} \ell^+ \nu$ decays.
- Corresponds to 90% confidence range $[-0.084, 0.068]$.
- Used the measured $\tau_{B^0} = 1.55 \pm 0.03$ ps. Corresponds to an upper limit of < 0.18 at 95% C.L.
- BEHRENS 00B uses high-momentum lepton tags and partially reconstructed $\bar{B}^0 \rightarrow D^{*+} \pi^-, \rho^-$ decays to determine the flavor of the B meson. Assumes $\Delta_{md}=0.478 \pm 0.018$ ps^{-1} and $\tau_{B^0}=1.548 \pm 0.032$ ps.

B^0 DECAY MODES

\bar{B}^0 modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing. Modes which do not identify the charge state of the B are listed in the B^\pm/B^0 ADMIXTURE section.

The branching fractions listed below assume 50% $B^0 \bar{B}^0$ and 50% $B^+ B^-$ production at the $\Upsilon(4S)$. We have attempted to bring older measurements up to date by rescaling their assumed $\Upsilon(4S)$ production ratio to 50:50 and their assumed D, D_s, D^* , and ψ branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, e.g., $B \rightarrow D^\pm X$, the values usually are multiplicities, not branching fractions. They can be greater than one.

- 1 Uses a fully reconstructed B meson as a tag on the recoil side while the other, on the signal side, is partially reconstructed from $B \rightarrow D\ell\nu$.
- 2 Uses a fully reconstructed B meson as a tag on the recoil side.
- 3 Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
- 4 BUSKULIC 97 assumes fraction (B^+) = fraction (B^0) = (37.8 ± 2.2)% and PDG 96 values for B lifetime and branching ratio of D^* and D decays.
- 5 ATHANAS 97 uses missing energy and missing momentum to reconstruct neutrino.
- 6 FULTON 91 assumes assuming equal production of B^0 and B^+ at the $\Upsilon(4S)$ and uses Mark III D and D^* branching ratios.
- 7 ALBRECHT 89J reports 0.018 ± 0.006 ± 0.005. We rescale using the method described in STONE 94 but with the updated PDG 94 $B(D^0 \rightarrow K^-\pi^+)$.

 "OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

WEIGHTED AVERAGE
 5.16 ± 0.16 (Error scaled by 1.4)

- 1 WAHEED 21 uses fully reconstructed $D^{*-}\ell^+\nu$ events ($\ell = e$ or μ).
- 2 Uses a fully reconstructed B meson as a tag on the recoil side.
- 3 Measured using fully reconstructed D^* sample and a simultaneous fit to the Caprini-Lellouch-Neubert form factor parameters: $\rho^2 = 1.191 \pm 0.048 \pm 0.028$, $R_1(1) = 1.429 \pm 0.061 \pm 0.044$, and $R_2(1) = 0.827 \pm 0.038 \pm 0.022$.
- 4 Measured using fully reconstructed D^* sample.
- 5 Uses the combined fit of both $B^0 \rightarrow D^*(2010)^-\ell\nu$ and $B^+ \rightarrow \bar{D}^*(2077)^0\ell\nu$ samples.
- 6 ABREU 01H measured using about 5000 partial reconstructed D^* sample.
- 7 ABBIENDI 00Q assumes the fraction $B(b \rightarrow B^0) = (39.7^{+1.3}_{-2.2})\%$. This result is an average of two methods using exclusive and partial D^* reconstruction.
- 8 BUSKULIC 97 assumes fraction (B^+) = fraction (B^0) = (37.8 ± 2.2)% and PDG 96 values for B lifetime and D^* and D branching fractions.
- 9 Combines with previous partial reconstructed D^* measurement.
- 10 Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
- 11 The results are based on the same analysis and data sample reported in ADAM 03.
- 12 ACKERSTAFF 97G assumes fraction (B^+) = fraction (B^0) = (37.8 ± 2.2)% and PDG 96 values for B lifetime and branching ratio of D^* and D decays.
- 13 ABREU 96P result is the average of two methods using exclusive and partial D^* reconstruction.
- 14 BARISH 95 use $B(D^0 \rightarrow K^-\pi^+) = (3.91 \pm 0.08 \pm 0.17)\%$ and $B(D^{*+} \rightarrow D^0\pi^+) = (68.1 \pm 1.0 \pm 1.3)\%$.
- 15 BUSKULIC 95N assumes fraction (B^+) = fraction (B^0) = 38.2 ± 1.3 ± 2.2% and $\tau_{B^0} = 1.58 \pm 0.06$ ps. $\Gamma(D^{*-}\ell^+\nu_\ell)/total = [5.18 - 0.13(\text{fraction}(B^0) - 38.2) - 1.5(\tau_{B^0} - 1.58)]\%$.
- 16 ALBRECHT 94 assumes $B(D^{*+} \rightarrow D^0\pi^+) = 68.1 \pm 1.0 \pm 1.3\%$. Uses partial reconstruction of D^{*+} and is independent of D^0 branching ratios.
- 17 ALBRECHT 93 reports 0.052 ± 0.005 ± 0.006. We rescale using the method described in STONE 94 but with the updated PDG 94 $B(D^0 \rightarrow K^-\pi^+)$. We have taken their average e and μ value. They also obtain $\alpha = 2\Gamma^0/(\Gamma^- + \Gamma^+) - 1 = 1.1 \pm 0.4 \pm 0.2$, $A_{FB} = 3/4 * (\Gamma^- - \Gamma^+)/\Gamma = 0.2 \pm 0.08 \pm 0.06$ and a value of $|V_{cb}| = 0.036 - 0.045$ depending on model assumptions.
- 18 Combining $\bar{D}^{*0}\ell^+\nu_\ell$ and $\bar{D}^{*-}\ell^+\nu_\ell$ SANGHERA 93 test $V-A$ structure and fit the decay angular distributions to obtain $A_{FB} = 3/4 * (\Gamma^- - \Gamma^+)/\Gamma = 0.14 \pm 0.06 \pm 0.03$. Assuming a value of V_{cb} , they measure V, A_1 , and A_2 , the three form factors for the $D^*\ell\nu_\ell$ decay, where results are slightly dependent on model assumptions.
- 19 ANTREASIAN 90B is average over B and $\bar{D}^*(2010)$ charge states.
- 20 The measurement of ALBRECHT 89C suggests a D^* polarization γ_L/γ_T of 0.85 ± 0.45, or $\alpha = 0.7 \pm 0.9$.
- 21 ALBRECHT 89J is ALBRECHT 87J value rescaled using $B(D^*(2010)^- \rightarrow D^0\pi^-) = 0.57 \pm 0.04 \pm 0.04$. Superseded by ALBRECHT 93.
- 22 We have taken average of the the BORTOLETTO 89B values for electrons and muons, 0.046 ± 0.005 ± 0.007. We rescale using the method described in STONE 94 but with the updated PDG 94 $B(D^0 \rightarrow K^-\pi^+)$. The measurement suggests a D^* polarization parameter value $\alpha = 0.65 \pm 0.66 \pm 0.25$.
- 23 ALBRECHT 87J assume μ - e universality, the $B(\Upsilon(4S) \rightarrow B^0\bar{B}^0) = 0.45$, the $B(D^0 \rightarrow K^-\pi^+) = (0.042 \pm 0.004 \pm 0.004)$, and the $B(D^*(2010)^- \rightarrow D^0\pi^-) = 0.49 \pm 0.08$. Superseded by ALBRECHT 89J.

- <4.1 90 ¹⁰ BEAN 93B CLE2 $e^+e^- \rightarrow \Upsilon(4S)$

- ¹ The signal events are tagged by a second B meson reconstructed in the fully hadronic decays.
- ² B^+ and B^0 decays combined assuming isospin symmetry. Systematic errors include both experimental and form-factor uncertainties.
- ³ The B^0 and B^+ results are combined assuming the isospin, B lifetimes, and relative charged/neutral B production at the $\Upsilon(4S)$.
- ⁴ The signal events are tagged by a second B meson reconstructed in the semileptonic mode $B \rightarrow D^{(*)} \ell \nu_\ell$.
- ⁵ Averaging with ALEXANDER 96T results including experimental and theoretical correlations considered, BEHRENS 00 reports systematic errors $\pm 0.33 \pm 0.41$, where the second error is theoretical model dependence. We combine these in quadrature.

- ⁶ ATHAR 03 reports systematic errors $^{+0.47}_{-0.50} \pm 0.41 \pm 0.01$, which are experimental systematic, systematic due to residual form-factor uncertainties in the signal, and systematic due to residual form-factor uncertainties in the cross-feed modes, respectively. We combine these in quadrature.
- ⁷ Uses isospin constraints and extrapolation to all electron energies according to five different form-factor calculations. The second error combines the systematic and theoretical uncertainties in quadrature.
- ⁸ BEHRENS 00 reports $^{+0.35}_{-0.40} \pm 0.50$, where the second error is the theoretical model dependence. We combine these in quadrature. B^+ and B^0 decays combined using isospin symmetry: $\Gamma(B^0 \rightarrow \rho^- \ell^+ \nu) = 2\Gamma(B^+ \rightarrow \rho^0 \ell^+ \nu) \approx 2\Gamma(B^+ \rightarrow \omega \ell^+ \nu)$. No evidence for $\omega \ell \nu$ is reported.
- ⁹ ALEXANDER 96T reports $^{+0.5}_{-0.7} \pm 0.5$ where the second error is the theoretical model dependence. We combine these in quadrature. B^+ and B^0 decays combined using isospin symmetry: $\Gamma(B^0 \rightarrow \rho^- \ell^+ \nu) = 2\Gamma(B^+ \rightarrow \rho^0 \ell^+ \nu) \approx 2\Gamma(B^+ \rightarrow \omega \ell^+ \nu)$. No evidence for $\omega \ell \nu$ is reported.
- ¹⁰ BEAN 93B limit set using ISGW Model. Using isospin and the quark model to combine $\Gamma(\rho^0 \ell^+ \nu)$ and $\Gamma(\omega \ell^+ \nu)$ with this result, they obtain a limit $<(1.6-2.7) \times 10^{-4}$ at 90% CL for $B^+ \rightarrow (\omega \text{ or } \rho^0) \ell^+ \nu$. The range corresponds to the ISGW, WSB, and KS models. An upper limit on $|V_{ub}/V_{cb}| < 0.08-0.13$ at 90% CL is derived as well.

3.1 ± 1.3 ± 1.0	7	⁵ ALBRECHT	88k	ARG $e^+e^- \rightarrow \Upsilon(4S)$

¹ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

² Uses a missing-mass method. Does not depend on D branching fractions or B^+/B^0 production rates.

³ AHMED 02b reports an additional uncertainty on the branching ratios to account for 4.5% uncertainty on relative production of B^0 and B^+ , which is not included here.

⁴ BORTOLETTO 92 assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D .

⁵ ALBRECHT 88k assumes $B^0\bar{B}^0:B^+B^-$ production ratio is 45:55. Superseded by ALBRECHT 90J which assumes 50:50.

⁶ BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.

⁷ AUBERT,B 04o reports $[\Gamma(B^0 \rightarrow D^- \pi^+)/\Gamma_{\text{total}}] \times [B(D^+ \rightarrow K_S^0 \pi^+)] = (42.7 \pm 2.1 \pm 2.2) \times 10^{-6}$ which we divide by our best value $B(D^+ \rightarrow K_S^0 \pi^+) = (1.562 \pm 0.031) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁸ ALAM 94 reports $[\Gamma(B^0 \rightarrow D^- \pi^+)/\Gamma_{\text{total}}] \times [B(D^+ \rightarrow K^- 2\pi^+)] = (0.265 \pm 0.032 \pm 0.023) \times 10^{-3}$ which we divide by our best value $B(D^+ \rightarrow K^- 2\pi^+) = (9.38 \pm 0.16) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

700 ± 500	5	6 BEHRENDTS	83	CLEO $e^+e^- \rightarrow \Upsilon(4S)$

¹ The second uncertainty combines in quadrature all systematic uncertainties quoted in the paper. AAIJ 15Y reports $B(B^0 \rightarrow \overline{D}^0 \pi^+ \pi^-) = (8.46 \pm 0.14 \pm 0.49) \times 10^{-4}$ in the kinematic region $m(\overline{D}^0 \pi^\pm) > 2.1$ GeV which we corrected to the full phase-space dividing by 0.945 from Belle.

² Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

³ No assumption about the intermediate mechanism is made in the analysis.

⁴ BORTOLETTO 92 assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D . The product branching fraction into $D_0^*(2340)\pi$ followed by $D_0^*(2340) \rightarrow D^0\pi$ is < 0.0001 at 90% CL and into $D_2^*(2460)$ followed by $D_2^*(2460) \rightarrow D^0\pi$ is < 0.0004 at 90% CL.

⁵ BEBEK 87 assume the $\Upsilon(4S)$ decays 43% to $B^0\overline{B}^0$. We rescale to 50%. $B(D^0 \rightarrow K^-\pi^+) = (4.2 \pm 0.4 \pm 0.4)\%$ and $B(D^0 \rightarrow K^-\pi^+\pi^+) = (9.1 \pm 0.8 \pm 0.8)\%$ were used.

⁶ Corrected by us using assumptions: $B(D^0 \rightarrow K^-\pi^+) = (0.042 \pm 0.006)$ and $B(\Upsilon(4S) \rightarrow B^0\overline{B}^0) = 50\%$. The product branching ratio is $B(B^0 \rightarrow \overline{D}^0 \pi^+ \pi^-)B(\overline{D}^0 \rightarrow K^+\pi^-) = (0.39 \pm 0.26) \times 10^{-2}$.

¹ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

² AUBERT, BE 06J reports $[\Gamma(B^0 \rightarrow D^*(2010)^-\pi^+)/\Gamma_{\text{total}}] / [B(B^0 \rightarrow D^-\pi^+)] = 0.99 \pm 0.11 \pm 0.08$ which we multiply by our best value $B(B^0 \rightarrow D^-\pi^+) = (2.51 \pm 0.08) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

³ Uses a missing-mass method. Does not depend on D branching fractions or B^{\pm}/B^0 production rates.

⁴ BRANDENBURG 98 assume equal production of B^+ and B^0 at $\Upsilon(4S)$ and use the D^* reconstruction technique. The first error is their experiment's error and the second error is the systematic error from the PDG 96 value of $B(D^* \rightarrow D\pi)$.

⁵ ALAM 94 assume equal production of B^+ and B^0 at the $\Upsilon(4S)$ and use the CLEO II $B(D^*(2010)^+ \rightarrow D^0\pi^+)$ and absolute $B(D^0 \rightarrow K^-\pi^+)$ and the PDG 1992 $B(D^0 \rightarrow K^-\pi^+\pi^0)/B(D^0 \rightarrow K^-\pi^+)$ and $B(D^0 \rightarrow K^-2\pi^+\pi^-)/B(D^0 \rightarrow K^-\pi^+)$.

⁶ BORTOLETTO 92 reports $(4.0 \pm 1.0 \pm 0.7) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^-\pi^+)/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0\pi^+)]$ assuming $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \rightarrow D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D .

⁷ ALBRECHT 90J reports $(2.8 \pm 0.9 \pm 0.6) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^-\pi^+)/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0\pi^+)]$ assuming $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \rightarrow D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D .

⁸ BEBEK 87 reports $(2.8^{+1.5+1.0}_{-1.2-0.6}) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^-\pi^+)/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0\pi^+)]$ assuming $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \rightarrow D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92 and ALBRECHT 90J.

⁹ Assumes $B(Z \rightarrow b\overline{b}) = 0.217$ and 38% B_d production fraction.

¹⁰ ALBRECHT 87c use PDG 86 branching ratios for D and $D^*(2010)$ and assume $B(\Upsilon(4S) \rightarrow B^+B^-) = 55\%$ and $B(\Upsilon(4S) \rightarrow B^0\overline{B}^0) = 45\%$. Superseded by ALBRECHT 90J.

¹¹ ALBRECHT 86F uses pseudomass that is independent of D^0 and D^+ branching ratios.

¹² Assumes $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.60^{+0.08}_{-0.15}$. Assumes $B(\Upsilon(4S) \rightarrow B^0\overline{B}^0) = 0.40 \pm 0.02$. Does not depend on D branching ratios.

- ¹ Assumes equal production of B^+ and B^0 .
- ² The measurement is obtained by amplitude analysis of $B^0 \rightarrow D^{*-} \omega \pi^+$. The second uncertainty combines in quadrature experimental systematic and model uncertainties.
- ³ Obtained by fitting the events with $\cos \theta_{D^*} < 0.5$ and scaling up the result by a factor of 4/3. No interference effects between $B^0 \rightarrow D_1^0 \omega$ and $D^{*0} \omega \pi$ are assumed.

¹ DAS 10 reports $[\Gamma(B^0 \rightarrow D^+ \pi^-)/\Gamma_{\text{total}}] / [B(B^0 \rightarrow D^- \pi^+)] = (2.92 \pm 0.38 \pm 0.31) \times 10^{-4}$ which we multiply by our best value $B(B^0 \rightarrow D^- \pi^+) = (2.51 \pm 0.08) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
² Derived using $\tan(\theta_C) f_D/f_{D_s} \sqrt{B(B^0 \rightarrow D_s^+ \pi^-)/B(B^0 \rightarrow D^- \pi^+)}$ by assuming the flavor SU(3) symmetry, where θ_C is the Cabibbo angle, f_D (f_{D_s}) is the D (D_s) meson decay constant.

$$\Gamma(D_s^+ \pi^-)/\Gamma_{114}/\Gamma$$

5 ALEXANDER 93B CLE2 $e^+ e^- \rightarrow \Upsilon(4S)$
 6 BORTOLETTO 90 CLEO $e^+ e^- \rightarrow \Upsilon(4S)$

¹ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
² AUBERT 07K reports $[\Gamma(B^0 \rightarrow D_s^+ \pi^-)/\Gamma_{\text{total}}] \times [B(D_s^+ \rightarrow \phi \pi^+)] = (0.63 \pm 0.15 \pm 0.05) \times 10^{-6}$ which we divide by our best value $B(D_s^+ \rightarrow \phi \pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
³ AUBERT 03D reports $[\Gamma(B^0 \rightarrow D_s^+ \pi^-)/\Gamma_{\text{total}}] \times [B(D_s^+ \rightarrow \phi \pi^+)] = (1.13 \pm 0.33 \pm 0.21) \times 10^{-6}$ which we divide by our best value $B(D_s^+ \rightarrow \phi \pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
⁴ KROKOVNY 02 reports $[\Gamma(B^0 \rightarrow D_s^+ \pi^-)/\Gamma_{\text{total}}] \times [B(D_s^+ \rightarrow \phi \pi^+)] = (0.86 \pm 0.37 \pm 0.30) \times 10^{-6}$ which we divide by our best value $B(D_s^+ \rightarrow \phi \pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
